KEY TO PRONUNCIATION.

ā as in ale, fate. Also see **è**, below.
ȧ " " senate, chaotic. Also see **è**, below.
â " " glare, care.
ă " " am, at.
ä " " arm, father.
à " " ant, and final *a* in America, armada, etc. In rapid speech this vowel readily becomes more or less obscured and like the neutral vowel or a short u (ŭ).
a " " final, regal, where it is of a neutral or obscure quality.
a " " all, fall.
ē " " eve.
ė " " elate, evade.
ĕ " " end, pet. The characters *ĕ*, *ā*, and *ä̆* are used for *ä* in German, as in Gärtner, Gräfe, Hähnel, to the values of which they are the nearest English vowel sounds. The sound of Swedish *ä* is also indicated by *ĕ*.
ẽ " " fern, her, and as *i* in sir. Also for *ö*, *oe*, in German, as in Göthe, Goethe, Ortel, Oertel, and for *eu* and *oeu* in French, as in Neufchâtel, Crèveœur; to which it is the nearest English vowel sound.
e " " agency, judgment, where it is of a neutral or obscure quality.
ī " " ice, quiet.
i " " quiescent.
ĭ " " ill, fit.
ō " " old, sober.
o̊ " " obey, sobriety.
ô " " orb, nor.
ŏ " " odd, forest, not.
o " " atom, carol, where it has a neutral or obscure quality.
oi " " oil, boil, and for *eu* in German, as in Feuerbach.
o͞o " " food, fool, and as *u* in rude, rule.
ou " " house, mouse.
ū " " use, mule.
u̇ " " unite.
ŭ " " cut, but.
u̥ " " full, put, or as *oo* in foot, book. Also for *ü* in German, as in München, Müller, and *u* in French, as in Buchez, Budé; to which it is the nearest English vowel sound.
û " " urn, burn.
y " " yet, yield.
B " " the Spanish Habana, Cordoba, where it is like a *v* made with the lips alone, instead of with the teeth and lips.
ch " " chair, cheese.
Đ as in the Spanish Almodovar, pulgada, where it is nearly like *th* in English then, this.
g " " go, get.
G " " the German Landtag, and *ch* in Feuerbach, buch; where it is a guttural sound made with the back part of the tongue raised toward the soft palate, as in the sound made in clearing the throat.
H as *j* in the Spanish Jijona, *g* in the Spanish gila; where it is a fricative somewhat resembling the sound of *h* in English hue or *y* in yet, but stronger.
hw " *wh* in which.
K " *ch* in the German ich, Albrecht, and *g* in the German Arensberg, Mecklenburg; where it is a fricative sound made between the tongue and the hard palate toward which the tongue is raised. It resembles the sound of *h* in hue, or *y* in yet; or the sound made by beginning to pronounce a *k*, but not completing the stoppage of the breath. The character K is also used to indicate the rough aspirates or fricatives of some of the Oriental languages, as of kh in the word Khan.
n̰ as in sinker, longer.
ng " " sing, long.
N " " the French bon, Bourbon, and *m* in the French Etampes; where it is equivalent to a nasalizing of the preceding vowel. This effect is approximately produced by attempting to pronounce 'onion' without touching the tip of the tongue to the roof of the mouth. The corresponding nasal of Portuguese is also indicated by N, as in the case of São Antão.
sh " " shine, shut.
th " " thrust, thin.
TH " " then, this.
zh as *z* in azure, and *s* in pleasure.

An apostrophe ['] is sometimes used to denote a glide or neutral connecting vowel, as in tā'b'l (table), kāz'm (chasm).

Otherwise than as noted above, the letters used in the respellings for pronunciation are to receive their ordinary English sounds.

When the pronunciation is sufficiently shown by indicating the accented syllables, this is done without respelling; as in the case of very common English words, and words which are so spelled as to insure their correct pronunciation if they are correctly accented. See the article on PRONUNCIATION.

A PARTIAL LIST OF THE LEADING ARTICLES IN VOLUME XV.

THE NEW INTERNATIONAL ENCYCLOPÆDIA

ONA, ō'nä. A group of tribes, apparently constituting a distinct linguistic stock, inhabiting the shores and islands of the Strait of Magellan and the northwestern part of Tierra del Fuego. In spite of the cold and desolate nature of the country, they go almost naked and build only slight brushwood shelters, protecting their bodies by copious rubbing of grease. They are tall and strongly built, and are expert hunters and fishers, using the club, sling, bow, bolas, and lance. Their bark canoes withstand almost any storm, and the baskets woven by the women are so well made that they will hold water. They have also trained dogs to hunt. Little is yet known of their religion or sociology, which, however, appear to be as elaborate as among most roving tribes. They formerly numbered nearly 3000, but are being exterminated by the sheep-herders who have occupied the country.

ONA'TAS (Lat., from Gk. *Ὀνάτας*). A Greek artist, whose activity extended from about B.C. 490 to 460. He was a native of Ægina and son of Micon. Among his famous works were a four-horse chariot at Olympia made for Hiero of Syracuse to commemorate a victory in the games, a colossal Hercules at the same place, dedicated by the Thasians, and a group of the Greek heroes casting lots to determine who should accept the challenge of Hector. At Delphi was a large group of fighting men dedicated by the Tarentines. Onatas is known only as a worker in bronze, but it is probable that the Æginetan sculptures (q.v.) show his influence on the art of his native island.

OÑATE, ō-nyä'tā, JUAN DE (c.1555-c.1615). A Spanish explorer, settler of New Mexico. He was born at Guadalajara, Mexico, of which city his father was the founder, and married a granddaughter of Cortés. In 1595 he received permission from the Viceroy, Velasco, to colonize what is now New Mexico. After his preparations were complete, the start was delayed by Monterey, who had succeeded Velasco as Viceroy, and who wished to transfer the grant to Pedro Ponce de Leon. In the latter part of January, 1598, the force of 130 colonists with servants and Indians started from Zacatecas; it crossed the Rio Grande in April; and in August founded San Juan, the first capital of New Mexico. Oñate led several expeditions into Arizona (1599, 1604, and possibly 1611), and seems not to have been Governor of the new settlements after 1608. The principal source for the history of the expedition is an epic poem by Gaspar de Villagrá (or Villagran), a captain, who accompanied Oñate and made him the hero of the epopee.

ONAWA, ōn'ä-wä. A town and the county-seat of Monona County, Iowa, 59 miles north of Council Bluffs; on the Illinois Central and the Chicago and Northwestern railroads (Map: Iowa, A 3). It carries on considerable trade as the commercial centre of a productive farming and stock-raising country. There is a public library. Population, in 1890, 1358; in 1900, 1933.

ONCKEN, ôṅk'en, AUGUST (1844—). A German economist, of the historical school. He was born at Heidelberg, studied there, at Munich, and at Berlin, and in 1872 became professor of political economy and statistics in the Imperial Agricultural Institute in Vienna, whence in 1877 he went to the Polytechnic Institute at Aix-la-Chapelle and in 1878 to the University of Bern. Among his works are: *Adam Smith in der Kulturgeschichte* (1874); *Adam Smith und Immanuel Kant* (1877); *Die Maxime "Laissez faire et laissez passer"* (1877); a valuable critical edition of Quesnay (1888), which gave fresh stimulus to the study of the physiocrats; *Geschichte der politischen Oekonomie* (part i., 1901); and contributions to *Berner Beiträge zur Geschichte der Nationalokonomie*, of which he was editor.

ONCKEN, WILHELM (1838—). A German historian, brother of August Oncken. He was born in Heidelberg; was educated there, and at Göttingen and Berlin; taught at Heidelberg (1862-70); and in 1870 was appointed professor of history at Giessen. In 1877 he became editor of the comprehensive series entitled "Allgemeine Geschichte in Einzeldarstellungen." He wrote: *Athen und Hellas* (1865-66); *Stadt, Schloss und Hochschule Heidelberg* (3d ed. 1885); and in the series mentioned: *Das Zeitalter Friedrichs des Grossen* (1881-83); *Das Zeitalter der Revolution,*

des Kaiserreichs und der Befreiungskriege (1885-87); and *Das Zeitalter des Kaisers Wilhelm I.* (1890-92).

ONCOCARPUS (Neo-Lat., from Gk. ὄγκος, *onkos*, hook, + καρπός, *karpos*, fruit). A genus of trees of the natural order Anacardiaceæ. *Oncocarpus vitiensis*, a remarkable Fiji Island tree about 60 feet high, has large oblong leaves, and a corky fruit, somewhat resembling the seed of a walnut. Its sap when brought in contact with the skin is very caustic, for which reason the wood is often called itch wood. The exhalations are said to cause itching with irritation for several days.

ONCORHYNCHUS (Neo-Lat., from Gk. ὄγκος, *onkos*, hook + ῥύγχος, *rhynchos*, snout). A genus of salmon including those of the Pacific coast, several species of which are of commercial importance. See SALMON.

O'NEALL, ō-nēl', JOHN BELTON (1793-1863). An American jurist. He was born in South Carolina, graduated at South Carolina College in 1812, and was admitted to the bar two years later. He served in the Legislature, and was Speaker in the House before being chosen associate judge in 1828. He was later judge in the Court of Appeals, and was also most energetic in promoting business enterprises which might benefit the State. Besides being a frequent contributor to the press on educational, temperance, and religious matters, he was the author of *A Digest of the Negro Law of South Carolina* (1848); *Annals of Newberry, S. C.* (1858); and *Biographical Sketches of the Bench and Bar of South Carolina* (1859).

ONEGA, ō-nyā'gȧ, LAKE. A lake in the northern part of Russia, Government of Olonetz (Map: Russia, E 2). It is, next to Ladoga (q.v.), the largest lake in Europe, and measures 150 miles in length by 50 miles in greatest width, its area being 3700 square miles. Its greatest depth is over 1400 feet. The north shore is indented with numerous deep and narrow fiords, and the lake contains a large number of islands, some of which are inhabited. Lake Onega receives the waters of a number of other lakes to the north and east of it, its own waters flowing into Lake Ladoga through the Svir. A canal runs along the south shore of the lake, from the Svir on the west to the Vytegra on the east, the latter river being further connected by canals with the Volga and the Dvina.

ONEGLIA, ō-nā'lyȧ. A town in the Province of Porto Maurizio, Italy, 40 miles east-northeast of Nice, on the Gulf of Genoa, at the mouth of the Impero, here crossed by two iron bridges (Map: Italy, C 4). The town has a prison resembling a church. It is a garrison town and a sea-bathing resort. It carries on a shipping trade in wine, oil, and fruits. Andrea Doria, the Genoese admiral, was born here. Population (commune), in 1881, 7286; in 1901, 8527.

ONE-HOSS SHAY, THE WONDERFUL. A familiar humorous poem by Oliver Wendell Holmes (1858), published under the title of *The Deacon's Masterpiece*. It tells of a vehicle constructed with such care that, after a long life, all its parts came to a sudden end at the same moment.

ONEIDA, ō-nī'dȧ. A central tribe of the Iroquois Confederacy (q.v.). The name by which they are commonly known is a corruption of their proper name, *Oneyotka-ono*, commonly rendered 'people of the stone,' referring to the tribal palladium, the celebrated 'Oneida Stone,' a large granite boulder near the site of their ancient village on Oneida Lake. Their territory was about the lake of the same name, in central New York, and extending southward to the waters of the Susquehanna. They were considered a younger member of the confederacy, and never attained any special prominence in its affairs, seeming always to have acted contrary to the spirit of the league, being usually friendly to the French and Jesuits, of whom the majority of the Iroquois were the determined enemies; at a later period they, almost alone of their kindred, took sides with the Americans in the Revolutionary War. Their friendship for the Americans during this struggle was due chiefly to the influence of their Congregational missionary, Samuel Kirkland, and drew down upon them the vengeance of the hostile Iroquois under Brant, who burned their villages and forced them to take refuge within the American settlements until the close of the war, when the main body returned to their former homes, while a considerable number emigrated to Canada and settled upon Thames River, Ontario, where they still remain. Between 1820 and 1835, having sold most of their lands in the State of New York, the majority of the Oneida removed to a reservation at the head of Green Bay, Wis., where they now reside, being fairly prosperous and civilized, as are also those in New York and Canada. The whole tribe numbers at present considerably over 3000 (being probably more numerous than at any former period of its history), distributed as follows: Oneida reservation, Wisconsin, 1980; Oneida and other reservations, New York, 270; 'Oneidas of the Thames,' Ontario, 800; with Six Nations on Grand River, Ontario, not specified.

ONEIDA. A city in Madison County, N. Y., 27 miles east of Syracuse; on the New York Central and Hudson River, the New York, Ontario and Western, and the West Shore railroads (Map: New York, E 2). It has a fine high school building, a public library, a city hospital, and Allen and Higenbotham parks. It is but five miles distant from Oneida Lake, on the southern shore of which is Sylvan Beach, a popular watering place. The industrial interests are represented by iron works, and manufactories of caskets, flour, hosiery, handcarts, carriages, wagons, furniture, steel and wood pulleys, and sash and blinds. The surrounding country is agriculturally productive. Under a charter of 1901, the government is administered by a mayor and common council, biennially elected. The water-works are owned and operated by the municipality. Population, in 1890, 6083; in 1900, 6364. The first settlers within the present limits of Oneida came in 1834, but a village was not established until 1839, and was not incorporated until 1848. The city was chartered in 1901. Oneida Castle, the ancient seat of the famous Oneida Indians, is not far distant, and two miles to the south is the Oneida Community (q.v.). Consult Durant, *History of Oneida County, N. Y.* (Philadelphia, 1878).

ONEIDA COMMUNITY. A communistic settlement at Oneida, Madison County, N. Y.,

founded in 1847 by John Humphrey Noyes (q.v.). It had a religious origin, Noyes having been led by his New Testament studies to believe in the possibility of Christians living a sinless life, and in other doctrines at variance with those of the established churches. In 1838 a small settlement of his disciples was formed in Putney, Vt., the home of his father's family, where it existed till its removal in 1847-48 to Oneida, N. Y. For the first ten years the Oneida Community was not financially successful, but after 1857 was prosperous, largely through the manufacture of the Oneida trap. There was no formally chosen leader, as it was believed that the most fit would naturally control, and Noyes remained the leading spirit. The distinguishing feature of the social life was the system of 'complex marriage.' Marriage was not permanent, but license did not prevail, as the marital relations were carefully regulated, and the Community assumed responsibility for the support and education of the children. A novel feature of the life was the plan of 'mutual criticism,' which is said to have successfully taken the place of ordinary means of government in the society. Outside opposition to this system, especially on the part of the churches, led to its abandonment in 1879, and the voluntary dissolution of the Community and re-organization into a joint-stock company took place January 1, 1881; but while communism of property and the distinctive social life were given up, a common dining-room, laundry, library, and assembly-hall and other coöperative features are still retained. At the time of the dissolution of the Community it had about 238 members, with 45 others at a branch at Wallingford, Conn., owned 650 acres of land, with numerous manufacturing establishments and other buildings, the total property being valued at $600,000. It has since largely increased its property and business, having manufactories at Kenwood, Sherrill, and Niagara Falls, N. Y., and Niagara Falls, Ont. Consult: Noyes, *The Berean* (Putney, 1847); id., *History of American Socialisms* (Philadelphia, 1870); Nordhoff, *Communistic Societies of the United States* (New York, 1875); Hinds, *American Communities* (Chicago, 1902). See COMMUNISM.

ONEIDA LAKE. A body of water in central New York, between the counties of Madison, Oneida, Onondaga, and Oswego, 11 miles northeast of Syracuse (Map: New York, E 2). It is 20 miles long, from 4 to 7 miles wide, and is connected with Lake Ontario by the Oneida and Oswego rivers. Oneida Lake was an important commercial highway before the era of railroads.

O'NEILL, *ō-nēl'*, ELIZA, later Lady BECHER (1791-1872). An Irish tragedienne, daughter of an actor, who managed the Drogheda Theatre. After playing for some years in Ireland, she went to London, where, on October 6, 1814, she appeared as Juliet at Covent Garden. Her success was immediate, and for five years she was the most popular actress in Great Britain. Then she married William Wrixon Becher, one of the Irish members of Parliament, who afterwards succeeded to a baronetcy. After her marriage she never again appeared on the stage.

O'NEILL, HUGH. See TYRONE.

O'NEILL, OWEN ROE (Gael. *Eoghan Ruadh*, Red Owen) (?-1649). The commander of the Irish forces in the wars against the English in the first half of the seventeenth century. He was the nephew of Hugh O'Neill, Lord of Tyrone, and on the flight of the northern chiefs in 1607 he accompanied his uncle to the Continent, where he was carefully educated at Louvain. Like most of the exiles of that period, he selected the profession of arms, and rose to distinction as commander of the Irish troops in the service of Spain. In the meantime, the wholesale confiscations in the north of Ireland, known in history as the 'Plantation of Ulster,' led to a general rising of the Irish in 1641. On the invitation of a delegation sent for that purpose, O'Neill crossed over to Ireland, assumed command of the forces levied by the General Assembly of the Irish nation, and for eight years held in check the whole power of England and the Scotch 'planters.' His most signal victory was won at Benburb on the Blackwater, in Tyrone, June 5, 1646, when with 5500 men he routed Monroe's army of 7000, killing, disabling, or taking nearly one-half the enemy, and capturing all the artillery, baggage, and 1500 horses, after which, rapidly facing around, he put to flight two other detachments of 2500 troops which were marching to effect a junction with Monroe. For two years more he continued to win one victory after another, in nearly every instance against superior force or equipment, until his death, November 6, 1649, after a brief illness. His removal deprived the Irish army of competent leadership, and the execution of King Charles I. and the overthrow of the Royalist Party in England left the way clear for the invasion by Cromwell in the same year.

O'NEILL, PEGGY. See EATON, MARGARET (O'NEILL).

O'NEILL, Sir PHELIM (c.1604-53). An Irish rebel, the eldest son of Turlough O'Neill. As a youth he studied law at Lincoln's Inn, but lived a lawless life on his return to his native land, where he became an active participator in the insurrection of 1641. He was one of the five who planned to surprise Dublin Castle, and through a treacherous breach of hospitality he obtained possession of Charlemont Castle, while as the result of further successes he was made commander-in-chief of the northern Irish forces. He represented Ulster in the Confederate Council of 1642, but his failure to capture Drogheda after a prolonged siege in 1641-42 lessened the confidence of his army, which had once numbered 30,000, and he yielded the chief command to Owen Roe O'Neill (q.v.). Sir Phelim then expected to regain it, but was disappointed, and he went into hiding after the surrender of Charlemont in 1650, but was caught at last, tried, and executed for the atrocious massacres he had ordered. He refused to save himself by giving evidence to show that Charles I. had authorized him to raise troops in Ireland.

O'NEILL, Sir TURLOUGH LUINEACH (c.1530-95). An Irish chieftain, lord of Tyrone, in the county of Ulster, where he was born. He was a cousin of the notorious Shane O'Neill, whom he tried unsuccessfully to oust from the headship of the clan during the latter's compulsory absence in England in 1562. Turlough succeeded Shane at his death five years afterwards. Though Turlough promised fidelity to Queen Elizabeth, he excelled even his predecessor in the formation of traitorous leagues with the Scots. An unsuccessful attempt was made to capture him in 1568,

and his country was invaded by Essex, the English Governor of Ulster, in 1574. Turlough was called upon to surrender his lands, merely that he might receive them again under an English tenure. He took up arms against the English in 1579, and four years later invaded Tyrconnel, but was beaten back by O'Donnell, and he next entered into strife for the possession of lands with the Earl of Tyrone, over whom he gained a victory in 1588, but he resigned in his favor five years afterwards. While Turlough was making a final effort to regain his lost sovereignty, his castle was destroyed by Tyrone, and himself obliged to hide in a ruin near by, where he died.

ONEONTA, ō'nē-ōn'tȧ. A village in Otsego County, N. Y., 61 miles northeast of Binghamton; on the Susquehanna River, and on the Delaware and Hudson and the Ulster and Delaware railroads (Map: New York, E 3). It is the seat of the Oneonta State Normal School, and has a public library, a State armory, and the Aurelia Fox Memorial Hospital. The village carries on considerable trade, and its industrial establishments include construction and repair shops of the Delaware and Hudson Railroad, a silk mill, planing mill, knitting mill, foundries, and cigar factories. Settled about 1800, Oneonta was incorporated in 1848. Under a charter of 1885, the government is vested in a president, annually elected, and a council, chosen on a general ticket. Population, in 1890, 6272; in 1900, 7147.

ON'ESAN'DER (Lat., from Gk. *Ὀνήσανδρος, Onēsandros*). A Platonic philosopher of the first century A.D. He lived at Rome under Nero, and wrote a tract, *Στρατηγικὸς λόγος*, dedicated to Veranius, consul in 49. The work deals with the ethical duties of a general, is based on Xenophon, and was first edited in Greek in 1599. Later editions are by Koraïs (Paris, 1822) and Köchly (Leipzig, 1860).

ONE-TO-ONE CORRESPONDENCE. See CORRESPONDENCE.

ONI'AS'S TEMPLE. A sanctuary built at Leontopolis in Egypt by the Jewish high priest Onias, probably not long after the desecration of the temple at Jerusalem by Antiochus IV., Epiphanes, in December, B.C. 168. According to Josephus, this Leontopolis was situated in the Heliopolitan nome (*Ant.*, xiii. 3, 2), 180 stadia northeast of Memphis (*Bel. Jud.*, vii. 10, 3), and is not to be confused with the well-known Leontopolis in the Delta. It consequently cannot have been far from the city of Heliopolis itself. In the *Itinerarium Antonini* a *Vicus Judæorum* is mentioned that may have belonged to the Nome of Heliopolis, but is 464 stadia from Memphis. At this place, the modern Belbeis, there once was a temple of the goddess Bast, and in the neighborhood there is a Tell el-Yehudiyyeh. Another Tell el-Yehudiyyeh, however, is found near Heliopolis with a Jewish cemetery. This has been identified by Naville as the capital of 'the land of Onias,' and it is probably identical also with the *Castra Judæorum* mentioned in a *Notitia Dignitatum Orientis*, c.25 A.D., while the so-called Camp of the Jews (*Ant.*, xiv. 8, 2) was in another direction, northwest of Memphis. A temple of Bast is perhaps more likely to have been allowed to fall into ruins there than nearer to Bubastis. There is no reason for doubting that an old pagan temple was given to Onias and remodeled by him. The tower-like shape indicates this. If it had been a new structure, the pattern of the temple in Jerusalem would no doubt have been followed in regard to the exterior as well as the interior.

As to the identity of the Jewish high priest there is still some uncertainty. In his *Jewish War*, written a few years after the fall of Jerusalem, Josephus states that Onias, son of Simon, fled from Antiochus IV., Epiphanes, to Egypt, and built the temple of Leontopolis (i. 1, 1, vii. 10, 2-4). He would consequently be Onias III., son of Simon the Just. With this agree Theodore of Mopsuestia, in his commentary on Psalm lv., the references in the Palestinian Talmud (Yoma vi. 3), and the Babylonian Talmud (Menachoth 109 a). On the other hand, Josephus declares in his *Antiquities* (xii. 5, 1; xii. 9, 7; xiii. 3, 1-3; xiii. 10, 4; xx. 10) that the builder was a son of Onias III., who fled to Egypt in the time of Antiochus V., Eupator (B.C. 164-162), when Menelaus was deposed, and Alcimus took his place. As the *Antiquities* were written c.95 A.D., and therefore may be thought to represent more careful research, and it is told in II. Macc. iv. 33 sqq. how Onias III. was murdered by Andronicus in a sanctuary at Daphnæ, near Antioch, and bitterly lamented by Antiochus IV., many scholars have credited the later account rather than the earlier. But neither Josephus himself nor Theodore, who elsewhere follows II. Maccabees, mentions any such murder of Onias, and Baethgen, Willrich, and Wellhausen have strongly argued that the notice is unhistorical, being either a confusion with the murder of Menelaus or a transference to the Jewish high priest of the tragic fate of a son of Seleucus murdered by Andronicus at Daphnæ and naturally mourned by Antiochus. Josephus may, in his old age, have been misled by a poorer source or an altered tradition, a change of attitude toward the temple at Leontopolis being clearly discernible on the part of the Jewish teachers.

If it was Onias III. who in B.C. 170 fled to Egypt, it is natural to suppose that the desecration of the temple in Jerusalem and its dedication to Zeus Olympius in B.C. 168 led him to ask Ptolemy VII., Philometor, and Cleopatra I. for the temple of Bast at Leontopolis. For three years the legitimate high priest and ethnarch would then have officiated in a temple dedicated to the worship of Yahweh before the restoration of the Yahweh cult in Jerusalem in December, B.C. 165. Onias not only had with him numerous emigrants who formed military colonies, but left behind many sympathizers. This is evident from Isaiah xix. 18-25, probably written in B.C. 150, when Jonathan sat by the side of Alexander Balas, as he was married to Cleopatra. Here reference is made to five cities in Egypt occupied by Hebrews, one of them called Leontopolis (the city of the Lion), and to an altar and sacred stone (or 'tower,' if the word is read Mizpah) at the border of Egypt, where the Egyptians are expected to offer sacrifices to Yahweh. The feeling of the Greek translator toward Leontopolis is seen in his rendering the name 'The City of Righteousness.' It has been supposed that the *Sibylline Oracles* (v. 492 seq.) refer to this temple, but that is probably wrong. Early regulations preserved in the Mishna

ONIONS, OYSTER PLANT, ETC.

1. CARROT (Daucus carota).
2. PARSNIP (Peucedanum sativum).
3 and 4. ONION (Allium Cepa).
5. LEEK (Allium Porrum).
6. GARLIC (Allium sativum).
7. OYSTER PLANT (Tragopogon porrifolius).

(Menachoth xiii. 10) provide that a sacrifice promised to this temple should be offered there, and that priests of the temple should not lose their priestly dignity or share of the offerings if they came to Jerusalem. It is only after the destruction of the temple, and especially by rabbis of the second and third centuries, that the cult there was condemned (Menachoth, 109 b). After the fall of Jerusalem in A.D. 70 it seems to have enjoyed such favor that the Romans had reason to fear it, and after A.D. 72 Lupus closed it, and some time later, possibly A.D. 75, Paulinus destroyed it (*B. Jud.*, vii. 10, 2-4). Josephus states that it had then stood 343 years. This is no doubt an error for 243, which would place its consecration as a Yahweh sanctuary in B.C. 168. Consult: Cassel, *De Templo Oniæ Heliopolitano* (Bremen, 1730); Herzfeld, *Geschichte des Volkes Israel*, vol. ii., p. 557 seq. (Leipzig, 1863); Ewald, *Geschichte des Volkes Israel*, vol. iii., p. 405 seq. (Göttingen, 1852); Graetz, *Geschichte der Juden* (4th ed., Leipzig, 1888); Baethgen, in *Zeitschrift für alttestamentliche Wissenschaft*, vol. vii. (Giessen, 1886); Willrich, *Juden und Griechen vor der makkabaischen Erhebung* (Göttingen, 1895); id., *Judaica* (Göttingen, 1900); Bertholet, *Die Stellung der Israeliten und der Juden zu den Fremden* (Leipzig, 1896); Schürer, *Geschichte des jüdischen Volkes*, vol. iii. ONION (Fr. *oignon, ognin*, from Lat. *unio*, pearl, onion). Certain species of the genus Allium (q.v.), particularly *Allium cepa*, a biennial bulbous-rooted vegetable with a swelling stem, leafy at the base and with tapering fistular leaves. The bulb is composed of thickened leaf elements in concentric layers. The native country of the onion is not certainly known, but is probably either India or Egypt, in both of which countries it has been cultivated from the most remote antiquity. The part chiefly used is the bulb, but the young leaves are also employed and young seedlings drawn from onion beds are a very common ingredient in soups and sauces in the beginning of summer.

The onion requires a light, friable, well-drained soil, well stocked with organic matter and liberally fertilized. Reclaimed marsh soils are successfully and extensively used for growing the crop. Onions are propagated from: (1) sets, i.e. little bulbs which form on the tops of the stems of some varieties in place of seed, or by division of the parent bulb as in the case of the potato onion, or from small onions obtained from thickly sown seed; and (2) from seed. The first method is the one generally employed by farmers and market gardeners in growing early bunching onions. The sets are planted either in the fall or spring in rows a foot apart and three inches distant in the row. The main crop of onions is usually grown from seed sown in the open field in rows 12 to 14 inches distant and thinned to 3 inches in the row. Sometimes the seed is sown in the fall and transplanted to the field in the spring; but the method coming into vogue now in the United States is to sow the seed under glass in the early spring and transfer to the field as soon as the weather will permit. Besides the certainty of an even stand by this method, the yields are much higher, the bulbs grade more uniformly, and the extra cost of transplanting is not much more than the cost of thinning and weeding when the seed is sown in place. Thorough cultivation is essential by whatever method grown. The bulbs are harvested when the most of the necks turn yellow, and are cured in rows if the weather is not too hot, or in open sheds or barns in rainy weather. They may be kept over winter by freezing and keeping in that state until spring or by storing in a dry apartment and keeping the temperature just above freezing. American varieties keep longer and are better adapted to most parts of the United States, but foreign varieties are better flavored and bring a higher price in the market. Bermuda onions, Spanish onions, and some other foreign varieties are quite extensively grown in California and the Southern States.

The potato onion, also called the Egyptian or ground onion, is a perennial variety which produces offset bulbs resembling the shallot but larger. They are milder than garlic, but are stronger than the common onion. The tree onion produces bulbs at the top of the stem, the umbels becoming viviparous. The Welsh onion (*Allium fistulosum*), also called cibol, is little cultivated in America. Its leaves are used like those of the shallot, by which name it is also known. Onions are similar to but milder than garlic (q.v.).

ONION-FISH. See GRENADIER.

ONION INSECTS. The principal insects which damage the onion crop are the onion-maggot (larva of *Phorbia cepetum*), the onion-thrips (*Thrips tritici*), and the onion-cutworm (larva of *Agrotis messoria*). The adult of the onion-maggot is a fly of the family Anthomyiidæ. The eggs are laid early in the spring, next to the stems or leaves at the surface of the ground, and preferably in young onion beds. The larvæ work their way into the bulb and cause the rapid decay and death of the plant. Inasmuch as the bulb is the edible part of the vegetable, the slightest damage by these maggots is fatal, since the decay continues even after the maggots are killed. The maggots reach full growth about the end of May, and about the middle of June the second generation of flies occurs. This generation often attacks seedling onions, ruining entire beds. The insect passes the winter partly in the pupa state in the ground, and partly as adult in sheltered locations. On a small scale damage may be prevented by the use of sand soaked in kerosene, mixed with drier sand and placed at the base of the onion plants along the rows. This prevents egg-laying and kills such of the young maggots as attempt to work through it. On a large scale, the first plants which wilt must be lifted out and destroyed, and then kainit and nitrate of soda must be applied broadcast to the roots.

The onion-thrips sometimes attacks onions in great numbers, puncturing the succulent leaves and leaving a small yellow dot after each puncture. The leaf gradually loses its vitality and the top turns yellow. This thrips is not confined to the onion, but is also found upon cabbages and the flowers of the orange farther South.

In 1898 the product reached 8,300,000 pounds, over half of which was exported into the United States. Iron is found in the same region as copper, and also in the region north of Kingston. An adverse tariff had prevented mining operations until recently, when the province placed a bounty upon its production. Since that time the industry has rapidly developed. The product for 1899 was estimated at $850,000.

Gold has been found at points along the entire length of the Archæan rocks of the province. It is in the most paying quantities, however, in the region west of Lake Superior. The gold lies in quartz veins, and only recently has its exploitation been seriously undertaken. The annual value of the product increased during 1890 to 1900 from nothing to $421,000. Silver is mined on the west shore of Lake Superior, but its production is small and uncertain. Prior to 1890 the principal mineral productions were secured from the older portion of the province, and consisted of petroleum and salt. Petroleum is found at the south point of Lake Huron in Lambton County. The average annual product from 1890 to 1900 exceeded 30,000,000 gallons. Farther north along the east shore of Lake Huron are the salt beds, whose annual yield from 1890 to 1900 averaged over $200,000. During the last decade, the mineral wealth of peninsular Ontario has been increased by the development of natural gas fields near Niagara in the east and near Detroit in the west. The product of the latter field is consumed by the city of Detroit, and that of the former by the city of Buffalo. The estimated annual value of the product since 1893 has been $350,000. Clay for brick and tile occurs in all parts of the province. Limestone and sandstone for building purposes abound in the Paleozoic region, and granite and marble are quarried in the Archæan region.

Fisheries. Ontario shares with the United States in the fishing advantages of the Great Lakes. The value of the annual catch has been above $2,500,000, about one-fourth the product being exported. Trout, whitefish, herring, and pickerel, in the order named, are the most important.

Agriculture. This, the leading industry, is highly developed throughout the lowland region. The productivity is great, the acreage yield for most crops being greater than the average for the same crops in the United States. No portion of the Dominion is superior in adaptability to mixed farming. Oats and hay lead in acreage, approximately 2,400,000 acres in each case being the average for the six years ending with 1900. Wheat increased during that period from 950,000 acres to 1,400,000. Peas are a staple crop and averaged about 800,000 acres. The average for corn and for barley has been about 500,000, the conditions being especially favorable for barley. Rye, buckwheat, beans, mangel wurzels, potatoes, and turnips are of considerable importance. Great attention is paid to apple-raising throughout the lowland region, especially in that portion lying west of Toronto. Here too are extensive vineyards. Peaches and other varieties of fruit are successfully grown.

Stock-breeding is extensively carried on, and the province excels in the purity and quality of the various breeds raised. Cattle-raising receives the greatest attention; the number, constantly gaining, exceeded 2,400,000 in 1900. The number of sheep and swine is likewise increasing, each numbering about 1,700,000 in 1900. Horses show a decrease, the present number being about 600,000. Dairying is an important industry, the principal branch being cheese-making. In 1900 there were 1173 cheese factories, the value of whose products was $13,023,025. This industry is rapidly growing in prominence.

Manufactures. There are some important manufacturing industries in the province, though manufacturing is not generally well developed. Ship-building (wooden vessels) was formerly an important industry, owing to the great timber resources. These are now extensively drawn upon in the manufacture of doors, window frames, and furniture. Pork-packing and flour-milling are each of some importance. Few countries have at hand such an abundance of water power. The Ottawa River and almost every smaller stream in the province have important falls or rapids, not to speak of Niagara Falls and the rapids along the course of the Saint Lawrence. All these chief sources of power are being extensively utilized.

Transportation and Commerce. The Dominion, the provincial, and the various municipal governments have contributed liberally to the construction of railroads, and the mileage has rapidly increased until in 1900 it amounted to 6812 miles, or twice that of any other Canadian province, there being one mile of track to every 32.24 square miles of area. The greatest part of this is in peninsular Ontario, the Canadian Pacific being the only line which traverses the great northern portion of the province. At a number of points the railroads connect with those of the United States. The position of Ontario in relation to the Great Lakes and the Saint Lawrence River provides excellent water communication with the markets of the world. Formerly a number of falls and rapids greatly lessened the commercial advantages of these waterways; but the Provincial and Dominion governments have constructed a series of canals from Sault Sainte Marie in the north to Lachine Rapids in the east, so that it is now possible for vessels drawing 14 feet of water to pass from the head of Lake Superior through the whole course of the Saint Lawrence. The longest of these canals—the Welland, connecting Lake Erie with Lake Ontario—is 26¾ miles in length and cost over $24,000,000. The severity of the winter season stops navigation during that period, and will always detract greatly from the otherwise superior advantages of the navigable waters.

The province is rapidly increasing in commercial importance. The imports for home consumption during the year 1900 amounted to $70,200,000 as against $43,600,000 for the year 1890. Coal is the leading import. The duty collected has grown correspondingly, and in 1900 was $10,700,000. The exports for the same year amounted to $56,100,000. The foreign trade of the province is principally with the United States and England. The merchant marine in 1900 consisted of 1064 steamers and 546 sailing vessels, with a combined tonnage of 141,112.

Banks. In 1900 the chartered banks and bank branches of the province numbered 306. The post-office savings banks numbered 487, having 101,000 depositors, and $23,637,000 on de-

posit. There was also one Government savings bank.

GOVERNMENT. The relation between the Provincial and the Dominion governments is somewhat similar to that between the States and the United States—matters of general interest being left to the Dominion Government. See CANADA.

The Provincial Government is administered by a Lieutenant-Governor, appointed by the Governor-General of the Dominion with the advice of the Prime Minister for five years. He is assisted by an executive council of eight members, which includes an attorney-general, commissioner of agriculture, secretary, registrar, treasurer, commissioner of Crown lands, commissioner of public works, and minister of education. The legislative assembly has only one House of 98 elective members. Voting is by ballot, and there is manhood suffrage limited by residence and citizenship. The judicial power is vested in a superior court of judicature, consisting of the High Court of Justice (with King's Bench, Common Pleas, and Chancery courts), and the Court of Appeal. In the Dominion Parliament the Province of Ontario is represented by 24 Senators and 92 members of the House of Commons.

The division of the province for purposes of local government is similar to the system found in the United States. The organized portion is divided into counties, and these are subdivided into townships. The more densely populated groups are classified according to size into villages, towns, and cities. The governing body in each of these units of government consists of an elective council. There are also administrative officers.

FINANCE. General property taxes are levied only for local purposes, the Provincial Government having sufficient income from other sources to meet all expenses and keep free from indebtedness. The two main sources of the provincial revenues are the Dominion subsidy (see CANADA) and the revenue from the Crown lands—a commission being charged for the privilege to cut timber in the forests, and dues also being collected on the amount cut. Other important sources of revenue are the liquor licenses, the collateral inheritance tax, the sale of law stamps, and (recently) the revenue from the mines. The cost of the Provincial Government since confederation has averaged a little over $3,000,000 annually. The province extends certain aids to the county municipalities, as, for instance, in the administration of justice. The law places a maximum limit upon the local tax rates, and a proposal to make a permanent debt must receive the sanction of the people. The support of public institutions constitutes the largest item of provincial expenditure, especially the charitable institutions, the Government meeting the expenses in whole or in part incurred in the care of the deaf, blind, or insane to the number of 4000.

POPULATION. Ontario, with 2,182,947 inhabitants (1901), is the most populous province of Canada, and contains about two-fifths of the total population of the Dominion. Formerly the inhabitants were centred almost wholly in the Ottawa and peninsular portions of the province, but the census of 1901 shows a decrease in almost all the counties of this region, which, however, has been more than balanced by the increase in the mining districts north of lakes Huron and Superior. The total increase for the decade 1891-1901 was less than $2\frac{1}{2}$ per cent. The birth rate is not low, but the province loses heavily through emigration. The large majority of the population is of English descent, though the Scotch predominate in the counties of Bruce, Grey, and Glengary. The German, Irish, and some other nationalities are represented in Toronto, and the negroes in the Niagara peninsula. The early development of Ontario profited from the migration of New England opponents of the War of 1812.

The census of 1901 returned the population of the largest cities as follows: Toronto, the capital, 208,040; Ottawa, 59,928; Hamilton, 52,634; London, 37,981; Kingston, 17,961; Brantford, 16,619; Windsor, 12,153; Guelph, 9959; Saint Catharines, 9946; Berlin, 9747; Belleville, 9117; Chatham, 9068.

INDIANS. The number of Indians is estimated at 20,700. The Government furnishes educational advantages for the Indian children, and the Indian is generally adopting agricultural and other occupations characteristic of civilized life.

RELIGION. There is no State Church, and all the churches are supported on the voluntary principle. The province is strongly Protestant, the ratio between the Protestants and Catholics being about 5 to 1. Of the Protestant denominations, the Methodists lead, followed by the Presbyterians, Episcopalians, and Baptists in the order named. The several bodies of Methodists have been united into one church, as have been also the several bodies of Presbyterians.

EDUCATION. Great attention is given to education, and the educational system is complete in scope, progressive in spirit, and efficient in administration. The taxpayers elect local boards of trustees, who have immediate control of the schools, but they are administered in accordance with the general regulations of the Minister of Education, and all follow a uniform course of study, use the same text-books, and are taught by teachers who have passed the provincial examination. The schools are free, and attendance is compulsory. Under certain conditions both Catholics and Protestants may establish separate schools which will be supported from the public taxes and appropriations (such schools continuing under the control of the Minister of Education). The exercise of this privilege, however, has not become common, nearly nine-tenths of the school children attending the unsectarian schools. Since 1898 the province has expended an average exceeding $9 per pupil of the total attendance. About two-thirds of this is raised by local taxes, the greater part of the remainder being the income from lands originally set apart as clergy reserves or for school purposes, and the smaller part being the annual legislative grant. There are additional aids to 'poor sections,' and the policy of pensioning superannuated teachers has long been in vogue. All the schools are in the hands of trained teachers, two-thirds of whom are females, the Government having provided for their training through the maintenance of 55 county model schools, two normal schools, and one normal college. The breadth of the public school system is shown in that it extends from the kindergartens (of which there are 119) to the university, and includes (besides

those mentioned above) high schools, night schools, and an agricultural college, the last being located at Guelph. Instruction in agriculture is becoming common in the rural schools. The school course provides the rudiments of a business education, and manual training is being introduced. Toronto University and College is at the head of the provincial school system, and has affiliated with it a number of denominational institutions, including Saint Michael's College (Catholic), Wycliffe College and Huron College (Episcopalian), Knox College (Presbyterian), and Victoria University (Methodist). There are a number of other private and sectarian colleges in the province, including the historic Upper Canada College, located at Toronto.

History. Champlain in 1615 was the first European to explore the region; by his alliance with the native Hurons he precipitated the war which led to their almost total annihilation by the Iroquois or Five Nations. In 1671 the French laid claim to the Lake Huron district; eight years later Niagara was settled by La Salle; and in 1749 Fort Rouillé, a French trading station, was established on the present site of Toronto. With the rest of Canada, the region was ceded to Great Britain in 1763 by the Treaty of Paris (q.v.), and formed part of the Province of Quebec. Its permanent settlement dates from the immigration of American Tories during the American Revolution and after its close in 1783. It became the Province of Upper Canada with a separate elective assembly in 1791; in the War of 1812 it was the scene of numerous Anglo-American conflicts, notably the battles of the Thames and Lundy's Lane; it was reunited with Quebec in 1841, in consequence of long continued political discontent and the rebellion fomented in 1837 by William Lyon Mackenzie (q.v.); in 1867 it received its present name, and again became an independent province in the newly organized Dominion of Canada. See Canada.

ONTARIO, Lake. The most eastern and the smallest of the five great lakes of North America. It lies between latitudes 43° 10′ and 44° 8′ N., and longitudes 76° 30′ and 80° W., and is enclosed by the Canadian Province of Ontario and New York State (Map: United States, K 2). With a water surface of 7240 miles, it is less than one-fourth as large as Lake Superior. It is 190 miles long, 55 wide in its widest part, and about 480 miles in circumference. Its distinctive hydrographic basin is 28,840 square miles in area. The mean elevation of its surface is 247 feet above tide water in the Atlantic, its maximum depth is 738 feet, its approximate mean depth is 300 feet, and the depth of its basin below the sea level is 491 feet, the bottom of the lake being lower in relation to sea level than that of any other of the Great Lakes. The water discharge of the Saint Lawrence basin has been found to be slightly less than half its rainfall; Lake Ontario, lying at the foot of the chain of lakes, has naturally the largest discharge, 300,000 cubic feet per second, as compared with 265,000 for Lake Erie, 235,000 for lakes Huron and Michigan, and 86,000 for Lake Superior. The lake is sufficiently deep throughout for vessels of the largest tonnage. Its shores are generally very flat and have little attractive scenery, except in the bay of Quinte, a long, crooked arm, which extends about 50 miles into the land, on the northeast side of the lake. The lake freezes only a few miles from the shore, which is due in part to the frequent agitation of its waters by violent storms, and also to a persistent surface current established through its centre which moves to the east with return currents and eddies along the shores and about the islands. This surface current is due to the fact that the larger axis of the lake coincides with the direction of the prevailing westerly winds. There are many convenient harbors and thriving ports, chief among which are Kingston, Port Hope, Cobourg, Toronto, and Hamilton on the Canadian shore, and Oswego, Sacketts Harbor, and Charlotte in New York. Many lighthouses along the coasts facilitate navigation, and the lake is connected with Lake Erie by the Welland Canal, with the Erie Canal and the Hudson River by the Oswego Canal, and with the Ottawa River by the Rideau Canal.

ONTENIENTE, ôn'tâ-nê-ān'tâ. A town of Eastern Spain, in the Province of Valencia, 45 miles south of Valencia, on a branch of the railroad between Valencia and Madrid (Map: Spain, E 3). It was formerly fortified. Linen and woolen fabrics and paper are manufactured. Population, in 1900, 11,441.

ONTOG'ENY (from Gk. ὤν, *ōn*, being + -γένεια, *-geneia*, production, from γίγνεσθαι, *gignesthai*, to become). The development of the individual animal, in contrast to *phylogeny*, or the development of the entire class. The development of the individual is accomplished in a few hours, days, or years, at the most, while that of the order or class or phylum may extend through several geological ages, and is represented by a series of forms so related that they appear to be blood relations, and descendants from a primitive type. (See Phylogeny.) The ontogeny of any animal is the successive stages it passes through in the course of its development after the fertilization of the egg until it reaches maturity. Such a series of stages roughly corresponds to and epitomizes the development or phylogeny of the class.

ONTOL'OGY (from Gk. ὤν, *ōn*, being, pres. part. of εἶναι, *einai*, to be + -λογία, *-logia*, account, from λέγειν, *legein*, to say). A term applied to that department of metaphysics (q.v.) which deals with the ultimate nature of the universe conceived as being. With many philosophers ontology is made so inclusive as to be practically identical with metaphysics, but with others it is distinguished from other departments of that science, notably from teleology (q.v.).

O'NUS PROBAN'DI. See Burden of Proof.

ON'YX (Lat. *onyx*, from Gk. ὄνυξ, nail, veined gem, onyx, thickening in the cornea of the

eye; connected with Lat. *unguis*, O.Ir. *inga*, nail). A cryptocrystalline variety of quartz (q.v.), consisting of layers of chalcedony of different colors, usually white and black, or white and dark brown. The finest specimens of this mineral are brought from India, although it occurs in small quantities in many other localities, such as the Lake Superior region, and near the Bay of Fundy. It was highly esteemed by the ancients, who used it for ornamental purposes.

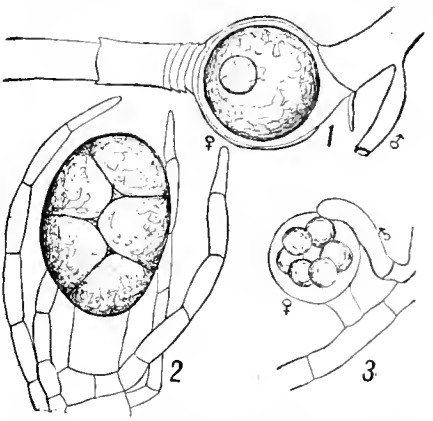
ONYX MARBLE. A beautiful ornamental stone composed chiefly of carbonate of lime colored by iron or manganese. This is the commercial variety of onyx, while true onyx is a banded variety of marble. Commercial onyx marble really includes two rock types, both of which are chemically deposited. The one is a hot-spring deposit or travertine, which is formed on the surface, the other is a cold-water deposit which is formed on the floor, roof, or walls of limestone caves in the same manner as stalagmites and stalactites. Owing to its method of formation, the cave onyx usually occurs in less extensive deposits than the travertine onyx marbles, which have been formed around springs, and both are far less extensive and less regular in their arrangement than the ordinary bedded limestones or marbles. The beautiful banding seen in onyx is due to the deposition of successive layers of carbonate of lime, while the colored cloudings and veinings are caused by metallic oxides, especially iron. The fact that onyx marble is colored along the veins or cracks is not necessarily due to an infiltration of the iron along these lines, but is caused by the iron carbonate in the stone being locally oxidized along the cracks. The cave onyx marbles are more coarsely crystalline and less translucent than the travertine onyx. Onyx marbles, although rarely occurring in large quantities, are widely distributed. The earliest worked deposits were probably those of Egypt, which were used by the ancients for the manufacture of ornamental articles and religious vessels. The Greeks and Romans also valued the material; the deposits near Urumiah and Yezd were extensively worked during the prosperous days of the Persian Empire. Many of the spring deposits occur in regions of recent volcanic activity and all of the known occurrences are of recent geological age. In the United States onyx marbles are said to occur in Arizona, California, and Colorado, but the American deposits have not been developed commercially to a large extent, most of the onyx used in the United States being obtained from Mexico, while small quantities are imported from Algeria and Egypt. The Mexican stone has for years been obtained chiefly from the vicinity of Pueblo and more recently from the vicinity of San Antonio. *Mexican onyx* is the name given to banded varieties of aragonite that are found extensively in Arizona, Missouri, and California, as well as in Tecali, Mexico. It is used for decorative purposes. The value of onyx varies considerably, the poorer grades selling for as little as 50 cents per cubic foot, while the higher grades bring $50 or more.

BIBLIOGRAPHY. DeKalb, "Onyx Marbles," in *Transactions of the American Institute of Mining Engineers* (New York, 1896); Merrill, *Stones for Building and Decoration* (2d ed., New York, 1897); Merrill, *The Onyx Marbles, Their Origin, Composition, and Uses, Both Ancient and Modern*, Annual Report of the United States National Museum (Washington, 1894); Merrill, "Onyx," in *Mineral Industry*, vol. ii. (New York, 1894).

OO, or **UHO**. One of the names of the Hawaiian feather-cloak bird. The bird is so called from its cry. See MOHO, and Plate of CREEPERS.

OODEYPORE, ōō'di-pōr'. Another spelling for Udaipur (q.v.), the name of a native State and city in India.

O'ÖGO'NIUM (Neo-Lat., from Gk. *ᾠογονεῖν*, *ōogonein*, to lay eggs, from *ᾠόν*, *ōon*, egg + *γονή*, *gonē*, generation). An organ in the algæ and fungi (thallophytes) which develops the eggs (oöspheres), hence the female sex organ. It is generally a single cell, but may bear accessory structures. The oögonium of the algæ was derived from a cell producing undifferentiated gametes (sex-cells). In the process of sexual evolution similar gametes became differentiated into eggs and



OÖGONIA IN, 1, ŒDOGONIUM; 2, FUCUS; 3, ACHLYA.

sperms; now the structure bearing the eggs is called the oögonium, and that developing the sperms ('antherozoids') the antheridium. The simplest and most primitive oögonia probably contained several eggs, although there are not now many illustrations of such conditions among the algæ. That is to say, the evolutionary tendency in the development of oögonia is to reduce the number of eggs until all of the protoplasm is devoted to one. Such highly differentiated oögonia are well illustrated in Vaucheria, Œdogonium, and Volvox. Chara and Coleochæte present further complications in the form of filaments that invest the cell containing the egg with a protective covering. The oögonia of fungi are in general similar to those of algæ, and indeed are believed in many cases to be directly derived from them. They are found chiefly in the group of the Phycomycetes, which is closely related to the algæ, but homologous structures are found in the Ascomycetes, although they generally bear the name of ascogonium or archicarp. The best illustrations of oögonia in the fungi are furnished by the water molds (Saprolegniales), and such well known genera as Albugo (Cystopus), Pythium, and Peronospora.

OO'JEIN'. A town of Malwa, Gwalior, Central India. See UJJAIN.

OOLACHAN, ōō'lä-kän, or **EULACHON**. See CANDLE-FISH.

OÖLITE, ō'ô-līt (from Gk. *ᾠόν, ōon,* egg + *λίθος, lithos,* stone). A term formerly used as synonymous with Jurassic, but now used to designate the middle and upper divisions of the Jurassic rocks, the lower division being called the Lias. In the United States the Oölite is of little importance, and in fact has only been identified along the Pacific coast, but in Europe it underlies a vast area, for during this period of geologic time there occurred one of the greatest encroachments of the sea over Europe and Asia which is known in geologic history. The rocks of the Oölite period are chiefly limestones. They are perhaps best known from their occurrence in the Jura Mountains of Switzerland, where the rocks have been bent into such beautiful folds as to attract the attention of the most casual observer. See JURASSIC SYSTEM.

OÖLOGY, ō-ŏl'ô-jĭ (from Gk. *ᾠόν, ōon,* egg + *-λογία, -logia,* account, from *λέγειν, legein,* to say). The science of eggs; especially the study of the breeding habits, nests, and eggs of birds; a branch of ornithology. Birds' eggs (q.v.) are conveniently classified as 'marked' and 'unmarked,' according to the ground color. Birds which lay their eggs in holes in trees or in the ground almost always have white, unspotted eggs, and they are frequently of a peculiarly smooth, translucent texture. Birds which build in trees generally have blue or greenish eggs, either spotted or unspotted, while birds that build in bushes, near the ground, are likely to lay speckled eggs. The shore-birds usually have the eggs heavily marked with dark brown on a yellowish background, while gulls and terns always lay heavily marked eggs. Ducks, geese, and herons lay unspotted eggs. Some birds lay only a single egg, and this is especially true of certain marine birds, such as auks, guillemots, and murres. Others lay two eggs, notably the humming-birds, while three, four, and five are the most common numbers. When the number is more than eighteen, there is reason to believe that more than one female has been concerned in the laying, as happens among ostriches and mound-birds. Gallinaceous birds and ducks, coots, and rails lay the largest number of eggs; the quail is said to lay eighteen, the coot fifteen, the wood duck fourteen, and the sora sixteen. There is no direct relation between the size of the bird and the size of the egg. The smallest eggs actually, and proportionately also, are those of humming-birds, which may be less than half an inch long by one-third of an inch wide. The largest eggs actually are those of the ostrich, but proportionately the eggs of the kiwi and mound-birds are much larger. Of North American birds, the largest eggs are probably those of the California condor, which are 4.5 × 2.5 inches. The swan lays an egg nearly as large, but does not breed within the United States. The great auk, though a much smaller bird than either of these, laid an egg 5 × 3 inches; but very few of them are now in existence. (See GAREFOWL.) The study of birds' nests is sometimes called *caliology,* as distinguished from oölogy proper. See NIDIFICATION.

Dr. Thomas M. Brewer (q.v.) may well be called the father of American oölogy, for his *North American Oölogy,* a quarto which appeared in 1857, was the first systematic work dealing with that subject published in this country. Unfortunately only one part of this was ever printed, but it is notable for its colored plates of birds' eggs. Capt. Charles E. Bendire (q.v.) became famous as an oölogist in the West, and in 1883 was appointed a curator in the National Museum. In July, 1892, appeared the first volume of his *Life Histories of North American Birds,* and the second volume appeared in September, 1896. They are quarto volumes of many hundred pages and numerous colored plates. An earlier descriptive work was Ernest Ingersoll's *Natural History of the Nests and Eggs of North American Birds,* of which seven 'parts,' describing the nidification of about 100 species of oscine birds, with colored plates of their eggs, were issued at Salem, Mass., in 1879-80. Other books dealing exclusively with American oölogy have been: Gentry, *Nests and Eggs of North American Birds* (Philadelphia, 1885); and Davie, *Nests and Eggs of North American Birds* (2d ed., Columbus, 1889). Several fine works describe the eggs of European and East Indian birds, of which one of the oldest and finest in English is Hewitson's (3d ed., London, 1856). For others consult Newton, *Dictionary of Birds* (London and New York, 1893-96). See EGG, and the accompanying colored plates.

OOMS, ōms, KAREL (1845-1900). A Belgian historical painter, born at Desschel, Province of Antwerp. He studied at the Antwerp Academy and under Nicaise de Keyser, and supplemented his artistic training by extensive travels through Holland, England, Germany, and Italy. His most important works include: "Philip II. Paying the Last Honors to Don Juan d'Austria," in the Antwerp Museum; "Forbidden Reading," Brussels Museum; "Innocence Protected by Law," Palais de Justice, Antwerp; "Last Days of Rubens" (1892); and "Christ and His Disciples on the Sea of Galilee" (1895).

OORI, ô-ō'rē, or **URI.** A river in Africa. See LIMPOPO.

OORIAL, ōō'rĭ-*al,* or **URIAL.** The name in the Punjab of a wild sheep (*Ovis Vignei*), called 'sha' in Ladak. It is a large, powerful species, which is to be found on the high mountains from Eastern Persia to Northern Tibet. The horns of the rams are heavy, rounded, much wrinkled, rise close together, and sweep around, so that in old specimens they almost complete a circle. A ruff of hair on the throat is usual. These wide-ranging and variable sheep are very wary and agile, and give the sportsmen a hard chase. The young are often captured, however, and wild bands often mingle with native sheep on remote hill-pastures. Consult: Blanford, *Fauna of British India: Mammals* (London, 1889); and writers upon natural history and sport in Central Asia. See Plate with WILD GOATS.

OORT, ōrt, HENRICUS (1836—). A Dutch biblical scholar, born at Eemnes. He studied theology at Leyden, preached at Santpoort, and, after two years teaching in the Amsterdam Athenæum, became professor of Hebrew language and archæology at Leyden. Oort edited the *Theologisch Tijdschrift,* and wrote: *De dienst der Baalim in Israël* (1864; Eng. trans. by Colenso, 1865); *Het menschenoffer in Israël* (1865); *Twaalf wonderspreuken van Jezus* (1870); *De Bijbel voor jonge lieden* (with Hooykaas, 1871; Eng. trans. by Wicksteed, 1873-79); *Evangelie en Talmud* (1881); *Atlas voor Bijbelsche en*

Kerkelijke geschiedenis (1884); and *Textus Hebraici Emendationes* (1900).

O'ÖSPHERE (from Gk. *ᾠόν, ōon*, egg + *σφαῖρα, sphaira*, ball). A general name given to the female sex-cell (gamete), and of course used only with heterogamous plants, in which the pairing gametes are unlike. It is the oösphere which upon fertilization becomes the oöspore (q.v.). The name is being abandoned for the simpler word 'egg.'

O'ÖSPORE (from Gk. *ᾠόν, ōon*, egg + *σπόρος, sporos*, seed). A general name given to the spore (in plants), which is the result of fertilization. Frequently the term is restricted to the sexual spores of heterogamous plants, that is, those whose pairing gametes are unlike (sperms and eggs). In this case the word 'zygospore' or 'zygote' is used for the sexual spore of isogamous plants, that is, those whose pairing gametes are alike. The oöspore is sometimes appropriately called the 'fertilized egg.' See FERTILIZATION; SPORE.

OOST, ōst, JAKOB VAN (1600-71) (called the Elder). A Dutch painter, born at Bruges. He studied under his brother, Frans van Oost, and then went to Italy, where he became an imitator of Annibale Carracci. In 1629 he returned to Bruges. His works are genre, historical, and portrait, and are to be found in many of the European galleries. His son JAKOB (1639-1713) was born at Bruges, and, after studying with his father, spent several years in Italy and went to Paris. He lived for more than forty years at Lille, where most of his works are to be seen.

OOSTEGITE, ō-ōs'tē-jīt. The name applied to the egg-case of certain crustaceans.

OOSTERHOUT, ō'stēr-hout. A town in the Province of North Brabant, Holland, 25 miles southeast of Rotterdam (Map: Netherlands, C 3). The handsome town hall, the great Roman Catholic church in the market place, and the Convent of Saint Catharine in the vicinity are among the town's notable edifices. The manufacturing establishments include beet-sugar refineries, tan-yards, potteries, shoe factories, and iron foundries, and there is an active trade in wood, linen, and agricultural products. Population, in 1889, 10,425; in 1899, 11,545.

OOTACAMUND, or **UTAKAMAND**, ut'ā-kā-mūnd'. A fashionable hill-town resort, and the summer headquarters of the Madras administration, in the Nilgiri Hills, Madras, British India, 36 miles northwest of Coimbatore, and 350 miles southwest of Madras (Map: India, C 6). A good macadam road, 12 miles long, leads from Coonoor, the nearest railway station. The town occupies a hill-encircled plateau 7228 feet above sea level, the surrounding hills, commanding views of magnificent scenery, attaining a maximum altitude of 8622 feet above sea level in Dodabetta on the east. The Government House, the public library, the Lawrence Asylum, with technical branches for soldiers' children, the churches of Saint Stephen and Saint Thomas, Victoria Hall, Assembly Rooms, Bruks Memorial School, the botanical gardens, recreation grounds, and the lake, one and one-half miles long, surrounded by a fine drive, are some of the principal features. In the neighborhood are numerous tea, coffee, cinchona, and eucalyptus plantations. The mean annual temperature is 55° F. Population, in 1891, 15,100.

OOTRUM (Dravidian *ōtrum*). A fibre derived from the stem of *Dæmia extensa*, an East Indian shrubby climbing plant of the natural order Asclepiadaceæ. The fibre is soft, white, silky, and strong, and is regarded as a promising substitute for flax. In some parts of the Deccan the plant is a troublesome weed.

OOZE. The fine homogeneous sediment, like mud, but softer and more sticky, forming a plastic floury substance, which constitutes a large portion of the bottom in the deeper parts of the ocean. As this ooze is principally made up of the shells of *Globigerina bulloides*, a surface foraminifer, it is generally called 'globigerina ooze.' As early as 1850 Pourtales stated that at depths of 257 fathoms "Globigerinæ are still living in immense numbers." He stated that at great depths in the strait of Florida the bottom is covered by a chalk-like layer, which resolves itself into a mass of Foraminifera, and their fragments more or less comminuted. This formation extends, he says, almost uninterruptedly in the whole bed of the Gulf Stream, in the greater depths of the Gulf of Mexico, in the deep channels which intersect the Bahama Banks, and then up the Atlantic coast from about the 100-fathom curve outward, or from the inner limit of the Gulf Stream, which nearly coincides with it, and so over the greater part of the Atlantic basin. The discovery of this formation belongs to the year 1853, when it was found almost simultaneously by Lieutenants Craven and Maffit, then in the Coast Survey, and exploring the Gulf Stream. It became more extensively known somewhat later by the soundings made for the Atlantic telegraph. The Foraminifera most abundantly represented in this bottom are of the genus Globigerina. Then occurs in order of frequency *Rotalina cultrata;* then several Textulariæ, Marginulinæ, etc. It is now pretty generally admitted that these rhizopods live and die in these great depths. But that animals living near the surface also contribute a large proportion is proved by the numerous shells of mollusks, teeth of fishes, etc., contained in it. The *Challenger* expedition explorations established that the pelagic bottom deposits are not derived from the shores of the continent, but are formed in the deep water of the central regions of the great ocean basins, and consist of organic oozes and a reddish clay. They are chiefly made up of the calcareous and siliceous remains of organisms that have fallen to the bottom from the surface waters, along with clay and volcanic débris in a more or less advanced state of decomposition. There is little or no trace of mechanical action on their components, their accumulation is relatively slow, and among them there do not appear to be any accumulations of materials identical with the marine stratified rocks of the continental areas. It seems doubtful, says Murray, whether the deposits of the abyssmal areas have in the past taken any part in the formation of the existing continental masses.

A 'pteropod ooze' is met with in depths of less than 2000 fathoms in the tropics, and is very largely made up of pteropod and heteropod shells, which also exist in considerable numbers in the deposits around oceanic and other islands.

In 'radiolarian' and 'diatom' oozes the deposits consist of siliceous skeletons and frustules of surface organisms, which have likewise fallen from the surface waters. A radiolarian ooze has hitherto been met with only in the deepest waters of the western and central Pacific, and diatom ooze appears to be confined to the Southern Ocean, a little north of the Antarctic Circle.

Thus it will be seen, as Agassiz has pointed out, that the character of a marine deposit is largely determined by its distance from land, and again by the nature of the organisms living in the surface waters. The dead shells of pteropods, foraminifers, radiolarians, and diatoms are heaped up on the bottom, some in one part of the ocean, some in another; and as no other materials reach these distant regions to cover them, they form characteristic deposits. Depth is, however, an important factor in reference to the composition of a deposit in any locality. There seems to be now no doubt that the whole of the carbonate-of-lime shells, such as those of mollusks and foraminifers, are entirely removed by solution in very deep water during their fall from the surface to the bottom, or immediately after reaching the bottom. It is found that, with increasing depth, the pteropod and heteropod shells are the first to disappear from deposits, then the more delicate surface foraminifers, and finally the larger and heavier ones. It is likewise observed that, the more numerous these shells are in the surface waters, the greater is the depth at which they will accumulate at the bottom. As a rule, a pteropod ooze or a globigerina ooze is found in deeper water in the tropics than in temperate regions.

It must be remembered that all the bottom deposits merge into one another, and at times it is difficult to say whether a deposit should be called a red clay, or a radiolarian ooze, or a globigerina ooze, or a blue mud. It was thought by Pourtales and others that the Globigerina lived in the oozes at the sea-bottom; but the *Challenger* observations have clearly established that many foraminifers have a pelagic mode of life (see PELAGIC ANIMALS), flourishing in the pure currents of the open ocean, nearly all the species being confined to tropical and subtropical waters. There are not more than twenty or twenty-two species of pelagic Foraminifera; yet, says Murray, so numerous are the individuals of the species that they usually make up over 90 per cent. of the carbonate of lime present in the calcareous oozes of the abysmal regions. The individuals belonging to even a dozen of these species far outnumber the individuals belonging to all the other known genera and species of Foraminifera. This is true not only with regard to their abundance in the deep-sea deposits of the present period, but also to their great development in Tertiary and other geological formations. Murray adds that the species of Foraminifera which live on the bottom in deep water "are habitually under very uniform conditions, and consequently their shells do not vary in size and thickness with change of latitude like those of the pelagic species, the animals of which are subject to great changes of temperature and salinity in the surface waters."

BIBLIOGRAPHY. Pourtales, in *Report of the United States Coast Survey*, for 1853; Agassiz, *Three Cruises of the Blake* (Cambridge, 1888); Murray, *Report on the Scientific Results of the Voyage of H. M. S. Challenger. Deep Sea Deposits* (London, 1891).

O'PAH, or KINGFISH. A beautiful and palatable fish (*Lampris luna*) of the Mariposa family (Lampridæ) and related to the John Dory (q.v.). It abounds in most northern waters, but is rare on the American Atlantic coast. It grows to a length of four feet or more, is of oval form (see Colored Plate of GAME FISHES, with TROUT), with a high dorsal fin and a powerful tail. It is brilliantly colored: the upper part of the back and sides rich green, reflecting purple and gold in different lights, the lower parts yellowish-green; round yellowish-white spots above and below the lateral line; all the fins bright vermilion. The flesh is much esteemed. This fish has many names, as 'mariposa,' 'moon-fish,' and 'king of the herrings.' Consult Hamilton, "British Fishes," in *Naturalist's Library* (London, undated).

OPAL (Fr. *opale*, from Lat. *opalus*, from Gk. ὀπάλλιος, *opallios*, opal; connected with Skt. *upala*, stone, upper millstone). A hydrous mineral silicon dioxide used as a gem. It differs from quartz by containing water, the quantity of which varies from 2 to 13 per cent. and even more. It occurs usually in pale shades of yellow, red, green, and blue, although sometimes the color is quite dark, the coloration depending on different oxides and frequently showing a brilliant play in the light. Opal is never found crystallized and has a conchoidal fracture, being easily broken. Among the ancients this mineral was held precious and regarded as a lucky stone. In the East the opal is believed to make its wearer beloved of God and man so long as he trusts sincerely in its power. The finest opal is said to be among the Austrian crown jewels. It weighs seventeen ounces and is five inches long by two and a half inches in width. The principal varieties of the opal are: (1) The precious opal; (2) fire opal; (3) girasol; (4) common opal. The precious opal, called also noble opal, and sometimes oriental opal, is semi-transparent or translucent, usually of a bluish or yellowish-white color, yellow by transmitted light, and exhibits a beautiful play of colors, due to minute fissures which, being filled with air and moisture, reflect all prismatic colors. This variety is used principally as a gem-stone and is polished with a convex surface because its play of color is best shown in that way; but it is never cut into facets, because of its brittleness. The finest specimens are found near Kaschau, in Hungary, where they occur disseminated in the conglomerate; also in Saxony, in Honduras, in South America, Queensland, and New South Wales in Australia, and especially near Querétaro, in Mexico; also at various localities in Oregon and Washington in the United States. The fire opal, which is of a hyacinth red color, with yellow and green reflections, occurs at Simapan, in Mexico, and also in Honduras. The girasol, which is bluish-white in color with reddish reflections in a bright light, also occurs chiefly in Mexico and Central America. The common opal is semi-transparent and may be watery-white, yellow, green, red, or brown; it exhibits no play of colors. It is found in Hungary, in various localities in Germany, in Cornwall, Pa., Idaho Springs, Colo., in Calaveras County, Cal., and elsewhere. Wood opal is

petrified wood showing the original form and structure. Hyalite, or Müller's glass, is a colorless or whitish variety of opal, while menilite is an opaque grayish variety which is frequently found in concretionary form.

OPATA, ō-pä'tä ('Enemies,' so called by the Pima, with whom they were anciently at war). An important tribe of Piman stock (q.v.) occupying the mountainous region on the headwaters of the Yaqui River in Sonora and the adjacent portions of Chihuahua, Mexico. Like all the tribes of Piman affinity, their traditions indicate a northern origin. When first known to the Spaniards they were found occupying settled villages of adobe huts, and cultivating fields of corn and other vegetables. They are brave and faithful, for which reason they have been extensively employed by the Spanish and Mexican governments as soldiers and frontier guards. They readily accepted the teachings of the missionaries and are now all Christianized, although still governed under the ancient forms by their village chiefs. In 1820, owing to neglect and abuse from Mexican army officers, under whom they served, their warriors revolted. Under their chiefs, Doraine and Espiritu, they defeated several expeditions sent against them, making a final stand in an adobe church against a force of 2000 Mexican troops until their ammunition was exhausted, when they were obliged to surrender. The two leaders and seventeen others were shot, but the abuses of which they complained were corrected, and they have since remained quiet and loyal. They number now about 5000.

OPDYCKE, ōp'dik, Emerson (1830-84). An American soldier, born in Hubbard, Trumbull County, Ohio. In July, 1861, he enlisted as first lieutenant in the Forty-first Ohio Volunteers, and was soon afterwards promoted to be captain. In January, 1863, he became colonel of the 125th Ohio. At Chickamauga his regiment lost one-third of its number; at Missionary Ridge his command was one of the first to reach the Confederate works; and at Franklin (q.v.) a timely charge of his brigade by his orders restored the Federal line broken by Cleburne's charge, and prevented what might otherwise have been a great disaster. He was made brigadier-general of volunteers in 1865, and in 1866 was brevetted major-general of volunteers to date from the battle of Franklin. After his resignation, in 1866, he entered business in New York City.

O'PECHANCA'NO. A chief of the Powhatan Indian confederacy of Virginia, succeeding the famous Powhatan, who died in 1618. He acted as mediator in preventing hostilities in consequence of the abduction of Pocahontas by the English in 1613, but on his succession to authority soon gave indication of settled dislike to the whites. Under cover of professions of friendship he united nearly all the tribes of tidewater Virginia into a conspiracy against the English, and on March 22, 1622, a simultaneous attack was made on all the scattered settlements, resulting in the massacre of 347 men, women, and children, or more than one-fourth of the whole white population of the colony. Jamestown alone escaped, through the timely warning of a friendly Indian. The war thus begun continued until both sides were exhausted, when a peace was made which endured for over twenty years. As the English settlements advanced the Indians were steadily pressed back from their old-time fields and fishing grounds until in 1644 Opechancano, now grown old and nearly blind, determined to make a last stand for his people. In another concerted attack along the frontier 300 English settlers perished. By this time, however, the whites had greatly increased in number, while the Indians had correspondingly diminished. A war of extermination was ordered and kept up for two years, the Indians being hunted down like wild beasts, without rest or quarter. In 1646 it was brought to an end by the capture of Opechancano by an expedition led by Governor Berkeley in person. The chief was taken to Jamestown, where he was soon afterwards shot and killed by the sentry appointed to guard him.

OPELIKA, ōp'ē-lī'kä. A city and the county-seat of Lee County, Ala., 29 miles northwest of Columbus, Ga.; on the Western of Alabama and the Central of Georgia railroads (Map: Alabama, D 3). It is an important cotton market, owing to its location in a productive cotton section, for which it is also a distributing centre. There are cotton gins, cotton mills, flouring mills, fertilizer works, brick plants, etc., the products of the town's various establishments, according to the census of 1900, being valued at $335,000. Opelika, settled about 1840, is governed, under a charter of 1896, by a mayor, elected biennially, and a council. Population, in 1890, 3703; in 1900, 4245.

OPELOUSAS, ōp'ē-lōō'sas. A town and the parish seat of Saint Landry Parish, La., 125 miles west by north of New Orleans; on the Bayou Teche, and on the Southern Pacific Railroad (Map: Louisiana, C 3). It has the Academy and Convent of the Immaculate Conception, and a free reference library of 1000 volumes is connected with the high school. There are a cotton compress, cottonseed oil and rice mills, and other industrial establishments. Population, in 1890, 1572; in 1900, 2951.

OPEN-BILL. Either of two species of East Indian and African storks of the genus Anastomus, remarkable for the structure of the bill, the mandibles being in contact only at the base and tip, with a wide interval between their edges for some distance near the tip. They frequent the seacoast and rivers, and feed chiefly on mollusks.

OPEN CHURCH. See Institutional Church.

OPEN DOOR. A term in international politics which came into general use in 1899, and has reference to the equality of commercial opportunity in China to all nations. The enunciation of the open-door policy had its origin in the acquisition by various European Powers of commercial ports in China and the insistence of the United States that such ports should be open to all the world on equal terms.

OPEN-FIELD (or Common-Field) **SYSTEM.** The term used to designate the scheme of agriculture which prevailed in England and other countries during the Mediæval period. At this time the rural population was grouped together in villages, either free or manorial, in which every man had his house with a small plot of ground about it, while around the village lay the plowed fields, the meadows, pastures, and for-

ests. The arable land was that to which the term under discussion is applied. It was divided as nearly as possible into three—or some multiple of three—equal fields, in each of which every man in the village had a certain share. The system had two distinctive features. In the first place, a man's holding in each field did not consist of one compact plot of ground, but was made up of several strips, each about an acre in size. Narrow strips of grass were the only boundary lines; hence the name open field. The second feature of the system was the rotation of crops. Every third year one of the fields was left to lie fallow. What crop it should bear the other two years was also regulated by custom. Survivals of the open-field system are present in English agricultural life to-day; in fact, during the nineteenth century more open fields were inclosed than had ever been inclosed in a like period before.

OPEN, SESAME, sēs'a-mē. In the story of Ali Baba in the *Arabian Nights*, the magic formula which opens the door of the thieves' cave.

OPEQUAN, ō-pēk'ăn, **CREEK,** Battle of. See Winchester.

OPERA (It., composition, from Lat. *opera*, work; connected with *opus*, Skt. *apas*, work). A musical form of stage-play. The Athenian drama was grand-parent to the opera. When that artistic reform, the Renaissance, swept Italy it stamped its influence on each one of the fine arts; it was a universal harking back to the period of the classics. The arts that had idled along through the Middle Ages were reanimated with the breath of classicism; but music alone was an exception to the rest. It was the youngest of the arts and differed by nature from the others in that it was not imitative. While its development was steady from about the tenth century on, this progress was almost entirely free from the influences of ancient models, and on lines dictated by evolution itself. One of the prevailing symptoms of the Italian Renaissance was complete dissatisfaction with art as it stood. It was easy enough to reconstruct the ideals of the other arts: there were tangible models to imitate; but none of these served the cause of music. Out of the hazy past came confusing echoes of the Greek drama, a combination of poetry, music, and the dance, and this was adopted as the ideal plan upon which to reconstruct music. Their choice seemed logical enough to the crew of reformers who went to Greece for most of its formulæ; but when it is considered that they knew little of the actual use to which music was put during those days of Athenian art, it must appear as a step in the dark. Remarkably enough, it was a step in the right direction; a step which, modernized and made practicable, afterwards led opera out of a discouraging tangle of half-hearted theories and ill-assorted experiments to a point of artistic culmination.

Previous to the real beginnings of opera there were plays to which in one manner and another music was linked. There were costumes, scenery, and action—all these displayed on a stage; and the trend was sometimes dramatically or sentimentally pastoral, frequently comic. Adam de la Halle (c.1235-c.1287) composed a dramatic pastoral called *Le jeu de Robin et de Marion* for the French Court at Naples, produced there about 1285, which has been mistaken for the actual starting point of opera. In reality it was nothing more than a string of ballads, popular in that day, joined by a dialogue; and as Halle wrote only the latter, his fame as a composer is almost erased. There were many other efforts of this kind, none of which had a direct influence on the opera of the future. The plight of the serious composer striving then for a vehicle of dramatic utterance was pitiable. The folk-song or ballad could not be taken seriously by him as it stood: all his training had taught him to honor only the complex art of polyphonic writing, which is melody multiplied, in which the different voices interwove and crossed each other. He might—and did—take folk-song as material about which to weave his counterpoint. This bred new troubles, since such a procedure could not endure the test of dramatic action: several voices singing in counterpoint scarcely could be made to stand for the dramatic utterance of a single person. So he dared such experiments only in the unexacting domain of the concert room. Another claim for attention comes from the ballet of that period, especially in France. Besides the grandeur of the scale on which these entertainments were carried out, the plots were sufficiently important dramatically to cause some historians to believe this the beginning of opera. We, from our point of vantage, can see now the theoretical errors of all these attempts; but they were seen long ago by a band of enthusiasts.

Toward the end of the sixteenth century there assembled a number of Florentine noblemen determined to free dramatic music from its trammels. They have gone down in history as *La Camerata*, and the circle was composed of Bardi, Strozzi, Galilei—father of the famous astronomer—and Corsi. With these amateurs there consorted Ottavio Rinuccini, a poet, and the two musicians Jacopo Peri (c.1560-1630) and Giulio Caccini (c.1558-1618). In pursuing their Hellenic ideal of reconstructing music upon the principles of the Greek drama they ignored all the contrapuntal advance music had made during four centuries. The only task they set before themselves was to express in sounds the sentiments of the poet; and music as an independent art was discovered. What latitude this gave composers is easy to imagine; it also freed the voice so that it could work singly with an orchestral accompaniment. In a word, it was the first known attempt of merging the word and the sound into an individual whole. Theories grew into actuality when a performance of *Dafne* was celebrated at the Palace of Corsi in 1595. The libretto of this, the first opera, was by Rinuccini and the music by Peri; and it was written according to the formulæ of the *Camerata* in the *stile rappresentativo*—the 'expressive style.' *Dafne* was successfully performed several times, but always in private, and now the score is not discoverable. The public was initiated five years later when two settings of Rinuccini's *Eurydice* were made—one by Peri and the other by Caccini. Both operas were produced in part during the marriage celebrations of Henry IV. and Maria de' Medici at the Pitti Palace, October 6, 1600. These two operas embody the tentative strivings of the Florentine *Camerata* in their efforts to revive the drama of the Greeks. Measuring the accomplished thing by the ideal model the former must appear ridiculous and very

wide of the mark. But here at least was a step in an untrodden path: Opera was now on a basis which admitted of development. Its career had begun.

THE INFLUENCE OF ITALIAN OPERA.

How ripe Italy was for the music reform begun at Florence is proved by the eagerness with which other composers took up and utilized the *Camerata's* ideas. Fortunately for the fate of opera, some great musicians interested themselves in it; musicians who were bolder even than the brave spirits that had launched it. First among these was Claudio Monteverde (1567-1643), by the nature of things a pioneer. Several innovations are laid at his door, the most important to the development of opera being the breath of life he put into the lifeless recitatives of Peri and Caccini. This meant the bursting of another bond which had restrained dramatic freedom, and dramatic melody replaced the stilted recitatives. He was aided in these reforms by his contemporary Marco da Gagliano. When Monteverde's first opera, *Orfeo*, appeared in 1607 and his second one, *Arianna*, a year later, synchronous with Da Gagliano's *Dafne*, it was evident that Peri and his comrade had been left far in the rear. The individuality of the later composers asserted itself and in a short space of time opera had made a great bound for freedom. Of the three following decades few records remain to prove any great advance along the line of reform, a surprisingly large number of scores having been destroyed. But opera made a great advance in 1637 when the Teatro di San Cassiano —the first public opera house—was opened in Venice. Now that the masses had a voice in the matter, it soon became evident that the people must be pleased and the Florentine ideals forgotten. The nobleness of the libretti deteriorated, mythology gave way to history, and melodrama was king. The masses were pleased, and the business of opera flourished until there were eleven opera houses in Venice alone. The leading musical spirit of this Venetian opera period was Monteverde's pupil, Pietro Francesco Caletti-Bruni (c.1600-1676), who adopted the name of his noble patron, Cavalli. He was an excellent musician and did much to give Venice opera local color by introducing the spirit of jest in his works; he is even credited with the invention of the operatic aria, distinct from the *musica parlante* used by his predecessor. (See ARIA.) But the introduction of the aria was a disastrous move for the good of opera; it boded degeneration of serious opera and paved the way for the *opera buffa*. The same fate was threatening Neapolitan opera despite the composer-genius Francesco Provenzale (c.1610-?), when a new force stayed the decline of opera. The contemporary composers who had not bothered their heads about the stage had gone quietly about their business developing the other forms of music in which they were unhampered by scenic bounds. It stands to reason that their art was a purer one; so when one of these—Marc' Antonio Cesti (c.1620-69), pupil of the celebrated Carissimi—came to Venice at the middle of the seventeenth century he brought with him a remarkable technique and a lot of musical ideas. That the latter were for the most part badly suited to the demands of opera is true, but he made his mark on the map of operatic history by ousting the comic element from serious opera. Hereafter *opera seria* and *opera buffa* traveled different roads. The latter tumbled mightily from grace at first, but gradually its cause was championed by Nicolò Logroscino (c.1700-63), Pergolesi (1710-36), and Piccini (1728-1800), who reëstablished it on an artistic basis. Under the above-mentioned Cesti serious opera fared very badly. His intentions doubtless were good—he even is said to have invented the *da capo*, or repetition, of aria—but his training under Carissimi was all antagonistic to the principles of opera. He tried to reconcile opera and oratorio and what resulted was neither. The product was some unfortunate thing that had fallen between the two stools; opera became undramatic and unscenic—in a word, it became unoperatic.

Even so great a musician as Alessandro Scarlatti (1659-1725) could not rescue opera from its plight. His one striving was to develop the musical end of the form, and in his eagerness he neglected the dramatic entirely—just as so many other composers had done and were doing. This wretched period, which has been called the 'oratorio epoch' of opera, lasted until the stern Gluck reform set in. Italy had been too small to hold the effects of the Florentine movement, and Dresden produced a German version of *Dafne* about 1627. The composer was Heinrich Schütz, who had been trained in Venice under Gabrieli, whose work was an imitation of the Italian. Nuremberg cropped up with something which purported to be more Teutonic later. This was a lyric drama called *Seelewig*, by Staden (1607-55), which proved, after all, to have little of the national in it. It was evident that Germany could not get on without Italy in matters musical, so it was no surprise to find a wholesale importation of Italian composers, operas, and opera troupes into Germany about the middle of the seventeenth century. Nevertheless by 1678 Hamburg had a German opera house. The opening performances were mere farces of serious work and the scheme was too ridiculous to last. A betterment came in 1697 when Reinhard Keiser (1674-1739) produced his *Ismene*; from then until 1734 he was actively connected with the opera. He worked diligently to divorce opera from Italian influences and wrote German music; but unfortunately he planned his work in the forms of the Neapolitan 'oratorio-opera,' which had no artistic excuse for existence at all. So far opera 'made in Germany' was not a success, and with Keiser's death Italy again flooded the country with its musical product. The Italians also forced their way into France. Their early performances there may be passed over, being of no great importance in themselves; but they awakened in the Frenchman's mind the possibility of a national opera. This culminated with the accession of Louis XIV. to the throne, for he bestowed on Pierre Perrin (1620-75) the right to found an academy of music. A company was incorporated, and on August 19, 1671, the Académie Royale de Musique, which still exists, began its career with *Pomone*, a mediocre pastoral, the music by Cambert (1628-77). So here was the Italian influence dominant in France and resulting in the founding of an institution in imitation of the Florentine *Camerata*. Although Perrin and Cambert founded the Académie Royale de Musique, their activity at its head was short-lived. The father of French opera is Lully

(1633-87). Giovanni Battista Lully, a Florentine by birth, was taken to France and began his Parisian career as a scullion. His violin-playing, however, drew attention to him, and under noble patronage he began the study of music. As a musician he acquired dignity, knowledge, and power; he intrigued against Perrin and Cambert, and in short order was the head of the Académie. Here he ruled with a high hand, but his extraordinary and numerous talents made him a valuable person; he composed a large number of ballets, divertissements, and operas—in all of them pandering to the local taste and keeping the dramatic element well forward. Naturally his operas betray Italian influence, but this is neatly modified or cleverly disguised; above all they are adapted to the stage. His principal successor—and this after a lapse of time—was Jean Philippe Rameau (1683-1764), who was a better musician, but had not so keen an eye for the dramatic end of opera, and under his reign Italian opera once again secured a hold in France. It must be recorded to the glory of French pride that the Italians did not succeed—as in Germany—in overwhelming national opera; but the taste of the musical public was divided, and afterwards—as we shall see—culminated in the Gluck-Piccini contest for operatic honors.

In England opera had tentative beginnings as in every other country; here it was the masque (q.v.) that gave early excuses for the employment of music with stage productions. But this form was no nearer opera than the gorgeous French ballet had been and it founded no school. It remained for Henry Purcell (1658-95) to lay the corner-stone of English opera. He was probably the greatest of England's musicians—certainly the last of the great ones—and was a pupil of Pelham Humfrey, who in turn had studied under Lully. Much of his work consists in musical settings for plays, but there is at least one real opera, *Dido and Æneas*. The early death of Purcell was particularly unfortunate for England, inasmuch as there was no one to succeed him; and as art cannot remain stationary, it declined. This was the usual opportunity for Italy, whose musical scouts were constantly surveying the operatic field for fresh conquests. The most important of the invaders, however, was the German George Frederick Handel (1685-1759), who had become thoroughly Italianized. He wrote and produced opera after opera until he became bankrupt, and then he turned out oratorios with equal facility. That he had dramatic ability—other than a musical one—is extremely doubtful, and his operas belong unquestionably to that dread 'oratorio-opera' style inaugurated by Carissimi through Cesti. Handel did not have the English field to himself; his rivals were Buononcini (1660-1750) and Ariosti (1660-c.1740). The stringing of ballads—as Dr. Pepusch (1667-1752) did in the case of John Gay's *The Beggar's Opera*—does not deserve serious consideration in itself, but in England it gave rise to the school of ballad opera from which nearly all later attempts at English opera stem. How widespread the influence of Italian opera was has been shown; also that it was the kernel of national opera in England, France, and Germany. Even a cursory glance into the matter will prove that in the haste to cover all available territory and in the eagerness to please the several masses the Florentine ideals were buried under the numberless mounds of failure which opera had left in its trail of popularity. A reform was imminent.

GLUCK, THE REFORMER, AND MOZART, THE MELODIST.

Christoph Willibald Gluck (1714-87) was a dissenter from the very start. His musical training had been principally in the Italian school, but he realized many of its operatic insipidities and had determined even with his first work to cut loose from some of the foolish conventions into which opera had drifted. At first he aimed to give importance to the dramatic in the libretto by means of music—something which had been overlooked by the composers of ornamental opera for decades. This experiment was tried with *Artaserse*, which, oddly enough, came on the boards the same year that Handel's final opera appeared. It would be silly to contend that Gluck had 'found himself' straightway in his first opera; no composer has done that yet. In fact, he seems simply to have defied convention with no rules of his own save just this one of defiance. Now no system can grow on such a basis, and after writing several operas and traveling about, he began to lose interest in his work. He had met convention at every turn, and this constant attitude of fight on his own part wore him out. Eventually he conferred with an Italian poet, Calzabigi, and the two decided that the trouble of the entire operatic situation was that the prima donna had grown too vain and important—she dictated to the composer—and that the libretto of the day was lacking in dramatic element. This happened when Gluck was already forty-six years old, and certainly the weaknesses which he and the poet unearthed must have been known to both of them long before. But what followed was important. Calzabigi wrote a libretto on entirely new lines, and Gluck set it sincerely to music. This was *Orfeo ed Euridice*, brought out in 1762, the first attempt not only to forsake the 'oratorio' school of opera, but also to formulate a new plan by which opera might claim attention as an art form. Of course the public complained; but after a while the intelligent ones among them realized the earnestness of both poet and musician and were won over. The next opera from these pens, *Alceste*, was a further improvement on the previous one, as was *Paride ed Elena*. Gluck now attracted the attention of the French poet Du Rollet, connected with the French Embassy at Vienna, and the two set to work to make an opera out of Racine's *Iphigénie en Aulide*. Then Gluck longed for a Paris success, and through the influence of Marie Antoinette succeeded in securing an invitation to that city. His patron also succeeded in precipitating the innocent composer into a political quarrel by antagonizing Mme. Du Barry. However, Gluck's *Iphigénie* achieved a hearing and afterwards a success in Paris. In the wake of this came one of the bitterest fights in all operatic history. At the bottom of it politics raged, but on the surface it seemed a controversy over æsthetic ideals. It culminated by forming two violently antagonistic parties which pitted Gluck on the one hand against Piccini on the other. Many prominent persons took active share in the conflict, which was almost an international affair, since the outcome would control the fate of Italian opera. The two composers were duel-

ing with operas. Gluck composed *Armide*, and against that Piccini wrote *Roland*. So matters might have gone on indefinitely had it not been decided that both of them should set the same subject to music. This was *Iphigenie en Tauride*, and Gluck triumphed because of the superiority of his work. So dramatic verity and operatic sincerity won the day. The principles upon which Gluck had insisted and for which he had waged successful war were really only those formulated by the Florentine *Camerata* almost two centuries earlier. It is a tribute to the Florentine noblemen; though probably they builded better than they knew.

At this period the influence of Mozart (1756-91), the genius of melody, began to make itself felt. Except that he had a keen appreciation for the dramatic, he was the antithesis of Gluck. He had no regard for the precepts of his planning predecessor; those formulæ over which Gluck had slaved meant nothing to him, and he succeeded by virtue of sheer genius. He composed with the greatest ease and rapidity, and wrote masterpieces with less care than other composers devote to writing trash. Yet his *Don Giovanni* is one of the greatest of the older operas. He individualized his characters musically, was alive to dramatic situations, and inclosed the whole in a network of pure melody—perhaps the most exquisite ever produced. It was more Italian than the sunny, melodious product of that country, but it was controlled by a genius which shone through at every bar. When he wrote in the vein amusing—as in *Le nozze di Figaro*—it made the efforts of the Italians, who created this *genre*, sound flimsy and trivial. When he grew serious—as in the grewsome scenes of *Don Giovanni*—he foreshadowed the Wagner music drama. Yet with all these attributes Mozart himself did not change the current of the operatic stream nor did he found a school of successors. Nowhere in the history of opera is there a parallel to his case.

THE ITALIANS AND THE FRENCH.

While supplying the world with operas and composers, Italy grew careless of her product. Too great a prosperity usually breeds decadence, and the business of music is no exception: besides, the Italians were exporting their music and importing none. The fertility of every nation has an end. Soon poverty threatened musical Italy, though she produced some remarkable men. Domenica Cimarosa (1749-1801) was unfortunate in that he was followed by Rossini (1792-1868), whose operas soon displaced those of his less gifted predecessor. Rossini had the fertile gift of melody, but lacked the ambition to develop his gifts. He wrote melody and let the action look out for itself. This was a distinct step backward to the ante-Gluck period, and it is remarkable to note how rapidly the vices of the old Italian school sprang into life again and thrived. The flourish became the thing: the singer's agility was a virtue: the ear was tickled and the eye insulted. In lighter opera this did not matter so much, and Rossini left the world at least one masterpiece and a model in this form: *Il barbiere di Siviglia*. His successor, Giovanni Pacini (1796-1867), tried to stem the flippant tendency which crept into opera: but in this work he was overshadowed by both Gaetano Donizetti (1797-1848) and Vincenzo Bellini (1802-35), who slaved for the dramatic in opera. They achieved it, all the while flattering the public with the flourish to which Rossini had accustomed it. Save for a very few operas, such as *Don Pasquale*, *Lucia di Lammermoor*, and *Norma*, their names have disappeared from the roster of opera houses to-day. They lead the way to Verdi, however. He, on account of the masterly works of his last period, will be treated later. In France the Gluck theories of opera had been driven home so sensationally that they were not dislodged in a hurry. After Gluck's death the work was carried on by his pupils, Antonio Salieri (1750-1825), and Sacchini (1734-86), who kept alive his master's ideas without accomplishing anything remarkable himself. Then come the stately Cherubini (1760-1842), and Gasparo Spontini (1774-1851), who has been called the last classicist of the lyric stage. Soon afterwards, Auber (1782-1871), who had previously worked for the Opéra-Comique, sprang into the arena of grand opera with *La muette de Portici*, also known as *Masaniello*, and sent Gluck classic traditions flying. This shock was still upon the people when Rossini's *Guillaume Tell* appeared—the most pretentious work attempted by this composer—and then the Romantic Period of 1830 possessed the Parisians heart and soul, bringing with it a lordly figure in the history of opera—Giacomo Meyerbeer (1791-1864).

Meyerbeer had a most remarkable genius for adaptation, combined with a shrewd technical mastery and a keen business insight. All these fitted the period, and he was careful to see that they did. By writing what pleased he controlled the operatic situation of France absolutely. His librettist was Scribe, a man of sprawling talent, and the two knew to a beat how quickly the Parisian's pulse throbbed. The success of *Robert le Diable* was simply stupendous, and Meyerbeer held French opera in the palm of his hand. His hold on the public did not relax with his later works, and even the music-lover of to-day acknowledges the tremendous moments in *Les Huguenots* and *Le Prophète*; but his last work, *L'Africaine*, betrays the sameness of his methods, though there is a decided advance on the technical side of the orchestra. Meyerbeer was a master of sensational effect; his operas are not lacking in it, and they are full of bombast; to this end he employed a large and fully equipped orchestra. If to-day there is much in his works which is obsolete, there still remains enough to convince the just critic that here was a man of great talent who molded himself so accurately to fit the time that one is frequently misled into believing that he was a product of the early thirties in Paris. In contrast to this honor-crammed career is the one of Hector Berlioz (1803-69), that strange, willful genius who yielded not a jot to popular likes. His operas are fantastic creations that have never appealed to managers of opera houses: in fact, his huge double work, *Les Troyens*, had to wait until 1893 for its première. He also composed a sprightly musical comedy, *Beatrice et Benedict*. It is most unlikely that his operas ever will become repertory pieces; when they were written they were considered too much in advance of their time, and now Richard Wagner's music dramas have made most of the advanced works seem old-fashioned.

Jacques Fromenthal Halévy (1799-1862) bridges the gap between Meyerbeer and Charles François

Gounod (1818-93), whose *Faust* is probably the most popular of French operas. His later work, of equal pretensions, *Romeo et Juliette*, is marred by its sentimentality. A word about the French Opéra-Comique: It was naturally the child of Italian *opera buffa*, and in time gained importance as an art form. Its earlier composers —Philidor (1726-95), Monsigny (1729-1817), Grétry (1741-1813), wrote light, pleasing music. Méhul (1763-1817), who was a pupil of Gluck, introduced some ideas bordering on the serious, as did Boieldieu (1775-1834). Then came Auber and Hérold (1791-1833), who raised the standard considerably. It grew entirely serious when the unique operettas of Offenbach attracted the jocose element to the Opera-Bouffe. The Opéra-Comique had branched out before, but Offenbach drew the dividing line plainly. Since then some of the works written for the Opéra-Comique differ from those at the Grand Opéra only in that the dialogue in the former is spoken, not sung. Among its serious contributors were Gounod with *Mireille*, Ambroise Thomas with *Mignon*, and Bizet with the masterpiece of them all, *Carmen*. This work is a classic, and where it is performed with sung dialogue rears its head high above some of the more pretentious works of the Grand Opéra school. Among more recent contributors to the repertory of the Opéra-Comique are Delibes, Massé, De Joncières, Massenet, Godard, Saint-Saëns, Lalo, Bruneau, D'Indy, and Charpentier. Some of the latter have even done away with the old-time formula of spoken recitative, and now there is little theoretical difference between works produced at the Comique and the Opéra.

THE GERMANS AND WAGNER.

Mozart's early death left Germany without any great opera composers until Ludwig van Beethoven (1770-1827) wrote *Fidelio*. Beethoven was about the last man who might be expected to attack the task of opera-writing—all his works had been in the line of absolute music; but finally he selected a surprisingly bad libretto and went to work. *Fidelio* is one of the most curious compositions in the entire literature of opera; it is so full of contradictions. From passages that are nothing short of superb and wonderful it ranges to episodes when the listener feels that the composer is decidedly out of sympathy with his subject and the art form. As a whole—despite the overwhelming 'Abscheulicher' air and the superb duo in the second act—it is disappointing and even admitting all greatness possible it is at best scarcely an opera. The next important figure is Louis Spohr (1784-1859), whose operas marked the beginning of German Romanticism, followed closely by Weber (1786-1826), whose works show this movement in full bloom. His principal opera, *Der Freischütz*, is still in the repertoire and apt to remain so for a long time to come, since the music displays a buoyancy and richness of sentiment that are remarkable. He is by far the most German of all opera composers—Wagner not expected—and seems to have embodied in his music many of the national characteristics. In the wake of Weber came a string of opera composers who have been designated depreciatingly as the writers of 'kapellmeister' music. The list is too long and unimportant to repeat; but there were a few others who rose distinctly above this level and really produced some good work. First among these is Heinrich Marschner (1795-1861), some of whose operas are still produced to-day in Germany; the same is the case with Albert Lortzing (1803-51). Peter Cornelius (1824-74) left at least—thanks to the kindness of Liszt—one opera, the *Barbier von Bagdad*, which has survived its critics. Incidental mention may be made of musical works with spoken dialogue—*Singspiele* they were called—among which Otto Nicolai's (1810-49) *Die lustigen Weiber von Windsor* is a charming example. But the operatic list might be prolonged indefinitely, it includes the names of Schubert, Mendelssohn, Liszt, and Schumann, and at the end it would be found that none of them affected the history of opera to be sufficiently worthy of mention. Besides, interest of this period centres in the greatest figure of the whole history of opera, Richard Wagner (1813-83).

Wagner's musical development is one of the most remarkable on record. Passing over two youthful works—*Die Feen* and *Das Liebesverbot*—which are of historical interest only, his career as opera composer began with *Rienzi*, a work designed for the Paris Grand Opéra, and one which out-Meyerbeers Meyerbeer. Successful as this was, Wagner must have realized that the old form was a bar to any progress, and he turned his back on it for all times. With his next opera, *The Flying Dutchman*, he works along the lines laid down by Weber; but his own individuality was so marked that the result is not at all Weberish. After this he takes a tremendous leap forward and lands with *Tannhäuser*, again a tentative move; then with another effort he achieves *Lohengrin*. No other case in music history comes to mind where three moves cover so great an advancement as those from *Rienzi* to *Lohengrin*. Now followed the period of his political exile, which gave him liberal opportunities to ponder the problem of music-drama. During these broodings he saw that opera was going the wrong way. The set forms of aria, recitative, of chorus, and orchestral accompaniments and interludes, must be abolished. He thought and wrote out the problem, arriving at the idea that the one possible salvation of this art form lay in abandoning all the excrescences of the later Italian, the Neapolitan school, and going back to the original principles of the Florentine *Camerata*. Upon these he experimented until he had formulated his basis for a music-drama with its logical development of the leitmotiv (q.v.)—or leading motive—and its welding into a great synthesis, song, action, and orchestra. Not only did he theorize, but he composed his tetralogy, *Der Ring des Nibelungen*, of which *Das Rheingold* was the first part. One vital point must be made here; that in every case Wagner was his own librettist. This was the first active rebellion against the puerile stuff furnished by poets for musical setting. *Rheingold* was followed by the second part, *Die Walküre*, and that by *Siegfried*. Poverty and troubles of exile compelled an interruption, during which time *Tristan und Isolde* and *Die Meistersinger von Nürnberg* were composed in hopes of having them produced—a thing which did not seem at all likely to happen to the *Ring*. Eventually he secured the patronage of King Louis II. of Bavaria and finished *Siegfried*, together with the final part, *Götterdämmerung*. Then followed the planning and contriving to

have an opera house built in which he could produce this great tetralogy, and after a long fight Bayreuth was selected and the theatre constructed. He closed his life's work by writing *Parsifal*, soon after the first performance of which he died. No other composer ever schemed such sweeping reforms; none other ever held out so obstinately for dramatic verity. He came nearer than any one in merging the word and its meaning into the sound musical, and his technical mastery allowed him to do just that which he started out to do; though in the last analysis Wagner the musician triumphs over the theorist Wagner. It is perhaps not just to speak of Wagner's work as an operatic reform; he did more than this, since he demolished opera as he found it—a mere string of idle tunes strung on silly words—and constructed it anew, with a few shadowy precedents to guide him. His versatility is shown by the range of poetic subjects he handled—each one with an enviable amount of sincerity; his *Ring* more nearly approaches the magnitude of the Greek drama than anything in modern times. And in *Tristan* he has on the simplest action achieved a musical drama that stands as a granitic block. His influence was and is tremendous; probably no composer of opera since has been able to escape it; either he has imitated or he has rejected Wagner—in both cases the influence is traceable.

MODERN TENDENCIES.

Giuseppe Verdi (1813-1901) must be considered first of all. He began his career when Italy was still absorbing the melodic treacle that flowed from the pens of Donizetti and Bellini, and he closed it two decades after Richard Wagner had died. He was a most prolific writer and a progressive one. His early works were of the approved style of the period; then came a spell during which he wrote what still remain his most popular works—*Rigoletto*, *Il trovatore*, and *La traviata*—and then he matured into such a work as *Aïda*, a vast improvement on all its predecessors. By this time he had acquired a certain amount of dramatic freedom which was most valuable, added to the skill with which he wrote for the voice. After the revolutionary period in opera—the period when Wagner was alive and during much of which Verdi lived in silence—the aged Italian came forward anew with *Otello*, considered by some critics his greatest work and certainly among the great operas. From Wagner he had learned the importance of being musically sincere to one's text at all hazards; and either by chance or fate he was blessed with one of the best operatic texts written, compiled from Shakespeare by Boito. *Otello* is an astounding work in many ways. It is lyric—Verdi apotheosized the voice—and forcefully dramatic; as a whole it is satisfying, in parts tremendous. Still later in life he brought forth *Falstaff*, a work so viable with youthful vigor that every page of it denies the number of years then piled on Verdi's head. With this he concluded his career.

Very near Verdi—his friend, and librettist in the later works—stands Arrigo Boito (1842—). His one produced opera, *Mefistofele*, was at its time full of a promise which the composer has not yet made good, although he has promised *Nero*, which in 1903 was reported to be almost completed. A follower of Verdi was Amilcare Ponchielli (1834-86), whose fame lives in *La Gioconda*. Then follows a list of younger composers—the school of brutal verity—Puccini, a man of much talent and great technique; Franchetti, Spinelli, Giordano, and others—to say nothing of Mascagni and Leoncavallo, whose *Cavalleria rusticana* and *Pagliacci*, respectively, have made them known the world over. But they all seem to be groping. Not only Wagner, but also Verdi, with his last works, left them in a maze of theories with no settled sign post to direct them. Germany is still subject to the Wagner influences. The later men have done nothing startling—as Verdi did—but principally have followed Wagner, as Humperdinck, Richard Strauss, Bungert, D'Albert, Goldmark, Schillings, Siegfried Wagner, Weingartner, Kienzl, and others. Very recently Richard Strauss has composed a *Singgedicht Feuersnot*, which has met with success, but it is scarcely possible that the form is favorable to great development. His early music-drama, *Guntram*, reveals post-Wagnerian ideals. Practically the history of German opera closes with Wagner. The name of Johann Strauss (1825-99), a member of the celebrated family of dance composers, must not be omitted. His joyous, sparkling light operas are a distinct *genre*—*Die Fledermaus* is a masterpiece in little. It has found a large following—Von Suppé, Genée, and others.

The Wagner influence also pervaded France, where it brewed a tempest. The public decried it—so did some of the native composers; but others and wiser ones bowed their musical heads, accepted and for a time followed the master. Of late France has developed operatic realism and has produced a school of very clever musicians who have more technique than ideas. An exception is the Belgian—musically, France and Belgium are one—César Franck (1822-90), who was a spiritual thinker; but his opera *Hulda* is almost unknown. Reyer (1823—) has made tedious attempts to preserve the classic in opera, while Saint-Saëns (1835—) and Massenet (1842—) have floundered from the school of Meyerbeer to the more sensational style of the younger men. Of the latter, mention must be made of Charpentier, D'Indy, Hue, Pierné, Leroux, and Bruneau. Faure, and later and more important, Debussy, have written serious and intricate incidental music to accompany spoken drama. This is mere experimenting, since poetry and music must be united by closer bonds if they are to be joined at all. Altogether the operatic situation in France is not promising. Most of the modern works are threatened with an early decline, and on the horizon there is no figure promising enough to originate a new operatic faith. The Bohemian Smetana (1824-84) and his pupil Dvořák (1841-1904) have added works of local color to opera, but nothing absolutely revolutionary. The Polish pianist-composer Paderewski composed *Manru* (1901), and two other Poles, Xavier Scharwenka and Moritz, or Moszkowski, respectively, wrote *Mataswintha* and *Boabdil*. Russia has worked long and earnestly to produce a school of national opera composers. Let a few names suffice: Glinka (1804-57), Dargomyzhsky (1813-69), Séroff (1819-71), Rubinstein (1829-94), César Cui (1835—), Tschaikowsky (1840-93), Borodin (1834-87), and Rimsky-Korsakoff (1844—). Few of their works are heard outside of Russia.

England makes sporadic attempts to breed

native composers, and every now and again succeeds in producing some operatic novelty which dies immediately or soon after its appearance in a world of which Wagner is still lord. After the Handel invasion England contented itself with imitative Italian opera and English ballad opera. Arne (1710-78), Bishop (1786-1855), John Barnett (1802-90), Balfe (1808-70), Wallace, (1814-65), Benedict (1804-85), Macfarren (1813-87), Goring Thomas (1851-92), and Arthur Sullivan (1842-1902), bring the list to the prominent ones of the younger school: Stanford, Cowen, Mackenzie, MacCunn, De Lara, Bunning, and Ethel Smyth. Some of their works have been fostered by local pride and have gained notoriety—there is scarcely a masterpiece among them. The cleverest one of the modern English composers, Sullivan, gave the best of himself to comic opera, in which line he achieved international reputation. England is far behind Italy, Germany, and France in the quality of its native operas produced, and its future seems unpromising enough to discourage any musical optimist. In the United States the field of serious opera has been plowed, but the harvest time is not yet. Of so-called comic operas—with a few honorable exceptions—which in the United States have degenerated into musical farces—there is no end to their number and no limit to the poorness of their quality. It seems safe to assert that the world's history of opera closed for the present with the last work of Verdi. Since then operas have been either experiments or imitations of the good that has gone before.

BIBLIOGRAPHY. Clément and Larousse, *Dictionnaire lyrique, ou Histoire des opéras* (Paris, 1869-77); Reynard, *La renaissance du drame lyrique 1600-1876; essai de dramaturgie musicale* (Paris, 1895); Apthorp, *The Opera Past and Present* (New York, 1901); Hanslick, *Am Ende des Jahrhunderts* (Berlin, 1899); Bruneau, *Musiques d'hier et de demain* (Paris, 1900); Henderson, *The Story of Music* (New York, 1891); Elson, *A Critical History of Opera* (Boston, 1901); Newman, *Gluck and the Opera* (London, 1895); Soubies and Malherbe, *Histoire de l'Opéra-Comique* (Paris, 1892); Streatfield, *The Opera* (London, 1901); Upton, *The Standard Operas* (Chicago, 1891); Krehbiel, *Studies in the Wagner Drama* (New York, 1891). See MUSIC—SCHOOLS OF COMPOSITION; and the separate biographies of the composers mentioned. The following list comprises merely some of the more important grand and light operas. Frequently the same libretto served a number of composers, in which case only the more important names are mentioned:

OPERA LIST.

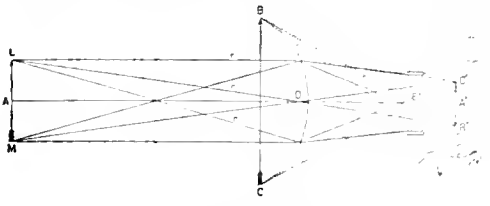
OPERA GLASS. A small double telescope, used for looking at objects that require to be seen clearly and distinctly rather than greatly magnified. The opera glass is short and light, and though it has usually small magnifying power (varying in most instances from two to three times), the large amount of light admitted by the object glass on account of its large angle of aperture enables it to present a well-illuminated picture which can be seen without undue strain to the eye. The opera glass allows the use of both eyes, which gives to the spectator the advantage of seeing objects stand out stereoscopically as in ordinary vision. It consists of two lenses, or sets of lenses, as each lens is generally achromatic and made up of two lenses of different glass fitted together. The object lens, which is the larger, is convex, and the eye lens is concave. They are mounted so that when the tubes are drawn out the distance between the two lenses shall be nearly equal to the difference of their focal lengths. The figure shows the

action of the opera glass. O is the object lens and E is the eye lens, the line AA′ representing the axis of the instrument. The object lens alone would form a real and inverted image C B′ of the distant object LM at or near its principal focus, were it not for the concave eye lens which changes the direction of the rays and causes them to diverge instead of converge at the focus.



OPERA GLASS.

Accordingly, the rays appear to diverge from an erect and magnified image located at BC. The formation of the image may be understood by tracing the course of rays, *r*, *r*, *r*, diverging from some point of the original object such as L. These rays diverge until they meet the convex lens O, which makes them convergent, and would bring them to a focus at B′, but the concave lens E causes them to diverge and take the direction of the rays *r′*, *r″*, *r‴*, entering the eye as if they came from the point B.

OP'ERET'TA (It., little opera). An opera of a light character, generally comic or humorous. Between the various numbers spoken dialogue is introduced. Although originally operettas were written in one act, they now contain generally two. As a rule these productions are ephemeral. But the operettas of Johann Strauss, Offenbach, and Sir Arthur Sullivan have survived their composers. See OPERA.

OPHELIA, ō-fē'lyā. In Shakespeare's *Hamlet*, the daughter of Polonius, in love with Hamlet, who puts her aside, and by mistake kills her father. Her mind gives way, and she becomes a pathetic figure in her madness. Her wandering fancies, her gayety and tears, and her old songs form a touching picture, true to nature. She meets an accidental death by drowning while gathering flowers.

OPH'ICLEIDE (from Gk. ὄφις, *ophis*, serpent + κλείς, *kleis*, key). A musical wind instrument of brass or copper, which ceased to be used in the orchestra about the middle of the nineteenth century. It consisted of a conical tube, terminating in a bell like that of a horn, with a mouthpiece similar to that of the serpent (q.v.), and with ten holes which were stopped by keys. The only ophicleide which was in general use was the bass, and that has now been superseded by the bass tuba in E flat. The compass of the ophicleide was about three octaves. The models varied in length from four to two feet.

OPHID'IA (Neo-Lat. nom. pl., from Gk. ὀφίδιον, *ophidion*, diminutive of ὄφις, *ophis*, serpent). An order of reptiles of the subclass Sauria, the serpents, which are distinguished from lizards by the fact that the right and left halves of the lower jaws are connected by an elastic band. See SNAKE.

O'PHIOCEPH'ALUS. See SNAKE-HEADED FISH.

OPHILETA. A genus of fossil gastropods very characteristic of the lower Ordovician strata of North America. The shells are from one-half to two inches in diameter, with impressed spires and flat or slightly concave lower surfaces. The upper surfaces of the whorls are sharply keeled, the keel of the outermost whorl being higher than those of the inner whorl. The shells resemble those of the genus Euomphalus, to which they are allied. About 15 species range from Potsdam to Trenton limestones, and of these *Ophileta complanata*, of the New York and Canadian Beekmantown limestones, is the best known.

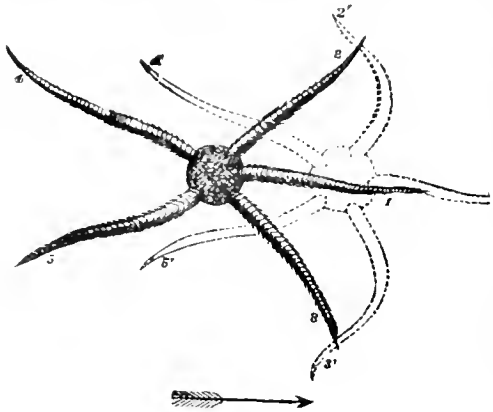
O PHIOL'ATRY. The worship of serpents. See NATURE-WORSHIP.

OPHIR, ō'fėr (Heb. *Ophīr*, Ophir). The region to which the ships of Hiram and Solomon went from Eziongeber, and whence they brought gold, precious stones, etc. (I. Kings ix. 26-28; x. 11; II. Chron. viii. 18; ix. 10). The region was chiefly remarkable for its gold. (Cf. Isa. xiii. 12; Job xxii. 24, et al.) The location of Ophir is a much vexed question. In Genesis x. 29 Ophir is mentioned in a list of the sons of Joktan. The names in this list are those of countries, and the Joktanites belong to Southern Arabia. The inclusion of Ophir shows, at least, where tradition placed the country, and there is much that speaks in favor of this traditional view, since Southern Arabia was known to the ancients as a gold-producing country. Hence, Glaser places Ophir on the east coast of Arabia, on the Persian Gulf. Other locations, however, have advocates, notably Zimbabwe, in Mashonaland (q.v.), South Africa. The Ethiopian coast of the Red Sea, Ceylon, and the Malay Peninsula have also been proposed. Consult the article "Ophir" by Price in the Hastings *Bible Dictionary*, vol. iii. (New York, 1900), and by Cheyne in *Encyclopædia Biblica*, vol. iii. (London, 1902).

OPHITES, ō'fits (Lat. *Ophites*, from Gk. Ὀφῖται, Ophite, from ὀφίτης, relating to a serpent, from ὄφις, *ophis*, serpent). A Gnostic sect. With the other Gnostics they shared the general belief of dualism, the conflict of matter and spirit, the emanations, the demiurgos, and other notions common to the many subdivisions of this school, but were distinguished from the rest by their peculiar doctrine and worship connected with their *ophis*, or serpent. Hence they were also called Naassenes (from Heb. *nāḥāsh*, serpent). Like most Gnostics, they regarded the demiurgos, or the Jehovah of the Old Testament, with great abhorrence, and, considering the emancipation of man from the power and control of the demiurgos as a most important end, they considered the serpent who tempted Eve, and introduced into the world 'knowledge' and revolt against Jehovah, to have been the great benefactor of the human race. Hence their worship of the serpent. Information regarding them is very meagre, and comes chiefly from antagonistic sources. They were in existence as late as the sixth century. Consult the monographs relating to them by Gruber (Würzburg, 1864) and Hönig (Berlin, 1889). See GNOSTICS.

O PHIUROI'DEA (Neo-Lat. nom. pl., from Gk. ὄφις, *ophis*, serpent + οὐρά, *oura*, tail). The class of brittle stars, or sand stars, of which Ophiura is the typical genus. Ophiuroids (or ophiurans) are star-shaped, freely moving echino-

derms (q.v.), with a flat, roundish or polygonal disk, from which suddenly arise five arms, which are slender, cylindrical, and contain no spacious continuation of the cœlomic cavity of the disk, or hepatic cæca, while there is no vent. There are no ambulacral grooves in the arms, and the



AN OPHIURAN.

Natural movements of a brittle star when proceeding along a solid horizontal surface. The arms are numbered.

suckers are but little used in locomotion, which is mainly effected by the arms themselves, the 'feet,' or ambulacra, being thrust out laterally and acting as tactile organs. The mouth and also the madreporite are on the under side of the disk. On the ventral surface, also, are five slits which connect with a corresponding number of respiratory sacs (bursæ) into which the ovaries or spermaries open. The eggs passing out through these slits are fertilized in the water,

STRUCTURE OF THE OPHIURAN ARM.

1. Diagrammatic cross-section of an arm; *a*, a dorsal plate; *b*, side plate; *c*, ventral plate; *d, d*, tube-feet, connected and penetrated by the ambulacral vessel; *e*, vertebral ossicle. 2. A vertebral ossicle, seen from the inward side, and surrounded by the external arm-plates. 3. Vertebral ossicles, viewed from the side.

the sexes being distinct. The ophiuroids, as a rule, pass through a well-marked metamorphosis, the free-swimming young being called a pluteus. Certain forms undergo self-division, and in others development is direct. The class is divided into two orders, *Ophiurida* and *Euryalida*, the latter having the arms greatly subdivided into long curly tendrils, as in Astrophyton, the basket-fish. Fossil ophiuroids begin to appear in the Silurian period, while genuine modern forms arose in the middle Trias. See BRITTLE STARS.

Both orders of the Ophiuroidea—the Ophiurida having simple arms and the Euryalida with branched arms—are represented from the Silurian onward, and the fossil forms show few important differences from their modern descendants. They are usually rare, but a few localities in the Devonian and in the Triassic and Jurassic shales and limestones have furnished well-preserved specimens in abundance. Such localities are Bundenbach (Devonian) and Solenhofen (Jurassic) in Germany, and Crawfordsville (Carboniferous) in Indiana. The more important genera are: Silurian—Eucladia, Protaster, Tæniaster; Devonian—Protaster, Ophiura; Carboniferous—Onychaster; Mesozoic—Aspidura, Geocoma, and Ophioglypha, with other modern genera. See ECHINODERMATA; BRITTLE STARS.

OPHTHAL'MIA (Lat., from Gk. *ὀφθαλμία*, disease of the eyes, from *ὀφθαλμός*, *ophthalmos*, eye; connected with *ὄπωπα*, *ὀπῶπα*, I have seen, *ὄσσε*, *osse*, the two eyes, Lat. *oculus*, OChurch Slav. *oko*, Skt. *akṣan*, OHG. *ouga*, Ger. *Auge*, Goth. *augō*, AS. *ēage*, Eng. *eye*). A term originally used to denote inflammation of the eye generally, and still employed in that sense at times, but now usually restricted to designate inflammatory affections of the conjunctiva or mucous coat of the eye. (See CONJUNCTIVITIS.) Sympathetic ophthalmia is, however, a term applied to describe an inflammation in one eye due to a similar inflammation of the other. This usually follows perforation by foreign bodies or ulcer of the cornea, or operations in the ciliary region. The sympathizing eye is usually affected about five to eight weeks after the injury of the exciting eye. After one or more periods of irritability of the sympathizing eye, marked by dread of light, pain in the eye, lachrymation, and dimness of vision, the sympathetic inflammation comes on. Removal of the exciting eye before this takes place will prevent its occurrence. The course of the sympathetic inflammation is slow and it usually results in blindness in some months or one or two years. The cause of sympathetic ophthalmia is not positively known, but it is probably due to extension of infection through the sheath of one optic nerve by way of the optic chiasm to that of the nerve of the other eye. (See EYE.) Treatment consists in the removal of the exciting eye before the sympathetic inflammation develops; after this period it is of no avail. If the injured eye, however, possesses good vision, it is often advisable not to excise it as long as there are no signs of trouble in the other. The inflammation itself is treated as in cases due to other causes. See IRITIS.

OPHTHALMIC GANGLION. One of the four ganglia connected with the branches of the fifth cranial nerve, and thought to be a part of the great sympathetic nerve. It is about the size of a pin's head, and situated at the back part of the orbit, between the optic nerve and the external rectus muscle. It lies in a quantity of loose fat which makes its dissection somewhat difficult. It has three branches of communication (motor, sensory, and sympathetic), which enter its posterior border. The long branch (sensory) is derived from the nasal branch of the ophthalmic nerve (first division of the fifth nerve). The second branch or root (motor) is derived from a branch of the third nerve supplying the inferior oblique muscle of the eyeball. The third branch, or root, is a slender filament from the cavernous plexus of the sympathetic. According to Tiedemann this ganglion receives a filament of communication from Meckel's ganglion (q.v.). Its branches of distribution are the short ciliary nerves. These are 10 or 12 delicate filaments arising from the fore part of the ganglion in two bundles. They run forward with the ciliary arteries, pierce the sclerotic coat at the back

part of the globe, pass forward in delicate grooves on its inner surface, and are distributed to the ciliary muscle and the iris. It is therefore seen that the ophthalmic ganglion is one of the most important nerve centres in the whole body, although no larger than a pin's head. The ciliary muscle is the muscle of accommodation of the eye, causing variation in the form of the aqueous humor and the crystalline lens so as to accommodate the focal length of the eye to the distance of objects. Its supply of nerve force to the muscular fibres of the iris is also intimately connected with the focal length of the eye-apparatus.

The other three of the four ganglia above referred to are Meckel's (already described), the otic, and the submaxillary.

The otic (Arnold's) ganglion is a small, flattened oval body reddish-gray in color, situated immediately below the *foramen ovale* (through which the inferior maxillary nerve escapes from the cranial cavity). It is connected with the inferior maxillary, facial, and glossopharyngeal nerves, and with the sympathetic system, sending branches principally to the various parts of the tympanic cavity (middle ear), to which it serves much the same purpose that the ophthalmic ganglion does to the eye.

The submaxillary ganglion is a small fusiform body, situated above the submaxillary gland. It receives branches from the lingual, facial, and sympathetic nerves, and is distributed by five or six filaments to the mucous membrane of the mouth and the submaxillary gland, and indirectly, it is thought, to the sublingual gland.

OPHTHALMOL'OGY. See EYE; EYE, DISEASES OF.

OPHTHAL'MOSCOPE from Gk. *ὀφθαλμός*, *ophthalmos*, eye + *σκοπεῖν*, *skopein*, to view). An instrument invented by Helmholtz in 1851 for the purpose of examining the deep-seated structures of the eye, and for detecting disease in it. It is a concave circular mirror, of about 10 inches focus, having a hole in the centre, and mounted on a handle and accompanied by a set of convex and concave lenses. In the most approved forms the mirror is cut in approximately the form of a parallelogram and is so arranged as to be tilted toward either side. The lenses are placed near the circumference of a disk, by pressure upon the reeded edge of which they are brought successively before the opening in the mirror. Light is reflected into the interior of the eye by the mirror, and a portion returns, through the opening in the mirror and through the lens placed opposite it, to the eye of the observer.

OPHTHALMOSCOPIC EXAMINATION. (1) *Of the Media.*—In a darkened room, an Argand burner is placed several inches from either side of the patient, a few inches behind, and on a level with the eyes. Facing the patient, the observer looks through the perforation in the mirror, which is held about 15 inches from the patient's eye and reflects light into it. An orange-red reflex from the fundus is seen in the normal eye. Dark spots show opacities of the media or cornea; ametropia (see SIGHT, DEFECTS OF) is shown by ability to see the vessels in the fundus. (2) *Indirect Method.*—This gives an inverted image of the fundus. For both this and the direct method the pupil should be dilated by some mydriatic. The light is placed as before, and the ophthalmoscope is held at the same distance but with a positive lens of sufficient strength before the opening. The light is directed by the mirror into the eye through a strong convex lens held at its focal distance of about two inches in front of the patient's eye. By varying the distance of the mirror and lens an inverted image of the fundus is obtained. The fundus appears as an orange-red surface, darker in brunettes than in blondes, finely dotted by pigment cells. It is crossed by blood vessels which radiate from the optic disk, the arteries bright, the veins darker red and more tortuous. The optic disk is usually circular, pinkish, often bordered by a white ring of sclera, and an external dark ring formed by the choroid coat. The blood-vessels emerge from a depression at the centre of the disk. The appearance of the normal fundus varies greatly. (3) *Direct Method.*—This gives an erect image, magnified about 14 times, a smaller field at one time, allows estimation of errors of refraction by noting the lens which is necessary to give a clear view, and is less difficult. The light is placed on the side of the eye examined; the ophthalmoscope is held about one inch in front of the patient's eye. Different portions of the fundus are brought into view by movement of the eye of the patient. In this method correction by lenses must be made for errors of refraction of both patient and observer. Much practice is required for the skilful use of the ophthalmoscope, but it is now as essential in the diagnosis of diseases of the eye as the stethoscope is in that of thoracic affections. Those of other parts of the body may also be detected or confirmed by its use. For example, inflammation of the optic disk occurs in 90 per cent. of brain tumors.

O'PIE, AMELIA (ALDERSON) (1769-1853). An English novelist and poet. She was the second wife of John Opie (q.v.), the painter, whom she married in 1798. After her husband's death she lived at her father's house in Norwich. She was an attractive woman and occupied a high position in London society. On Sundays during her stay there, her house was thronged with visitors, including Sheridan, Sydney Smith, Byron, Scott, Wordsworth, and Humboldt. In 1825 she joined the Society of Friends and devoted herself to charitable work. Among her publications are: *Father and Daughter* (1801); *Miscellaneous Poems* (1802); *Adeline Mowbray* (1804); *Detraction Displayed* (1828); and *Lays for the Dead* (1833).

OPIE, JOHN (1761-1807). An English artist. He was born at Saint Agnes, Cornwall, and had but elementary village schooling. His early attempts at art won the notice of Dr. Wolcott ('Peter Pindar'), whose patronage secured for him important local custom. After he had already accomplished much in portraiture, he was in 1780 taken by Dr. Wolcott to London, where he was presented at Court, received numerous commissions from the fashionable world, and was known as the 'Cornish Wonder.' This favor was soon withdrawn, and the artist, well prepared for such an event, was left to supply his many defects in art and general culture. Still abundantly employed as a portrait-painter, he thoroughly acquainted himself with the Latin, French, and English literatures, and in 1786 sent seven canvases to the Academy. For a number of

years thereafter he exhibited frequently at the Academy, and illustrated such works as the Boydell *Shakespeare* and Macklin's *Poets*. In 1788 he was elected Academician, in 1805 was appointed professor of painting at the Academy, and in 1807 delivered before that institution four lectures which are a recognized part of permanent art-criticism. Severe application to work hastened his death. His works include: "James I. of Scotland Assassinated by Graham;" "The Assassination of David Rizzio;" "Arthur Supplicating Hubert;" "Jephtha's Vow;" and "The Presentation in the Temple." He contributed a biography of Reynolds to Dr. Wolcott's edition of Pilkington's *Dictionary of Painters* (1798).

OPINION (Lat. *opinio*, from *opinari*, to suppose; connected with *optare*, to hope, *apisci*, Skt. *āp*, to obtain) (of a court). A statement of the principles of law and legal reasons, which govern the court in reaching its decision in an action. It is usually handed down in writing, but may be delivered orally by a judge from the bench, in open court. When there are several opinions from several judges sitting together as a court, the opinion of the majority is the only one which has legal effect; and it is known as the 'opinion of the court' or the 'prevailing opinion.' The majority opinion usually contains, besides the reasons of the court, the application of the principles of law therein enunciated to the particular case, and a direction as to its disposition, and therefore includes the decision. For this reason, an opinion and a decision are sometimes confused, and an opinion is often defined as a written statement of the decision.

Where a judge in the course of an opinion expresses his views as to the law on some point which may be incidental to, but is not necessarily involved in, the issues before him, such part of the opinion is said to be *obiter dictum* (Lat., outside remark), or 'extra-judicial,' and has no absolute binding effect as a statement of the law, although it may be referred to in an argument on a mooted point of law, as the individual opinion of a learned judge. However, that part of the opinion which is necessary to the conclusion of the court is deemed a statement of the law, which inferior courts are bound to respect and follow. An opinion is a part of the record of a case, and is the authority for the entry of judgment.

The statutes of some States provide that certain public officers, such as the Governor, or a mayor of a city, may ask the courts for opinions on questions of law involving the public interests. For example, a Governor might ask for a judicial interpretation of an obscure statute creating a new public office. An opinion delivered under such circumstances may be considered as law. See DECREE; JUDGMENT.

OPINION EVIDENCE. See EVIDENCE; EXPERT.

O'PISTHOC'OMI (Neo-Lat. nom. pl., from Gk. *ὀπισθόκομος*, *opisthokomos*, wearing the hair long behind, from *ὄπισθεν*, *opisthen*, behind + *κομη*, *komē*, hair). Birds now regarded as a suborder of the Gallinæ, including only a single species, the remarkable hoactzin (q.v.). The order differs from other birds chiefly in the remarkable character of the sternum and shoulder-girdle. The clavicles are ankylosed with the coracoids and with the manubrium of the sternum. The latter has a pair of notches on each side of its posterior margin and the keel is cut away in front.

OPIS'THOGLYPH'A (Neo-Lat. nom. pl., from Gk. *ὄπισθεν*, *opisthen*, behind + *γλυφή*, *glyphē*, carving). A group of snakes of the family Colubridæ, characterized by the fact that one or more of the posterior maxillary teeth are grooved in front, and in most cases serve the purpose of poison-fangs, conveying venom from labial poison-glands. (Compare PROTEROGLYPHA.) They comprise about 300 species, occurring in all the warmer parts of the world excepting New Zealand, and containing terrestrial, arboreal, and aquatic forms. All are more or less poisonous, but so far as man is concerned are comparatively harmless, since the poison is not very strong, does not exist in large quantities, and the fangs stand so far back that the snakes cannot easily inflict wounds with them. The tree-snakes (Dipsas, Septognathus, etc.) of tropical South America and the cat-snake (q.v.) are conspicuous examples.

OPITZ, ō'pĭts, MARTIN (1597-1639). A German poet and literary reformer, born at Bunzlau, Silesia, December 23, 1597. He studied at Frankfort-on-the-Oder and at Heidelberg; visited, with his friend Hamilton, a Dane, the Netherlands and Jutland (1620); returned to Silesia (1621); occupied various subordinate confidential posts at small German courts; was knighted by the Emperor Ferdinand II. (1628), and died of the plague in Danzig, August 20, 1639. For a century after his death he passed for the Father of German Poetry, less for his mediocre verses than for his critical *Aristarchus, seu de Contemptu Linguæ Teutonicæ* ("or Scorn of the German Tongue") (1618), and his *Buch von der deutschen Poeterei* (1624, revd. 1876). Opitz borrowed his poetical theories mostly from Scaliger, Heinsius, and Ronsard. In 1627 he made the verses of the oldest German opera, *Dafne*, after Rinuccini, music by Heinrich Schütz. He laid great stress on Greek and Latin learning, urging that classic forms ought to be adopted in German poetry. Opitz laid down the law that rhythm must be pure, and there must be alternating masculine and feminine rhymes. The Alexandrine, a measure of French origin, which had come to be the standard French verse in the sixteenth century, he held up as the ideal for German poets. The influence of Opitz did much to secure the acceptance of the literary German of Luther in the Catholic States and so to make a common German literature possible. Opitz's works were incompletely gathered in three volumes (Breslau, 1690; Amsterdam, 1646; Frankfort, 1724). There are *Lives* by Strehlke (Leipzig, 1856); Hoffmann von Fallersleben (ib., 1858); Weinhold (Berlin, 1862); and Palm (Breslau, 1862). Consult also: Borinski, *Die Kunstlehre der Renaissance in Opitzens Buch von der deutschen Poeterei* (Munich, 1883); Witkowski, *Aristarchus und das Buch der Poeterei* (Leipzig, 1888); Scherer, *Kleine Schriften*, vol. i. (Berlin, 1893); Burdach, in *Forschungen zur deutschen Philologie* (ib., 1894); and Perry, *From Opitz to Lessing* (Boston, 1884).

OPIUM (Lat., from Gk. *ὄπιον*, poppy-juice, from *ὀπός*, *opos*, juice, sap). The dried juice of the unripe capsules of a species of poppy (q.v.), *Papaver somniferum*, sometimes called the com-

mon poppy, and sometimes the white poppy, although the latter name is really appropriate only to one of its varieties. The plant is probably a native of some of the warmer parts of Asia, although it is now common in cultivated and waste grounds throughout all the south and middle of Europe, and is occasionally found in Great Britain and the United States. It is an annual, varying in height from one to six feet erect, branched, of a glaucous green color, with ovate oblong sessile leaves, the stem and leaves generally smooth, the branches terminated by large flowers on long stalks, the capsules globose or roundish-ovate and smooth. There are two principal varieties cultivated for the opium which they yield, which have been regarded by some botanists as distinct species; the one (*Papaver somniferum*) having generally red or violet-colored flowers, numerous flower-stalks rising together, globose capsules opening by a circle of pores under the persistent stigma, and black seeds; the other (*Papaver officinale*) having white flowers, solitary flower-stalks, the capsules somewhat ovate, the circle of pores almost wanting, the seeds white. The former variety is generally cultivated in the mountainous parts of the north of India, the latter in the plain of Bengal. The cultivation of the poppy for the sake of opium is carried on in many parts of India, although the chief opium district is a large tract on the Ganges. The poppy is also extensively cultivated for opium in the Asiatic provinces of Turkey, in Egypt, and in Persia. It is a garden flower in the United States and Great Britain, but is not of commercial importance. The poppy requires for its profitable cultivation a rich soil, and in India is generally sown in the neighborhood of villages where manure can be easily obtained. The soil ought to be fine and loose when the seed in sown. The subsequent cultivation consists chiefly in thinning and weeding. Irrigation is practiced. Mild moist weather, with night dews, is deemed most favorable during the time of the collection of the opium. Very dry weather diminishes the juice, and much rain is injurious.

Opium, as a commercial article, is of great importance, exceeding that of any other drug in use. The seed is sown in India in the beginning of November; it flowers in the end of January, or early in February, and three or four weeks later the capsules or poppy-heads are about the size of hens' eggs, and are ready for operating upon. When this is the case, the collectors take a little iron instrument, called the *mishtur*, and wound each full-grown poppy-head in the field. This is always done in the afternoon and early on the following morning the milky juice which has exuded is collected by scraping it off with a kind of scoop called a *sittuoha*, and transferred to an earthern vessel called a *kurrace*. It is then transferred to a shallow open brass dish, which is left for a time tilted on its side, so that any watery fluid may drain out; this watery fluid is very detrimental to the opium unless removed. It now requires daily attention and has to be turned frequently, so that the air may dry it equally, until it acquires a tolerable consistency, which requires three or four weeks; it is then packed in small earthern jars and taken to the factories. The opium is then thrown into vast vats, which hold the accumulations of whole districts, and the mass being kneaded is again taken out and made into balls or cakes for the market.

The manufacture of opium is carried on to the greatest extent in India, but large quantities are also made in Turkey, and this latter is considered the best in quality. It is also made in Persia and Egypt; occasionally it has been produced in Germany, France, and England. Next to the Chinese the largest consumers of Indian opium are the Burmese and the natives of Malacca, who use annually an amount of the value of nearly $5,000,000.

In the United States and Europe opium is used chiefly for medicinal purposes, and large quantities of it undergo a still further stage of manufacture, in order to separate from it the active principles morphine, codeine, etc.

Physical and Chemical Properties. Good opium is a hard compact solid of reddish-brown color, which leaves an uninterrupted stain when drawn across paper, and breaks with a deeply notched fracture. It has a strong characteristic odor and a rather bitter, acrid taste. The pharmacopœia of the United States requires that it shall contain at least 9 per cent. of morphine, its most important alkaloid. A good Turkey opium contains 12 to 16 per cent. and should average about 14. Fifteen other alkaloids are found in opium, the most important being codeine, narceine, narcotine, and papaverine. It also contains meconic and other acids, gum, resinous and extractive matters, besides a volatile odorous principle. Although opium was cultivated for use before the Christian Era, morphine was not discovered until 1816.

Some of the most important and characteristic constituents are meconic acid, morphine, and narcotine. The only isolated constituents of opium now extensively used in medicine are *codeine*, which is less powerful and less narcotizing than morphine and which is very widely used as a nerve quietant, and also to control excessive cough, and it is used with good effect in diabetes mellitus; *morphine*, and two derivatives of morphine, *apomorphine* and *heroin* (q.v.). The salts of these alkaloids and derivatives are preferred on account of their greater solubility.

Physiological Action. (1) In *small doses*, as from a quarter of a grain to a grain, opium acts as an agreeable stimulant, producing a sense of well being, and stimulating the imagination by blunting the reason, judgment, and memory, this effect being followed by a desire to sleep, from which the person awakes unrefreshed or with some headache, depression, dryness of the mouth and throat, and slight constipation. When it is given in a *full medicinal dose* (as from two to four grains), the stage of excitement is soon followed by contraction of the pupils, well marked depression or torpor, both of the bodily and mental organs, and an almost irresistible sleepiness; these effects being usually succeeded by constipation, nausea, furred tongue, headache, and listlessness. Among Eastern nations, in whom the emotional element is strong, the imagination is highly stimulated, and the ingestion of opium is followed by loss of all disagreeable sensations with the onset of a delightful mental state, with gorgeous visions and a sense of happiness. Among the more stolid races the hypnotic effect is usually experienced at once, though some nervous persons experience terrible mental agony after even a small dose. When it is administered

in a dangerous or *poisonous dose*, the symptoms begin with giddiness and stupor, generally without any previous stimulation. The stupor rapidly increasing, the person becomes motionless, and insensible to external impressions; he breathes noisily and very slowly, with slow full pulse, the eyes shut, and the pupils contracted and not reacting to light; and the whole expression of the countenance is that of deep and perfect repose. As the poisoning advances the features become ghastly, the pulse feeble and imperceptible, the muscles exceedingly relaxed, respiration stertorous and constantly slower, and, unless assistance is speedily procured, death ensues from paralysis of the respiratory centre. If the person recovers, the insensibility is succeeded by prolonged sleep, which commonly ends in twenty-four or thirty-six hours, and is followed by nausea, vomiting, giddiness, and loathing of food. The treatment of acute morphine poisoning consists in removing the drug as far as possible, chiefly by washing out the stomach; in the administration of potassium permanganate; and in keeping the patient awake at any cost. This is accomplished by large doses of coffee, enforced exercise, and flagellation. If breathing is very slow artificial respiration may keep the person alive until the drug is eliminated. In case of failure of respiration or the heart suitable stimulants are employed. The effects of morphine are practically the same as those of opium, but it is less likely to derange digestion, is less constipating, less diaphoretic, and less tetanizing. When given hypodermically the stimulant effect is more marked and immediate.

(2) The *habitual use of opium*, whether the drug be eaten or smoked, is undoubtedly in most cases injurious to the constitution, although probably not to the extent that some Eastern travelers assert. In numerous cases very large quantities of this drug may be regularly taken with impunity.

Opium-Smoking is a habit that is chiefly confined to China and the islands of the Indian Archipelago. An extract, called *chandoo*, is made into pills about the size of a pea. One of these pills is put into the small cup at one end of the opium pipe; the pill being lighted, the smoke is inhaled and then exhaled through the nostrils. Although the immoderate practice of opium-smoking is most destructive to those who live in poverty and distress, it does not appear that the Chinese in easy circumstances, and with the comforts of life about them, are materially affected, in respect to longevity, by addiction to this habit. The Chinese practice the habit frequently, but in moderation, while those of Western races who become addicted to it carry it to an excess and soon show its degrading effects.

The 'morphine fiend,' as the victim of the morphine habit or chronic morphine poisoning is called, is pale, with parchment-like skin. He suffers from chronic digestive disturbance, pain in the region of the stomach, constipation, insomnia, irritability, mental and moral weakness, itching of the skin, and other disorders. With many the temptation to lie is not confined to statements in regard to their habit. The habit may be broken by immediate withdrawal of the drug or the dose may be gradually reduced. Diarrhœa is apt to occur when either plan is followed. Careful feeding and absolute control of the supply of the drug are essential.

There can be no doubt that the essential and primary operation of opium is on the nervous system, the other effects being for the most part secondary.

Opium is undoubtedly the most valuable remedy of the whole materia medica. We exhibit it not only to mitigate pain, to allay spasm, to promote sleep, to arrest vomiting and convulsions, to relieve nervous restlessness, to produce perspiration, and to check discharges from the bronchial tubes and intestinal canal; but we also find it capable of relieving some diseases in which none of the above indications can be always distinctly perceived. It is a valuable cardiac tonic and its action is almost miraculous in some cases of heart disease in which digitalis and other drugs have failed. It is a constituent of nearly all cough mixtures.

Its use is contraindicated in coma, in chronic uræmia, and in chronic diseases unless necessitated by pain which nothing else will relieve, as there is great danger of forming the habit. It is borne badly by children and by some adults. It must be used with great caution in some affections, and in painful abdominal conditions in which its effect may hide the presence of peritonitis or other grave affections. It may be administered by mouth, by rectum, or hypodermically. The best known preparations of opium in the United States Pharmacopœia (in addition to the alkaloid morphine and codeine) are laudanum, paregoric, and the mixture of opium and ipecac known as Dover's powder. For hypodermic use a solution in water of 16 grains of morphine to the ounce is frequently employed. It is known as 'Magendie's solution,' and is not official. See Antidote; Codeine; Heroin; Morphine; Laudanum. Consult Potter, *Handbook of Materia Medica, Pharmacy, and Therapeutics* (Philadelphia, 1901).

OPIUM WAR, The. A war between China and Great Britain which broke out in 1840, resulting from the attempt of the former to stop the opium trade with India. Though declared illegal in 1796, the importation of opium about 1840 amounted yearly to £1,500,000. Charles Elliott, the moderate British representative, was superseded by Sir Henry Pottinger, who carried on the war with such vigor that when it ended with the Treaty of Nanking (1842) China opened the treaty ports to foreign trade and ceded Hong Kong to Great Britain with an enormous indemnity. See Chinese Empire.

OP'ODEL'DOC (of obscure etymology, the first part apparently from Gk. *ὀπός, opos*, juice). A popular synonym for *soap liniment*. The term was apparently applied by Paracelsus to various forms of liniments or local applications. Soap liniment is composed of common soap, camphor, oil of rosemary, alcohol, and water, and is employed as a stimulating application for sprains, bruises, etc. See Liniment.

OPÓN, ō-pōn'. A town of Cebú, Philippines, situated on the small island of Maetán, opposite the town of Cebú (Map: Philippine Islands, H 9). Here Magellan was killed by the natives in 1521. Population, 11,506.

OPOP'ONAX (Lat., from Gk. *ὀποπάναξ*, juice of the plant panax, from *ὀπός, opos*, juice + *πάναξ, panax*, sort of plant, from *πᾶς, pas*, all +

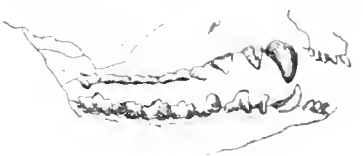
ἄκος, *akos*, cure). A gum resin obtained by puncturing the roots of a species of parsnip which grows in Persia (*Pastinaca opoponax*). The chief interest in this material is the great importance which the ancient physicians attached to it as an antispasmodic medicine. It is not much used, except for the preparation of a well-known perfume. It is practically obsolete in medicine.

OPOR'TO, *Port. pron.* u-pōr'to (Portug. *Porto, O Porto*, The Port). The second city of Portugal in population and importance. It is situated on the north bank of the Douro about three miles from its mouth, in the Province of Entre-Minho-e-Douro, District of Oporto, and 172 miles north by east of Lisbon (Map: Portugal, A 2). It is one of the most beautifully situated towns of the whole peninsula, being built on an amphitheatre of hills between two rocky headlands extending to the river banks, while the little village of Villa Nova de Gaia nestles in a similar position on the opposite side of the river. Like Lisbon, the city rises in a steep incline from the river side, the houses and gardens being terraced above one another with a very picturesque effect. The newer portions spread out over the upper slopes and are surrounded by wooded heights dotted with villas. Many of the streets in the older portion of the city are steep, narrow, and tortuous, but on the heights there are several wide avenues commanding fine views of the river and city below and of the ocean beyond. From the heights east of the city two magnificent iron bridges span the river. The first, that of Luiz I., crosses the river in a single arch of 560 feet span, and carries a roadway 200 feet above the water. It is rivaled in size and beauty by few other bridges of the kind in Europe. The second bridge, that of Maria Pia, is almost as large as the Luiz I., and carries a railroad. The centre of the business section of the city is the low-lying portion around the Praça de Dom Pedro, faced by the city hall on the north, and having in its centre a bronze equestrian statue of Pedro IV., Emperor of Brazil (as such Pedro I.). From this square the streets lead upward to the hills on either side, which are crowned on the west by the high and slender clock-tower of the Clerigos Church, and on the east by the cathedral. West of the Clerigos Church is the Jardim da Cordoaria, which, like the other garden-plazas of the city, has a luxuriant wealth of mingled southern and northern flora. Still farther west is another park containing the Crystal Palace, a large building erected for the industrial exposition of 1865, and now occupied by a theatre and ballrooms. Among other buildings worthy of note are, besides several churches, the exchange, a handsome building with a central court, and the English factory house, an imposing structure built in 1785, and used chiefly for club-rooms. Oporto is distinctly a modern city, and the commercial and industrial interests predominate. The chief educational institutions are the polytechnic academy and the schools of commerce and navigation, besides a school of medicine, and one of philosophy, and several colleges. There is a municipal library of 120,000 volumes.

About one-third of the population of Oporto are engaged in manufacturing industries, which are represented by distilleries, sugar refineries, tanneries, and manufactures of woolen, cotton, and silk fabrics, hats, preserved foods and beverages, soap, pottery, corks, tobacco, and jewelry. There are also a number of factories in Villa Nova de Gaia, on the south bank of the river, and here are large depositories for the well-known port wine. The only harbor facilities of Oporto formerly consisted of the quays along the banks of the river, which is here 600 feet wide. The water of the river is deep enough for large vessels, but the mouth is almost closed by a sandy spit prolonged into a bar. To avoid this bar a new harbor was completed in 1892 at Leixões, on the ocean front, 2½ miles north of the river-mouth, and connected with the city by a street railroad. This harbor is formed by two jetties or breakwaters, each about three-fourths of a mile long, and projecting into the ocean so as to form an artificial port with a narrow entrance. The total shipping of both harbors in 1900 amounted to 2765 vessels, aggregating 1,821,780 tons, and the total trade was valued at nearly $25,000,000, of which about $17,000,000 represented imports. The chief exports are wine, oil, and olives, raisins, oranges, lemons, onions, cork, salt, cattle, and building materials. The city is the seat of a United States consular agent. The population in 1890 was 139,856; and in 1900, 172,421.

In ancient times the site of Oporto was occupied by the harbor-town *Portus Cale*, afterwards *Porto Cale*, from which has been derived the name of the Kingdom, Portugal. It was an important city during the supremacy of the Arabs, was destroyed in 820 by Almansur of Cordova, but was restored and peopled by a colony of Gascons and French in 999. During the Middle Ages it was famous for the strength of its fortifications, its walls being 30 feet in height, and flanked with towers. In 1808 it was taken by the French; but in the following year it was retaken by an Anglo-Portuguese force under Wellington. In 1832-33 Dom Pedro, the ex-Emperor of Brazil, was unsuccessfully besieged in this city by the forces of Dom Miguel. Consult Sellers, *Oporto, Old and New* (London, 1899).

OPOS'SUM (from the American Indian name). The opossum (*Didelphus Virginiana*) is certainly the most distinctive and characteristic of American mammals, for not alone is it found only in America, but it is with a single exception (see MARSUPIALIA) the only marsupial mammal



DENTITION OF AN OPOSSUM.

found in the United States, and the family, to which the name opossum is now universally extended, does not occur except in America. This family, the Didelphidæ, is characterized, in distinction from the other marsupials, by numerous (18) small, subequal incisors, the canines larger, the molars with sharp cusps, and the hind feet with the four outer toes subequal, distinct, and having a well-developed, opposable hallux. The tail usually is long, naked, and prehensile. The

marsupial pouch is complete in the common opossum, but in most of the family it is rudimentary or wanting. The family includes only one genus besides Didelphys, and that is Chironectes, which contains the single species *variegatus*, the 'yapock' (q.v.) of South America.

The common or 'Virginia' opossum is widely distributed in the United States. It ranges as far north as southern New York State and southern Michigan; southward it extends through Mexico into Central and perhaps South America. The opossum is about as large as a big cat: it has rather short but equal legs, and a somewhat pig-like snout. The hair is coarse, of a yellowish tint, the tips of the hairs on the back and sides brownish or blackish, and intermingled with these are larger white hairs. The tail is scaly like that of a rat, but is hairy at the base. The brain is small, but the senses of smell and sight are well developed. The opossum is ordinarily a solitary animal, and except during the breeding two individuals are seldom found together. It is not exclusively arboreal, though fitted especially for such a life. It makes its retreat for the day chiefly in hollow trees, for it is nocturnal in its habits. The young, six to twelve in number, are brought forth in a nest of dried grass and leaves in some hollow in a stump or tree. The embryonic life lasts only about twenty-six days, when the young are born in a helpless condition and are transferred by the mother to the teats, where they are concealed and protected by the pouch. (See MARSUPIALIA.) They are at this time about the size of young mice, but grow rapidly and at the end of six weeks are large enough to leave the pouch and run about, but for the first few weeks thereafter they return to the pouch for shelter and protection. The food of the opossum is chiefly insects, but almost any available animal food will be used, especially reptiles, and birds' eggs and young. As an article of food the animal is in particular demand among the negroes of the South. Under the stress of capture, the opossum has the remarkable habit of simulating death, lying with closed eyes and limp muscles, until a favorable opportunity to make its escape. When so simulating, no amount of handling, kicking, or ordinary abuse will cause the animal to show signs of life, but if tossed into water it realizes its peril and resumes activity with great promptness.

The number of species of Didelphys and their geographical limitations are still in doubt, on account of great individual diversity, but there are probably about twenty good species, nearly all smaller than the common opossum, and many no larger than rats. The crab-eating opossum (*Didelphys cancrivora*) is an interesting Brazilian species, which feeds chiefly upon crustacea and is consequently found most commonly in swamps. One of the species from Surinam (*Didelphys dorsigera*) carries the young, after they leave the teats, on the back of the mother, with their tails twined around hers, and this method of caring for the young is common to various other species in which the pouch is rudimentary or wanting. Several of the Peruvian opossums are remarkable from their habit of living mainly upon fruit. Among the smallest species may be mentioned the mouse-opossum (*Didelphys murina*), a little larger than a mouse, bright red in color, and ranging from Mexico through Brazil; and the three-striped opossum (*Didelphys Americana*) of Brazil, which is very small and shrew-like, without a prehensile tail, of a reddish-gray color, with three distinct black stripes down the back. The name opossum is used in Australia for several mammals of widely different families, and not entitled to the name. See Colored Plate of MARSUPIALS; and Plate with CARNIVORA.

OPOSSUM-MOUSE. One of the diminutive, mouse-like flying phalangers of New South Wales, of the genus Acrobates, whose appearance and habits, not only, but even its dentition approach a murine type. It is the smallest of marsupials.

OPOSSUM-RAT. A name given to a little marsupial (genus Cænolestes) representing the otherwise extinct Patagonian family Epanorthidæ, rediscovered at the end of the nineteenth century in Colombia and Ecuador. It is of particular interest because otherwise the only marsupials in the New World were those of the family Didelphidæ, which is polyprotodont, while Cænolestes belongs to the diprotodont division of marsupials. Consult Thomas, *Proceedings of the Zoölogical Society of London* for 1895. See MARSUPIALIA.

OPOSSUM-SHRIMP (so called because the female carries the eggs in pouches between the thoracic legs). A small, shrimp-like marine crustacean of the order Schizopoda and genus Mysis. See CRUSTACEA.

OP'PELN. The capital of a district and a river port in the Province of Silesia, Prussia, on the Oder, 51 miles by rail southeast of Breslau (Map: Prussia, II 3). The Church of Saint Adalbert is believed to have been founded by Adalbert, Bishop of Prague, in 995. The so-called new castle of the Dukes of Silesia, dating from the fourteenth century, is situated on an island in the Oder and is used as a Government building. The educational institutions of the town include a gymnasium, a seminary for teachers and a school of agriculture. Oppeln manufactures cement, cigars, machinery, barrels, etc., and trades in grain and cattle. From 1288 to 1532 Oppeln was the residence of the dukes of Oppeln. It came into the possession of Prussia in 1742. Population, in 1890, 20,300; in 1900, 30,115, chiefly Polish-speaking Roman Catholics. Eduard Schnitzer (Emin Pasha, q.v.) was born at Oppeln.

OPPER, FREDERICK BURR (1857—). An American illustrator. He was born at Madison, Lake County, Ohio, January 2, 1857, and after a brief experience in newspaper work, in 1872, he came to New York City, where he entered the employ of a mercantile house, devoting his leisure to drawing. He produced some clever sketches, which he sold to comic papers, and after attending one term of the evening class in drawing at the Cooper Union Institute, he devoted himself to drawing as a profession. He studied for a time with Frank Beard, the designer, whom he assisted in his work. From 1877 to 1880 he was engaged on Frank Leslie's publications, then became illustrator for *Puck* until May, 1899, since which time he has been employed by the New York *Journal*. Opper has illustrated the writings of Bill Nye and Mark Twain, Hobart's *Dinkelspiel*, and Peter Dunne's *Mr. Dooley*, and has himself published *Folks in Funnyville* and a col-

lection of drawings entitled *Puck's Opper Book*. While lacking the highest artistic and technical qualities, Opper's illustrations are forcibly executed and are characterized by fine humor. His political cartoons have been of notable influence in several Presidential campaigns.

OPPERT, ô'pâr', JULES (1825—). A French Orientalist, born at Hamburg. He studied law at Heidelberg, Oriental languages at Bonn and Berlin, and obtained the degree of doctor of philosophy at Kiel in 1846, with a thesis *De Jure Judiciorum Criminale*. In 1848 he was elected professor of German in the Lyceum of Laval, and in 1850 to the same position at Rheims. His interest in Oriental studies still continued, however, and in 1851 he was appointed a member of the expedition sent by the French Government to Mesopotamia. On his return in 1854 he laid his system of deciphering the Assyrian inscriptions before the Institute. In 1857 he was made professor of Sanskrit at the Imperial Library in Paris, in 1869 teacher of Assyriology in the College of France, and in 1874 he was elected professor. Among his works are: *Les inscriptions des Achéménides* (1852); *Expédition scientifique en Mésopotamie* (2 vols. and atlas, 1859-64); *Grammaire sanscrite* (1859); *Les fastes de Sargon* (1864); *Histoire des rois de Chaldée et de l'Assyrie* (1866); *Eléments de la grammaire assyrienne* (2d ed. 1868); *Documents juridiques de l'Assyrie et de la Chaldée* (with J. Menant, 1877); *Le peuple et la langue des Mèdes* (1879); as well as translations of inscriptions, and many monographs and contributions to periodicals. He has been one of the editors of the *Revue d'Assyriologie*. A full list of his articles may be found in Haupt and Delitzsch, *Beitrage zur Assyriologie*, vol. ii. (Leipzig, 1891).

OP'PIAN (Lat. *Oppianus*, from Gk. Ὀππιανός, *Oppianos*). (1) A Greek didactic poet, who flourished in the reign of Marcus Aurelius. He was born in Coryeus in Cilicia of a wealthy and distinguished family. When the Emperor Verus visited Coryeus, Oppian's father failed to join in the general manifestations of adulation, and therefore was banished to the island of Melita in the Adriatic. Oppian accompanied him in his exile, and after the death of Verus (A.D. 169) won such favor with Marcus Aurelius by means of his poem in five books on fishing, *Halieutica* (Ἁλιευτικά), dedicated to the Emperor and his son Commodus, that the Emperor not only granted him his father's release from exile, but, according to the tradition, paid him a piece of gold for every verse. The poem is written in a smooth but ornate and artificial style, and at times descends to bombast. The high esteem in which it was held in antiquity is to us incomprehensible. Oppian died in his thirtieth year; his native town honored his memory with a statue.

(2) To this same Oppian the ancient writer of his *Life* falsely attributes two other didactic poems, one on hunting in four books, *Cynegetica* (Κυνηγετικά), the other, now lost, on bird-catching, *Ixeutica* (Ἰξευτικά). But it is clear from internal evidence that the *Cynegetica* was not written by the earlier poet, for it is dedicated to the Emperor Caracalla and apparently was composed in A.D. 212; furthermore, the author speaks of his home as Apamea in Syria; and finally the metrical structure is inferior to the careful elegance of the *Halieutica*. The *Ixeutica* is possibly preserved in a paraphrase by a certain Dionysius. The best edition of the *Halieutica*, *Cynegetica*, and the paraphrase, is by Lehrs in his *Poetæ Bucolici et Didactici* (Paris, 1846). There is an English translation of the *Halieutica* by Draper and Jones (Oxford, 1722), and of the *Cynegetica* by Mawer (London, 1786). See also Ausfeld, *De Oppiano et Scriptis sub eius Nomine Traditis* (Gotha, 1876).

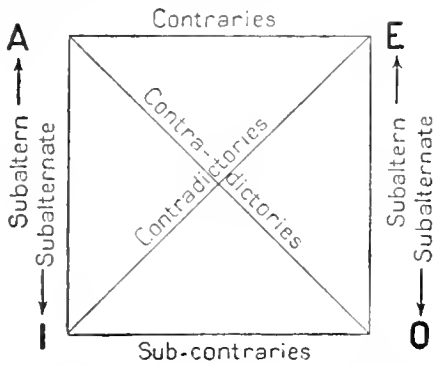
OP'PIUS, CAIUS. A Latin writer. He was an intimate friend of Julius Cæsar, and in conjunction with Balbus managed all affairs at Rome during the dictator's absence in Spain. He wrote biographies, not now extant, of Cæsar, Cassius, and Scipio Africanus, the elder, and was regarded by some as the author of the continuation of Cæsar's *Commentaries*, the *De Bello Alexandrino*, *De Bello Africano*, and *De Bello Hispaniensi*. This theory, however, is untenable as to the last two, and improbable as to the first. Consult Nipperdey, *De Suppletionis Commentariorum Cæsaris* (Berlin, 1846).

OPPOLZER, ôp'pol-tsĕr, JOHANN VON (1808-71). An eminent Austrian physician. He was born at Gratzen, Bohemia, and studied medicine in Prague, where he practiced for some time and in 1841 became professor in the medical clinic. For two years he was professor of special pathology and therapy in Leipzig, and in 1850 was called to the university at Vienna, where his name contributed much to the fame of the medical faculty. He was widely known as a clinicist and for his opposition to 'nihilism' in therapeutics. His *Klinische Vortrage* (1866-72) were edited by Stoffella.

OPPOLZER, THEODOR VON (1841-86). An Austrian astronomer, son of the preceding. He was born in Prague. In 1866 he was appointed docent and in 1870 professor in the University of Vienna. In 1884 he began his important studies on the pendulum. His earlier research had been on the orbits of planets and comets. His publications include: *Lehrbuch zur Bahnbestimmung der Kometen und Planeten* (1870-80), the best and most complete work of this kind; *Ueber die Bestimmung einer Kometenbahn* (1868-71); *Syzygientafeln für den Mond* (1881); *Kanon der Finsternisse* (1887), with tales of eclipses of the sun between B.C. 1207 and A.D. 2163; and *Entwurf einer Mondtheorie* (1886).

OPPOSITION. In logic, the name applied to express the relation between propositions which have the same subject and the same predicate, but which differ in quality or in quantity, or in both. Thus "All cows ruminate" and "Some cows ruminate" stand in opposition or are opposites, because they have the same terms ('cows' and 'ruminate') but differ in quantity. If opposites differ only in quantity, the universal proposition is called the subaltern and the particular the subalternate. When the opposites differ only in quality and are both universal, they are said to be contraries; if they are both particular and differ only in quantity, they are said to be subcontraries. If the opposites differ in both quantity and quality, they are said to be contradictory. These relations are generally represented graphically in the so-called 'square of opposition,' in which the symbols A, E, I, O, stand for the four mutually opposing propositions. See LOGIC.

From this square probably arises the expression 'squarely contradictory.' An 'immediate inference by opposition' is made when from the known or granted truth or falsity of any proposition, the truth or falsity of its opposites is inferred. Thus, if A be true, E and O are false and I is true. If E be true, A and I are false



and O is true. If I be true, E is false, and either—not both—A or O is true; which is true cannot be inferred from the premise. If O be true, A is false, and either—not both—E or I is true; which is true cannot be inferred from the premise. On the other hand, if A be false, O is true, and either—not both—I or E is true; which is true cannot be inferred from the premise. If E be false, I is true, and either—not both—A or O is true; which is true cannot be inferred from the premise. If I be false, E and O are true, and A is false. If O be false, A and I are true and E is false.

OPTIC, Oliver. The pen-name of William Taylor Adams (q.v.).

OPTICAL ILLUSION. See Illusion.

OPTICALLY ACTIVE SUBSTANCES. See Light, section *Rotation of the Plane of Polarization.*

OPTIC AXIS. See Light.

OPTIC NERVE. See Eye.

OPTIC NEURITIS. Inflammation of the optic nerve may be (1) papillitis, in which the optic disk is affected, or (2) retrobulbar neuritis; in which the disk is but slightly involved and the changes are in the nerve fibres behind the eye. In papillitis both eyes are usually involved, most frequently as the result of brain tumor, meningitis, abscess of the brain, or hydrocephalus. Syphilis is a common cause, and less frequently acute febrile affections, general diseases and inflammations in the region of the eye. The only subjective symptom is impairment of vision. The ophthalmoscope (q.v.) shows a condition known as choked disk, in which the optic disk is swollen, its edges indistinct and fringed, the veins dilated and tortuous, or less projection of the disk and involvement of more of the surrounding retina. The inflammation runs a chronic course and may terminate in recovery or be followed by atrophy of the nerve with consequent loss of sight to a varying degree. Retrobulbar neuritis may be acute or chronic. The former is rare, and results from rheumatism, syphilis, exposure, acute infectious diseases, and poisons. There is neuralgia, pain in the eye and near it, rapid loss of sight, while even ophthalmoscopic examination shows little or nothing. Sight usually returns within a few months, but often with a central scotoma; sometimes there is partial or total blindness. The chronic form is usually the result of excessive use of tobacco and alcohol, separately or combined. Both eyes have gradually diminished vision. (See Amblyopia.) If the patient gives up the use of the drug causing the neuritis complete recovery may occur; on the other hand, there may be partial loss of sight.

OPTICS. See Light.

OPTIMATES (Lat., aristocrats) **AND POPULARES** (Lat., democrats). In the politics of later republican Rome, the conservative or aristocratic, and the democratic or progressive, parties respectively. The *populares* comprised the great body of the people, including not only the proletariat, but many men of wealth, who, however, were generally without personal influence. The *optimates* were the aristocracy and their followers. The two parties perpetuated the old contests between the patricians and plebeians. In the second century B.C. the *populares* gained great power under Tiberius Gracchus and his brother Gaius, whose drastic measures were, however, nullified at their deaths. From this time until the Empire, politics entered less into the controversies of the *optimates* and *populares* than did the personal ambitions of the leaders. Marius, the leader of the *populares*, was overthrown by Sulla in the name of the *optimates*, and, later on, Cæsar led the party of the *populares* in opposition to the aristocracy at whose head was Pompeius. See Cæsar, Gaius Julius; Gracchus; Marius; Pompeius; Sulla.

OPTIMISM (from Lat. *optimus*, best; connected with *optare*, to choose, *apisci*, Skt. *āp*, to obtain). The name given to the doctrine of those philosophers and divines who hold that the existing order of things, whatever may be its seeming imperfections of detail, is nevertheless, as a whole, the most perfect or the best which could have been created, or which it is possible to conceive. Some of the advocates of optimism content themselves with maintaining the dogmatic position, that although God was not by any means bound to create the most perfect order of things, yet the existing order is *de facto* the best; others contend, in addition, that the perfection and wisdom of almighty God necessarily require that His creation should be the most perfect which it is possible to conceive. The full development of the optimistic theory as a philosophical system was reserved for Leibnitz (q.v.). His main thesis may be briefly stated to be that among all the systems which presented themselves to the infinite intelligence of God, as possible, God on account of His goodness selected and created, in the existing universe, the best and most perfect, physically as well as morally. The details of the controversial part of the system would be out of place in this work. It will be enough to say that the existence of evil, both moral and physical, is explained by Leibnitz as a necessary consequence of the finiteness of created beings; and it is contended that in the balance of good and evil in the existing constitution of things, the preponderance of the former is greater than in any other conceivable creation. The great argument of the

optimists has always been in essence identical with Leibnitz.

OPUNTIA, ō-pŭn'shĭ-ȧ. A genus of cacti. See PRICKLY PEAR.

OPZOOMER, ŏp'zō-mēr. CORNELIS WILLEM (1821-92). A Dutch philosopher and jurist, born at Rotterdam. He studied at the University of Leyden, became professor of philosophy at the University of Utrecht in 1846, and in 1861 was chosen president of the Royal Academy of Science. He was a leader of the empirical school of philosophy. Among his works are: *De weg der wetenschap* (1851); *Het wezen der kennis* (2d ed. 1867); *De Bonapartes en het recht van Duitschland, ook na Sedan* (1871); and *Scheiding van Kerk en Staat* (1875).

OQUAS'SA TROUT (North American Indian name). The blueback trout, or 'quasky,' of the Rangeley lakes, Me. See Plate with TROUT.

OR (Fr., gold). In heraldry (q.v.), the metal gold.

ORACHE (formerly also *arrach*, from Fr. *arroche*, from Lat. *atriplex*, orache, from Gk. *ἀτράφαξις*, *atraphaxis*, orache). *Atriplex*. A large genus of plants of the natural order Chenopodiaceæ, some species of which are common weeds in gardens and waste places throughout Europe and the United States. Garden orache, mountain spinach (*Atriplex hortensis*), an annual native of Tatary, with thick greenish or reddish slightly acid leaves, was formerly much cultivated as a substitute for spinach. Sea orache (*Atriplex littoralis*), a native of the British coasts, and *Atriplex patula*, a garden weed, are similarly used.

ORACLE (Lat. *oraculum*, from *orare*, to pray, from *os*, Skt. *asya*, mouth). The place where a deity gives responses to the inquiries of votaries, or the response itself. The belief that the gods could and would reveal the future was common among the nations of antiquity, and few undertakings were entered upon without consultation of those who were able to interpret the signs by which the future was manifested. Thus we find the kings of Egypt, Babylonia, and Assyria seeking divine advice or sanction before their campaigns, while among the Hebrews the high priest made use of the Urim and Thummim to determine the will of Jehovah. The Greeks and Romans were fully convinced of the importance of signs and omens, and the need of their correct interpretation, as well as of the possibility of predicting the future by means of various methods, which are treated under DIVINATION. While consultation of the gods was thus possible anywhere, there were certain places especially chosen by the gods as seats of answer to human inquiries, and these oracles played an important part in ancient life. They were naturally connected with sanctuaries, and the answers were usually imparted or interpreted by the priests. The number of such oracular shrines was very great, and most of them doubtless enjoyed little more than a local reputation. Only a few reached a national or international importance, but these may fairly be taken as typical. They fall naturally into three classes: (1) those in which the answer was given through signs; (2) those in which the god spoke through the mouth of some inspired person; (3) those in which the god manifested his will by dreams or visions in the sanctuary.

In the first class belongs the very ancient oracle of Zeus at Dodona (q.v.) in Epirus, where answers seem at first to have been given by the rustling of the leaves of the sacred oaks, though later other methods of divination, including the lot, were also employed. At Olympia the family of Iamidæ, in whom the prophetic gift was hereditary, answered inquiries and predicted the future from the sacrifices at the great altar, and a similar method was followed in early times at the oracle of Ismenian Apollo near Thebes. Next to Dodona, and in later times surpassing it in fame, was the oracle of Zeus Ammon, in the oasis of Siwah in Libya, noted for the visit of Alexander the Great, who was there hailed as the divine son of Ammon. It was, however, frequently consulted by Greeks in earlier times. The answers were determined by the swaying of the image of the god, as it was carried in solemn procession on the shoulders of the priests. At some places the answer was given by casting lots, or throwing dice bearing characters or numbers, which were interpreted by the priests or by a key. Thus at Attaleia in Phrygia the numbers referred to a collection of oracles in verse, and the answer was sought in the verses indicated by the number.

The second class were far more numerous, and seem to have been prevailingly oracles of Apollo, for this god was the special minister of Zeus in declaring the future. Here belongs far the most famous of the ancient oracles, that of the Pythian Apollo at Delphi (q.v.). The responses were here given by a prophetess, the Pythia, who after ceremonial purifications drank from the sacred water of the Cassotis, chewed leaves of the sacred laurel, and seated herself on the sacred tripod, which was placed in the shrine of the temple over a subterranean chasm from which issued a cold vapor, whose fumes threw her into an ecstasy. The questions were propounded by a prophet, and the mutterings or ravings of the Pythia were reduced by the priests to hexameter verses, and thus communicated to the inquirer. Responses were at first given in but one month each year; later, however, they could be obtained on all but unlucky days. The favorable days were determined by examining the sacrificial victims. The order of the inquirers was determined by lot, unless precedence in consulting the oracle had been granted as a mark of honor by the community. The oracle early attained wide fame, and in the sixth century B.C. received rich gifts from King Croesus of Lydia. Later it was frequently consulted by Athenians, Spartans, and other peoples before venturing to decide critical questions of policy, especially in matters connected with religion. In spite of *Medism* during the Persian wars and some undoubted cases of deception, the oracle maintained its reputation through the best period of Greek history, and with some fluctuations enjoyed prosperity even under the Roman emperors. Other famous oracles of Apollo where inspired prophets or prophetesses revealed the answers of the god were at Branchidæ near Miletus, at Abæ in Phocis, at Claros near Colophon, at Patara in Lycia, and at Argos. The inspiration was in most cases communicated by drinking from a sacred spring or of the blood of a sacrifice.

The third class of oracles finds its best examples in the temples of Æsculapius (q.v.), where the sick who came to consult the god slept in a hall attached to the sanctuary, and were either cured by a vision of the god during the night, or received directions which were later interpreted to them by the attendants. The most celebrated of these shrines was the Hieron of Epidaurus (q.v.), and the inscriptions found there throw much light upon the character of these establishments. The dream-oracles were not confined, however, to the sick. In the sanctuary of Amphiaraus at Oropus in Attica visions not only helped the sick, but enlightened the inquirer on other subjects. Before the incubation certain sacrifices and purifications with fasting were required, and fees were of course collected, especially from those who had been cured of disease. Peculiar in many ways, and not above a very strong suspicion of charlatanry, was the procedure at the oracle of Trophonius at Lebadea in Bœotia. After prolonged preparatory rites and sacrifices, the inquirer, a honey cake in each hand, descended by a ladder into an artificial subterranean chamber, where he thrust his feet through a hole in the side wall. He was then seized by some unseen power and borne below the earth, where by apparitions or voices the future was revealed, and he then found himself hurried feet foremost into the chamber he had left, whence he was removed by the priests in a dazed and bewildered condition. By Lake Avernus, near Cumæ, in Italy, was a celebrated oracle where the future was revealed by the spirits of the dead, and we hear of other places where necromancy was practiced, either by calling the spirits in person to answer the inquirer, or by means of dreams.

As it was believed that many of the great prophets of the past had predicted the distant future, there were also in circulation in the ancient world many collections of oracles attributed to Bacis, Musæus, Orpheus, and other famous seers, and these predictions were freely cited at any time of national calamity or consulted for guidance in difficulties by the less educated.

(Berlin, 1902).

ORAN, ô-răn′ *Fr. pron.* ô′răN′. A department of Algeria, sometimes called the Department of the West, from the fact of its forming the western frontier of the country. It is bounded on the north by the Mediterranean, on the east by the Department of Algiers, on the west by the Empire of Morocco, and on the south by the desert. Area, 44,616 square miles, of which 13,514 belong to the Tell and a large portion to the Sahara. Population, in 1891, 942,000; in 1901, 1,107,354, four-fifths being Arabs. Besides the capital, Oran (q.v.), the seats of arrondissements are the communes of Sidi bel-Abbès (population, in 1901, 25,739), Mostaganem (population, 17,956), Mascara (population, 20,914), and Tlemcên (population, 35,382).

ORAN (Ar. *Waran*). A seaport and Catholic episcopal city of Algeria, capital of the department of the same name. It stands at the inner extremity of the Gulf of Oran, an inlet of the Mediterranean, 260 miles west-southwest of Algiers, with which it is connected by rail (Map: Africa, D 1). The town, girt by walls and defended by strongly armed forts, is situated at the foot of a high mountain, crowned by the forts Santa-Cruz and Saint-Grégoire. The ravine of Oued Rekhi, laid out with boulevards and buildings, divides the port and old Spanish town on the west from the modern French town on the east. The streets and promenades are generally spacious, the houses elegant and airy. The principal edifices are the Château-Neuf, the residence of the general of division; the departmental offices, including the Hôtel de la Préfecture, the civil, criminal, commercial tribunals, etc.; the great mosque of la Rue Philippe; the Catholic cathedral, and the barracks. The city has a college, primary and native schools, a geological and archæological society, Protestant and other churches, synagogues, mosques; a branch of the Bank of Algeria; exchequer, post, and telegraph offices; an immense military hospital, with accommodations for 1400 beds; and various splendidly appointed magazines and Government stores. The town has a good water supply. Formerly vessels had to find shelter in the roadstead of Mers-el-Kebir, three miles distant, but the construction of moles since 1887 has improved the harbor, and vessels with an aggregate tonnage of 2,310,000 entered and cleared the port in 1898. There is a large trade with interior Africa and with Spain, Almería being only 140 miles and Gibraltar 220 miles distant. The exports include agricultural produce, iron ore, and alfa. The United States is represented by an agent. The country in the vicinity is bare and arid, although the land is not sterile. To the south of the town the country is uncultivated, but toward the southeast highly cultivated lands are seen. Cattle are raised, and grain, tobacco, and cotton are grown. The vine covers large tracts of land, and its cultivation is attended with great success; the wines produced are of good quality.

The town of Oran was built by the Moors. It was taken by the Spaniards in 1509, by the Turks in 1708, and again by the Spaniards in 1732. In 1791 it was destroyed by an earthquake, and shortly after it was altogether abandoned by the Spaniards. Oran was taken by the French in 1831, and has been developed by them into a large and prosperous town. Population of commune, comprising the three suburbs, Mers-el-Kebir, La Senia, and Aïn-el-Turk, in 1891, 75,000; in 1901, 88,235.

ORANGE, ô′răNzh′. The capital of an arrondissement in the Department of Vaucluse, France, in a beautiful plain, on the Aigue, 18 miles north of Avignon by rail (Map: France, L 7). There are several notable Roman remains here and in the vicinity. The triumphal arch, 60 feet high, is celebrated for the beauty of its architecture, and its richly sculptured bas-reliefs. The ancient theatre, the largest of its kind in France, has a well-preserved stage. The Church of Notre Dame dates from the eleventh century. Orange has a college and a library. It had a university till the French Revolution. It manufactures silks, mus-

lins, serges, etc., and there are oil-works, dye-works, and tanneries. A trade in wine, spirits, oils, honey, and fruit is carried on. Population, in 1901 (commune), 10,096.

Orange is the Roman Arausio. It was the capital of the independent Principality of Orange from the eleventh century. On the death of Philibert of Chalon in 1530 the estates and title passed to the House of Nassau. William of Orange, surnamed the Silent, and his son, Maurice of Nassau, founded the greatness of the House of Orange by the rôle which they played in the foundation of the Dutch Republic. (See NASSAU and NETHERLANDS.) William III., Prince of Orange and King of England, died in 1702 without issue; and at the Peace of Utrecht (1713) the King of Prussia, one of the principal claimants to the principality, ceded the territory of Orange to the King of France. The title Prince of Orange is now borne by the heir presumptive to the Dutch throne.

OR'ANGE. A town, including several villages, in Franklin County, Mass., 86 miles west by north of Boston; on Millers River, and on the Boston and Maine Railroad (Map: Massachusetts, C 2). It has a public library of 7000 volumes. Its parks—Central, Brookside, and Goddard—are very attractive. The town is actively engaged in manufacturing, the products including sewing-machines, sewing-machine needles, furniture, lumber products, clothing, especially Russian vests, boxes, tapioca, automobiles, water wheels and other kinds of machinery. The government is administered by town meetings. The water-works are owned and operated by the town. In 1783 Orange was created out of parts of Warwick, Athol, Royalston, and New Salem, and incorporated as a district. In 1810 it became a town. Population, in 1890, 4568; in 1900, 5520.

ORANGE. A city in Essex County, N. J., four miles northwest of Newark; on the Lackawanna Railroad, a branch of the Erie, and electric railroads connecting with Newark, Montclair, Bloomfield, East Orange, South Orange, and other towns of the vicinity (Map: New Jersey, D 2). It is situated at an elevation of from 150 to 200 feet, near the base of First (Orange) Mountain, a great ridge of trap rock, which extends for many miles in a northeast and southwest direction rising to a height of over 600 feet above tide water. Among the picturesque spots in the neighborhood are Llewellyn Park of 750 acres (West Orange), with many fine residences; Eagle Rock, on the east brow of the mountain, now a part of the new public park system of Essex County; and Hemlock Falls (South Orange), situated amid wild scenery. The city is noted as a residential place, having the homes of many New York business men, and from its elevated suburbs commands magnificent views of the surrounding country. In the city and vicinity are many miles of excellent roads. The noteworthy buildings include the Stickler Memorial Library, Columbus School Building and Theatre, Decker Building, Metropolitan Building, Music Hall, Orange Memorial Hospital, with the Shepard pavilion and a training school for nurses, Orphan Home, House of the Good Shepherd, Masonic Temple, and the First Presbyterian Church, originally built in 1719, and several times remodeled. The city has a public library, a bureau of associated charities, a well-known Mendelssohn Union, a New England Society, Essex County Hunt and Essex County clubs, and other athletic and social clubs. Orange is widely known also as the seat of an extensive hat-manufacturing industry. Adjoining Llewellyn Park is the Edison laboratory. The government, under a revised charter of 1879, is vested in a mayor, biennially elected, and a council. The board of education is independently elected by popular vote. The water-works are owned and operated by the municipality. Population, in 1890, 18,844; in 1900, 24,141.

Orange, originally a part of Newark and called the 'Newark Mountain,' was probably settled as early as 1666 or 1667. In 1718 the settlers established a separate Church and called it "The Mountain Society.' This in 1781 became the 'Second Church of Newark,' and still exists as the 'First Presbyterian Church of Orange.' In 1806 Orange was separated from Newark and incorporated as a town under its present name, the name Orange Dale having been in use from about 1791. In 1870 it was chartered as a city. Out of Orange were created South, West, and East Orange in 1861, 1862, and 1863 respectively. Consult: Whittemore, *The Founders and Builders of the Oranges* (Newark, 1896); and Wickes, *History of the Oranges from 1666 to 1806* (Newark, 1892).

ORANGE. A city and the county-seat of Orange County, Texas, 271 miles east of Austin; on the Sabine River, and on the Southern Pacific Railroad (Map: Texas, H 4). It is especially noted for its extensive lumbering interests, and is also an important shipping centre for the rice, cotton, and live stock of the vicinity. Lumber mills, cotton gins, and a rice mill constitute the principal industrial establishments. The water-works are owned by the municipality. Population, in 1890, 3173; in 1900, 3855.

ORANGE (OF. *orenge*, Fr. *orange*, from It. *arancia*, *arancio*, from Ar. *nāranj*, orange, from Hind. *nārangī*, from Skt. *nāraṅga*, *nāgaraṅga*, orange; influenced by popular etymology with Fr. *or*, Lat. *aurum*, gold, in allusion to its yellow color; with loss of initial *n* as in *adder*, *apron*, *auger*, *umpire*, cf. dial. It. *naranza*, *naranz*, Sp. *naranja*, Wall. *narance*, orange). *Citrus aurantium*. A low-branching, long-lived evergreen tree of the natural order Rutaceæ. In cultivated orchards it seldom exceeds 30 feet in height. The leaves are oval or elliptical; the blossoms pure white and very fragrant. The fruit is a large, globose, 8- to 10-celled berry, yellow when ripe, and containing a refreshing acid juicy pulp. The orange is used as a dessert fruit and for preserves, marmalade, etc. The principal types of oranges are as follows: *Citrus aurantium sinensis*, which includes the common sweet oranges of commerce, including more than 70 horticultural varieties. *Citrus aurantium amara*, which includes the sour, bitter, or Seville oranges, largely used as budding stocks for sweet oranges and for the oil obtained from the rind of the fruit for use in perfumery. *Citrus aurantium bergamia*, which includes the bergamot orange, from which bergamot oil is obtained. The species *Citrus aurantium*, var. *nobilis*, includes the mandarin or kid-glove oranges, and tangerines. These are mostly small early sorts and hardier than sweet oranges.

The trifoliate orange (*Citrus trifoliata*) is valuable chiefly on account of its hardiness and compact growth, which makes it a good hedge plant as far north as New York City. It has a value as a stock for the Satsuma variety and the kumquat, rendering them more hardy than when worked on their own roots. Promising hardy hybrids between this and *Citrus aurantium* are being obtained.

The fruit of these various species varies exceedingly in form, size, juiciness of pulp, thickness of rind, etc. Some varieties have very numerous seeds, while others are seedless. The navel orange is so called because of a remarkable development of adventitious cells which at the apex of the orange give the fruit an umbilical mark. The orange is a native of India or Southern China, whence it has been distributed by successive stages to all parts of the subtropical world and the warmer temperate regions. It was introduced into Florida and South America by the early Spanish explorers, and now flourishes wild there in many localities. It is cultivated in nearly all the countries bordering on the Mediterranean Sea, and in Portugal, India and Southern Asia, Japan, East Indies, Brazil, Jamaica, Florida, Louisiana, California, Australia, etc. In the United States the production of oranges has declined somewhat since 1896, owing to the severe winter freezes of 1894-95 and again in 1899, which ruined many of the orange groves of Florida. The twelfth census estimates the number of orange trees in the United States in 1899 at 8,397,710, and the production that year at 6,171,259 boxes. California, with 5,648,714 trees, produced 5,882,193 boxes; while Florida, with 2,552,542 trees, produced but 273,295 boxes.

Oranges are usually propagated from seed. Some varieties come true or nearly true to seed, but most do not, and so are propagated by budding. They thrive on nearly all kinds of fertile soils and are found in high, dry situations as well as low, alluvial lands subject to occasional overflow. They cannot be grown in situations subject to severe frosts during the growing season. The trees are set in the orchard when about two years from the bud, the distance apart usually favored in California being 10 feet for dwarfs, 18 to 24 feet for semi-dwarfs, 24 to 30 feet for standards, and 30 to 40 feet for seedlings. Clean, thorough cultivation is practiced during the growing season and irrigation given wherever necessary. Nearly all California orchards are irrigated. Orange trees under favorable conditions continue in bearing to a great age. Blossoms and green and ripe fruit are frequently seen on the trees at the same time, but the bulk of the crop ripens at about the same time. In harvesting the fruit is usually gathered by hand, being cut off and placed in sacks or cloth-lined baskets. It is kept for a few days in baskets or shallow bins in the packing house for the skins to dry and soften a little, then graded, each fruit wrapped in tissue paper, and packed for market in boxes holding two cubic feet each. Boxes hold from 96 to 252 oranges, according to the size of the fruit. Average sized fruit runs from 176 to 200 to the box. Oranges stand shipment well and when properly handled sometimes keep for months.

Orange Diseases. The orange, in common with many of the other citrus fruits, is subject to a number of injurious diseases by which the trees are destroyed or stunted in their growth and the fruit injured or rendered unsightly. One of the widest spread diseases, especially destructive of lemons and sweet oranges, is the 'foot-rot,' which is of unknown origin, but occurs in Florida, California, Europe, and Australia, and, according to estimates, has caused annual losses of more than $100,000 in Florida alone. It may be recognized by copious exudation of gum near the base of the tree, sparse, small yellow leaves, and dead small branches, and patches of dry bark which fall off. Other centres appear and the disease spreads until the whole tree is girdled. Removing the soil from around the crown of the tree seems to be the most effective treatment. Over cultivation is to be avoided and good drainage secured. 'Die-back,' so named from the dying of the young twigs for several inches from their tips, is a serious trouble in Florida. No variety or age of tree appears exempt from this disease, which seems to be due to malnutrition, resulting in part at least from improper cultivation and improper drainage. The fruit on trees is not abundant, ripens prematurely, and frequently splits, dropping from the tree before ripening. Withholding nitrogenous fertilizers, stopping cultivation, mulching about trees and thorough drainage have given good results in overcoming this disease. The sooty mold (*Meliola camelliæ*) is a fungus that follows scale and other insects which exude honeydew upon the trees. It covers the leaves and stems, interfering with their functions, and renders the fruit unsalable by the covering of black, almost felt-like mycelium. By destroying the insects with resin washes or by fumigation, the excretion of honeydew (q.v.) is stopped and the sooty mold disappears. Not only citrus trees, but many others are subject to this pest. 'Blight,' a destructive and apparently contagious disease of unknown cause, for which no cure is as yet known, seems to attack bearing trees only. The leaves suddenly wilt, even in rainy weather; numerous sprouts appear upon the trunk, and die after a season or two. The trees blossom profusely the season following the wilting, but are usually leafless, and set few fruits and ripen fewer. A single branch, or the whole tree, may be affected, but in any case the tree is finally destroyed. The scab is due to a species of Cladosporium which causes warts or scabs on the leaves and fruits, especially of lemons. Thorough spraying with ammoniacal copper carbonate will prevent this disease. At least five applications should be given. See Colored Plate of Citrus Fruits.

ORANGE, Prince of. See William I., the Silent; William III., King of England.

ORANGE-TREE SEEDLINGS, RIVERSIDE, CALIFORNIA

OR'ANGEBURG. A city and the county-seat of Orangeburg County, S. C., 51 miles south by east of Columbia; on the north fork of the Edisto River, and on the Southern and the Atlantic Coast Line railroads (Map: South Carolina, D 3). It is the seat of Claflin University (Methodist Episcopal) for negroes, opened in 1869, and of the Colored Normal, Industrial, Agricultural and Mechanical College. There are cotton and cottonseed oil mills, lumber mills, a furniture factory, machine shops, brick yards, etc. Orangeburg has a considerable trade in cotton, lumber, and turpentine. The water-works and electric light plant are owned by the municipality. Population, in 1890, 2964; in 1900, 4455.

ORANGE CITY. A town and the county-seat of Sioux County, Iowa, 45 miles north-northeast of Sioux City; on the Chicago and Northwestern Railroad (Map: Iowa, A 2). It has the Northwestern Classical Academy, with the Rapelye Library of 3000 volumes, and is interested principally in farming and stock-raising. The new court house here is a handsome structure. Population, in 1890, 1246; in 1900, 1457.

ORANGE FREE STATE. See ORANGE RIVER COLONY.

ORANGE INSECTS. The insects which affect the orange, also, as a rule, affect the lemon and other trees of the genus Citrus. The most important and injurious are the scale insects of the family Coccidæ, which attack the leaves, twigs, branches, and trunk. The long scale (*Mytilaspis Gloveri*) and the purple scale (*Mytilaspis citricola*) were for a long time the principal insect enemies of the orange groves in Florida, but the Florida red scale (*Aspidiotus ficus*) and the chaff scale (*Parlatoria pergandei*) have become numerous and injurious. In Louisiana the chaff scale has been the principal enemy, although the purple scale has done some damage. The orange chionaspis (*Chionaspis citri*) also occurs abundantly in this State as well as in Mexico and the West Indies. In California none of these species are noted as pests in the orange groves, although the purple scale and the long scale have been accidentally introduced into some localities during the past few years. The principal California scales are the California red scale (*Aspidiotus citricola*), the white or fluted scale (*Icerya Purchasi*), and the black scale (*Lecanium olea*). The white or fluted scale has been practically exterminated by the introduction of the Australian ladybird (*Vorius cardinalis*—*see* LADYBIRD), and the black scale is more of a pest to the olive orchards than to the orange groves. The California red scale is therefore the only serious scale insect enemy to the citrus trees of California, and is kept in check by fumigation with hydrocyanic acid gas, and by spraying with the kerosene distillate emulsion. The soft scale (*Lecanium hesperidum*), the hemispherical scale (*Lecanium hemisphæricum*), the Florida wax scale (*Ceroplastes Floridensis*), and the barnacle scale (*Ceroplastes cerripediformis*), as well as the common mealy-bug (*Dactylopius citri*), are also found in orange groves, but seldom do any great damage. *See* SCALE INSECT.

A rather serious pest in Florida, and to a lesser extent in Louisiana, is the white fly (*Aleurodes citri*) which sometimes swarms upon the leaves of citrus fruits, stopping the pores and extracting the sap, and which through its saccharine excretion is also the nidus for the spores of a black smut-fungus which further damages both the health and appearance of the trees and fruit. A mite enemy of the orange injures the fruit to some extent, and is especially harmful to the salable value of the fruit. This is *Phytoptus oleivorus*, called the 'rust mite' of the orange and the 'silver mite' of the lemon, since it produces a rusty appearance on orange fruit and a silvery appearance on lemons. The sovereign remedy against these mites is flowers of sulphur added to kerosene emulsion spray. Another mite which occurs upon oranges, and which is closely allied to the so-called 'red spider' of greenhouses, is the six-spotted mite (*Tetranychus sexmaculatus*). It feeds mainly on the under sides of the leaves, and it is also readily controlled by the use of sulphur in some form or another. (See MITE.) Some damage is occasionally done to orange trees by termites or so-called white ants, but usually because of some prior damage.

The leaves are injured by the orange aphis (*Siphonophora citrifolii*), and by several sucking bugs, such as the green soldier bug (*Nezara hilaris*) and the thick-thighed metapode (*Metapodius femoratus*). A number of caterpillars feed upon the leaves, the most conspicuous of which is the larva of *Papilio cresphontes*, sometimes known as the 'orange dog.' The saddle-back caterpillar (larva of *Empretia stimulea*), and the bagworm (larva of *Oiketicus Abbotii*), and several other less prominent lepidopterous larvæ eat the leaves to a greater or lesser extent, and there are several leaf-rollers which also damage the foliage. The cotton-stainer (q.v.) or red-bug (*Dysdercus saturellus*) punctures the fruit; as does also the leaf-footed bug *Leptoglossus phyllopus*). A very serious enemy of the orange in Mexico, and one the advent of which is greatly feared by the orange-growers of the United States, is the Morelos orange worm or fruit-fly, the larva of *Trypeta ludens*. Here the fly lays her eggs upon the skin of the young orange, and the maggots which hatch from these eggs penetrate the pulp and ruin the fruit. Nearly all of the species just mentioned occur in Mexico and the West Indies, and several of them are found in the orange groves in Mediterranean regions. In South Africa and Australia the orange has a different insect fauna, but the species are allied to those in America and represent practically the same groups.

ORANGEMEN. The members of the Irish society called 'The Loyal Orange Institution.' After the battle of the Boyne (q.v.) in 1690, the Irish Catholics, who on account of their Jacobite leanings were oppressed by the English, began to form various semi-revolutionary societies. In opposition, the Irish Protestants formed the above-named society, the object of which was to oppose Roman Catholicism and to maintain the union of England and Ireland and the Protestant succession to the crown. Though it derived its name from William III. (of Orange), who drove out the Catholic James II., it was first definitely established in Ulster in 1795. It extended rapidly, and even had some lodges in England and Canada. Parliament was compelled

to check the turbulence of the organization on several occasions, and from 1813 to 1828 it was suspended in Ireland. It had a complex organization, and the grand lodge had a meeting twice a year, in May and on November 5. In Ireland the society has for a long time had no influence, but there are numerous lodges still existing in the United States. July 12th, the anniversary of the battle of the Boyne, is 'Orange Day.' Consult: *View of the Present State of Ireland and of the Disturbances in That Country* (London, 1797); "An Unbiased Irishman," *Orangeism Exposed* (New York, 1824); *Parliamentary Report on the Orange Association* (London, 1835); Lilburn, *Orangeism: Its Origin, Constitution, and Objects* (ib., 1866); Lecky, *History of England in the Eighteenth Century*, vols. vii., viii. (ib., 1878-90).

ORANGE-NASSAU, Order of. A royal order of the Netherlands, with five classes, founded in 1892 in the name of Queen Wilhelmina. It is conferred as a reward for services to the country or to the royal house, and may be given to foreigners as well as natives. The decoration, a blue enameled cross with eight points, surrounded by a laurel wreath, bears the national arms on a blue ground with the legend, *Je maintiendrai*, on the reverse a W with the inscription *God zij met ons* ('God be with us').

ORANGE OIL. An essential oil obtained from the rind of the orange. *Essence de Bigarade*, from the bitter orange, is distinguished from *essence de Portugal*, from the rind of the sweet orange. The oil is extracted sometimes by distillation, but more commonly by the sponge process, which consists in pressing the peel of the fruit forcibly against a piece of flat sponge in such a manner as to break the cells, from which the oil exudes and is absorbed by the sponge. When exhausted the peel is thrown aside and the sponge wrung out into a bowl, where the oil separates from the watery liquid which accompanies it, and is then decanted. This oil, which is a pale yellowish liquid, consists of nearly 98 per cent. of a terpene called lemonene, and is used for flavoring and in perfumery. The essential oil obtained by the aqueous distillation of the fresh flowers of the bitter orange is chiefly used in perfumery under the name of oil of orange flowers, or oil of neroli. The yield from one ton of flowers is about forty ounces, and the finest trees afford about sixty-six pounds of flowers. The neroli oil is a yellowish or brownish liquid with an odor of orange flowers and a bitter aromatic flavor. Both orange oil and oil of neroli are made chiefly in the south of France.

ORANGE RIVER (Hottentot *Gariep*, Great Water). The principal river of the extreme southern part of Africa (Map: Africa, F 7). Its farthest headstream rises on the slope of Champagne Castle, a peak of the Drakenberg on the boundary between Natal and Basutoland, scarcely more than 100 miles from the Indian Ocean. It flows across the continent in a general westward course, first southwestward through Basutoland, then forming in a large bend the southern boundary of the Orange River Colony, after which it flows across the northern part of Cape Colony, and finally forms the boundary between the latter and German Southwest Africa until it empties into the Atlantic Ocean. Its total length is nearly 1300 miles. It receives in the upper two-fifths of its course practically all its permanent tributaries, the last and largest of which is the Vaal (q.v.), which is by some geographers considered as the true upper course of the river. Below its confluence with the Vaal the Orange flows through the arid wilderness of the southern Kalahari region and Namaqualand. In the last 500 miles of its course it receives no permanent tributaries, though several large wadis lead into it. Its volume decreases by evaporation, and at its mouth it is almost exhausted. A sand bar blocks the mouth. In the wet season the river becomes an impetuous torrent. About 20 miles from its mouth it is completely obstructed by rapids, and farther inland, above its confluence with the Molopo Wadi, it forms the famous 'Hundred Falls' or the Great Aughrabies. Here the river descends 400 feet in a course of 16 miles in a continuous series of rapids and cataracts between a confusion of high rocky crags. The river received its present name in 1777 in honor of the House of Orange. Consult Chavanne, *Afrikas Ströme und Flüsse* (Vienna, 1883).

ORANGE RIVER COLONY (formerly the Orange Free State). A British colony in South Africa, lying between the Orange River and its tributary the Vaal (see accompanying map). The latter separates the colony from the Transvaal Colony on the north, and the former from Cape Colony on the south. Cape Colony (Griqua Land West) also forms the western boundary, while on the east the colony is bounded by Natal and Basutoland. The area is estimated at 48,226 square miles.

Physical Features. The surface is an undulating plateau lying at an elevation of 3000 to 4000 feet above the sea. This plateau is bounded on the east by the Drakenberg, with a height of 7000 to 11,000 feet, and slopes mainly westward and northwestward toward the Vaal River. It is for the greater part a prairie country, affording good pasturage in summer, but very sparsely wooded except in the eastern mountains and along the rivers, which are fringed with willows. The colony is watered entirely by the tributaries of the Orange and the Vaal. The climate, owing to the high altitude and the dryness of the air, is very healthful and agreeable. The region is, however, subject to hot winds from the interior, so that the temperature rises actually higher than in the lower ground of Natal. The mean temperature is about 61°, and the average extremes are: highest 95°, in January; lowest 40°, in June. The dominant flora is herbaceous, becoming shrubby toward the west. The large wild animals have entirely disappeared. The country suffers occasionally from the locust plague.

The northeastern portions of the country consist mainly of Triassic sandstones and shales interbedded with horizontal coal seams which outcrop especially in the Kroonstad and Heilbron districts in the extreme north. The southwestern portion belongs to the great South African lacustrine basin, the surface rock being of the Karoo series with intrusions of igneous rocks.

Mining. The mining industry of the colony is confined principally to the production of diamonds, which are found at Koffyfontein and Jagersfontein, in the Fauresmith district. They are also found to some extent in the neighborhood of Kroonstad, in the north. During the last decade of the nineteenth century considerable prog-

ress was made in the exploitation of the diamond fields, the output having increased from 99,225 carats, valued at £224,000, in 1890, to 307,000 carats, valued at £1,508,000, in 1898. The large coal deposits in the north around Kroomstad are extensively exploited. Gold is also found.

AGRICULTURE. By the conformation of the surface the soil is better adapted for grazing than agriculture, and, although grain-raising is on the increase, it is still inferior to the pastoral industry. There are at present about 10,000 holdings, comprising about 30,000,000 acres, of which a very small part is under cultivation.

COMMERCE AND TRANSPORTATION. The principal exports of the colony are wool, hides, corn, and diamonds. The commerce was almost entirely suspended by the Boer War, exports falling off from about £2,000,000 in 1898 to about £23,000 in 1901. The imports, consisting mostly of general merchandise, were less affected. The colony has about 400 miles of railways, the main line entering from Cape Colony and connecting Bloemfontein with the Cape and the Transvaal railway systems. There is also another line connecting the northeastern part of the colony with the Natal system. The railways were originally constructed by Cape Colony and acquired by the Orange Free State in 1897.

GOVERNMENT. Since the establishment of civil government after the annexation of the colony to Great Britain, the Orange River Colony has been under the supreme authority of the Governor of Orange River and the Transvaal colonies, who is represented in the former colony by a Lieutenant-Governor, assisted by an executive council. The revenue is derived principally from customs. The revenue and expenditure for 1902-03 were estimated at £775,000 and £760,000 respectively.

There is a system of Government schools, but education is neither compulsory nor free. The population of the colony in 1890 was 207,503, of whom 77,716 were white and 129,787 natives. The majority of the white inhabitants belong to the Dutch Reformed Church. Capital, Bloemfontein (q.v.).

HISTORY. Before 1836 the region between the Vaal and Orange rivers was a wilderness, inhabited by wandering bands of Bushmen and broken tribes of refugees from the armies of the great Zulu rulers, Chaka, Dingaan, and Maselikatse. In 1836 there was a great emigration of Boers from Cape Colony, owing to dissatisfaction with the British Government. This movement, the 'Great Trek,' had Natal for its goal, but, the British not allowing the Boers to remain in possession of this region, a part of them settled in the country north of the Orange and another in the territory north of the Vaal. The republic thus established between the Orange and Vaal (1842) proved a disturbing neighbor to Cape Colony, so that after some friction it was forcibly annexed by the British in 1848. The country continued in their possession until 1854, when it was formally given up. The independence of the Orange Free State was declared on February 23d and a constitution adopted on April 10th, which was revised February 9, 1866, May 8, 1879, and May 11, 1898. About the year 1862 a large number of Griquas (q.v.) sold their farms to the Free State Government, and migrated in a body to the coast side of the mountains in independent Kaffraria, occupying a large tract of country there known by the name of No Man's Land. In 1866 a treaty was concluded with Moshesh, chief of the Basutos, by which a portion of the territory known as Basuto Land was ceded to the Orange Free State. The boundaries agreed on by this treaty were, however, somewhat modified by the Governor of Cape Colony in 1869. The intimate relationship of the Orange Free State and the South African Republic established a community of interests between them whenever local jealousies were put aside, and a party in each State always desired their union, or at least a close alliance. When in 1899 the jealousy between the Boers and the Uitlanders, or foreign settlers in the two republics, together with the pugnacious diplomacy of President Kruger of the South African Republic and Joseph Chamberlain, the British Colonial Secretary, brought on war between the countries they represented, the Orange Free State cast its lot with its sister republic. This was in accordance with a treaty, arranged in April, 1897, for mutual support in case of attacks upon the independence of either. After the first aggressive campaigns of the Boers, the Orange Free State was overrun by the tide of British success; and on May 24, 1900, Field-Marshal Lord Roberts, commanding the British forces, issued at Bloemfontein, the capital, a proclamation annexing the Orange Free State to the British Empire as the Orange River Colony. The Orange Free State witnessed much of the guerrilla fighting after the formal annexation of the Boer republics; it was repeatedly traversed by British columns in 1900-1902, and its President, Steyn, was one of the last to submit to the British. See TRANSVAAL; SOUTH AFRICA; SOUTH AFRICAN WAR.

ORANGE ROCKFISH. See ROCKFISH.

ORANGE ROOT. See HYDRASTIS.

ORANGE-TIP. Any one of several butterflies of the family Pieridæ, which are usually white in color marked with black, and have a conspicuous orange spot at the end of the front wings, the lower surface of the hind wings being mottled with a greenish network. The most noted species in the United States is *Anthocharis genutia*. It is found throughout the Southeastern United States, reaching as far north as Connecticut.

ORANG'-UTAN' (Malay, man-of-the-woods). One of the three great anthropoid apes (*Simia satyrus*). It inhabits Borneo and Sumatra, and differs in several important respects from its African relatives, the chimpanzee and gorilla (qq.v.). Its individual features are the height

of the skull, the long arms, nine bones in the wrist and sixteen dorso-lumbar vertebræ, of which twelve bear ribs. In external appearance the orang is not so human as the gorilla, the reddish-brown hair with which the body is clothed, the long arms, with a very short thumb,

TEETH OF ORANG-UTAN.

and the long slender hands and feet, combining to emphasize the resemblance to monkeys. The head is more anthropoid, as the skull lacks the prominent superciliary ridges of the gorilla and is strikingly brachycephalic; moreover, the openings of the nostrils are more pear-shaped than in the other apes. The brain is noticeably like that of man, more so than that of either the gorilla or chimpanzee, as the cerebral hemispheres are much convoluted. The teeth, however, are more ape-like than human, for the canines, especially of the male, are strongly developed. The formation of the larynx is extraordinary, as there is a large sac, developed from its united ventricles, which hangs down in front of the trachea. The thumb and big toe are very small and often lack nails, and sometimes even the terminal phalange is missing. The body is bulky and the legs are short and comparatively weak, but the arms are so long that they reach to the ankles when the animal is erect, and are exceedingly muscular. In walking the weight is born on the knuckles of the hands and the outer sides of the feet, so that neither the palms nor the soles are placed squarely on the ground. Only when assisted by some artificial support do these apes walk on the feet alone. In height the orang is about 50 inches or less, the males being much the larger.

These apes are now inhabitants of the swampy forests of Borneo and Sumatra alone, but there is reason to believe that species of this genus formerly inhabited the southeastern portion of the Asiatic continent. They have few natural enemies, of which large serpents and crocodiles are the most important, but even for these the orangs have little fear, nor are they alarmed at the appearance of man. They are arboreal in their habits and rather deliberate in their movements, but are agile and very much at home in trees. They build nests or platforms of branches at a height of 30 or 40 feet from the ground, and there they are said to sleep, being diurnal in habit. The female also brings forth her single young one in such a home, which it is said the male builds for her. Wounded orangs build such shelters for themselves, when escape by flight is impossible. These apes are purely vegetarian in diet, living chiefly on fruit and young, tender shoots, and they rarely have occasion to go to the ground for food. Sometimes, however, they go in search of water and are thus obliged to travel on the earth. They ordinarily go on all fours, but may raise themselves on their feet, and, by grasping overhanging branches with their hands, progress rapidly in an erect position. In traveling in this way or from tree to tree, they make as much as five or six miles an hour. They are not gregarious, but are usually found single or in pairs. Though naturally peaceable, they can make a fierce resistance when cornered and compelled to defend themselves. When taken young, they can be readily tamed, and are frequently seen in zoölogical gardens.

See Plate of ANTHROPOID APES, with APE.

ORANIENBAUM, ô-rä'nê-en-boum. A town in the Government of Saint Petersburg, Russia, 19 miles west of that city, on the Gulf of Finland, opposite Kronstadt (Map: Russia, B 6). It has a fine palace, built by Mentchikoff, now belonging to the Grand Duke of Mecklenburg-Strelitz, a summer theatre, many fine villas, a marine hospital, and other benevolent institutions. Its proximity to Saint Petersburg and its sea-bathing facilities make it a popular summer resort. The place was originally the private estate of Prince Mentchikoff, and the palace was for some time occupied by Peter III. Population, in 1897, 5300.

ORÁONS, ô-rä'ônz. Inhabitants of the west and northwest of Orissa and Chota Nagpur, in India, one of the groups of tribes speaking Dravidian languages. They are still a very primitive people. Their dances and marriage customs are of considerable interest. The young people have great freedom in their choice of wives and husbands. The Oráons, or Uráons, call themselves Kurukh; and are also known as Dhangar ('mountaineers'). Consult: Batsch, "Notes on the Oráon Language," in the *Journal of the Royal Asiatic Society of Bengal* for 1866; Dalton, *Descriptive Ethnology of Bengal* (Calcutta, 1873); Rowney, *The Wild Tribes of India* (London, 1882).

OR'ATO'RIO (Ital., oratory). A form of sacred music chiefly epic in character, consisting of choruses and soli accompanied by the orchestra, and generally preceded by an instrumental overture. The name is derived from the oratory of churches, where the first performances took place. The full title of such a work was *Rappresentazione per il oratorio*. Gradually the name of the place came to be used for the art-form itself. The originator of the oratorio is Philip Neri (q.v.), who, soon after his ordination to the priesthood (1551), began a series of public lectures on Bible history. In order to make his talks more interesting, Neri engaged the services of Animuccia, the master of the Papal chapel, who composed so-called *Laudi Spirituali* (hymns) for these lectures. The success of this undertaking was pronounced. After the death of Animuccia no less a master than Palestrina furnished the music. At the beginning these *Laudi* had but a loose connection with the subject matter of the lecture, but they soon grew into a kind of mystery with moralizing tendencies. The characters generally were personifications of abstract ideas. The first work of this kind was Cavalieri's *Anima e corpo* (1600), in which the composer makes use of the new kind of recita-

tive that had just then been originated by the founders of the Florentine musical drama (*stilo rappresentativo*). These first oratorios were called *Azioni sacri*, and differed in nothing from operas except in choice of the subjects. Even the ballet is introduced. Carissimi (1604-74) banished scenery and acting from these performances. But to compensate he introduced the character of the *historicus* (later called *narrator*), a person who sang the narrative portions of the text. Alessandro Scarlatti (1659-1725) introduced the aria into the oratorio, thus relieving the monotony of the purely declamatory style of his predecessors. For the passages assigned to the narrator he wrote *Recitativo secco*. Along these lines followed Caldara, Leo, and Stradella.

In Germany the oratorio also developed from the mysteries. The earliest work of this kind is Stephani's *Passio secundum Matthæum* (1570), but it remained the only one for some time. Not until 1623 do we meet another oratorio, Schütz's *Die Auferstehung Christi*. Whereas the Italian composers favored the new monodic style, Schütz clung to the polyphonic manner to such an extent that the words of a single personage, the Evangelist, were set to a chorus with elaborate accompaniment. His second oratorio was *Die sieben Worte Christi*. The subject matter of these oratorios indicated the direction in which that form was to develop in Germany, for all succeeding composers limited themselves to the story of the Passion of Christ. Thus the oratorio became the *passion oratorio*, or briefly the *passion*. In 1704 two oratorios appeared in Hamburg, one by Keiser, the other by Handel, which attracted the attention of other composers, especially Mattheson (1681-1764) and Telemann (1681-1767). These works placed the oratorio upon a higher level than it had attained in Italy. The German masters, while not repudiating the monodic style, worked in the polyphonic style and won great popularity for the new art-form by the frequent use of the chorale (q.v.). They even employed phrases of chorales as subjects for the fugues. The way was now prepared for Bach (1685-1750), in whose *Passion According to Saint Matthew* the form found its loftiest expression (1729). Into some of the choruses a contemplative element is introduced, consisting of meditations upon the events just narrated. After Bach only one other composer, Graun (1701-59), wrote a passion that has not fallen into oblivion. This was *Der Tod Jesu* (1755).

In Hamburg Handel had written a German passion. Four years later, in Italy, he wrote two oratorios: *Il trionfo del tempo e del disinganno*, an allegorical work entirely after the manner of Carissimi; and *La Resurrezione*, a real Italian oratorio like those of Scarlatti. In 1716 he wrote one other German passion. All these works were only a preparation for his great English oratorios, upon which the fame of Handel (1685-1759) rests, and which to this day mark the perfection of this art-form. When the master wrote his first English oratorio, *Esther* (1720), he had completely formed his style. The excellent choruses which were at his disposal in London led him to assign the chief portions of the oratorio to the chorus. And it is just in these numbers that Handel's genius shines most. In the masterly treatment of vocal fugues Handel stands without a rival, as does Bach in his mastery over the instrumental fugue. The chorus is used for various purposes; sometimes it is contemplative, as in Bach's passion, at other times didactic, teaching a moral lesson; then again he uses it in a dramatic manner to mark a climax, and again at times for descriptive or narrative purposes. In the matter of the aria-forms Handel does not hesitate to employ all the various kinds in common use then in the opera, even the bravura-aria. The recitative is generally the dramatic recitative; the *recitativo secco* is practically banished, for it appears only in very short numbers, and even then with changing harmonies. His subjects Handel chose from the whole range of biblical history, a proceeding that has been followed by all subsequent composers of oratorios.

At the same time that Handel perfected the oratorio in England this art-form rapidly deteriorated in Germany. The baneful influence of the decadent opera affected all forms of sacred music. The oratorio, like the opera, soon consisted of a number of arias or duets, loosely strung together, and served no other purpose than the exhibition of bravura singing. There was practically no difference between the music of an oratorio and an opera. The works of this period have, therefore, very aptly been called 'concert oratorios.' What has just been said regarding the oratorio in Germany applies with equal force to that form in Italy. The oratorio had entirely lost its distinctive traits and assimilated those of the opera. It is not at all surprising, then, that when the reforms of Gluck brought about a change in operatic music, some change at once became noticeable in the oratorios. But even the best works of that time have not attracted more than passing attention. The first master since Handel who has written oratorios of sterling merit is Haydn (1732-1809) (*The Creation*, *The Seasons*). But Haydn's style is radically different from Handel's; while the latter's might be characterized as epic, the former's is rather lyric and descriptive. Even the instrumental introductions show the difference between the two masters. Those of Handel are fugal and belong entirely to the polyphonic-contrapuntal style, those of Haydn are descriptive and belong to the homophonic harmonic style. In Haydn's works the orchestra is a far more important factor than in Handel's. Strictly speaking, only the *Creation* is an oratorio; the *Seasons* is entirely secular in character and really a charming idyl in oratorio-form. Spohr (1784-1859) chooses loftier subjects and treats them in an individual manner, although he does not depart from established forms, while the sixteen oratorios of his contemporary, Schneider (1786-1853), who enjoyed great popularity during his life-time, were soon forgotten. The next great master in the history of the oratorio is Mendelssohn (1809-47). His two oratorios, *Saint Paul* and *Elijah*, are undoubtedly the greatest works in this form since the days of Handel. On the whole, Mendelssohn follows the principles that guided Bach, for, like the great Leipzig cantor, he insists upon the chorale. The overture to *Saint Paul* begins with an instrumental setting of one of the most famous chorales; then follows some fugal writing in which motives from the chorale are skillfully interwoven. The fugal writing in many choruses is more in the manner of Handel. But although

Mendelssohn adopted general art principles from his great predecessors, his music preserves throughout its own individuality, so that nothing could be further from the truth than to regard Mendelssohn as an imitator of either Bach or Handel. Liszt (1811-86) also tried his talents in the oratorio (*Christus, Saint Stanislas, Saint Elisabeth*), but these works do not mark any distinct phase in the development of the art-form. Rubinstein (1829-94), when he found that he was unable to compete with his formidable rival Wagner in the field of dramatic composition, turned his attention to the oratorio. His determined efforts to be original led him to make several attempts to revive scenic representations of the oratorio under the name of *sacred opera* (Geistliche Oper). His works in this form, *Paradise Lost, The Tower of Babel, Moses*, met only with a *succès d'estime*. Not even the idea of sacred opera is original with Rubinstein, for, as we have seen, up to the time of Carissimi oratorios were practically sacred operas. But even much later biblical subjects had been introduced upon the operatic stage, as *Joseph*, by Méhul, and *Mosè in Egitto*, by Rossini.

In France the form of the oratorio never found much favor. Not only have French composers not added to the repertoire of oratorios, but the performances of such works by Handel and other composers are very rare. The first biblical oratorios written in France are those of Lesueur (1763-1837). All of these are very short and were never performed outside of France. The first French oratorio that was heard outside of its native land was *L'enfance du Christ*, by Berlioz (1854). It only enjoyed a short popularity when after 1870 the Berlioz cult was at its height. Gounod's *Redemption* (1882) and *Mors et Vita* (1885) are probably the most important of the French oratorios, and they have both been given outside of France. The sacred works for the stage written by Saint-Saëns (1835—), *Samson et Dalilah* and *Déluge*, are constantly performed, both as operas and, without scenic accessories, as oratorios. The elaborate choruses are certainly in true oratorio style. Massenet's *Ève* (1875) and *La Vierge* (1880) and the four-act sacred drama *Marie-Madeleine* (1873) continue the tradition of the French school of oratorio.

Among modern oratorios the *Franciscus* (1888) of Tinel and the *Saint Ludmilla* (1886) of Dvořák have attracted considerable attention, while *The Dream of Gerontius* (1900), by Elgar, a young English composer, has been accepted by many writers as the finest specimen of English oratorio since the days of Handel. Quite recently (1897) a young Italian composer, Perosi (1872—), has come forward with a most ambitious work, an oratorio-trilogy, the three parts of which bear the titles: *Passion according to Saint Mare, The Transfiguration of Christ, The Resurrection of Lazarus*. The composer evidently attempted nothing less than a combination of the art-styles of Palestrina, Bach, and Wagner. But if we except the oratorios of Mendelssohn it would seem that the nineteenth century has produced no oratorios that are likely to live long. This inability of composers to write successful biblical oratorios led to the establishment of a form that has been called *secular oratorio*. It is true Handel (*Heracles, Semele*) and Haydn (*Seasons*) wrote such works, but these appear to be rather isolated instances, and besides attempt to preserve some connection with the real oratorio by occasional religious choruses. Schumann may be regarded as the founder of the 'secular oratorio.' His *Das Paradies und die Peri* (1843) was the first work in which the form of the oratorio was employed for a purely secular work. To this class belong also Schumann's *Faust* (1853) and *Der Rose Pilgerfahrt* (1851). Next to Schumann the greatest master of the secular oratorio is Bruch, whose *Odysseus* (1873) and *Achilleus* (1885) are frequently performed by the larger choral societies of Germany and England. Of other composers of this form the following are deserving of mention: Gade (*Die Kreuzfahrer*), Vierling (*Der Raub der Sabinerinnen, Alarich*), Lorenz (*Otto der Grosse*), Goldschmidt (*Die sieben Todsünden*), and Benoit (*Die Schelde*). See MIRACLE PLAY; MORALITY; MYSTERY; OPERA; and consult: Patterson, *The Story of Oratorio* (New York, 1902); Kretzschmar, *Führer durch den Concertsaal* (Leipzig, 1895-99); Upton, *The Standard Oratorios* (Chicago, 1890).

LIST OF IMPORTANT ORATORIOS.

Armes, P.	Hezekiah (1878).
	St. John the Evangelist (1881).
Arne, Abe	Abel (1755).
	Judith (1764).
Arnold, S.	Abimelech (1768).
	Prodigal Son (1767).
Atterbury, L.	Goliath (1773).
Bach	Christmas Oratorio (1734).
	St. Matthew Passion (1729).
	St. John Passion (1720).
Barnby	Rebekah (1870).
Barnett, J. F.	The Raising of Lazarus (1876).
Beethoven	Christus am Oelberg (1799).
Benedict	St. Cecilia (1866).
	St. Peter (1870).
Bennett	The Woman of Samaria (1867).
Berlioz	L'Enfance du Christ (1854).
Brahms	The German Requiem (1868).
Carissimi, G. (c.1604-74.)	Jephte.
	Baltazar.
	Jonas.
Cavaliere	La Rappresentazione dell' Anima ed il Corpo (1600, first oratorio).
Cimarosa, D.	Il Sacrificio d'Abramo (1786).
	L'Olimpiade (1787).
Costa	Eli (1855).
	Naaman (1864).
Cowen, F. H.	The Deluge (1878).
	Ruth (1887).
Crotch	Palestine (1812).
	The Captivity of Judah (1834).
Cusins	Gideon (1871).
David, F. C.	Moïse au Sinai (1846).
Dvořák	St. Ludmilla (1886).
Elgar, E.	The Light of Life (1896).
	The Dream of Gerontius (1900).
Goldschmidt, O.	Ruth (1867).
Gounod	La Redemption (1882).
	Mors et Vita (1885).
Graun	Der Tod Jesu (1755).
Handel	Israel in Egypt (1738).
	Il Trionfo del Tempo (1707).
	Esther (1720).
	Saul (1738).
	The Messiah (1741).
	Samson (1742).
	Joseph (1743).
	Judas Maccabæus (1746).
	Occasional (1746).
	Theodora (1749).
Haydn	The Creation (1796-98).
	The Seasons (1800).
Hiller, F.	Die Zerstörung Jerusalems (1810).
	Saul (1858).
Horsley, C. E.	Gideon (1860).
	David.
	Joseph.
Jenkins, D.	The Legend of St. David (1894).
Kiel, F.	Christmas (1874).

Klein, B.	Jephthah (1828). David (1830). Hiob (1829).
Leslie, H. D.	Immanuel (1853). Judith (1858).
Liszt	Die Legende von der heiligen Elisabeth (1864). Christus (1866).
Loewe	Die Festzeiten (1829). Die Zerstörung Jerusalems (1829).
Loreto, V.	St. Ignatius Loyola (1622).
Macfarren	St. John the Baptist (1873).
Mackenzie	The Rose of Sharon (1884).
Marx, A. B.	Moses (1850).
Massenet	Marie-Madeleine (1873). Eve (1875). La Vierge (1880).
Mendelssohn	St. Paul (1836). Elijah (1838-46). Christus (1841-47).
Meyerbeer	Gott und die Natur (1811).
Molique, B.	Abraham (1860).
Neukomm	Mount Sinai (1839). David (1834).
Ouseley	The Martyrdom of St. Polycarp (1855). Hagar (1873).
Paine	St. Peter (1873).
Parry, C. H.	Judith (1888). Job (1892). King Saul (1894).
Parry, Jos.	Saul of Tarsus (1892). Emmanuel (1880).
Pergolesi	San Guglielmo d'Aquitania (1731).
Pierson	Jerusalem (1852).
Porpora (1686-c.1766.)	La Martiria di Santa Eugenia.
Rheinthalen	Jephta (1856).
Rossini	Stabat Mater (1832-41).
Rubinstein	Der Thurm zu Babel (1870). Das verlorene Paradies (1876). Moses (1887). Christus (1895).
Saint-Saëns	Noël (1858).
Scarlatti, A. (1659-1725.)	Dolori di Maria. Sacrifizio d'Abramo.
Schneider, F.	The Judgment of the World (1819). Paradise Lost (1824). Pharaoh (1828). Christ the Child (1829). Gethsemane and Golgotha (1838).
Schubert	Lazarus (1828).
Schumann	Paradise and the Peri (1843).
Schütz, H. (1585-1672.)	Resurrection. Passion.
Spohr	Last Judgment (1812). Calvary (1833). Fall of Babylon (1840).
Stainer, J.	St. Mary Magdalen (1883). The Crucifixion (1887).
Stanford	The Resurrection (1875). The Three Holy Children (1885).
Sullivan	The Prodigal Son (1869). The Light of the World (1873).
Verdi	Manzoni Requiem (1874).
Winter	Pilgrimage to Calvary (1792).
Zingarelli, N.	The Passion (1787). The Flight into Egypt (1837).

ORATORIO SOCIETY. See CHORAL SOCIETIES.

ORATORY (Lat. *oratorius*, relating to an orator, from *orator*, orator, from *orare*, to pray, as a legal petitioner). The art or act of speaking persuasively to an audience, with elevation of thought and sentiment and corresponding expression.

The art of speaking in public in such a manner as to convince and persuade was one of the first to be developed in comparative perfection. Like other attainments of primeval man, it was crude in its early forms. The oldest record of such speech is what might be expected of Methusael's son Lamech, who, having commanded his small audience to hear his voice and hearken to his speech, declares that he will slay a man for wounding him, and cites an historic precedent in justification. It is the earliest type of oratory—the war harangue, either by way of rousing warlike ardor in the tribe, or of bragging about heroic deeds, as happens among savages to-day. Similar examples of the war speech occur in the *Iliad* and in Herodotus and Thucydides, all the while growing longer and fuller of form and art with progress in literary cultivation.

After the military address, as of generals to armies, and often with it, other forms began to be evolved as races emerged from barbarism. When a sense of equity and regard for human rights prevailed over despotic might sufficiently to establish tribunals, it became necessary that men should defend their own interests. As these soon began to be sacrificed to the difference in natural ability which prevails in communities, the monopoly of speaking in courts passed to the skilled advocate, who first had written the client's argument for him to deliver in person, and who later became his proxy in speaking. Three names mark the progress of this movement in the fifth and fourth centuries B.C.—Corax of Syracuse, who attempted to make every man his own advocate by furnishing him a blank brief which needed but little variation in filling at a time when the purpose of most litigation was to recover alienated estates; Lysias, who wrote arguments with more reference to the character and rank of the several clients who were to deliver them; and finally Isocrates, who instructed men of native ability in the principles and practice of oratory, into whose hands the business of advocacy at length passed from the unskilled citizen and the professional logographer. In this school of Isocrates the great orators of Greece were trained, and by him eloquence was raised to a height corresponding to that of the contemporary art of sculpture. His own Eulogy on Athens was the labor of years, and at the age of ninety-eight he is said to have been still revising and correcting it. It was copied and recited in all Hellenic lands.

To the oratory which arose from the maintenance of personal rights in courts of law another kind was added when government by popular legislation succeeded despotism, and deliberative speaking in the assembly followed forensic in the tribunal. This political oratory Isocrates principally taught, and from his school proceeded a group known as the Attic Ten (eight in addition to Isocrates and Lysias), who contributed to the literature of ancient eloquence its choicest examples. At the same time they illustrated several styles which have proved most effective, establishing the truth that excellence is not the sole prerogative of any one of them. Andocides, for example, represented natural orators, who rely upon native gifts and have a corresponding contempt for rhetorical precepts and methods. As a consequence he was sometimes obscure, irrelevant, and careless in arrangement; carrying his point by keeping in sympathy with his audience, interesting them by anecdotes, and by making his plain speech still clearer by abundant illustration—his energy and self-conceit bringing him through difficulties that might have foiled more sensitive speakers. Isæus exemplified a step forward by his skill in arranging his arguments and massing them with cumulative force, without loss of the animation and vivacity which are the dependence of the natural orator. Hyper-

ides used still greater craft in the disposition of his material—a matter of great importance to the ancients—emphasizing his strong points, artfully concealing his art, popularizing his diction with colloquialisms, a general speaker with a variety of graces, witty, sarcastic, playful, and grave by turns. Æschines was a man who did not permit a natural gift of spontaneous eloquence to lead him into the pitfalls of extemporization, but habitually practiced composition, to which he added a careful study of literature, together with such training in delivery as the stage could give. In consequence his speeches were sometimes called greater than himself, too theatrical for reality. This was not the charge against Demosthenes, with whom he had the honor to be associated in the famous case of the Crown, and in whom Attic oratory culminated. Having had its rise in the dialectics of the Sophists and the formal rhetoric of the Sicilian forensics, it took on by turns leading phases in the solemnity of Thucydides, the majesty of Pericles, the stateliness of Antiphon, the plainness of Lysias, the ornateness of Gorgias, the elegance of Isocrates, the artlessness of Andocides, and the vigor of Isæus. All these were aspects of eloquence by which Demosthenes profited. By study of them all he gathered from each the best, making such selection and combination with his own personal gifts as placed him above them all.

These gifts did not at first promise the final achievement. With neither good voice nor commanding presence, short-breathed, defective in articulation, clumsy in manner, Demosthenes on his first appearance in the assembly aroused uproarious and derisive laughter. But he determined to be heard later. He ran up hill, declaimed by the seashore, gestured before a mirror, and learned from actors the outward signs of eloquence. To getting the inner spirit and power were devoted seven years of apprenticeship in speech-writing and studies in history and law, politics and economics, with civil cases in courts, until he began to discuss State affairs in the assembly and to assert for Athens her leadership and to rouse her slumbering patriotism. Then there was the ethical element as the basis of all, giving irresistible force to his clear, terse, and direct address. What is honorable, for States as for citizens, as distinguished from what is expedient, was the undercurrent of his discourse; so what was best for the whole country rather than what was profitable for his own city. With this main motive underlying the power he had gained by patient toil, he won the primacy in a group not easy to approach. It is not possible to sum up briefly the secret of his surpassing power; but the vast variety which follows exact adaptation to present purpose as related to a final issue covers in a general way the many phases of Demosthenes's eloquence. Like all great masters of art, he could go out of himself to become a part of occasions and opportunities. Losing himself in these, he gained the whole world's tribute of admiration, and his fame still survives as the most eloquent orator of antiquity.

With the decline of liberty Greek oratory began to be imitative, and an age of original production was followed as usual by classification, criticism, and partial reproduction.

Early Roman oratory, like the people, was sturdy and energetic, more practical than imaginative. War, politics, legal and political rights were controlling ideas. Extension of domain and the sway of law were the main purpose of national life, and public speech took its tone from these sentiments. At first it was martial, to soldiers on the field and to the populace on the return from war, when the victor found eloquence an aid in winning civil honors. The courts, too, were an early training ground for speakers, as also the primitive drama had been in both Rome and Greece, in which lengthening speeches of actors finally outgrew dialogue.

Pristine oratory in Italy was exemplified by Cato the Censor in the first half of the second century B.C. Austere, reserved, morose, as Cato was, his speaking was rude, unpolished, and ungraceful, yet clear, concise, and direct, making him a formidable accuser and a strong defender. Contemporary eloquence was marked by a similar vigor and vehemence unaccompanied by Athenian graces, until the Gracchi dropped early harshness and introduced a milder and freer mode. Their successors, condescending to learn at Athens, began to elevate the art to the eminence attained by Greek genius. Marcus Antonius was master of point and pathos; Licinius Crassus of perspicuity and the union of brevity with elegance; Cicero reached the height of Roman eloquence.

For one hundred years increasing refinement had been adding imported grace to native strength. Cicero, after the custom of his time, sought foreign accomplishments in the rhetorical schools of Greece and Asia. At forty he was skilled beyond his contemporaries as a forensic and deliberative orator. His excellence lay in harmonious and full development more than in possession of special aptitudes alone. Skilled in all the arts of discourse, like the rhetorician that he was, methodical in arrangement, adroit in treatment of subject and audience, resourceful, versatile, adaptive in discussion; copious, lucid, graphic in diction; flexible, rhythmical, harmonious in style; plausible, felicitous, brilliant in manner; knowing the power of an apposite word and a fitting phrase, always adapting his mood to that of his hearers in order to bring them eventually to his own position—these were Cicero's virtues, ranging over the whole field of oratorical possibilities. Adapting himself to every class of subjects, he also brought himself into harmony with the structure of the Latin language, which required fullness for perspicuity; also into sympathy with Roman taste, which loved the swell and the rhythm, the balance and the cadence of sonorous sentences. His copiousness sometimes runs into verbosity and his elaboration into artificiality; but his customary wealth of diction, solid argument, philosophic sentiments, and fervent declamation captivated his hearers and carried his points by persuasion, if not by conviction. Cicero spoke right onward toward the end and object of discourse, reducing his usual amplification to briefest enumeration, making his speech both clear and stimulating. Better than all else, he possessed the ethical element which is the foundation essential to all effective speaking, an honesty and sincerity which is everything to the unskilled, and without which brilliant eloquence is mere trickery. His aim was to do right; his mistakes were those of his judgment rather than his heart. In a sense his eloquence was

complementary to Demosthenes's, his acknowledged master. If not so energetic, it was more vivacious, enlivened with a wit which the terribly earnest Greek did not possess. If it did not sweep down throngs with chain shot, there was much display of flash and fire, which pleased by picturesqueness and accomplished the same purpose with superficial hearers, that is with the majority. If it was more wordy, the people whom it addressed and the language they used demanded more leisurely thought and more expanded expression; but together these two leaders of speaking men in the two dominant nations of ancient Europe achieved every excellence of oratorical form and manner. What they lacked was not yet revealed—the higher reaches of ethics and a more comprehensive kindness.

When this revelation came, after the decline in eloquence with the loss of liberty that followed Cicero's age, a new spirit seized upon old forms. While Quintilian, the rhetorician, was gathering up the remains of Latin oratory, as Aristotle had done with Greek oratory, a provincial, Paul of Tarsus, was declaring Christianity at Rome and Athens and in the provinces. Later, Athanasius took up its defense and propagation at Alexandria, Chrysostom at Antioch, Basil and the Gregories in other cities, while the Latin Tertullian at Carthage, Ambrose at Milan, and Leo at Rome exemplified the new eloquence, and founded a new empire upon the ruins of the old. This eloquence had a freedom and irregularity which could not be restrained within classic bounds, as the new wine could not be kept in old bottles; but it was suited to the work it had to do, and it did it well.

When zeal took on a crusading temper another and wilder style of preaching was addressed to mobile multitudes, starting them toward Palestine by its harangues and keeping them moving by continual exhortation. Such was the oratory of Peter the Hermit. These pilgrimages from the West into the East being over, oratory subsided into the eccentricities of mediæval preaching against which Dante inveighed, angrily declaring that certain priests were bent only on amusing with jests and idle tales, so that their flocks went home fed on wind. The *Exempla* of Jacques de Vitry bear witness, also, to the mediæval, yet not wholly mediæval, appetite for anecdotic sermons. Oratory was once more infused with earnestness at the Reformation; its classic forms were recalled with the rise of great preachers like Bossuet; it reflected the stormy aspects of the French Revolution, and reappeared in its better phases in the parliamentary eloquence of Great Britain in the last half of the eighteenth century.

This was nearest to a repetition of the ancient periods of classical eloquence that has occurred, and one of the results of the revival of Greek learning. The education of deliberative orators like Pitt and Mansfield, Burke and Fox, was chiefly in the oratory of antiquity. From its best examples each gathered such features as were worth most to him: Pitt, simplicity of treatment, luminousness of statement and illustration, enforced by impetuousness of delivery; Mansfield, a statement of his case better than most men's arguments, leading hearers step by step irresistibly to his conclusions; Burke, who combined the study of ancient classics with those of his own country, gaining from both the power of common words effectively placed, and of the sonorous sentence when needed; Sheridan, more Asiatic in manner, as Fox was Attic—all of them, and others, too, having their counterpart in men who lived twenty centuries before, a group of statesmen orators whose equals collectively and individually have appeared but once in history, and whose works remain as the second embodiment of eloquence in the records of human speech.

It is not an idle boast to say that a third period is found in the century between 1765 and 1865 in our own land. Questions of colonial confederation, of independence, of self-government under a constitution, of reserved and delegated rights, of extension or extinction of slavery, of war and reconstruction, formed a series of issues demanding political wisdom and involving earnest discussion, which incidentally trained three generations of orators. Their model at first was British eloquence. The fathers read it and replied to it in a manner to compel the respect and praise of English statesmen. Patrick Henry, Richard Henry Lee, Drayton, and the Rutledges and their compeers in the South, and James Otis, the Adamses, Hamilton, Jay, and their fellow patriots in the North, led the people in the war of ideas and words which preceded the strife of arms. In the Congress of the new nation three men came to the front in the early part of the nineteenth century, who represented as many sections of the country and styles of oratory. Of these Henry Clay was earliest and longest in legislative halls. Frank and bold in nature, honest and sincere in conviction, ardent and hopeful in temperament, he had a rare power of inspiring others with his own sentiments and expectations. His clear and positive views were expressed in lucid terms addressed to the understanding of the people with a freedom and unconstraint that belonged to a new country, and on the floor of Congress his magnetic presence and flowing speech won the hearts of many who could not agree with his political doctrines. He reached more of his countrymen in all sections than any other contemporary, standing as he did on middle ground geographically and politically. An extreme Southern position was held and defended by Calhoun, a man of rigid logic, commanding more respect than enthusiasm, sincere, devoted, persistent; calm and impressive in manner, or vehement and fiery, but relentless in his inexorable demonstration of what he believed to be true. For the North of his day Daniel Webster stood and spoke. Though somewhat academic in his early manner, he found later the value of plain words with plain people and of the best English with everybody. Having a strong grasp of legal principles at the bar and broad views of national questions in Congress, he added perspicuity and energy, vigor of reasoning and felicity of diction to a majesty of voice, presence, and personality which delighted, impressed, and awed assemblies beyond all that the printed pages of his speech can convey. History and tradition alone can prolong his fame.

In the department of occasional addresses, commemorative, eulogistic, and expository, Webster had an eminent successor in Everett, whose eulogy upon Washington is the best example of its kind. The approach of the Civil War gave a fresh impulse to genuine oratory through the magnitude of the issues at stake. In Congress,

Sumner, whose academic discourse had been heavy as cloth of gold with ancient spoils, now devoted his wide learning, moral force, and commanding eloquence to the cause of unqualified freedom throughout the land. The same demand was made before popular assemblies by Wendell Phillips in his own way and by a manner of speech that for convincing an audience against its understanding and persuading it against its will has seldom been surpassed.

BIBLIOGRAPHY. For general view and reference: Sears, *History of Oratory from the Age of Pericles to the Present Time* (Chicago, 1896); also his "Introduction" to the *Library of Modern Eloquence* (New York, 1901). For ancient oratory: Jebb, *Attic Orators* (London, 1876); Mahaffy, *History of Classical Greek Literature* (New York, 1880); Crutwell, *History of Roman Literature* (London, 1898); Cicero, *Oratory and Orators*, and *Brutus* (ib., 1871); Tacitus, *Dialogus de Oratoribus* (ib., 1865); Longinus, *On the Sublime* (ib., 1890); Quintilian, *Institutes of Oratory* (ib., 1865). For patristic and mediæval: Consult the lives of the Christian Fathers in Cave and the *Ante-Nicene Library* (New York, 1895); and biographies of Peter the Hermit, Bernard of Clairvaux, and other preachers of crusades. For Jacques de Vitry, consult Crane, *Exempla*, edited for the Folklore Society (London, 1890). For modern: Cormenin, *Orators of France* (New York, 1847); also biographies and sermons of the great preachers of Louis XIV.'s reign; the *Lives* of the reformers, especially Luther and Latimer; Goodrich, *British Eloquence* (New York, 1861); Nicoll, *Great Orators* (Edinburgh, 1880); Magoon, *Orators of the Revolution* (Cincinnati, 1847); Mathews, *Oratory and Orators* (Chicago, 1879); Parker, *Golden Age of American Oratory* (Boston, 1857). For technique and construction: Aristotle, *Rhetoric*, and its successors to the present day, including the *Lectures* of J. Q. Adams (Cambridge, 1810); of Blair (Edinburgh, 1825); of Channing (Boston, 1856). On special departments: Robinson, *Forensic Oratory* (Boston, 1893); Phelps, *Theory of Preaching* (New York, 1881); Storrs, *Preaching Without Notes* (ib., 1897); Holyoake, *Public Speaking and Debate* (London, 1895); Sears, *The Occasional Address* (New York, 1897); and "After-Dinner Speaking," in *Library of Modern Eloquence* (New York, 1901). And above all, the works of the best orators in all ages.

ORATORY. A chamber or building designed for worship of a private or domestic character. From the earliest days of the Christian Church the use of oratories is traceable; and before the regular organization of parishes they had probably a considerable place in the common, although not in the public worship. Until the middle of the third century A.D. Christians gathered for worship almost entirely in the main hall of some large private house, and when independent church buildings became the rule, the service of prayer and even the celebration of the mass were continued, by superior permission, in many houses. One oratory of the third and another of the fourth century have been recently discovered in Rome. The councils of the Church then legislated against the abuse of such private oratories. Another class of oratories were the memorial chapels erected to noted persons, where mass could be celebrated at the anniversary; only prayer at other times. These were usually circular or polygonal in shape, like that of the father of Saint Gregory Nazianzus. Oratories took on a different character with the opening of the Middle Ages and the distinction was more closely drawn between those where prayers alone could be held and those where mass could be celebrated either on certain days or at any time. The Papal, episcopal, royal, and feudal castles and palaces were not complete without their chapels or oratories. Oratories for mass were under the strict supervision of the local bishop and required his consecration. The Council of Trent placed them under stringent regulations, which have been enforced and developed by later popes, especially Benedict XIV. During the Middle Ages oratories were attached to monastic, cathedral, and other churches, like the famous San Venanzio at Saint John Lateran in Rome.

ORATORY, CONGREGATION OF THE. The name of two religious associations in the Roman Catholic Church.

(1) The Oratory of Saint Philip Neri, the account of whose origin is given in the article on this saint. Unlike most other founders of religious Orders, he had never committed to writing any definite body of rules for the government of the members; even his scattered papers, from which his intentions might have been collected, had been burned by his orders a short time before his death. Soon afterwards, the fathers, at the instance of Baronius, who was then superior, compiled from the existing practices and from memory a rule framed so as to embody the spirit of the founder. This was approved by Paul V. in 1612. The object of the congregation was to carry on Saint Philip's work in his own spirit; its members are a body of priests living in community, but without monastic vows and under a constitution of a very democratic character. They are at liberty to withdraw at any time, and to resume possession of any property they brought with them. There is no general superior; each house is independent, with a superior elected for three years. Seven houses were already in existence at the founder's death; the number increased rapidly, and reached one hundred in Italy alone, twenty-one in Spain, six in Portugal, and eight in France. It is now, however, reduced to a few houses in Italy and Spain. It took a fresh life in England in the middle of the nineteenth century, when John Henry Newman, soon after his change of religion, established at Maryvale, near Birmingham, a house which was afterwards transferred to the town, and later another in King William Street, Strand, London, since transferred to Brompton, near the South Kensington Museum. The English Oratorians, who have mainly been converts, have numbered not a few distinguished men. An account of the London Oratory is given in Bowden, *Life of Frederick William Faber* (London, 1869). The Italian houses also counted many men of eminence in various branches of sacred learning; the great historian Baronius and his continuators; the celebrated explorers of the Roman catacombs, Bosio, Severano, and Aringhi; and the historian Theiner. Consult Villarosa, *Scrittori Filippini* (2 vols., Naples, 1837-42).

(2) The Oratory of Jesus, a French congregation, founded in 1611 by Pierre (later Cardinal) de Bérulle. As early as 1601 he had conceived

the idea of founding a community of priests not bound by monastic vows, and spent a long time in preparation, endeavoring to secure Francis de Sales or César de Bus as its first superior. At the bidding of the Archbishop of Paris he finally undertook the work himself, and began the community life with five associates. The new congregation received Papal confirmation in 1613, under the name of 'Oratory of our Lord Jesus Christ,' when it already numbered seventeen or eighteen members. It soon spread through France, and established a house in Rome in 1618. Unlike the Italian Oratory, it was under one superior-general, elected for life. The founder, who died in 1629, was succeeded by Père Condren. Under the third general, Bourgoing, who held the office from 1641 to 1662, the Oratory began to be implicated in the Jansenist troubles. Some outspoken Jansenists, such as Quesnel, left the congregation to secure greater freedom of action; but others remained, and in 1711 the superior-general, de La Tour, was at the head of the opposition to the Constitution *Unigenitus*. (See JANSENISM.) In spite, however, of the drawbacks which this recalcitrant attitude entailed, the congregation had at the outbreak of the Revolution 70 houses, with 751 members, of whom about one-third were priests. Such distinguished men as Malebranche, Massillon, and Thomassin are among its glories. It was practically extinguished by the Revolution, and did not come into full life again until 1852, when it was revived by six men, among them the famous orator Gratry and the future cardinal Perraud. It was confirmed anew, with some slight modification of the rule, in 1864. Consult: Perraud, *L'Oratoire de France au XVII^ème^ et au XIX^ème^ siècle* (2d ed., Paris, 1866); Tabaraud, *Histoire de Pierre de Bérulle* (ib., 1817); and the historical memorials of the early days contained in the *Bibliothèque oratorienne* (ib., 1880 sqq.).

ORBEGOSO, ôr'bā-gō'sō, LUIS JOSÉ (1795-1847). A Peruvian general. He was born in the Province of Huamachuco, was well educated, and successfully managed the great estates left by his father, besides gaining some military reputation in the war for independence, to which he devoted his wealth. In 1833 he was chosen President by the Constitutional Assembly. A civil war, which broke out in 1834, was peaceably settled, but the revolts of the next year were so much more serious that the President asked help from Santa Cruz, then President of Bolivia. Peru and Bolivia were united in 1836, and Orbegoso became President of the State of Northern Peru, from which post he was ousted (1837) by a force of independent Peruvians and soldiers from Chile. He was exiled, but returned to Trujillo shortly before his death.

ORBICULOIDEA (Neo-Lat. nom. pl., from Lat. *orbiculus*, diminutive of *orbis*, circle). An extinct genus of hingeless brachiopods allied to and closely resembling the modern genus Discina, with which it was formerly considered identical. The shells are thin, depressed, subcircular in outline with eccentric beaks and concentric growth lines, and they vary from one-tenth to two inches in diameter. A slit-like opening in the lower valve served for the passage of a tough muscular pedicle that attached the shell to foreign objects. The genus is represented in all formations from the Ordovician to the Cretaceous in America, Europe, and Asia, and is especially abundant in some shales of Devonian and Carboniferous age.

ORBIGNY, ôr'bē'nyē', ALCIDE DESSALINES D' (1802-57). A French paleontologist, born at Couëron (Loire-Inférieure). He early devoted himself to the study of natural history. In 1826 the Museum in Paris sent him to South America, whence he returned in 1834 with a large collection of notes and specimens. The results of his travels appeared in *Voyage dans l'Amérique méridionale* (1834-47). In 1840 he began the publication of his valuable *Paléontologie française* (14 vols., 1840-51), which he continued until within three years of his death. In 1853 Orbigny was appointed to the chair of paleontology at the Jardin des Plantes, Paris. Among his principal works are: *Cabrie ornithologique des oiseaux d'Europe* (1836-38); *Mollusques vivants et fossiles* (1845); and *Prodrome de paléontologie stratigraphique universelle des animaux, mollusques et rayonnés* (1850).

ORBIL'IUS PUPIL'LUS (*c.*113-*c.*13 B.C.). A Roman grammarian remembered chiefly as the teacher of Horace, who has immortalized him as the 'flogging' (*plagosus*) Orbilius (*Epistola*, ii. 1. 71). He was a native of Beneventum, but settled at Rome during the consulship of Cicero, B.C. 63. After his death a statue was erected to him at Beneventum.

ORBIS PIC'TUS (Lat., World Illustrated). The title of the first successful illustrated manual of instruction for the young, and the most popular and widely circulated school-book ever issued in Europe. It was published by the celebrated educator Johann Amos Comenius in 1657, has been translated into many European and some of the Asiatic languages, and in various modified forms has continued popular, having been issued in many editions down to recent times. This work can be considered as the beginning of the introduction of object-teaching and nature-study into school work. See COMENIUS; EDUCATION; NATURE-STUDY; OBJECT TEACHING.

ORBIT (from Lat. *orbita*, track of a wheel, course, orbit, from *orbis*, circle). In astronomy, the path described in space by a heavenly body. The paths described by the different planets are of elliptic form, and would be accurately an ellipse, were it not for disturbing influences of the other heavenly bodies known as perturbations (q.v.). The complete determination of a planet's orbit is of the greatest importance to astronomers, as it enables them to predict the planet's place in the heavens at any period, and thus to determine the exact date of eclipses of the sun and moon, of transits and occultations of the planets. For the determination of a planet's orbit, it is necessary to know three things: (1) The situation of the plane of the orbit in space; (2) the position of the orbit in this plane; and (3) the situation at a given epoch, and rate of motion, of the planet in its orbit. Since the plane of the ecliptic (q.v.) is for convenience taken as the reference plane, the position of the plane of a planet's orbit is known when its inclination to the plane of the ecliptic (1) and the line of intersection of the two planes (2) are known. The orbit cannot lie wholly above or below the plane of the ecliptic, but must cut it in two points, called *nodes* (q.v.), and the position of

the line of intersection, or line of nodes, is generally given in terms of the longitude of the ascending node. The situation of a planet's orbit in its plane is determined when we know its shape (3), magnitude (4), and the position of its major axis or line of apsides (5). The shape and magnitude of the orbit depend upon the length of its major and minor axes, but astronomers prefer to employ the major axis and eccentricity (see ELLIPSE); and the position of the major axis is known by determining the heliocentric longitude of its *perihelion*. To complete our knowledge of a planet's motion, all we now require are the epoch of its appearance at some determinate point of its orbit, say at the perihelion (6), and the velocity of its motion in its orbit (7), for when this last is known, the law of areas, as given in Kepler's second law, enables us to determine the position of the planet in its orbit at any future period. These seven facts, the possession of which gives us a complete clue to a planet's motion, are called the seven 'elements' of a planet's orbit. What has been here stated concerning the planetary orbits is similarly true of the comets and satellites, though in the case of the latter the effect of disturbing forces is so great as to produce a considerable change of the elements in one revolution. See ELEMENTS.

ORB-WEAVER. A spider of the family Epeiridæ, that spins a wheel-shaped web. The framework of the web is composed of strands of silk that radiate out from the centre like the spokes from the hub of a wheel. When this framework is completed, the spider begins at the centre to spin a spiral line out toward the edge. Whenever the spiral line crosses the spokes it is attached to them. When the outside is reached, the spider begins to spin a closer spiral, gradually approaching the centre. While the threads of the first spiral were smooth, those of the last are sticky. These are the snare threads. The threads of the first smooth spiral, which served merely as a stay, are bitten away during the course of the construction of the new sticky spiral. The webs of some of the orb-weavers are strengthened by zigzag ribbons, while the webs of other species are not complete orbs.

OR'CA. A killer-whale. See KILLER.

ORCAGNA, ôr-kä'nyä. ANDREA (c.1308-c.1368). The greatest Italian artist of the fourteenth century, excepting Giotto. His real name was Andrea di Cione, and he was probably born about 1308 at Florence. He is supposed to have first studied in the workshop of his father, Cione, a famous goldsmith, and to have then passed to the studio of Andrea Pisano, then at work on the bronze baptistery gates. Perhaps he also studied with Giotto, but Pisano's influence upon his art was decisive. His masterpiece of sculpture is the tabernacle at Or San Michele (1359), the most beautiful product of Gothic sculpture in Italy; that of wall-painting, the "Paradise," in the Strozzi Chapel at Santa Maria Novella; that of mosaic work, the façade of the Cathedral of Orvieto; that of tempera-painting, the altar-piece in the Strozzi Palace at Florence. The "Last Judgment" and the "Inferno" in the Strozzi Chapel are inferior to the other part of the trilogy, the "Paradise." Orcagna is more spiritual in feeling and more sculpturesque in rendering than Giotto, and more epic in his compositions. His figures are far more graceful and well proportioned. He mastered tenderness as well as energy of expression, and in painting made great advances in perspective, and in the treatment of light and shadow in sculpture.

Modern study has shattered several of Vasari's and other ancient writers' attributions to this master. It is known that he did not build the famous Loggia dei Lanzi at Florence, or paint the "Triumph of Death" and the "Last Judgment" in the Campo Santo at Pisa. Orcagna's influence was great even beyond Tuscany. Consult Vasari's *Lives* in the edition annotated by Milanesi (Florence, 1878-85), and in the Blashfield translation (New York, 1896); also, Crowe and Cavalcaselle's *History of Painting in Italy* (London, 1864-66); Marcel Reymond, "La sculpture florentine," in *Gazette des Beaux-Arts* (1893-94); Dobbert, in Dohme, *Kunst und Künstler Italiens* (Leipzig, 1878).

ORCEIN, ôr'sē-in, $C_{19}H_{17}NO_3$. An amorphous red coloring matter produced by the action of oxygen and ammonia upon orcin (q.v.). It is freely soluble in alcohol, but only sparingly in water. With metallic salts it yields insoluble colored precipitates (lakes), which are of considerable value in dyeing. Orcein is the chief constituent of commercial archil (q.v.).

ORCHARD (AS. *ortceard, ortgeard*, Goth. *aurtigards*, from *ort*, Goth. *aurti*, Oicel. *urt*, herb; connected with AS. *wurt*, Goth. *waurts*, OHG. *wurz*, Ger. *Wurzel*, Olr. *frem*, Lat. *radix*, Gk. *ῥάδαμνος, rhadamnos* + *geard*, Goth. *gards*, OHG. *gart*, Ger. *Garten*, garden; connected with Olr. *gort*, crop, Lat. *hortus*, garden, Gk. *χόρτος, chortos*, yard). Any plantation of cultivated fruit trees. The fruits usually classified as orchard fruits include apples, peaches and nectarines, plums and prunes, pears, cherries, quinces, and apricots. These are all deciduous fruits. Plantations of citrus fruits, olives, etc., are sometimes referred to as groves and sometimes as orchards, and the same is true of plantations of cultivated chestnuts, pecans, walnuts, etc. In this article only deciduous fruits are considered. In Europe, especially in Germany and France, much of the deciduous fruit is produced on the fruit trees which line the principal highways. There also large quantities of deciduous fruit are grown on walls, espaliers, and cordons, requiring special pruning and training. Practically every farm in America, more particularly in the Northern States and Canada, contains an orchard for family use. The largest commercial orchards in the world are found in America, where the trees are allowed to grow naturally with but relatively little pruning, and where attention is given to thorough cultivation, spraying, and fertilizing. The total value of the orchard fruits produced in the United States in the year 1899 was $83,751,840. The total number of fruit trees that year is reported as 367,164,694, of which 55 per cent. were apple trees, about 27 per cent. peach and nectarine, 8 per cent. plum and prune, and 4.5 per cent. pear; cherry trees stood next in importance, and apricot trees last. Among the more striking developments in modern orchard fruit-growing are (1) the increased attention given to orchard tillage; (2) the practice of spraying to control insect pests

and fungous diseases; (3) fertilizing; (4) thinning; (5) use of small packages in marketing; and (6) the development of cold storage and refrigerator-car transportation.

Formerly the orchard in America was a small adjunct of the general farm. After setting out the trees the orchard was largely left to itself. Occasionally the trees were pruned, but the orchard was seldom fertilized or tilled, and was either left in sod or planted to farm crops. With the increased demand for fruit among all classes of people, greater attention was paid to orchards. In favorable localities they become the most important part of the farm. Gradually whole farms and localities come to be given up to orchards, which in many districts occupy hundreds of square miles.

With the development of the orchard came increased attention to cultural details. Orchards are prepared by deep plowing, subsoiling in heavy lands, and thorough harrowing. After the trees are set they are given as clean cultivation as other farm crops. Hoed crops may be planted between the rows of trees for the first few years, but as the trees increase in size these are more and more restricted to the middle of the rows, until finally when the trees come into bearing the whole space is devoted to them alone. Neither cereals nor tall-growing crops that are likely to shade the trees are sown in the young orchard, nor is the orchard seeded down except under special conditions, as when the trees are growing too rankly and produce little or no fruit. In such cases seeding to cereals, grass, etc., may tend to check growth and throw the trees into bearing. The orchard is plowed in spring as early as the ground can be worked. This is followed by cultivation every week or ten days until about the middle or last of summer, or until the wood growth of the tree has practically ceased. At the last cultivation a cover crop is sown. If the soil is poor in nitrogen a leguminous crop is used, otherwise some cereal or grass may be sown or the weeds allowed to grow. The object of the cover crop is fully to check the growth of the tree for the season, so that the wood may ripen up well before winter. The cover crop also protects the soil from leaching, washing, and puddling in winter. The following spring the cover crop is plowed under, and the summer cultivation repeated. In arid regions irrigation (q.v.) must be practiced. Spraying to check the ravages of injurious insects and plant diseases is considered absolutely essential in American commercial orchards for the production of first-class fruit. (See FUNGICIDE.) The fact that the production of orchard fruits draws on the fertility of the soil in exactly the same manner that wheat, corn, or any other farm crop does, is well recognized, and the orchard is regularly fertilized. Orchards are no longer permitted to bear all the fruit the trees will set, so that the limbs have to be propped up to keep them from breaking. Crops thus produced were found to contain too many small and unmerchantable fruits, besides rapidly exhausting the energies of the tree. Especially is thinning practiced with the more expensive fruits, such as peaches, and in many orchards even the cheaper fruits, like apples, are thinned. The thinning is done soon after the fruits attain the size of the end of the thumb.

In the marketing of fruits much more attention is paid than formerly to the convenience of the ultimate purchaser, i.e. the consumer. Small packages which he can conveniently carry home from market are most in demand. (See MARKET.) Cold storage is being employed not only in the main centres of consumption, but in the fruit districts themselves. It makes possible the prolongation of the marketing from a few weeks to, in some cases, as many months, thus lessening the danger from glut on the market, increasing the net returns to the grower, and greatly prolonging the season when fresh fruits may be obtained by the consumer. Refrigerator cars also make possible the transportation of perishable fruits to distant and better markets. See also REFRIGERATION.

The agricultural experiment stations have published an enormous number of bulletins and reports on the various phases of orcharding, some of which are *Orchard Cover Crops* (New York Cornell Agricultural Experiment Station, Bulletin 198); *Improving an Orchard* (Rhode Island Agricultural Experiment Station, Bulletin 83); *Orchard Experiments* (Massachusetts Agricultural Experiment Station, Bulletin 82); *The Apple Orchard* (Missouri Agricultural Experiment Station, Bulletin 490). Consult also literature under the various orchard fruits. See FRUIT, CULTIVATED; HORTICULTURE.

ORCHARD GRASS, COCK'S-FOOT GRASS (*Dactylis*). A genus of grasses, closely allied to Festuca, having the panicle of flowers mostly on one side of the stem, and the spikelets much crowded into clusters. The common orchard grass (*Dactylis glomerata*), a native of the Northern Hemisphere, grows in tufts in meadows, open woods, etc., from sea-level to high altitudes, and is an important natural pasture grass, since it is much relished by cattle, grows with great rapidity after being cut, yields a large quantity of herbage, succeeds well on most soils and in situations too shady for any other grasses. A large improved variety has been introduced into cultivation. It succeeds well in all parts of the United States except in the extreme South, and in the arid regions of the West, yields excellent hay abundantly, and is unexcelled by other grasses in its yield of aftermath, but its tendency to grow in tussocks is rather against it. This habit may be prevented to some extent by frequently rolling the ground. On this account also it is usually sown mixed with other grasses.

ORCHARD ORIOLE. See ORIOLE.

OR'CHARDSON, WILLIAM QUILLER (1835—). A Scotch genre and portrait painter. He was born in Edinburgh, and was educated at the Trustees' Academy. He exhibited his earliest pictures in the Scottish Royal Academy, but in 1863 he went to London, where he afterwards lived. He became associate to the Royal Academy in 1869 and member in 1877. His work is a pictorial representation of the social side of life, the pleasures of ballroom and drawing room being attractively defined in movement and rich coloring, and graceful and richly robed figures. Among his most important pictures are: "The Challenge" (1865); "The Queen of Swords"

(1877); "Napoleon on Board H. M. S. Bellerophon" (1880), South Kensington Museum; "Un Mariage de Convenance" (1884); "Un Mariage de Convenance—After" (1886); "The Salon of Madame Récamier" (1885); "The Young Duke" (1889); "In the Gloaming" (1901).

ORCHESTRA, ôr'kĕs-trä (Lat. *orchestra*, from Gk. ὀρχήστρα, from ὀρχεῖσθαι, *orcheisthai*, to dance, from ὄρχος, *orchos*, row; connected with Skt. *ṛgh*, to rage). In the Greek theatres, the place allotted to the chorus of dancers; in modern theatres, the part of the building assigned to the instrumentalists, also the parquet; and in the modern concert-room, the place occupied by the instrumental and vocal performers. The word orchestra is also used to denote the musicians collectively, and especially the instruments on which they play.

The modern orchestra (referring to the instruments) is the result of a long and slow development. Before the seventeenth century composers had employed various instruments in the accompaniment of their vocal works. But in the choice of instruments the composers seem to have been influenced more by chance than by any definite plan. In fact, the manner in which many instruments were treated gives conclusive evidence that their nature and possibilities were not at all understood. The development of the orchestra coincides with that of the opera (q.v.). In the first opera ever performed in public, Peri's *Euridice* (1600), the orchestra consisted of a harpsichord, a lute, a theorbo, a lyre, and three flutes. The function of this combination of instruments was to give the very simplest kind of accompaniment to the dramatic recitative. Claudio Monteverde (1567-1643) was the first to discover the nature and relative value of some of the instruments. Yet the instrumentation of his first opera, *Orfeo* (1607), differs little from that of his predecessors. But his *Combattimento di Tancredi e Clorinda* (1624) shows a consciousness of purpose and is full of original and striking orchestral effects. Here we find for the first time the *tremolo* of the strings. The strings, in fact, form the foundation of the orchestra. In this work is also found the first instance of *pizzicato*. Monteverde had discovered that instruments had their own peculiarities, and acting upon this knowledge he became the inventor of a distinctively *instrumental* style; whereas his predecessors wrote a truly *vocal* style for all instruments. Since Monteverde the strings have been regarded as the foundation of the orchestra, and with him the various kinds of viols were employed for this purpose. Alessandro Scarlatti (1659-1725) employed violins, violas, and basses, although their treatment is still very crude. The 'celli generally played in unison with the basses. But occasionally the violas were treated with freedom and were even divided into two parts. The principal woodwind instrument was the oboe; bassoons were used only to strengthen the basses. Legrenzi (1625-90) strengthened the violins, so that his orchestra consisted of 20 violins, 2 violas, 2 viole di gamba (the precursor of the 'cello), 4 flutes, 2 bassoons, 2 cornets, and 3 trombones. About this time the kettle-drums also found their way into the orchestra. But the real art of writing for the strings was not yet known; there was no sonority. To render the harmony fuller the harpsichord was used. Even so great a master as J. S. Bach did not know how to use the instruments. He treats them throughout like voices without the slightest appreciation of tonal color. Handel is not much more advanced. This composer scored heavily for the wood-wind, but with no other purpose than that of reënforcing the strings. In fact, many of his works were reorchestrated by Mozart, and to-day Handel's works are almost exclusively heard with the instrumental rearrangement of Mozart.

Joseph Haydn (1732-1809) is universally known as the father of the symphony (q.v.). At the same time he is also the father of the modern orchestra. When Haydn began his work the string orchestra was pretty well established and its resources known. But the employment of the wood-wind was utterly planless. In 1760 Haydn was appointed director of music to Prince Paul Anton Esterházy. At first his orchestra numbered only 17 instruments, 6 violins and violas, 1 'cello, 1 double-bass, 1 flute, 2 oboes, 2 bassoons, and 4 horns. In order to obtain the best effects from this little orchestra, the master directed all his energies to discover and make use of the true nature of the wood-wind. In his first symphony (1759) Haydn uses in addition to the strings (the violins being divided into *first* and *second*) only two oboes and two horns. In his last symphony (D major, written in London, 1795) the score calls for 2 flutes, 2 oboes, 2 clarinets, 2 bassoons, 2 horns, kettle-drums, and the regular strings. In two of his last works, the *Creation* (1798) and the *Seasons* (1801), Haydn employs 2 flutes, 2 oboes, 2 clarinets, 2 bassoons, 1 contra-bassoon, 2 horns, 2 trumpets, 3 trombones, kettle-drums, and the strings. And here we have the modern *symphony orchestra* (which, however, usually has four horns).

Mozart did not add any new instruments. His great merit is the development of the clarinets as permanent orchestral instruments. In fact, Haydn himself admits that he learned the use of not only the clarinets, but of several other instruments, from the considerably younger Mozart. Strange to say, Mozart does not employ clarinets in his *Jupiter Symphony*. In the score of the *G Minor Symphony* the clarinets were added later. In his first two symphonies Beethoven employs the same instruments as Haydn in his last, with the addition of two trumpets. In the *Eroica* (1803) Beethoven separates the 'celli and basses and introduces a third horn. In all subsequent symphonies the master continues to separate the 'celli and double-basses, but returns to the use of only two horns. In his last symphony, the *Ninth*, the orchestra is considerably increased. This score calls for 2 flutes, 1 piccolo, 2 oboes, 2 clarinets, 2 bassoons, 1 double-bassoon, 4 horns, 2 trumpets, 3 trombones, kettle-drums, cymbals, triangle, bass drum, and the regular strings. This is the *grand symphony orchestra* of to-day. All composers since Beethoven (Schubert, Schumann, Mendelssohn, Brahms, Tschaikowsky, Dvořák) have used it, the only addition being the *bass tuba* as the lowest instrument of the trombone choir.

The modern *opera orchestra* is still larger and employs many other instruments to obtain special characteristic effects. This colossal combination of instruments was developed by two men, almost independently of one another—Wagner and Berlioz. Wagner started with the

grand symphony orchestra of Beethoven. Since *Tannhäuser* (1845) the division of violins into four parts has been frequently employed. In *Tristan* Wagner divides the strings into no less than *fifteen parts!* Since *Lohengrin* (1850) the *opera orchestra* consists of *three* of each family of the wood-wind instruments. The number of flutes and bassoons is increased to three; to the two oboes is added the cor anglais (q.v.) (an alto oboe); to the two clarinets the bass clarinet. This increase naturally calls for an increase in the number of the strings. For the *Ring des Nibelungen* Wagner requires 3 large flutes, 1 piccolo, 3 oboes, 1 English horn, 3 clarinets, 1 bass-clarinet, 3 bassoons, 1 contra-bassoon, 8 horns, 3 trumpets, 1 bass trumpet, 2 tenor trombones, 1 bass trombone, 1 contra-bass trombone, 4 tubas (specially constructed for Wagner, 1 tenor, 2 bass, and 1 contra-bass), 6 harps, 2 pairs of kettle-drums, 1 glockenspiel, bass and snare drums, cymbals, tamtam, and even tuned anvils. It goes without saying that the number of strings must be in proportion. Wagner demands as a minimum 34 violins (18 first, 16 second). The demands made by Berlioz in his *Requiem* are unique. He calls for 4 flutes, 2 oboes, 2 clarinets, 8 bassoons, 12 horns, 4 cornets, 12 trumpets, 16 trombones, 4 ophicleides, and 8 pairs of kettle-drums, and indicates the strength of the strings by demanding 18 double-basses.

The following table shows the number of instruments composing some of the most celebrated orchestras of to-day:

	Gewandhaus, Leipzig	Philharmonic, Vienna	Philharmonic, London	Philharmonic, New York	Boston Symphony, Boston	Conservatoire, Paris	Crystal Palace, London	Bayreuth Festival, 1876	N.Y. Festival, Thos. Thomas (1882)	Handel Festival, London (1880)

Consult: Elson, *Orchestral Instruments and Their Use* (Boston, 1903); Henderson, *The Orchestra and Orchestral Music* (New York, 1899); Corder, *The Orchestra and How to Write for It* (London, 1896). See INSTRUMENTATION.

ORCHESTRATION. The art of scoring a musical composition for the different instruments of the orchestra. See INSTRUMENTATION.

ORCHESTRION, ôr-kĕs'trĭ-ŏn (from *orchestra*). A mechanical instrument with powerful reed pipes. By skillful devices almost all the wind instruments of the orchestra are imitated. The idea was originally conceived by a Frenchman, M. de Saint-Pern, in 1870. It was then perfected by F. T. Kauffmann, and is to-day extensively used in places of amusement instead of a regular orchestra.

ORCHID, ôr'kĭd (from Lat. *orchis*, from Gk. ὄρχις, testicle, orchid, so called from the shape of the roots). The common name of members of the family Orchidaceæ, which has the most highly organized flowers among monocotyledons. Although beautiful orchids occur in the temperate regions, such as species of Habenaria (rein orchis), Pogonia, Calopogon, Calypso, Cypripedium (lady's slipper, moccasin-flower), etc., their chief display is in the tropics. There are more than 400 genera and a conservative estimate puts the number of species at 6000, while those that have been proposed amount to 10,000 or more. The flowers, which may be solitary, racemed, or spiked, are exceedingly irregular, and most elaborately adapted to the visits of insects, a fact discovered by Sprengel in 1793 and more widely proved by Robert Brown in 1833 and later verified in detail by Darwin, Müller, Gray, and others. (See POLLINATION.) The brilliant coloration of the flowers, some of which are fragrant, and their bizarre forms have made them much prized in hot-house cultivation. The most conspicuous structure of the flower is the so-called labellum or lip, which is one of the three petals. This lip is of the greatest importance in attracting insects, guiding them to the nectar, the pollen, and the stigma. In most orchids it is a conspicuous flat and more or less pendant organ, but in Cypripedium (lady's-slipper) it forms a sac which suggests the common name. Another conspicuous feature of the flower is the spur, which is really a prolongation of the base of the labellum, and in the bottom of which the nectar is secreted. In a curious Madagascar orchid the spur attains the length of 10 or 11 inches. A prominent technical character of the family is the fusion of the one or two stamens with the style or stigma, forming a central mass called the column. In general also the pollen is not granular, but the pollen grains cling together in one or more masses (pollinia), which are carried away by insects. The fruit is usually a capsule, the seeds are like fine sawdust in appearance, and are so numerous that a single capsule of a Maxillaria, it has been estimated, may contain more than 1,700,000. The root is usually composed of simple cylindrical fibres, which are often accompanied by one or more fleshy tubercles or bulbs, a tubercle dying and a new one being produced annually. The habits of orchids

are almost as varied as their floral structure, and upon this basis they are often grouped under these heads. Some are saprophytes, and have lost entirely the green color of independent plants, being usually of a brownish or yellowish hue, as the ordinary coralroots of the United States. Other orchids are epiphytes, and are found in the moist atmosphere of tropical or subtropical regions. On account of the special food reservoirs which they develop, they are distorted-looking plants, in general resembling coarse bulbs with not very attractive leaves, but their flowers are often exceedingly brilliant. Among the epiphytic orchids two forms of roots are developed, clinging roots by which attachment is secured, and aërial roots which hang down to absorb water for the plant. The third group comprises the terrestrial orchids, among which are some of the largest and many of the most prized forms. Orchids are found in all parts of the world except the coldest and the most arid, but are most numerous in the humid forests of the torrid zone, and especially in Mexico and Central and South America, which furnish such well-known genera as Cattleya, Odontoglossum, and Oncidium. Calypso borealis ranges in British America, as far north as latitude 68°.

Fully 3000 species are under cultivation, while the hybrids and varieties are innumerable. In the United States, including Alaska, there are about 75 species, distributed in 20 genera, and of these, seven or eight, belonging to the genus Epidendrum, and found in Florida and other Gulf States, are epiphytes, all the other species being terrestial. Few genera except Salep and Vanilla have a commercial value aside from culture as ornamentals. The prevailing colors of orchids are rose, or lilac, yellow, white, and green. The odor of some species resembles that of violets or orris-root. Of North American orchids a number are very striking, especially Arethusa bulbosa, Pogonia ophioglossoides, the purple, white, and the yellow fringed orchids or habenarias, and the showy, the yellow, and the pink lady's-slippers (Cypripedium).

The culture of orchids began in England about 1820, but did not become general in the United States before 1865. There are many fine public and private collections of growing orchids, and almost fabulous prices have been paid for single rare specimens. Many epiphytal orchids may be planted in pots filled with loose fibrous peat; the roots of others are placed in baskets or are fastened to blocks of wood or cork, with a little moss around them to retain moisture, and are thus placed on shelves, or are suspended from the roof of the hot house. Ventilation and temperature must be carefully attended to, and the atmosphere must not be constantly very hot and humid, but seasons of rest must be given to the plants, since in their native climate they have generally a wet and a dry season. Most of the American species can be easily grown in shaded gardens.

ORCHIL. See ARCHIL.

ORCHOM'ENUS (Lat., from Gk. Ὀρχομενός, *Orchomenos*). A famous ancient city of Bœotia, situated on a spur of Mount Acontium, on the northwest shore of Lake Copais. It seems to have played a great rôle in legendary times as capital of the Minyæ and chief city of Bœotia. A relic of this early age is the bee-hive tomb, or Treasury of Minyas, a work of the Mycenæan civilization, and but little smaller than the 'Treasury of Atreus' at Mycenæ. (See ARCHÆOLOGY.) It was excavated by Schliemann in 1880 and 1886. After the Bœotian conquest Orchomenus was a member of the confederacy, and second only to Thebes. In the fourth century B.C. it appears as bitterly hostile to Theban supremacy and in close alliance with Sparta. In consequence after the battle of Leuctra (B.C. 371) the Thebans destroyed the city and sold the inhabitants into slavery (B.C. 368); restored by the Phocians, it was again destroyed in B.C. 346. Rebuilt by Philip or Alexander of Macedon, it continued to exist in Roman times. Orchomenus was chiefly noted for its worship of the Charites or Graces, here ancient and powerful goddesses of light and bringers of fruitfulness. Their festival, the Charitesia, was accompanied by musical and poetic contests, of which records are preserved in inscriptions containing the names of the victors. The remains of the ancient walls and the small castle which crowned the Acropolis are still well preserved, and are fine examples of the best period of Greek fortification. Consult: K. O. Müller, *Orchomenos und die Minyer* (Breslau, 1844); Leake, *Travels in Northern Greece*, ii. (London, 1835); Schliemann, "Orchomenos" (Leipzig, 1881; translated in *Journal of Hellenic Studies*, ii. 1881); Schuchhardt, *Schliemann's Excavations* (London, 1891); Frazer, *Pausanias*, v. (ib., 1898). (2) Orchomenus was also the name of a town in Northeastern Arcadia, represented in the legends as of much importance during the heroic age, but of little importance in later times. Its situation on a lofty hill commanding the roads from Mantinea to the north made it a position of some strategical value during the time of the Macedonian wars and the Achæan League.

ORCIN (from *orchil*, *archil*, from OF. *orchel*, *orchel*, *orseil*, Fr. *orseille*, It. *orcella*, *oriello*, archil; of uncertain origin). $C_7H_8O_2 + H_2O$. A colorless substance contained in the lichens from which the commercial coloring matters archil and litmus (qq.v.) are made. It has a sweetish nauseating taste, but no odor, and is soluble in water, alcohol, and ether. In the hydrated state it melts at 58° C.; in the anhydrous state at 108° C. Its chemical constitution is represented by the formula $C_6H_3(CH_3)(OH)_2$, showing it to be a di-oxy-toluene. Besides being contained in the lichens ready-formed, it is produced in considerable quantities from the orcellinic acid contained in the lichens when the latter are heated

with lime. It has also been prepared artificially. When exposed to the simultaneous action of ammonia and oxygen, orcin is transformed into orcein (q.v.).

OR'CUS. The Latin name of Hades.

ORD, EDWARD OTHO CRESAP (1818-83). An American soldier, born at Cumberland, Md. He graduated at West Point in 1839, was commissioned a second lieutenant in the Third Artillery, and sent to Florida, where he took part in the Seminole War (1839-42). During the war with Mexico he performed garrison duty at Monterey, Cal. (1847-49), and in 1850 was promoted to be captain. During the following years he was engaged on frontier duty, and saw much active service against the Indians, but in 1859 he was ordered to the East and took part in the capture of John Brown at Harper's Ferry. At the outbreak of the Civil War he was commissioned brigadier-general of volunteers and defeated Gen. J. E. B. Stuart at Dranesville (December 20, 1861). He was promoted to be major-general of volunteers on May 2, 1862, and soon afterwards sent to the West, where he commanded the left wing of Grant's army. For his services at the battle of Iuka (September 19, 1862), he was brevetted colonel in the Regular Army. On July 21, 1864, he was appointed commander of the Eighteenth Army Corps, and took part in the Richmond campaign, but was wounded at the capture of Fort Harrison (September 29, 1864), and was on sick leave until December. For his gallantry on this occasion, he was brevetted major-general in the Regular Army (March 13, 1865), and after his recovery received command of the Department of Virginia. It was largely owing to his skill and energy that Lee's troops were finally headed off and compelled to surrender. He was commissioned brigadier-general in the Regular Army in 1866, and soon afterwards was mustered out of the volunteer service. He retired in 1880, and the next year by special act of Congress was commissioned major-general.

ORDEAL (AS. *ordēl, ordāl,* OHG. *urteili,* Ger. *Urteil,* decision, judgment, from AS. *ā-,* OHG. *ar-, ir-, ur-,* Ger. *er-,* out + AS. *dal,* Goth. *dails, daila,* OHG. *teil,* Ger. *Teil,* part, connected with OChurch Slav. *dělŭ,* part). A practice, which has prevailed among various widely separated nations, of referring disputed questions, particularly such as relate to the guilt or innocence of an individual, to the judgment of God, determined either by lot, or by the success of certain experiments. Of its existence among the ancient Jews we have an instance in Numbers v., where a Hebrew woman, accused of adultery, is required to drink the 'bitter water' as a test of innocence; a similar ordeal for incontinence is said to be in use among the natives of the Gold Coast of Africa. The practice of ordeals as existing among the Greeks is referred to in Sophocles's *Antigone.* Among the Hindus the ordeal has been practiced in nine different ways—by the *balance,* by *fire,* by *water,* by *poison,* by the *cosha,* or drinking water, in which images of the sun and other deities had been washed, by *chewing rice,* by *hot oil,* by *red-hot iron,* and by drawing two images out of a jar into which they have been thrown.

The Celts in Ireland, the Germans before their conversion, and the early Slavs made use of ordeals. After their conversion to Christianity they employed ordeals with the full sanction of the Church. In the early Middle Ages there was no trial in the modern sense of the word. The accused was required to prove his innocence by compurgation (q.v.), the wager of battle (q.v.), or an ordeal. In the wager of battle and the ordeal of the cross (see below) both plaintiff and defendant were put to the proof, but in all other ordeals and in compurgation the burden of proof rested upon the negative. Christian rites took the place of pagan ceremonies and God was called upon to show the truth. The forms most commonly employed were the ordeals of boiling water, of fire, of red-hot iron, of cold water, of the cross, of the *corsned,* and of the eucharist.

In the ordeal of boiling water the accused was obliged to insert his hand into a caldron of boiling water. Sometimes he had to take out a small object; in some cases he put in his hand only as far as the wrist; in the triple ordeal, as far as the elbow. After the trial the hand was sealed up for three days. Innocence or guilt was held to be proved by its condition when unsealed. In the ordeal of fire, the original custom may have been that the accused placed his hand in the fire. Later two piles of wood were laid a short distance apart and then were set on fire. The accused walked between the two. In such cases it is probable that fifteen days were allowed to the accused before his injuries were inspected. The genuineness of relics was often tested by this ordeal. The ordeal of red-hot iron was employed in two forms. In one case 6, 9, or 12 red-hot plowshares were placed on the ground, among which the accused walked blindfolded, and his innocence was shown by his avoidance of them; or he was compelled to step on each. In the second form the accused was compelled to carry a red-hot iron, usually for a distance of nine feet. This ordeal was generally chosen by persons of rank. The ordeal of cold water rested upon the belief that the water when sanctified by religious rites would refuse to receive the guilty, while the innocent would sink. This method long remained in use for witches. In the ordeal of the cross, both accuser and accused stood with uplifted hands before a cross and the one who kept his position longest won. This was prohibited by the Emperor Louis the Pious (814-40), but was frequently employed. The *corsned* was in use by the Anglo-Saxons and was carried out by giving the accused a piece of bread or cheese to swallow. If he was successful he was innocent. The ordeal of the eucharist was similar. In all of the forms the ordeal was administered only after special religious services.

Other kinds of ordeal were practiced under particular circumstances in different parts of Europe. In the ordeal of the *bier,* a supposed murderer was required to touch the body of the murdered person, and was pronounced guilty if the blood flowed from his wounds.

Trial by ordeal at first carried with it the sanction of the Church, as well as of the civil power, though the clergy in the course of time came to discountenance it. At the fourth Lateran Council in 1215 ecclesiastical ceremonies at ordeals were absolutely forbidden. Secular rulers followed the Pope's example in condemning the ordeal, and it was abandoned generally in the thirteenth century, although, as noted above, cer-

tain isolated usages long prevailed. Consult: Schlagintweit, *Gottesurtheile* (Munich, 1864); Lea, *Superstition and Force* (4th ed., Philadelphia, 1892); Patetta, *Le ordalie* (Turin, 1890); Brunner, *Deutsche Rechtsgeschichte* (Leipzig, 1892); Thayer, *Preliminary Treatise on Evidence*, etc. (Boston, 1896).

ORDER (Lat. *ordo*, row, series, orderly arrangement; connected with *oriri*, Gk. ὄρνυμι, *ornymi*, Skt. *ar*, to rise). A term used for a group of plants or animals in classification (q.v.).

ORDER. A term used in classic and neoclassic architecture to designate the fundamental characteristics of each architectural style as marked by a vertical section of the façade consisting of a column (q.v.) with its entablature (q.v.). The Greeks were familiar with two orders: the *Doric* and the *Ionic*; the *Corinthian*, though also invented by them, hardly attained to the dignity of an order until Roman times. The *Tuscan* was a variant of the Doric, invented by the Etruscans and other early Italian races, and perpetuated by the Romans. The *Composite* was a novelty of the Roman Imperial period, combining Ionic and Corinthian characteristics in a rich design pleasing to the Roman love of ornament. See COLUMN.

ORDERLY. In the United States Army, the term applied to officers or soldiers engaged in the transmission of orders from a superior officer to the details of his command. Duty rosters are kept by the regimental adjutant, regarding the detail of orderly officers, and by the regimental sergeant major as regards the detail of non-commissioned officers. The orderly officer, or officer of the day, is the officer detailed for the superintendence of the interior economy of the command. (See GUARD.) In the company the first sergeant performs the duties of orderly sergeant. A guard orderly is a specially selected private soldier who is detailed from the guard for duty as commanding officer's orderly. A stable orderly is a soldier detailed for special stable duty under the stable sergeant. In the British Army, as in practically all other European armies, the duties of orderly officers are identical with those of the United States. Orderly sergeants, however, are detailed to attend orderly officers during their tour of duty, as are also orderly corporals. Company orderly sergeants are the duty sergeants of a company, who are detailed for duty with their companies, taking turn, week about, notifying and preparing men for duties, parades, or fatigues, and calling the roll of their companies on parade and in quarters. They are assisted by company orderly corporals, who accompany them when notifying men for duty and at roll call, and who also have the separate duty of superintending the drawing of the daily rations of their companies. This latter duty is performed by the orderly men, who are private soldiers detailed daily, to protect and keep in order the room or mess of which they are members, and in various ways assist the company cook.

ORDERS. Under the general title of orders are usually included monastic orders, orders of chivalry, and orders of merit. There is a certain connection between the first two, as the members of the earliest orders of knights took monastic vows. Again, there is a connection between the last two, as formerly persons distinguished by meritorious service were sometimes, even when not noble, admitted to an order of knights, and gradually membership in these orders became wholly an honorary distinction. Thus, in spite of the vast difference between an ancient monastic order and the present 'Legion of Honor,' it is possible to see the evolutionary process which included under a common designation such widely different organizations.

Monastic orders were the earliest and became very important in the Middle Ages. Under the general term 'monastic' may be included the various orders of canons, such as the Premonstratensians (q.v.), as well as of monks and nuns. Of these orders many are no longer in existence, but the total number, of those extant and extinct, is over five hundred; of these about one hundred and seventy-five adopted the Rule of Saint Augustine; about one hundred and twenty-five the Rule of Saint Benedict; and about seventy-five the Rule of Saint Francis; the others adopted various special rules. For a fuller discussion of monastic orders, see MONASTICISM; CANON; and the names of the several orders.

Orders of knighthood are comparatively modern in their origin, although some have attempted to ascribe to certain ones great antiquity. In the ancient societies there was nothing of a similar nature. The 'equestrian order' or the 'order of decurions' in Rome was entirely different. (See EQUESTRIAN ORDER.) It was believed formerly that Clovis had founded in the fifth century an Order of the Holy Grail, but this is purely legendary. Equally mistaken is the attempt to attribute the beginnings of the orders of chivalry to Charles Martel, who is said to have established the Order of the Genette in 726. The romances of chivalry usually attributed the creation of knightly orders to Charles the Great or King Arthur; but the 'twelve peers of Charlemagne' and the 'Knights of the Table Round' are equally mythical. The mediæval orders, in reality, had their beginning in the Holy Land during the time of the Crusades. The Knights of the Hospital and the Knights of the Temple were the earliest orders, and were alike in requiring their members to be of noble birth, and also to take the three monastic vows of poverty, chastity, and obedience. (See SAINT JOHN OF JERUSALEM, KNIGHTS OF; TEMPLARS.) These religious military orders became very renowned and gained enormous wealth. Their example led to the foundation of other similar orders for the protection of the Holy Land. In all there were about twenty which originated in the Kingdom of Jerusalem. Later some transferred their sphere of action to crusades against the heathen in the West, or to service in the Papal armies. As their members were bound by no national ties, they were of great service to the Church in its wars. The destruction of the Templars and the temporal weakness of the popes in the fourteenth century led to a decline in the importance of these religious orders. Those which still exist, as the Hospitalers do under the name of the Knights of Malta, are merely honorary orders of nobility.

On the other hand, the rise of strong monarchs in the period of the Renaissance led to the creation of royal and noble orders whose members were selected by the kings. By this means the rulers were enabled to confer honorary distinc-

tion upon their favorites, and to bind closely to their own fortunes members of the nobility. Since the age of the Renaissance many orders have been created by monarchs to reward services or merit.

These orders may be classified as royal orders, noble or family orders, and orders of merit; but the last two are scarcely distinguishable in some respects. The royal orders, such as the Garter, the Golden Fleece, or the Black Eagle, are sometimes known as the 'Prime Orders of Christendom.' Membership is usually reserved for persons of royal stock and those who are of the most eminent rank in the European kingdoms. Noble orders, such as Calatrava or Montesa, are few in number, and their members are usually selected from the higher nobility. Family orders, such as the Royal Victorian or the Hohenzollern, are composed of those who have in some way rendered especial service to the reigning family from which the order takes its name. Orders of merit, such as the Bath, Pour le Mérite (in Prussia), or the Legion of Honor, are intended to recompense especially meritorious service of any kind.

Of late years there has been an enormous increase in the number of orders which are now purely honorary. The custom has spread from European countries to Asia, Africa, and the Pacific islands. Probably a majority of the civilized or semi-civilized countries of the world now have one or more orders intended to confer distinction upon their own citizens, but also awarded at times to foreigners who are favorites of the sovereign, or have performed some especial service to the country, or are noted for their conspicuous scientific ability. The *Almanach de Gotha* enumerates more than three hundred and fifty in the different countries of the world; but this list contains some agencies established for the recognition of merit which are not, properly speaking, orders. Thus the Medal of Honor established by the United States in 1862 does not confer upon its possessor membership in an order. In fact, in the United States there are no real orders, with the possible exception of the Cincinnati. The patriotic societies and the many organizations which have taken the name of orders could not be included among orders as usually defined; they are all, even the Cincinnati, omitted from the list in the *Almanach de Gotha*. (See PATRIOTIC SOCIETIES.) Neither is the Victoria Cross, awarded in Great Britain for conspicuous bravery, the insignia of an order. In comparatively recent times several orders, including the Royal Order of Victoria and Albert and the Imperial Order of the Crown of India, have been created especially for women.

The great orders usually have only one class; other orders commonly have three classes: Knight Grand Commanders (K.G.C.) Knight Commanders (K.C.), and Companions (C.). Sometimes an order contains more classes, as the Royal Victoria, founded in 1896, which has five classes, designated, respectively, as G.C.V.O., K.C.V.O., C.V.O., and M.V.O. The last constitutes the fourth and fifth classes; although they are all entitled 'members,' the insignia of those who belong to the fourth class are different from that of the fifth class. The Order of Merit, instituted by Edward VII. in 1902, contains but one class. The insignia naturally vary greatly in the different orders, but almost all consist of either stars, crosses, or ribbons. The Knight Grand Commanders usually have a cross or star on a ribbon worn over the shoulder. The Knight Commanders have a star or other badge, but the ribbon is worn about the neck. The Companions have a badge, but no star or cross. These rules do not hold good for all orders, but they represent ordinary usage in European countries.

Membership in orders is highly prized, but in some countries, especially the United States and France, restrictions are placed upon the acceptance by citizens of such distinctions. By the Constitution of the United States no one holding an office of profit or trust under the Government is allowed, without the consent of Congress, to accept any decoration from a monarch or foreign State. In France, since 1815, although the law has been repeatedly modified, no citizen can be a member of a foreign order unless he receives the authorization of the Government.

The following is a list of the principal orders of the world. Those marked with the asterisk are described in their alphabetical order in this Encyclopædia.

ABYSSINIA.

**Seal of Solomon.*

ANHALT.

Albert the Bear.—An order with five classes, founded by the reigning dukes in 1836. The oval decoration shows a crowned bear mounting a wall, with the motto, *Fuerchte Gott und Befolge seine Befehle*.

Order of Merit for Science and Art.—Founded by Duke Frederick in 1873 and affiliated with the Order of Albert the Bear in 1895.

ARGENTINA.

Argentine Sun.—An order of unknown origin. The decoration is a golden medal, with the sun surrounded by a laurel wreath.

AUSTRIA-HUNGARY.

**Golden Fleece.* See also Plate of ORDERS.

**Maria Theresia.*

**Saint Stephen.* See also Plate of ORDERS.

**Leopold.*

Iron Crown.—A civil and military order, founded by Francis I. in 1816. The decoration is the iron crown of Lombardy under the double-headed Austrian eagle bearing upon its breast a shield of blue enamel with the initial F.

Franz Joseph.—A civil order of merit, founded in 1849 by the Emperor Francis Joseph. The decoration is a red cross with the double-headed eagle, the initials F. J., and the motto *Viribus Unitis*.

Elisabeth-Theresia.—A military order, founded in 1750 by the Empress Elizabeth Christina and reorganized by Maria Theresa in 1771. The order was instituted for twenty generals and colonels, and was conferred after thirty years' service in the Imperial army. It carries with it a yearly pension. The decoration is an eight-pointed star bearing the initials E. C. and M. T. in an oval, with the inscription *Maria Theresia Parentis Gratiam Perennem Voluit*.

Star and Cross.—An order for women of the old nobility, founded in 1668 by the Empress Eleonore to commemorate the recovery of a relic which had been lost.

**Teutonic Knights.*

Military Order of Merit.—An order founded by Emperor Francis Joseph in 1849.

Civil Order of Merit.—An order founded by Emperor Francis Joseph in 1850.

Order of Merit for Science and Art.—An order founded by Emperor Francis Joseph in 1887.

BADEN.

Order of Fidelity.—An order with one class, founded in 1715 by the Margrave Charles William, and conferred on foreign princes and State officials of high rank. The decoration is a cross of red enamel with eight points, the arms connected by intertwined C's, which appear also on the central white field above three rocks, with the legend *Fidelitas*.

Charles Frederick.—A military order of merit, with three classes, founded in 1807 by Charles Frederick, Grand Duke of Baden. The decoration consists of an eight-pointed cross of white enamel within a laurel wreath. The medallion bears the initials of the founder and the legend *Fur Badens Ehre*.

Lion of Zahringen.—An order of merit, established by Grand Duke Charles Louis in 1812 and reorganized in 1877. The central shield of the decoration bears the ancestral castle of the family.

BAVARIA.

**Saint Hubert.*
**Saint George.*
**Saint Elizabeth.*
Max Joseph.

Bavarian Crown.—A civil order of merit, founded in 1808 by King Maximilian I. It is given to State officials of all classes, and confers noble rank on the recipient. Foreigners who have rendered service to Bavaria are also eligible for the order. The decoration is a white cross with eight arms bearing the inscription *Virtus et Honos*.

**Saint Michael.*
**Maximilian.*
**Louis.*
Theresa.

Cross of Merit.—A distinction for voluntary services to the army during the years 1870 and 1871, founded in 1871 by King Louis II.

Military Order of Merit.—An order founded in 1866 by King Louis II.

BELGIUM.

**Leopold.* See also Plate of ORDERS.

African Star.—An order founded in 1888 by King Leopold II. as a distinction for services to the Congo State and to African civilization in general. The decoration, a five-pointed star with laurel wreath, bears the legend *Travail et Progres*.

Order of Merit.—A civil order, founded in 1867 by Leopold II. for civic virtue, and for bravery and self-sacrifice.

BRAZIL.

**Southern Cross.*

Order of Dom Pedro I.—An order founded by Dom Pedro I., Emperor of Brazil, in 1826, and suspended in 1889. It had three classes, the first of which was limited to crowned heads and restricted to 12 members, the other two classes being limited to 150. The decoration was a white cross with five arms on a golden five-rayed star.

**Rose.*

Order of Christ.—A Portuguese order, nationalized in Brazil in 1823. In 1843 it lost its religious character and became a civil order conferred for services rendered by natives and foreigners. It was dissolved in 1890. See CHRIST, ORDER OF THE KNIGHTS OF.

Aviz.—Originally the Portuguese order of the same name extended to Brazil in 1823. The decoration is the same as that of the Portuguese order. See AVIZ.

Saint James. See SAINT JAMES OF THE SWORD.

BRUNSWICK.

Henry the Lion.—A civil and military order of merit, founded in 1834 by Duke William. The decoration is an eight-pointed cross of blue enamel, with red centre, bearing a pillar and a leaping horse in white. The arms of the cross bear peacock feathers and are separated by a W surmounted by a lion. The cross is surmounted by a lion and a crown which suspends it from a red ribbon. The legend is *Immota Fides*.

BULGARIA.

Alexander.—(1) A military order of merit, founded by Prince Alexander in 1881. The decoration, an eight-pointed white cross, with crossed swords between the arms, bears the Bulgarian lion on a red field, with the inscription *Za Chrubrost* (for courage), and the monogram of the Prince. (2) An order of civil merit, founded by Prince Alexander in 1879. The decoration is an eight-pointed white cross bearing in a red field the legends *Saint Alexander* and *God With Us*.

Order of Merit.—An order founded in 1891 by Prince Ferdinand.

CHINA.

**Double Dragon.* See also Plate of ORDERS.

Order of the Precious Star.—An order with three classes.

Order of Merit.—A civil order, with three classes.

CONGO FREE STATE.

**African Star.* See above under *Belgium*.

**Red Cross.*

**Star of India.*

Imperial Order of the Indian Empire.—An order founded in 1878 by Queen Victoria on assuming the imperial title.

Imperial Order of the Crown of India.—An order for women, including natives of India, founded by Queen Victoria in 1878.

Order of British India.—An order, with two classes, founded by Queen Victoria in 1837.

Order of Merit for Native Soldiers.—An order with four classes, founded by Queen Victoria in 1887.

Military Order for Natives of British India.—An order founded in 1842.

Royal Victorian Order.

Order of Merit. See MERIT, ORDER OF.

GREECE.

**Redeemer.* See also Plate of ORDERS.

GUINEA.

Black Star.—An order founded by King Tossa in 1890.

HANOVER.

**Saint George.*

**Guelphic Order.*

Order of Ernest Augustus.—A royal military and civil order, established by King George V. in 1865. The decoration is a silver star with eight rays, the monogram E.A. appearing on a red ground, surrounded by a blue band with the motto *Suscipere et Finire*, and a white cross with a similar medallion. The decoration is conferred for services to the country or King, and for distinction in science and art.

HAWAII.

**Kamehameha.*

Kalakaua.—An order of four classes, founded in 1874 by Kalakaua.

Kapiolani.—An order of six classes, with a special class for women, founded in 1880 by Kalakaua. The decoration is an eight-pointed cross of red enamel, surmounted by a crown, with similar crowns between the arms. A central plaque of red bears on a white border the legend *Kulia*.

Hawaiian Crown.—An order with four classes, founded by Kalakaua in 1882.

Star of Oceania.

HESSE.

Louis.

**Philip the Magnanimous.*

**Lion.*

Military Service Cross.—A decoration founded in 1870 by Grand Duke Louis III. for men and women. The cross bears the inscription *For Care of Soldiers, 1870.*

**William.*

HONDURAS.

Santa Rosa.

INDIA.

See above under *Great Britain.*

ITALY.

Annunziata. See ANNUNCIADE; also Plate of ORDERS.

**Mauritius and Lazarus.*

Civil Order of Savoy.—An order with one class, founded by King Charles Albert of Sardinia in 1831. It was included among the Italian orders in 1860.

Military Order of Savoy.—An order with four classes, founded by King Victor Emmanuel I. of Sardinia in 1815.

Crown of Italy.—An order commemorating the union of Italy, founded by Victor Emmanuel II. in 1868. The decoration is a white cross, with the iron crown of Lombardy, the black eagle, and the cross of Savoy.

JAPAN.

Rising Sun.

Chrysanthemum Order.—An Imperial order conferred only on monarchs and the highest State officials, founded in 1876 by the Mikado. The decoration is a star with 32 white rays with four chrysanthemums between green leaves. The obverse of one of the flowers bears the inscription, "Exalted deeds and honorable actions." See Plate of ORDERS.

Order of the Sanctified Treasure.—An order with eight classes, founded by the Mikado Mutsu Hito in 1888.

LIBERIA.

African Liberation.—An order with three classes, established by the Legislative Assembly in 1879.

LUCCA.

Saint George.—A military order of merit, founded in 1833 by Charles Louis, Duke of Lucca.

Saint Louis.—A civil order of merit, founded in 1836 by Charles Louis, Duke of Lucca.

LUXEMBURG.

Oak Crown.

Golden Lion.—An order founded in 1858 by Duke Adolph of Nassau and King William III. of the Netherlands. It consisted originally of only one class, but later was divided into five, and now exists only as an order of Luxemburg with one class. The white cross, the arms of which are separated by golden N's, has a central blue medallion with the lion; on the reverse the motto, "Je maintiendrai." The ribbon is orange with blue stripes.

Adolph of Nassau.—A military and civil order with five classes and two crosses, founded by Duke Adolph in 1858.

MECKLENBURG.

Order of the Griffin.—An order of merit, instituted in 1884 by Grand Duke Frederick Francis III. of Mecklenburg-Schwerin. The insignia are an eight-pointed red cross with a golden medallion bearing a griffin, and an eight-pointed silver star with the legend *Affior Adversis.*

Wendish Crown.

Military Order of Merit.—An order with two classes, founded in 1848 by Grand Duke Frederick Francis II. of Mecklenburg-Schwerin.

Military Order of Merit.—An order founded in 1871 by Grand Duke Frederick William of Mecklenburg-Strelitz.

MEXICO.

Order of Guadalupe.—An order commemorating Mexican independence, founded by Iturbide, restored in 1853 by President Santos, and reorganized in 1865 by Emperor Maximilian, after whose death it expired. The cross had an oval green medallion with the image of Our Lady of Guadalupe, and the inscription *Religion, Independencia, Union*; on the reverse *Al Mérito y Lealtad.*

Mexican Eagle.

See Carlos.

MODENA.

Order of the Eagle of Este.—An order with three classes, founded by Duke Francis V. in 1855

MONACO.

Saint Charles.

MONTENEGRO.

Order of Saint Peter.—A house order with one class, founded by Prince Danilo I. in 1852.

Danilo Order.—A military and civil order with four classes, founded in 1855 by Prince Danilo I. The cross bears the initials of the Prince, the inscriptions, "Prince of the Black Mountains," "For the independence of the Black Mountains," and the date, 1852-53. The grand cross is conferred only on princes.

NETHERLANDS.

William.

Netherland Lion. See also Plate of ORDERS.

Orange-Nassau.

NORWAY.

See section on *Sweden and Norway.*

OLDENBURG.

Order of Duke Peter Frederick Louis.—A civil and military order, founded by Grand Duke Frederick Augustus in 1838. The decoration, a white cross, has a blue medallion with the monogram P. F. L., surrounded by a red band with the inscription *Ein Gott, Ein Recht, Eine Wahrheit.*

PARMA.

Constantine Order of Saint George. See SAINT GEORGE, CONSTANTINIAN ORDER OF.

Saint Louis.—A civil and military order of merit, founded in 1849 by Charles III., Duke of Parma.

PERSIA.

Order of Aali.—An order with one class, founded by Feth Aali Khan in 1808.

Order for Women.—An order with one class, founded in 1873 by Shah Nasr-ed-Din.

Sun and Lion. See also Plate of ORDERS.

PORTUGAL.

Avis.

Christ. See CHRIST, ORDER OF THE KNIGHTS OF; also Plate of ORDERS.

Saint James. See SAINT JAMES OF THE SWORD.

Order of the Castle and Sword.—An order founded in 1459 by Alfonso V. and reorganized in 1832 by Dom Pedro. The order is conferred upon foreigners as well as natives for merit, bravery, and distinguished services. The decoration is a five-pointed white cross, having between the upper arms a tower, by which it is suspended. On the medallion is a sword in an oak wreath. The reverse bears an open book. The inscriptions are *Valor, Lealdade, Merito,* and *Pelo Rei e pela Lei.*

Our Lady of Villa Vicosa.—An order of merit, founded in 1819 in Rio de Janeiro by King John VI. The decoration is a nine-pointed star with the inscription *Padroeira do Reino.*

Saint Isabella.

PRUSSIA.

Black Eagle. See EAGLE, BLACK; also Plate of ORDERS.

Red Eagle. See EAGLE, RED.

Pour le Merite. See also Plate of ORDERS.

Prussian Crown.—An order with four classes, founded in 1861 by King William I. in commemoration of his coronation. The cross bears the royal crown with the inscription *Gott mit uns.*

Hohenzollern.—A civil and military order of merit of the princely house of Hohenzollern, founded in 1841 by the princes Frederick William Constantine and Charles Anthony. It was under Prussian protection, and when Hohenzollern was united with Prussia was made in 1851 a royal order with two branches. The Prussian order has four classes. Its decoration consists of a black and white cross, and an eagle, each with the device *Vom Fels zum Meer,* and the date, January 13, 1851. The princely order has four classes, with a golden eight-pointed cross enameled in white and black as a decoration, with the motto, *Fur Treue und Verdienst.*

Iron Cross. See also Plate of ORDERS.

William.

Louise.

Cross of Merit.—A distinction conferred on women for services during the War of 1870-71, founded by Emperor William I., in 1871.

RUMANIA.

Star of Rumania. See also Plate of ORDERS.

Order of the Crown.—An order with five classes, founded in 1881 by King Charles I. It commemorates the elevation of Rumania to a kingdom.

Order of Elizabeth.—An order with one class, founded by Queen Elizabeth in 1878.

RUSSIA.

Consult: Lawrence-Archer, *Orders of Chivalry* (London, 1887); Gritzer, *Handbuch der Ritter- und Verdienstorden aller Kulturstaaten der Welt innerhalb des neunzehnten Jahrhunderts* (Leipzig, 1893); *Almanach de Gotha* (Gotha, annually). See also the bibliographies under the separate orders.

ORDERS, HOLY. The distinction of rank or office which differentiates the clergy of various Christian bodies from the laity; also the rite by

which this office is conferred, which is one of the sacraments of the Roman Catholic and Eastern churches. As to the nature of the powers conferred by ordination, an acute controversy has raged for centuries. The principal divergent views will be found partly under BISHOP, especially as to distinctions of polity arising from them; but some further details remain to be given here.

The central point of the Roman Catholic and Eastern doctrine is the belief in the continuous existence of a real priesthood in the fullest sense of the word—of a body whose chief function is the offering of sacrifice. (See SACRIFICE; PRIEST; MASS.) While there is a sense in which the priesthood of all the faithful may be asserted, it is yet contended that in its definite sense and in the fullness of its powers, priesthood is conferred only by the laying on of a bishop's hands. (See APOSTOLIC SUCCESSION.) As a matter of hierarchical gradation, the Council of Trent asserts that the divinely instituted hierarchy consists of bishops, presbyters, and ministers. It follows, however, from what has been said that from another point of view the episcopate and the priesthood are not two separate orders, but the episcopate is simply the fullness of the priesthood, the power of ordination and confirmation being reserved to it. The orders, then, are seven: those of priest, deacon, and subdeacon (major or holy orders), acolyte, reader, exorcist, and ostiarius or doorkeeper (minor orders). The latter as distinct gradations are admitted to be of ecclesiastical institution, and the Eastern churches practically include them all in the single office of *anagnostes* or reader. As to the outward and visible sign which constitutes the 'matter' of the sacrament, there has been considerable difference of opinion among theologians, some making it the 'tradition of the instruments' (the delivery of the chalice and paten to the candidate), while the majority in modern times hold it to be the laying on of hands; practically both are considered necessary. The sacrament is believed to confer an indelible stamp or 'character,' so that a man once a priest is always a priest, and ordination can never be repeated. See DEPOSITION.

The Church of England, followed by her daughter churches, declares that "from the Apostles' times there have been three orders of ministers in Christ's Church, bishops, priests, and deacons," and requires them to be made by the laying-on of the bishop's hands. For various technical reasons, however, the Roman Catholic Church (while not questioning the orders of the Easterns, whom it regards as schismatics) has never in practice admitted the validity of Anglican ordinations; and an exhaustive discussion of the matter in 1896 was followed by a definite Papal decision against them. Much difference of opinion has prevailed in the Anglican communion about the powers conferred, some holding doctrines undistinguishable from those of Trent, while others as emphatically deny the existence of any vestige of sacerdotal power. In practice the indelibility of holy orders is recognized here also, though in England a clergyman may legally renounce his orders and be considered a layman before the law, thus becoming capable of sitting in the House of Commons.

The non-episcopal churches recognize but one order of the ministry, the presbyterate, as having Scriptural sanction. They assert that bishop and elder in the primitive churches were identical in function and authority. There is in many cases in their polities no clear distinction between order and office. The Baptist churches declare that there are but two Scriptural officers of a Christian Church—pastor and deacon. In the polities of the Presbyterian and Reformed churches, the perpetual officers of the Church are declared to be bishops or pastors, ruling elders, and deacons. The Methodist Church in America, while it uses the title bishop, does not differ substantially from the other bodies in this class as to its view of the nature of the ministry.

No study of holy orders can be complete without a consideration of their civil aspects. Here great changes have come about through the changed relations of Church and State. Ever since the Christian Church received the recognition of the political power, and more especially since the development of ecclesiastical establishments, the possession of holy orders has impressed a peculiar civil character upon the individual. For many centuries in all the European States the possession of orders, even the minor ones, caused a greater or less exemption from the jurisdiction of the civil courts. (See BENEFIT OF CLERGY.) By the common law as it has developed in the United States ministerial orders are regarded as voluntary relations which may be terminated at any time by the possessor and as not containing any contractual element. Along with certain benefits there have been certain civil disabilities attached to holy orders. In England and in the State of Maryland a 'minister of the gospel' is not eligible for the Legislature. Exemption from jury duty and service in the militia still generally attaches to the possession of ministerial orders.

ORDERS IN COUNCIL. An English legal term, denoting orders issued by the sovereign with the advice of the Privy Council. The Privy Council of Great Britain has no power to legislate, except so far as authorized to do so by Parliament; but in periods of emergency it has nevertheless occasionally issued and enforced orders of a legislative kind, those who were concerned in passing, promulgating, or enforcing the orders trusting to Parliamentary protection, and taking on themselves the personal responsibility of the proceedings. In such cases a subsequent act of indemnity has relieved from liability those who advised the order or acted under it, and has given compensation to all who suffered by its enforcement. The most famous orders in council were those issued in retaliation for Napoleon's Berlin and Milan decrees. These are described in detail under CONTINENTAL SYSTEM.

ORDINAL (Lat. *ordinalis*, denoting order, from *ordo*, series, row, orderly arrangement). A book containing the forms to be used in making, ordaining, and consecrating bishops, priests, and deacons in use in the Church of England since the Reformation. The original form was prepared by order of the Crown by a commission appointed in the third year of Edward VI. (1550), and received the approval of Parliament. It was slightly amended in the year 1552, and again in 1662 on the recommendation of convocations. Although technically a separate book, the English Ordinal has since 1552 been

bound up with the Book of Common Prayer. In their general structure the offices are similar to those found in the ancient liturgies, although much more simple. The series of questions addressed to the candidates is, however, a feature peculiar to it.

ORDINANCE (ML. *ordinantia*, decree, from Lat. *ordinare*, to order, from *ordo*, row, series, orderly arrangement). In its broadest sense, any law or statute enacted or promulgated by a governmental authority, but more commonly used to designate laws or regulations passed by the governing bodies of municipalities. The term was formerly employed in England to describe a law or regulation which needed the assent of one of the three powers necessary to the validity of an act of Parliament, viz. the King, the House of Lords, and House of Commons. It is now used in England to designate any rule or regulation enacted by any authority less than sovereign. In the United States the term is almost exclusively applied to the laws or regulations passed by the common councils, boards of aldermen, or other governing bodies of municipalities. An ordinance differs from a resolution, which is an expression of the will of any organized body, generally to carry out some ministerial act relating to its own internal management, or other matter not affecting the general public, as a resolution of respect in honor of a deceased person. The formalities for the enactment, publication, enforcement, and repeal of ordinances are largely regulated by statutes. See Act; By-law; Municipality; Resolution; Statute.

ORDINANCE OF 1787. An act of the United States Congress, of July 13, 1787, relating to the government of the Northwest Territory of the United States. See Northwest Territory.

ORDINANCES OF MANU. The English rendering of the Sanskrit *Dharmaśastra*, or code of law, attributed to Manu (q.v.).

ORDINARY. A charge in heraldry (q.v.).

ORDINARY RAY. See Light.

ORDINATE (Lat. *ordinatus*, arranged, ordered, p.p. of *ordinare*, to order). In a system of rectilinear coördinates, the coördinate which is measured parallel to or on the Y-axis. See Analytic Geometry.

ORDINATION (Lat. *ordinatio*, setting in order, from *ordinare*, to order). The ceremony by which a man is set apart to or invested with an order or office of the Christian ministry. Ordination is a general custom throughout the various Christian bodies, both episcopal and non-episcopal. In the Episcopal churches ordination includes as an essential feature the imposition of hands by a bishop. The act of elevating a priest to the episcopate is in strict technical use called consecration, not ordination. In a broader sense, ordination includes admission to the minor orders, when the act of admission consists in the delivery of the symbolic instruments. In the various Presbyterian churches the power of ordination rests with the presbytery, who appoint one or more of their number to conduct the ordination service, which includes the feature of the imposition of hands. In the Congregational and Baptist churches ordination is usually performed by the pastors of neighboring churches of the same denomination, but is regarded as necessary only for the preservation of church order, not as conferring any special religious or ecclesiastical authority. See Orders, Holy.

ORDNANCE (variant of *ordinance*, OF. *ordinance*, *ordonance*, *ordonnance*, Fr. *ordonnance*, ordinance, from Lat. *ordinare*, to order). The word ordnance is now commonly understood to comprise all cannon requiring a support or mounting of some form. The early projectile machines, the bow, cross-bow, sling, catapult, and ballista, are related to modern cannon by the similarity of their purpose only, and have in principle of action and construction no bearing upon the subject of ordnance. The blow-gun, acting by compressed air, has some analogy with the modern pneumatic gun, but teaches no lesson of importance. The use of gunpowder cannon as factors of any consequence in war dates from the fourteenth century, during which period they were used beside the existing catapults with, for some time, less actual effect. The first cannon were wide-mouthed bowls, like an apothecary's mortar, called mortars, vases, bombards, etc. They gave little velocity to the stone projectile, and had little accuracy or power. They were made of bars (like barrel staves) wrapped and hooped to obtain necessary strength. Some were breech-loaders, but were so crude that they were given up for the simpler muzzle-loader. The guns of this time had no trunnions, and many not even carriages, being fired from the ground. Some were mounted on blocks of timber to which they were lashed with no movement for aiming. Later improvements in shape were made, the bore being cylindrical with a narrow powder chamber, whereby the effect of the powder gas was more concentrated, the walls of the piece stronger, and the projectile always in the same position.

The fifteenth century witnessed increased use of cannon and many changes. The improvements in shape continued, and there was constant striving to increase size. Bombards were made as large as 18 tons and fired stone projectiles as heavy as 900 pounds. Some were of 20-inch and even 25-inch bore. Some guns were in this century forged of iron in one piece—some

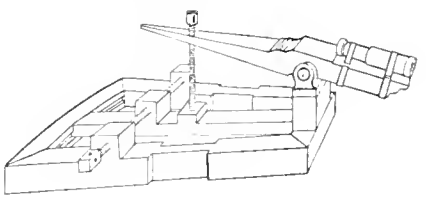

Fig. 1. Fifteenth-century gun and mount.

in several, separable for transportation. Framed carriages were made, some having the gun lashed to a hinged beam which could be altered in elevation. France, 1461 to 1483, made marked advances. Trunnions were introduced; stone projectiles gave way to cast iron, with improvement in carrying power and effect, due to greater density, which, however, increased pressures and forced a reduction in calibre and a thickening of the walls of the cannon. Brass casting was generally adopted for gun construction, while carriages were developed to move with troops.

At the beginning of the sixteenth century guns were generally of brass, but processes progressed sufficiently for them to be cast of iron. These were found to be too heavy for field use, and a return to the lighter brass was made for those requiring mobility, which rule held until the middle of the nineteenth century. Guns had handles and cascabels, and were much ornamented, and given individual names as well as complicated class designations, depending upon the size and proportion of length to calibre. During this century the field carriage limber was introduced. Case shot and explosive shell were used to some extent, but as the fuzes for the latter had to be lighted before insertion in the gun, many accidents occurred. Shell were first made of two hollow hemispheres fastened together. Guns were sometimes made of extreme length, as, for instance, 58 calibres. It was thought that the range increased with the length without limit.

To increase mobility, Gustavus Adolphus brought forth his 'leather gun' of thin copper wound with leather for strength, and afterwards used an iron 4-pounder weighing 650 pounds. Stationary carriages were made of wood supporting the gun by trunnions and resting upon wooden wheels. Elevating was done by wedges under the breech, and change in direction was given by moving the carriage bodily. The Dutch introduced the howitzer, a cannon reduced to such length that shell could be put into it by hand. Gustavus Adolphus, in addition to his gun, introduced the method of inserting the powder charge in a package or cartridge, thus avoiding the danger and loss of time due to ladling it into the gun.

In 1747 the French made the important discovery that, if the earth tamping about a shell were omitted, the discharge would ignite the shell fuze. This expedited loading, removed the great danger of shell fire, and increased its use. At this time field carriages were still crude, made of wood, with wooden axletrees, low limbers, and horses harnessed in tandem. Commencing about 1765 remarkable improvements were made in ordnance by Gribeauval. He had his guns cast solid and bored to accurate dimensions instead of being cast to approximate size. This diminished clearance, with the result of no loss of power, in spite of reduced length and weight. Trunnion-rim bases, removable copper vent pieces, and iron axletrees were introduced, and draught lightened by making the wheels of the limbers higher. An improved vertical 'pin tail' facilitated limbering and unlimbering. Heavy guns had traveling trunnion beds provided on the carriage to distribute their weight over the four wheels. The powder cartridge and projectile were fastened together. Aiming was facilitated by the elevating screw and tangent scale, and for moving the piece unlimbered the prolonge and bricoles were used. All parts were made of standard dimensions, so that spare parts could be taken into the field for repair. Carriages for heavy guns were greatly improved by the use of a pivoted chassis.

Hollow projectiles were much used. Grape (a number of shot in a net) were used until superseded by Gribeauval's canister (a thin can to hold a number of small shot and break up as soon as discharged from the gun). Near the end of the eighteenth century carronades became popular, especially at sea, and were much used. Being short, they were easily loaded, and at the ranges of that day their heavy projectiles with low velocity were very effective.

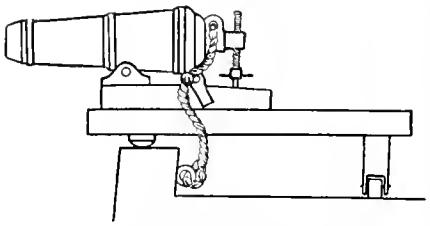

FIG. 2. CARRONADE (68-POUNDER) ON WOODEN NAVAL MOUNT. (Early nineteenth century.)

Early in the nineteenth century Colonel Bomford (United States) invented the 'columbiad' (q.v. for illustration), a gun of considerable length and having a long chamber, designed to fire at high velocity and low elevation either shot or shell. This idea was taken up abroad by General Paixhans (q.v.), of France, about 1822,

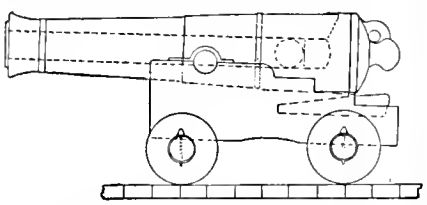

FIG. 3. ENGLISH 32 CWT. CAST-IRON SMOOTH-BORE 32-POUNDER, ON COMMON WOODEN SHIP CARRIAGE. (Early nineteenth century, but still in general use at sea in 1850.)

and 'Paixhans guns' came into very extensive use. They were important factors in rendering necessary the adoption of armor for ships. During the War of 1812 the most important guns in use were the columbiads and the carronades of the eighteenth century.

Admiral Dahlgren, United States Navy, in 1856, made the 'Dahlgren guns' for naval use of outline proportioned to the curve of pressures—therefore heavy at breech and light at muzzle. See GUNS, NAVAL.

RODMAN CAST-IRON GUNS. A casting cools and solidifies first on the surface, then progressively inward. The metal contracting as it solidifies draws inward from the solid outer shell, and the inner portion is thus put under tensile strain, while the outer is compressed by the reduction of its diameter. The effect of powder pressure in the bore is to strain the inner portion by tension. If now this inner shell be already under tensile strain, it is predisposed to rupture. General Rodman, Ordnance Department, United States Army, announced this condition, and proposed to avoid it by casting guns hollow and cooling them by water from the interior of the bore, while the exterior was kept hot by fire; the bore-surface then solidifying first would be compressed by the contraction of the outer layers, which would consequently be under tensile strain. The gun would therefore be stronger than a gun cast solid and cooled from the exterior, or even one without initial strain. Rodman's system of construction, used

in America and elsewhere for many years, gave the best results possible with cast iron, and was superseded only when the demand for rifles and higher power necessitated the use of stronger material. See ARTILLERY for illustration of Rodman gun.

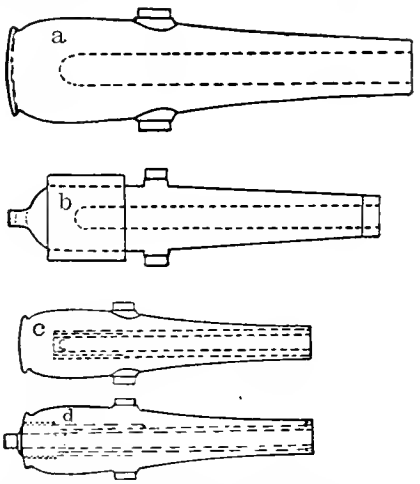

FIG. 4. NINETEENTH-CENTURY TYPES OF CANNON.

Chambers (United States) patented in 1849 a gun of wrought-iron tube with strengthening hoops. In 1855 Blakely (England) and Treadwell (United States) invented guns with hoops shrunk on. To them is due the real origination of the built-up system. Sir W. G. Armstrong (q.v.) of England made built-up guns for the English service from 1858. For many years his hoops were formed by coiling a rectangular bar of iron helically about a mandrel, and then closing and welding the coils together. These hoops were shrunk on the tube with initial tension. Whitworth guns were built up of cast and forged homogeneous steel hoops without shrinkage, the hoops being made slightly tapering and forced on by hydraulic pressure. The West Point Foundry (Parrott's) at Cold Spring, N. Y., to meet the demand for a cheap and quickly made rifle for use in the Civil War, made hollow cast-iron guns reinforced by a band of coiled wrought iron shrunk around the breech. These were the well-known 100-, 200-, and 300-pounder Parrott rifles, and served their purpose admirably, but the system was not capable of extension. Cast iron was, as always, unreliable.

The adoption of rifled guns, commencing about 1860, found all nations with large stocks of cast-iron smoothbores on their hands. Parsons (United States) in 1860 planned to convert these to rifles by inserting a steel tube through the breech and then closing that end by a permanent screw plug. Sir W. Palliser (England) in 1863 suggested a tube of coiled wrought iron inserted from the muzzle end of the gun. In the Palliser system the tube was prevented from forward motion by a collar screwed in front of it into the cast iron. Forward motion of Parsons's tube was prevented by several shoulders. This was the better method, as the tube was thus supported at several points with less danger of opening the welds between the coils. The Palliser system, which was cheaper, was adopted in England, and many guns converted by it. In America, between 1874 and 1880, many 10-inch guns were so converted into 8-inch rifles, comparing favorably with contemporaneous European rifles. Experiments were made in the conversion of larger calibre guns, in some of which the welds gave trouble, causing general distrust of muzzle-insertion, and the last 8-inch converted rifles had breech-inserted tubes. Variations of this conversion system were proposed for original construction, and several such guns were built and tested, notably the 12.25-inch rifle, between 1870 and 1880. Cast-iron bodies hooped with steel were strongly advocated by some, and the United States model 1886, 12-inch breech-loading mortars, made in this way, are now in service.

It was not until 1880 that the first really modern guns were commenced in the United States (by both navy and army), and commencement of regular manufacture was several years later. The establishment of the Army

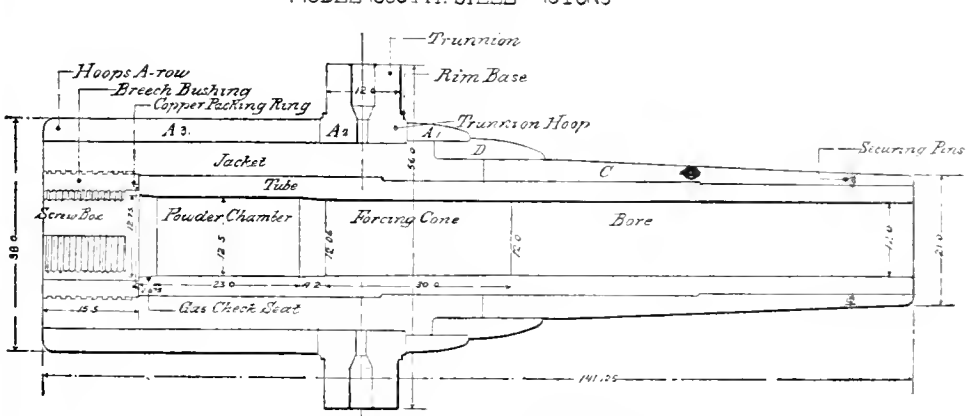

FIG. 5. 12-INCH BREECH-LOADING STEEL MORTAR,
Showing modern hooped construction, which is similar to that of guns, except in dimensions and details, arrangements, etc.

Gun Factory in 1889 may be regarded as the final commitment of the United States Government to the built-up forged-steel system. In 1890 the United States Navy had 6-inch, 8-inch, and 10-inch modern built-up guns in service; the army 8.2-inch guns and 12-inch mortars; both services had types of all calibres under test. Meanwhile elaborate calculations were being made in Europe, and reliable working formulas for the shrinkage deduced. By 1880 the system may be said to have been quite fully elaborated. Krupp in Germany, Armstrong in England, and Italy, the French, and others were then regularly turning out excellent built-up guns.

Wire-Wound Guns. In 1872 Dr. Woodbridge's design for a 10-inch muzzle-loading rifle made of a thin steel tube wrapped with wire brazed together by immersion in melted bronze was much recommended. The gun after 93 rounds was torn apart longitudinally by the force of discharge. It was evident that brazing could never be relied upon for longitudinal strength. Two other 10-inch guns upon the Woodbridge design were recommended in 1881 to be made and tried. One of cast iron with breech wrapped with wire was abandoned before completion. The second consisted of a steel tube the full length of the gun, the rear half being surrounded by longitudinal bars of steel, and the whole wrapped with steel wire at high tension, decreasing toward the exterior. The pressure upon the breech was transmitted through the longitudinal bars to the trunnions.

The Crozier wire-wound gun, commenced in 1889, consisted of a forged-steel tube wrapped over its whole length with tinned square steel wire and incased by cast-steel jacket and hoops, the jacket carrying the breech block and trunnions. All circumferential strength was to be obtained from the tube and wire. The tube was first wound at such tension as to compress it beyond its elastic limit and thus give it a special elastic limit, then unwound and wound again with the designed tension. The wire was continuously wound, the ends of the pieces as manufactured being electro-welded.

The first Brown segmental tube wire-wound gun was of 5 inch calibre, and had a very thin tube of high elastic-limit steel extending only from the breech to a short distance forward of the seat of the projectile, and forming a mere lining for the main tube, which was of longitudinal steel bars the length of the gun. This was wire-wrapped throughout with such high tension that even when powder pressure acts the tube is under compression. This is necessary to prevent the joints from opening, but necessitates the tube being initially compressed beyond its elastic limit, which is not desirable. In the latest development of the Brown system, not as yet fully tried, the segmental bars are replaced by thin plates radially and bent into epicycloidal forms by the wire winding. They extend from the breech to the muzzle, and are designed to give longitudinal strength and some tangential resistance from their frictional hold upon each other. A steel jacket connects the trunnions to the breech block.

Steel for Ordnance. Armstrong designed a steel tube for his built-up rifles of 1858, but was forced to abandon the idea after eight unsuccessful attempts to make one tube. In 1863 Sir Joseph Whitworth successfully made two steel guns, and by 1873 had perfected his fluid compression system for improving ingots, which led to renewed trials of steel for guns. Then and for some years the progress of gun-making was much hindered by efforts to cast guns of steel in one piece. Since 1890, however, steel has been universally used for guns.

Breech-Loading Systems. Of the breech-loading systems in use to-day nearly all can

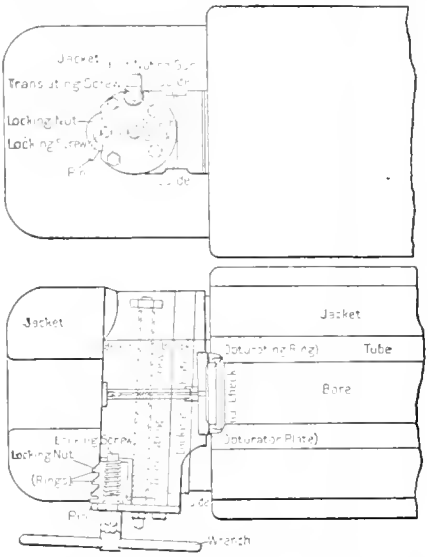

Fig. 6. Krupp breech mechanism.

The upper figure shows a vertical view of the breech of a Krupp gun. The breech block, which is wedge-shaped and has its axis not perpendicular, but oblique to the axis of the gun, moves transversely as shown in the lower diagram, a horizontal section, and when moved to the right by the rotation of the translating screw allows the projectile and charge to be inserted in the gun by bringing an open portion of the block in line with the bore. To close the breech the translating screw, which has a quick pitch and works in a half nut on the gun jacket, is turned. This moves the breech block so that the solid part comes in front of the bore, but does not, however, lock the breech or force the gas check into its place. This is accomplished by the locking screw and accompanying mechanism, which forces the block forward and secures it firmly.

be classified under either the transversely sliding block system, of which Krupp's is the most important, or the longitudinal screw-block sys-

Breech open, showing tray, double-threaded translating screw, block spindle, gas check, pad, and latch.

tem, of which the United States service types are prominent examples. In 1858 Armstrong's 32-pounder rifled breech-loading guns introduced

into the English Navy had a transverse block supported by a longitudinal screw block bored out to permit loading when the transverse block was removed. About the same time Krupp had a breech-loading system of transversely sliding wedge-shaped block, essentially his present system. In 1849 Chambers (United States) patented

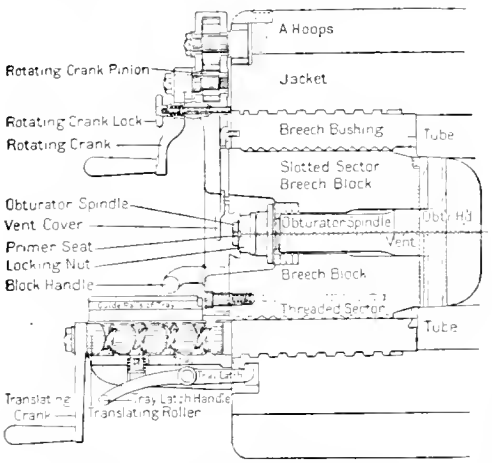

FIG. 8. SECTION BREECH MECHANISM OF U. S. 12-INCH BREECH-LOADING MORTAR, MODEL 1890, MARK I.

a longitudinal screw block with interruptions in the threads that permitted it to be slid to the rear after only a partial rotation. This is the present American system. The French developed the idea in their naval and land service in 1870, calling it the Reffye mechanism.

Both the Krupp and the French breech-loading systems, as well as many others, were tried in the United States before the final adoption of a modification of the French system. In the earlier guns much difficulty was experienced with gas checks; Krupp used a ring of steel, the thin edges of which pressed by the gas prevented escape; the De Bange check used by the French was a plastic pad of asbestos flour and tallow, held in a canvas bag which, being pressed back by a spindle receiving the powder pressure, was spread sidewise tightly against the walls of the bore, sealing the joint. (See illustration under GUNS, NAVAL.) Finally A. H. Gerdom designed steel split rings, one in front and one behind the pad, to act themselves as gas checks, the function of the pad being simply to press upon their beveled inner surfaces and wedge them outward. This gas check is now in successful use, and constitutes one of the most important of the American improvements of the system.

In its latest development, the breech mechanism for heavy guns is operated by a continuous rotation of a single crank in one direction, which, by means of a combined spiral and spur gear, first rotates the block to bring the threaded sectors opposite the open ones of the gun, then draws the block to the rear clear of the gun, and finally swings it to one side on a tray hinged to the gun. These three motions are always

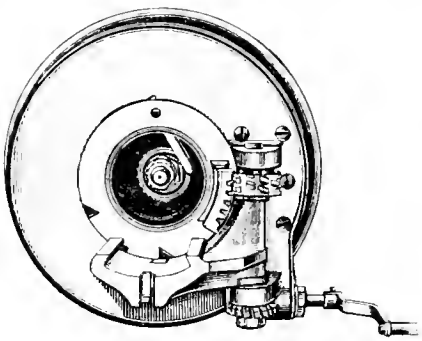

FIG. 9. BREECH MECHANISM (INTERRUPTED SCREW) OF 12-INCH BREECH-LOADING RIFLE, MODEL 1895.

Differs from that of model 1888 by device for opening by continued turning of crank. Breech closed and locked.

necessary to the withdrawal of the interrupted screw block. In guns of 6-inch calibre and less, they are accomplished by a single quick motion of a crank connected by links, gears, or otherwise, to the block so as to accomplish the rotation, withdrawal, and swinging successively and automatically. A very recent adaptation of the screw block is the Nordenfelt eccentric block, which is not withdrawn at all, but being rotated about a centre not in the axis of the gun, a hole in the block can be brought opposite the bore for loading, or the bore may be closed by the solid part of the block, while the block is at all times held by circular grooves and cuts in its housing. Great attention has been paid to locking the block of all systems, and to devices for preventing fire before this locking is complete.

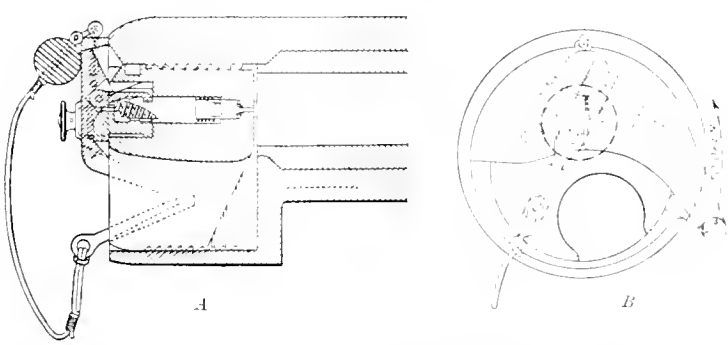

FIG. 10. NORDENFELT ECCENTRIC BLOCK BREECH MECHANISM FOR RAPID-FIRE GUNS. A, Longitudinal vertical section. B, Section through breech.

SIZE AND POWER OF GUNS. By 1880 the introduction of large-grain slow-burning powder and of heavier projectiles had much increased the power of guns in proportion to calibre. At that time the English had guns weighing about 100 tons, of 17.72-inch bore, firing a 2000 pound projectile, with 1640 feet per second velocity. In the United States, to keep pace with this movement, a 16-inch gun was designed, to weigh

127 tons, and to fire a 2400-pound projectile, with a velocity of 2300 feet per second. This gun, when finished, was the most powerful ever built. The time elapsed since its design has, however, seen a reaction of opinion adverse to the construction of guns above 12-inch calibre, and the experience of several recent wars, meagre as it has been, has led to a strong sentiment in favor of a limit even lower.

Principles of Design. A gun has to withstand three kinds of stress: (1) A pressure radially outward; (2) a force tending to stretch the gun longitudinally; (3) transverse stress due to the weight of the parts of the gun on opposite sides of the point of support. The first, tending to enlarge the bore, stretches the metal circumferentially, and on account of the resistance of the outer layers compresses the inner parts radially. The powder pressure is at a maximum before the projectile has moved more than a few inches—due to sudden evolution of gas, restricted space, and resistance of rifling—and quickly falls as the projectile moves forward. When the size of the interior of the gun and the conditions of loading are determined, the intensity of the pressure to be expected at each point along the bore is calculated and a pressure curve plotted. The way is now clear for the design of the gun as an engineering structure to withstand these known forces at the various points. The tube of a built-up gun is strengthened by putting over it hot hoops, which when cool are of less diameter than the tube's exterior by an amount called the 'shrinkage.' The shrinkages are so calculated that at no time shall any portion of the metal be strained beyond its elastic limit, and that in case of accidental high pressures bringing the gun up to its limiting strength all the component cylinders would reach their elastic limits simultaneously. Thus it is necessary to calculate the shrinkage and strength under the assumption that the maximum powder pressure is acting, and again that no interior pressure is acting; i.e. the 'system at rest.'

Construction of Built-up Steel Cannon. The material of which modern guns are made is 'low steel' containing about one half of one per cent. of carbon. In the United States it is made by the open hearth process. (See Iron and Steel, Metallurgy of.) In Germany crucible steel is used. Bessemer steel is practically debarred, because it is not pure or sound enough for use in cannon. The steel is cast into ingots roughly approximating in shape the pieces to be made from them, but larger. United States Army specifications require about 30 per cent. at top and 6 per cent. at bottom of the ingot to be discarded. The metal is generally compressed by Whitworth's fluid compression.

After the ingot is cast, it is cooled very slowly to avoid strains, and then the surplus portions are cut off and specimens taken for chemical analysis and tensile test. The balance of the ingot is now bored in a lathe, then heated and forged on a mandrel.

After forging, the specifications require that the strains due to this operation be removed by annealing. The forging is then turned and bored in a lathe to nearly its finished size and specimens taken for test. It is then oil tempered to give toughness, but this process is apt to induce strains in the metal, to remove which the forging is generally required to be again annealed. Tubes are bored in a lathe with a long boring bar fed into the tube, which rotates while the bar remains stationary. The tool carried at the end of the bar is a 'hog-nose' or semi-cylinder of cast iron, which, by its pressure on the bore, already cut, steadies and supports a cutting tool at its forward end. The bore thus produced is straight (within a small fraction of an inch in the whole length of the tube), but rough, and is smoothed by a reamer, a cylinder of wood fitting the bore tightly and carrying long side cutters. During or after the boring, the outside of the tube is turned to diameters greater by the calculated shrinkages (about 0.0003 of the diameter) than the inner diameter of the hoop to encircle it. (The operations upon jackets and hoops are in general similar to those upon tubes.)

When ready for assemblage the hoop or jacket to be put on is heated in an oven (generally in a vertical position, in an oil furnace, to 500 to 800 degrees F.), and expanded to 0.03 inch to 0.08 inch larger diameter than the part it is to surround. It is then lowered over the latter, which stands in a vertical position, until it abuts against a shoulder on the tube. In order that it shall not in cooling grip the gun higher and draw away from this shoulder, water is poured on to the hot hoop near the joint to cool it there first, and then the water ring is gradually moved up to produce progressive cooling through the whole length of the hoop. The gun, as it begins to be called as soon as any pieces have been assembled on the tube, then goes to a lathe to have the surface turned for the next hoops to be shrunk on.

The sequence of assemblage of the jacket and the hoops is dependent upon the system used to transfer the longitudinal forces to the trunnion. In mortars generally, and in some guns, the tube is run through the jacket from the rear until its shoulder abuts against one in the jacket. In most 8-inch, 10-inch, and 12-inch United States guns the 'C' hoops (covering the chase or muzzle portion) are first put on from the front of the tube, then the jacket is put on from the rear. This leaves both jacket and hoops held from sliding off the ends of the tube by their grip only. The grip is very great, but is not regarded as sufficient security, and an 'L' hoop, or locking hoop, is put on, having a portion of its bore near the centre of greater diameter than the bores at each end. This portion corresponds to a raised shoulder on the forward end of the jacket and one on the rear of the first 'C' hoop, thus binding them together. The 'L' hoop is expanded sufficiently to allow its smaller diameters to pass over these raised shoulders in assemblage. The trunnions are forged solid with the trunnion hoop, which is assembled upon the gun by shrinkage like any other hoop. When all hoops have been assembled, the gun, after a careful inspection for dimensions and straightness, is finish-bored to its proper calibre, turned to the prescribed shape outside, rifled, and the powder chamber, forcing slope, and breech recess finished.

Rifling is done by pushing in from the muzzle a bar, carrying a planer tool to cut the grooves, and so rotated by rack-and-pinion and a forming bar, or by a guide-pin and groove in the bar, as to make the groove of the prescribed twist. The curve of the rifling, to reduce resistance at first,

increases from one turn in 50 calibres, at the commencement, to one turn in 25 calibres, at the muzzle (the United States standard), and is, when developed on a plane surface, a semi-cubic parabola. The forming bar referred to, being set to that curve as calculated for the particular gun, guides a straight bar, perpendicular to the rifling bar, in such a manner that by means of its rack and the rifling bar's pinion the proper rotation is imparted to the tool.

The powder chamber is in rear of the rifled part of the gun, and is of slightly larger diameter to hold more powder in a given length, and to allow for a narrowing cone at its front end to stop the projectile in the right position and bring it to a central position. Forward of this cone is the rifling, but, to prevent excessive pressures due to instantaneously overcoming the whole resistance of the rotating band to taking the rifling, it is customary to ream off about half of the depth of the lands (or ridges of metal between the rifling grooves) at this point, and this reaming is done in the form of a cone several feet long, so that the increase in height of the lands shall be gradual throughout this distance. The breech recess is the part in rear of the tube which is threaded and slotted for the breech block.

Each gun is required in the United States (and all nations have similar requirements) to be fired at least five rounds before it is issued for use in fortifications. Before the adoption of a new type of gun, one gun of this type must have withstood 500 rounds.

In the manufacture of wire-wound guns the tube must be machined as for the built-up gun, and is wound by rotating it in a lathe while the wire is fed from spools through a machine, giving the wire the tension calculated therefor. Whatever jacket and hoops are to be used in the design are shrunk on exactly as in built-up guns.

Classes of Cannon. Cannon are classified as guns, howitzers, and mortars. Guns fire at high velocity and therefore low elevation, about 12° being the maximum; howitzers, shorter than guns of same calibre, have lower velocity, and therefore, range for range, higher angles of elevation, generally up to 20°; mortars, still shorter in proportion, fire at still lower velocities and at 45° to 60° elevation.

Another classification of cannon, depending upon their use, whether for field, siege, or seacoast purposes, involves no essential differences in the guns themselves, other than the limits of weights imposed by the required mobility. (See Field Artillery; Siege Gun; and Coast Artillery.) Yet another classification of cannon, depending upon their mode of operation and service, differentiates between the ordinary breech mechanism with separate loading of projectile, charge, and primer, and the rapid-fire (or quick-fire) gun, semi-automatic, automatic, and machine gun. The rapid-fire gun is one with a breech mechanism opened and closed by a single motion of a lever and loaded with fixed ammunition—projectile, charge, and primer fixed in a metal case, so that all can be inserted at one motion. (They will be found described under Rapid-Fire Guns.) Semi-automatic guns are those rapid-fire guns in which the energy of recoil is utilized to open the breech, reload, and cock—each round being, however, inserted by hand and the trigger pulled for each discharge. Automatic guns are those in which the above utilization of recoil is extended to all operations, the cartridges being fed automatically in strips or belts, or otherwise, and the gun firing round after round automatically as long as a trigger is pressed.

Machine guns include all guns in which the action is as described for automatic guns, whether the power for operation is derived from the recoil as above, and as exemplified in the Maxim, Colt, and Hotchkiss automatic guns, or is supplied by a cannoneer or motor continuously turning a crank as in the Gatling machine gun and the Hotchkiss revolving cannon. They will be found treated under Machine Gun.

At one time much was promised for guns in which compressed air was employed to throw large quantities of dynamite or other high explosive relatively short distances. A pneumatic dynamite gun for coast defence was invented by Captain E. L. Zalinski, U. S. A., and after a number of experiments several of these guns were constructed and installed in fortifications in the United States, but these have since been removed as obsolete. These guns were smoothbore, the largest having a tube 50 feet in length and a calibre of 15 inches. Compressed air derived from a compression plant located near by and stored in reservoirs so that it could be used in the gun at a pressure of 1000 pounds to the square inch was employed. A range of about 5000 yards was attained with the 15-inch guns and projectiles containing 100 pounds of high explosives. The Zalinski gun has also been used at sea, the dynamite cruiser *Vesurius* having been constructed with three tubes, and was employed at Santiago, but without the success anticipated. Another form of pneumatic gun is the Sims-Dudley gun, in which a projectile containing a charge of about four pounds of high explosives is fired by air compressed by the explosion of gunpowder in a lower barrel. This gun was used with some success during the Spanish-American War. See Air Gun.

The distinctions between smoothbores and rifles, and between muzzle-loaders and breech-loaders, are obvious; all modern guns are breech-loading and rifles, but it is customary to designate them as 'breech-loading rifles' (B.L.R.) to avoid confusion with the obsolete guns still in existence.

Carriages. Gun carriages are either stationary (as seacoast) or mobile (siege and field); as to mode of action, barbette, disappearing, turret or casemate, or motor carriages, or rapid-fire mounts (recoil and non-recoil). The main function of a gun carriage is to support the gun during firing; secondly, means must be provided for pointing the gun. Mobile carriages must also possess the attributes of vehicles.

Modern seacoast carriages have a cast-iron base ring, solidly set in concrete, an iron or steel turntable or racer upon this, and the chassis assembled thereon. Generally a top carriage of some sort runs back on rails on the chassis, its motion in recoil controlled by a brake, generally hydraulic. Such a brake consists of a cylinder fastened to the top carriage, which contains a piston fastened to the chassis. Oil in the cylinder can pass the piston, as the cylinder moves to the rear, only through small orifices in the piston varying in size during recoil.

The first step in design is to construct a curve showing the velocity the gun would have if left free to recoil with no resistance but its own inertia. A certain constant resistance is now fixed upon for the brake, and the resulting velocity of retarded recoil is plotted. From this the opening in the piston, varying with the distance recoiled, to give the desired constant resistance, is calculated—resistance to flow through

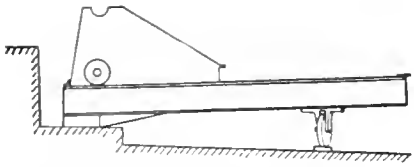

FIG. 11. U. S. IRON SEA COAST BARBETTE CARRIAGE FOR RODMAN SMOOTHBORE.
(In use up to 1875 and later modified for 8-inch converted rifle.)

an orifice being known to vary inversely as the square of the velocity. Thus the constant pull transmitted to the chassis by the piston rods, and hence the stresses borne by all parts, are determined and used to calculate their dimensions.

Prior to the adoption of the hydraulic brake various means of checking recoil were used. Up to about 1850 the friction of wooden wheels and axles was used with a rope for final stop. About 1860 naval carriages were made of iron and had no rear wheels but a shoe (for friction). The front wheels helped in returning the gun to battery. On land heavy carriages had I-beam chassis, and top carriages like the above. Friction of top carriage on chassis rails as well as the inclination checked recoil. Eccentric axles allowed recoil on friction and return on rollers. As the power of guns increased, recoil had to be further controlled. Between 1870 and 1880 various frictional devices were used. One or more bands of iron fastened to chassis were gripped by plates on top carriages pressed tightly on them.

The earliest hydraulic cylinders (about 1876) had pistons either pulled out or pushed in by recoil, the oil flowing around the piston in the clearance. Sir W. Siemens introduced holes in the piston head. So far, the orifice being constant, the pressure varied, running up to high values, then decreasing. To obtain constant pressure (to do the same work with less maximum strain) the orifices came to be varied, by taper rods passing through them, by rotating disks partially closing them, by by-pass pipes with spring valves and by other methods, among which are the 'throttling bars' used in the United States carriages. Here the piston has notches in its circumference partly closed by bars of varying depth screwed to the cylinder. As the piston travels in the cylinder the orifices change with the depth of the bars.

Top carriages now recoil on rollers to eliminate as much as possible the uncertain effect of sliding friction.

Return to firing position is accomplished by gravity, springs, or pneumatic or air power.

For giving elevation, guns are generally rotated about their trunnions (at or near the centre of gravity) by a screw, rack-and-pinion, or similar device at the breech. In rapid-fire mounts the principle is the same although elevation is generally given to a cradle or slide in which the gun's axis is fixed. In field guns, to economize space, the motion is doubled by having one screw work inside of another.

For traversing, the early carriages were pried bodily sidewise by levers; then the chassis was pivoted and rotated by ropes and pulleys or later by gearing of one kind or another. Still later the chassis was fixed upon a turntable rotated by a pinion working in a circular rack in the foundation and operated by gearing.

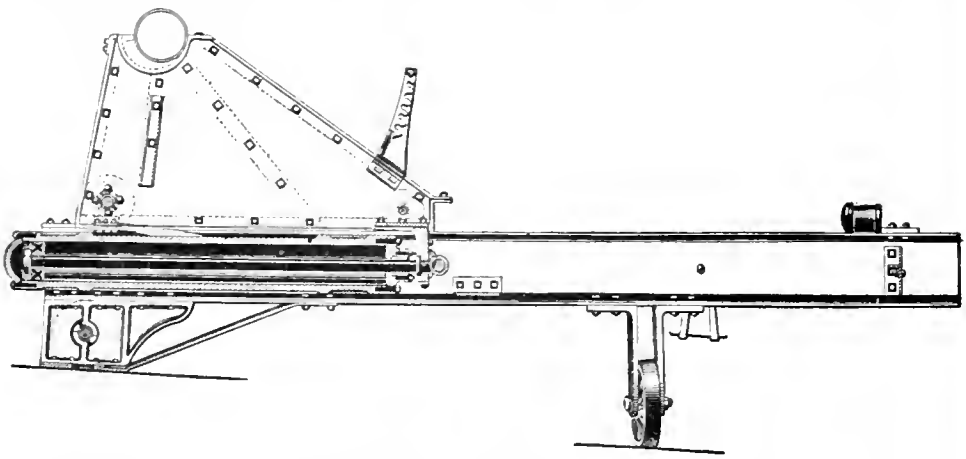

FIG. 12. U. S. IRON BARBETTE CARRIAGE FOR 8-INCH RIFLE.
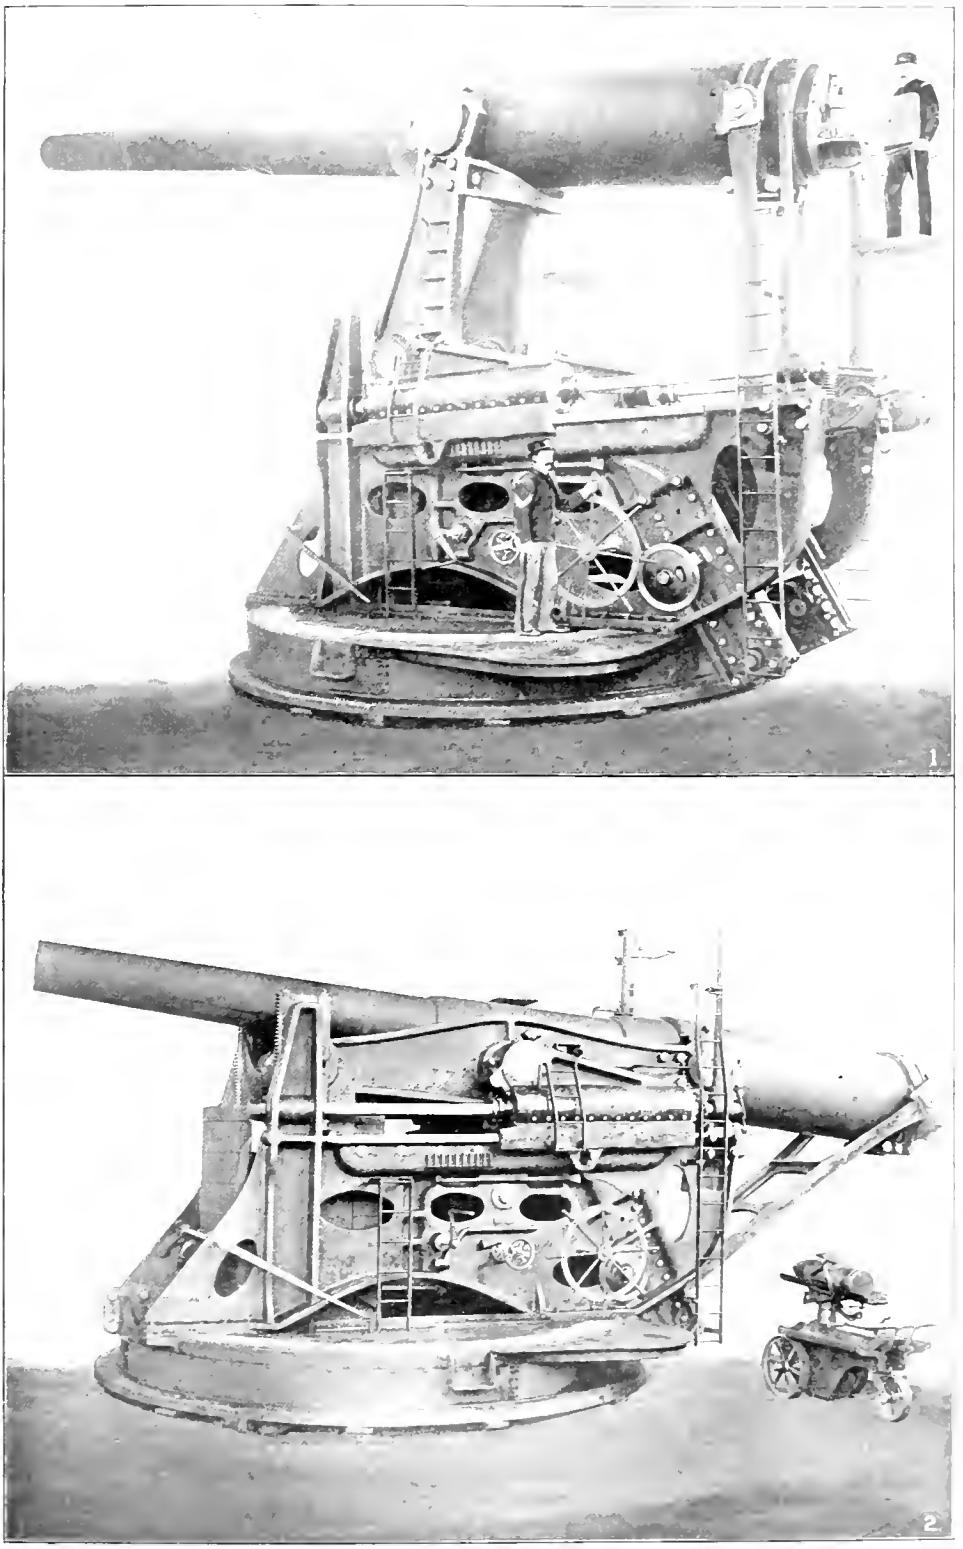
Altered from carriage for 8-inch smoothbore, and used for the 8-inch converted muzzle-loading rifles. This carriage has eccentric wheels traveling on the chassis and a hydraulic recoil brake.

In barbette carriages the gun is generally mounted on trunnions directly in the top carriage, which slides to the rear (restrained by a hydraulic brake) on the chassis rails. These incline upward slightly, to make the gun run into battery again. This type is mostly used in land forts for heavy guns. See illustration of 8-inch Breech-loading Rifle on Plate of COAST ARTILLERY.

The essential feature of carriages for use in casements or turrets is that the opening in the wall or armor necessary for them to



U. S. ARMY DISAPPEARING CARRIAGE, MODEL 1895, FOR 12-INCH BREECH-LOADING RIFLE. Buffington-Crozier Design.
1. In firing position. 2. In loading position.

fire through with the desired horizontal and vertical angles of train shall be as small as possible. The former was provided for up to very recent time by placing the pintle or point of revolution at the front end of the carriage, or even in the wall, and connected with the carriage by a metal rod called the tongue. In turrets, land or naval, it is customary to rotate the turret, gun and all, and thus eliminate all horizontal movement of the gun with respect to the opening or embrasure. To reduce the embrasure vertically the gun is lifted or lowered by two hydraulic presses, or other power, the muzzle being stationary. The necessity for such carriages for land service has decreased with the abandonment of masonry forts, but exists in naval mounts, whether in turrets or not, and in land turrets (as yet few in use).

Disappearing Carriages. In the United States disappearing carriage for seacoast guns (the Crozier-Buffington) the gun's trunnions rest in the upper ends of two levers which have an axle at their centres resting in a top carriage and pins at their lower ends supporting a counterweight in vertical guides. The motion of the gun's trunnions in recoil is a resultant of the horizontal motion of the gun-levers' centre and the vertical motion of their lower ends—therefore an ellipse. The breech is held up at the proper height by a rod pivoted at bottom in a slide raised or lowered to change elevation. In recoil, therefore, the breech moves in a circular arc. The gun's muzzle moves to the rear almost horizontally until it clears the parapet—then sharply downward. In the loading position, the breech (the most exposed part) is protected from fire over the parapet of less than 7° angle of fall. The motion of the top carriage is controlled by a constant resistance hydraulic brake. The recoil is also somewhat absorbed by raising the counterweight, but this is incidental, as the counterweight's function is simply to return the gun to the firing position. Pawls catch on teeth on the counterweight crosshead holding the gun in the recoiled position for loading until released by a lever. Entirely protected from the enemy's fire, the cannoneers load the gun and traverse and elevate by means of hand cranks or electric motors. This may be directed from a distance by telephone, or by one man on the sighting platform—the only one exposed to fire—who, in the later models of carriages, can himself perform the training by electric controllers within reach. This carriage was invented in principle by Gen. A. R. Buffington in 1872, and developed into the present form, about 1890, by Gen. William Crozier (both of the Ordnance Department, United States Army).

The only other disappearing carriage of any importance now in use is the English Elswick carriage, in which the gun levers have fixed pivots at their lower ends and are controlled in rotation by a rod from their centres carrying at its lower end the piston of the hydro-pneumatic cylinder, which by oil-flow softens recoil, and by air-compression stores up energy to return the gun to the firing position.

Mortar Carriages. Mortar carriages have the turntable and chassis as in the preceding, but no top carriage. As they are for high angle fire and recoil necessarily downward, springs are necessary for return to firing position. In the United States model of 1896 the mortar rests on the end of a lever pivoted at its bottom to the turntable and with spring columns and hydraulic buffer beneath. Previous to the adoption of such types as these mortar carriages had been simple iron boxes with trunnion beds. See Plates of Coast Artillery and Artillery.

Rapid-Fire Mounts. Rapid-fire mounts are a development of the last twenty years. They are either recoil or non-recoil. Applied first to small guns (as one-pounders and three-pounders), no recoil was allowed, the mount being made strong enough to transmit the shock of discharge to the deck, which, however, could not stand the shock due to large calibres when so mounted. A non-recoil mount for six-pounders reduces the shock on the deck to about one-sixth. There are other advantages. So recoil mounts are now almost universally used, even for small guns. Such a mount consists of the pedestal bolted to deck or platform, a Y-shaped yoke rotating about a vertical axis in the pedestal and in its upper arms carrying upon trunnions a cradle in which the gun has longitudinal motion. In the under portion of the cradle is the cylinder of a hydraulic brake and either in this cylinder or beside it are spiral spring columns.

Training is done in the small-calibred guns by a shoulder bar with rubber cushion, fastened in non-recoil mounts to the gun or yoke, in recoil mounts to the yoke or cradle. With his shoulder against this bar the gunner points the gun in direction and in elevation almost as a small arm. In guns of over 3-inch calibre it is customary to train by hand wheels within easy reach of the gunner.

Balanced pillar mounts are rapid-fire mounts like the above, but mounted on a vertical cylinder which is balanced by a counterweight and can, when not in action, be lowered to mask the gun and carriage completely behind the parapet.

Mobile Carriages. Carriages for field guns and howitzers and for siege guns and howitzers differ in detail and size, while the same in principle. Siege carriages are generally high enough to fire over a five-foot or six-foot parapet, and much heavier than field carriages because of the greater energy of recoil and because they do not require so great mobility. They weigh about 5500 pounds, with limber, while field carriages are limited to 4000 pounds, including limber, and three cannoneers and 700 pounds or more of ammunition.

Mortars for field and siege use are generally fired from immobile carriages and transported on wagons. Siege carriages generally require platforms to which they are attached to assist in control of recoil.

A carriage, field or siege, must have two wheels with axletree and a trail giving a third point of support on the ground when firing. The trail also connects with the limber for traveling. Until recently trunnion beds were formed in the front ends of the sides or flasks of the trail and the gun had no recoil relative to the carriage, which ran back on the ground until the energy was absorbed by friction of brake and resistance of ground.

Up to the United States Civil War all mobile carriages were made mostly of wood, although with metal bracings, axletrees, and other parts. At this time iron was recognized as the coming material and was soon adopted. Since 1880 all carriages have been made of iron or steel, now al-

most entirely of the latter. Earlier iron carriages had flasks of plates and angles. The Buffington carriage (United States), of steel pressed with bulb edges, has been in use from 1888 to the present time.

braking and helical springs for returning the gun to the firing position. The carriage is so stable that cannoneers sit on the trail, aiming, etc., during firing. This is the result of careful calculation of the forces in equilibrium during

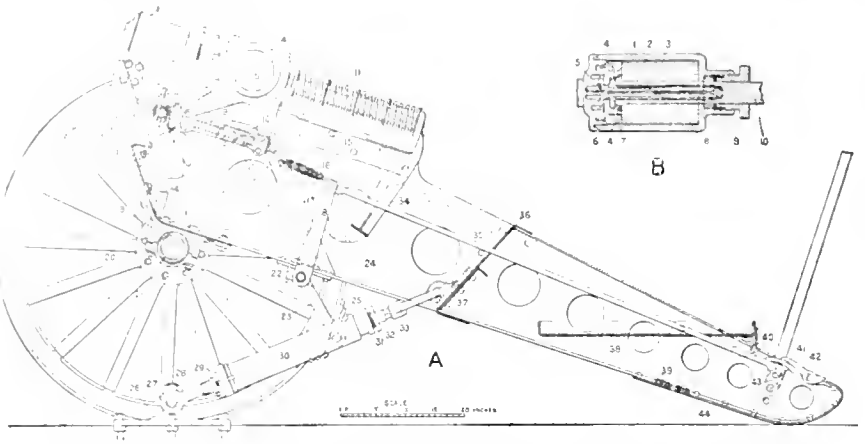


FIG. 13. SEVEN-INCH SIEGE HOWITZER CARRIAGE, UNITED STATES ARMY MODEL, 1899.

A, (Vertical section). 1, recoil cylinder; 2, gland for recoil cylinder; 3, piston; 4, cap-square; 5, trunnion carriage; 6, elevating rod; 7, elevating nuttres; 8, equalizing pipe; 9, worm buffer; 10, elevating worm; 11, recoil springs; 12, elevating wheel; 13, front transom; 14, hand-spike, etc., socket; 15, slide rail; 16, brake spring; 17, flask stiffener; 18, brake shaft lever; 19, axle bracket; 20, axle bracket-cap; 21, axle; 22, brake-shaft bearing; 23, brake shaft; 24, flask; 25, brake shoe; 26, pintle plate; 27, 29, cylinder head; 28, pintle nut; 30, brake cylinder; 31, gland; 32, piston; 33, piston eye; 34, stop transom; 35, reach rod; 36, carriage brake transom; 37, brake fastener; 38, foot plate; 39, lunette reinforce; 40, tool chest lock; 41, brake lever socket; 42, brake catch pawl; 43, brake rod crank; 44, trail shoe. B, Recoil cylinder (horizontal section). 1, recoil cylinder; 2, piston; 3, throttling rod; 4, oil passage; 5, front cap; 6, piston; 7, piston liner; 8, follower; 9, gland; 10, piston.

To enable carriages to stand guns of increased power without undue recoil, brakes were devised, set by recoil, and released by running forward. Later, spades were introduced. When power increased so as to work the spade too hard, a short recoil was given the piece upon the carriage, this being first applied to siege, and later to field carriages. This enabled the spade to hold, but resulted in the wheels of the carriage jumping from six to twelve inches from the ground with derangement of aim and loss of rapidity of fire. In the last few years rapidity has been much discussed and sought for in ideal rapid-fire field guns to fire about twenty aimed shots per minute. This result has been nearly attained in a number of recent constructions.

Such a system requires a carriage unmoved by discharge (necessitating about 45-inch recoil of the piece upon it, with automatic return to firing position—quick, but without shock—and a spade to take sure hold of earth); also means for traversing the gun on the carriage and for elevating by cranks within reach of one man at the sights. The Ehrhardt carriage (adopted by England) has the gun on a slide under which is a hydraulic brake or cylinder surrounded by a helical spring. Its trail can be extended for stability. Krupp uses a similar arrangement for recoil springs. The United States conducted in 1902 experiments for election of a type; testing two carriages made by the Bethlehem Steel Company, one by the Cockerill Company, one by the Vickers-Maxim Company, and several others, including two Ordnance Department designs by Captain Wheeler, one with 8-inch and the other with 46-inch recoil, have been submitted. In the latter the gun recoils through a bronze cradle which holds two cylinders containing oil for discharge. To prevent jump, the moment of the pull on the piston rod about the spade must not exceed that of the weights about the same point. The guns selected embraced the best points of the Ehrhardt gun, with the improvements and original features of the United States Ordnance Department's models. All parts must be reduced to minimum weight needed for strength, to keep within the limit of weight allowed for draught. See FIELD ARTILLERY.

BIBLIOGRAPHY. Of the many publications on ordnance matters, the reader is referred to the following few as comprehensive and most accessible, viz.: Bruff, *Ordnance and Gunnery* (New York, 1896); Ingersoll, *Text-book of Ordnance and Gunnery* (United States Naval Academy, 1887, used in the United States Military and Naval academies); *Annual Reports of the Chiefs of Ordnance, United States Army and Navy* (Washington); *Treatise on Military Carriages*, English War Office (London, 1895); *Treatise on Service Ordnance*, English War Office (ib., 1891). Also numerous official pamphlets and books of instruction, issued by the United States and foreign war departments, advertising matter of private firms, especially Armstrong and Hotchkiss, and the numerous technical periodicals. *Mittheilungen über Gegenstände des Artillerie- und Genie-Wesens* (Vienna, bimonthly); *Militär-Wochenblatt* (Berlin, semi-weekly); *Revue d'Artillerie* (Paris, monthly); *Revue Militaire Suisse* (Lausanne, monthly); *Revue de l'Armée Belge* (Brussels, bimonthly); *Journal of the United States Artillery* (Fort Monroe), etc. See ARTILLERY; GUNS, NAVAL; GUNPOWDER; EXPLOSIVES; MACHINE GUN; PROJECTILES; RAPID FIRE GUNS; SIEGE GUN; COAST ARTILLERY; etc.

ORDNANCE DEPARTMENT OF THE U. S. ARMY. One of the divisions of the United States Army, to which is assigned the duty of procuring by purchase or manufacture the ordnance and ordnance supplies required by the army and distributing the same. Accordingly the establishment and maintenance of arsenals, armories, and depots for the manufacture and storage of ordnance are assigned to this department. The regulations define ordnance and ordnance stores as including cannon and artillery carriages and equipments; apparatus and machines for the service and manœuvre of artillery; small arms, ammunition, and accoutrements; horse equipments and harness for the artillery; tools, machinery, and materials for the ordnance service. This department is under a Chief of Ordnance, who has the rank of brigadier-general while serving in this capacity, and in 1903 there were four colonels, six lieutenant-colonels, twelve majors, twenty-four captains, twenty-four first lieutenants, one ordnance storekeeper with the rank of major, and 110 ordnance sergeants. Previous to the Army Bill of 1901, the officers in the Ordnance Department held permanent appointments, but this act provided that line officers should be detailed to the Ordnance Department by the President for a period of four years. Before an officer can be so assigned he must first pass a rigorous examination in which his professional qualifications are thoroughly tested. The officers, in addition to a thorough scientific military training, must possess a thorough knowledge of mechanical engineering in general and especially in its application to the various engines of war. This department has always maintained a high standard and many important inventions have been made by its members. In fact, the larger and more important guns constructed in the United States have been designed and constructed by the officers of this department at army arsenals instead of at the shops of private corporations, as is the case in most European countries. See ORDNANCE; ORDNANCE ESTABLISHMENTS.

ORDNANCE ESTABLISHMENTS. The United States maintains two Government gun factories, one at Watervliet, N. Y., for the army, and one at the Navy Yard, Washington, D. C., for the naval guns. Carriages for naval guns are made at Washington Navy Yard, and those for the army at the Watertown Arsenal, Watertown, Mass., and Rock Island (Ill.) Arsenal. Small arms for the army and navy are made at the Army Armory at Springfield, Mass., and ammunition therefor at Frankford Arsenal, near Philadelphia, Pa. The last mentioned arsenal makes also all fuzes, primers, sights, etc. Rock Island Arsenal, above mentioned, makes, in addition to mobile gun carriages, harness and other equipments used in the army. Material of war is fired and tested at the proving grounds at Sandy Hook, N. J. (Army) and Indian Head, Md. (Navy). There are various ordnance repositories, arsenals, armories, etc. (See ARSENAL.) Heavy gun carriages have been made for the United States by the Bethlehem and Midvale Steel companies, which firms also supply all the steel forgings for cannon. Bethlehem has also made 8-inch, 10-inch, and 12-inch modern built-up cannon. Other American firms also have made heavy gun carriages, 12-inch mortars, and smaller guns, projectiles, etc. Explosives are furnished principally by the DuPont, the Laflin-Rand, and the California Powder companies. Revolvers, machine guns, etc., are furnished principally by Colt, and Smith & Wesson. In Europe the principal Government ordnance factories are at Woolwich Arsenal (England), Bourges and Puteaux (France), Turin and Naples (Italy), Alexandrovsk and Aboukhoff (Russia), Seville and Trubia (Spain). European nations depend principally for ordnance on private manufacturers, of which the most prominent are: Friedrich Krupp, at Essen, Germany; Sir W. G. Armstrong, Whitworth & Co., Ltd., Newcastle-on-Tyne, England, and Italy; Vickers Sons & Maxim Co., Ltd., England; Schneider et Cie, Le Creusot and Saint Chamond, France; Hotchkiss et Cie, Saint Denis, France; and the Skodawerke, Pilsen, Austria. Proving grounds are located at Havre and Hartleur, France; Spezia, Italy; and Essen, Germany.

ORDONNANCE DE LA MARINE, ôr'dō'nänS' de la mà'ren'. A naval code of admiralty law, in 5 books, issued by Louis XIV. of France, at Fontainebleau, in August, 1681. Book i. deals with the organization of admiralty jurisprudence; book ii. with the contractual relations between masters and seamen; book iii. with the entire subject of marine contracts, covering such topics as charter-party, affreightment, insurance, average, jettison, etc., also privateering and letters of marque and reprisal; book iv. with the administration of the customs; book v. with fisheries. Consult *Ordonnance de Louis XIV. . . . touchant la marine* (Paris, 1681).

ORDOVICIAN (from Lat. *Ordovices*, name of an ancient British tribe of North Wales), or LOWER SILURIAN SYSTEM. A division of geologic time following the Cambrian and preceding the Upper Silurian or Silurian proper. The Ordovician comprises rocks originally classed by Murchison as the lower portion of his Silurian system. It was considered to be of sufficient importance to be classed as a separate division by Lapworth in 1879, who proposed for it the term Ordovician. The type section of the American Ordovician is found in New York State, and consequently the names of many of the subdivisions are locality terms used in New York. It is as follows:

Ordovician	Trenton	Hudson Cincinnati Utica Trenton
	Canadian	Chazy Beekmantown, Calciferous

The Ordovician rocks are chiefly limestones, with the exception of the upper and lower members, which may be very shaly, indeed the Hudson River shales form a very prominent series of rocks in the Appalachian States. The Trenton rocks are widely distributed over the continent. The Ordovician strata are often found fringing the Archæan areas, being sometimes separated from them by but a thin strip of Cambrian. Thus there are belts of Ordovician rocks around the New York Adirondacks; from central New York westward to Wisconsin and Minnesota; along the line of the Appalachians on the eastern and sometimes on the western slope from Vermont to Alabama; around the V-shaped Archæan or Lauren-

tian of Canada; and in the Central States, in Ohio, Kentucky, Indiana, and Tennessee. Ordovician rocks are also known in the Uinta, Wasatch, and Rocky Mountains. In Europe the Ordovician rocks form a large area extending from Iceland into Russia. They are of considerable thickness in Great Britain and Wales. Additional areas are found in Bohemia, Germany, France, Portugal, Spain, and Northern Africa.

In neither North America nor Europe do we find any marked break between the Cambrian and Ordovician systems, but the faunal changes are well shown. There was during the Ordovician times a great interior sea over the United States, and the coastal States were also under water, but in the southwest much dry land was known. At the close of the Ordovician there were great disturbances. The mountains along the New York-New England border were formed and gave rise to the so-called Taconic ranges and the Green Mountains. Much faulting and folding accompanied the uplift. There was also developed a line of uplift in Ohio, Kentucky, and Tennessee, which domed the rocks up into a low, broad anticline known as the Cincinnati arch.

The life of the Ordovician, while being in advance of the Cambrian time, was not of a high order. Many seaweeds have been found, and cryptogams probably existed, though only scanty remains had been found. Being land plants, their preservation would be doubtful in marine sediments. Foraminifera and Radiolaria were abundant, as were also the sponges. In the Hudson River slates graptolites were very common. Among the corals were many representatives of the Tetracoralla, and also large cup corals like Streptelasma, while Columnaria was a common compound one. Cystidean crinoids are numerous, and many starfishes and even sea-urchins are known. The trilobites were very well developed, but the genera were largely different from those of Cambrian age. The brachiopods were represented by many well-known genera, especially Orthis, and many groups of Mollusca existed. Pleurotomaria among the gastropods, Orthoceras among the cephalopods were numerous. Fishes were the only representatives of the vertebrates, and of these were found armored ostracoderms in the Ordovician sandstones of Colorado. Fish teeth are known in the European Ordovician.

Among the useful minerals of the Ordovician are great quantities of building stone, including limestone and marble. In Ohio and Indiana great supplies of petroleum (q.v.) and natural gas occur in the rocks of the Cincinnati arch. Zinc and lead ores are mined in southeastern Missouri and the Upper Mississippi Valley in Wisconsin, Iowa, and Illinois. Along the contact between the Cambrian and Silurian in rocks in many parts of the Appalachians there are found deposits of limonite ores, many of which are mined.

ORD'WAY, JOHN MORSE (1823—). An American chemist and educator. He was born at Amesbury, was apprenticed to an apothecary (1836-38), and graduated from Dartmouth College in 1844. He was a member of the faculty of Grand River College, Trenton, Mo., from 1850 to 1857, and thereafter held superintendencies in a chemical factory at Johnston, R. I., and in a print works in Manchester, N. H. After several years as consulting chemist, Ordway, in 1869, became professor of metallurgy and industrial chemistry in the Massachusetts Institute of Technology. In 1884 he was appointed professor of applied chemistry in Tulane University, New Orleans, where he reorganized the biological department, and in 1891 became head of the department of engineering. His original work includes valuable research on lubricating oils and on non-conducting coverings for steam-pipes.

ORE (AS. *ār, ar*, ore, brass, copper, bronze, Goth. *ais*, OHG. *ēr*, brass; connected with Lat. *æs*, copper ore, bronze, Skt. *ayas*, metal). A mineral mass containing one or more metals in sufficient quantity and purity to warrant its exploitation. In a mineralogical sense all metallic minerals are ores, but technically the term is limited to those rocks or minerals that can be mined and treated at a profit; thus, menaccanite (a mixture of iron and titanium oxides) is classed by mineralogists as an iron ore, although, owing to its composition, it is not utilized as such in metallurgy. An ore may contain metal in the native state, as most gold ores, or the metal may be chemically combined with other elements, as is illustrated by iron ores and most of the other commercial ores. See ORE DEPOSITS.

ÖREBRO, ē're-brō *or* ē're-brōō'. A seaport of Sweden, situated at the entrance of the Svartâ-Elf into the Hjelmar Lake, 135 miles west of Stockholm (Map: Sweden, F 7). Part of the town is built on an island in the river, and contains the old castle, now a museum. The church and the town hall are the most notable buildings. The town has manufactures of machinery, tobacco, matches, and chemicals. These industrial products, together with the minerals obtained from the neighboring silver, copper, and iron mines, are conveyed to Göteborg and Stockholm by means of the extensive system of canals which connects the lakes of the interior with the maritime ports. Population, in 1890, 14,547; in 1900, 22,013. At the Diet of Örebro, held in 1529, Lutheranism was established as the State religion of Sweden.

ORE DEPOSITS. The name applied to deposits or accumulations of metalliferous minerals or ores found in the earth's crust. The term ore includes those portions of the ore body in which the metallic minerals form a sufficiently large proportion to make their extraction profitable; aside from these there are often quantities of

associated non-metallic minerals forming masses containing little or no metal, which are termed the gangue. The metallic mineral of the ore is sometimes in the native or metallic form, but more commonly it is an oxide, sulphide, sulphate, carbonate, silicate, or some other salt of the metallic element. A deposit may contain the ores of one or several metals, and there may also be several compounds of the same metal in any one deposit. Gold, platinum, and tin are usually found in the native condition, while copper, lead, and zinc commonly exist as sulphides and iron as oxides. The common gangue minerals are quartz, calcite, barite, dolomite, fluorite, hornblende, feldspar, etc. They may sometimes be so evenly mixed with the metallic minerals that it is necessary to crush the ore and separate the two by mechanical or magnetic methods, while at other times the gangue forms horses (q.v.) which can be easily separated or avoided in mining. Ore deposits vary greatly in form, size, and geological position as well as in their mode of origin.

ORIGIN. The fact that the deposits occur as masses of greater or less concentration may be explained in two ways: that they have been formed contemporaneously with the inclosing rock, or that they have been formed by a process of concentration at a later date. The former theory involves a consideration of ore occurrences in both igneous and sedimentary rocks. If the ore in an igneous rock were formed at the same time as the rock, it would indicate a crystallization of metallic minerals from the igneous magma during cooling, and this in some cases is true. If the ores of sedimentary rocks were of contemporaneous origin, then the deposit must be a bedded one, conforming to the strata of the rock; this supposition requires the presence of metalliferous minerals in and their deposition from sea water. While certain metallic elements are found in the waters of the ocean, their quantity is extremely small and not to be compared with the amount which may be found in disseminated or concentrated form in sedimentary and igneous rocks. Some economic geologists have assigned a contemporaneous origin to certain ores found in sedimentary strata, but the majority at the present day believe that most ore deposits have been formed by the process of concentration. That metallic minerals are widely distributed, although in small quantities, in both igneous and sedimentary rocks, has been shown by the researches of Sandberger and others, and the quantity of them found in igneous rocks is slightly greater than that occurring in sediments. Since, however, the sediments were originally derived from the igneous rocks, it follows that the latter must be the original source of the minerals. Where ores have resulted by a natural process of concentration, their accumulation requires the presence of disseminated metals in the earth's crust, the existence of a solvent and carrier, and the presence in most cases of cavities in which precipitation of the ore occurs. The first point has already been referred to. As regards the second, it is found that the analyses of many spring and mine waters have shown the presence of metallic elements in solution, including gold, silver, copper, zinc, lead, and mercury. Indeed, some of these metals are actually being deposited in some hot springs at the present day: Weed has described a spring in Montana which carries gold and has deposited its burden of auriferous quartz on the plants near its mouth. That there is a wide circulation of meteoric water in the rocks of the earth's crust has been quite clearly shown by the work of Van Hise. The return of this water to the surface may occur along fissures or other openings which it can easily follow. That these circulating meteoric waters may play an important rôle in the concentration of many

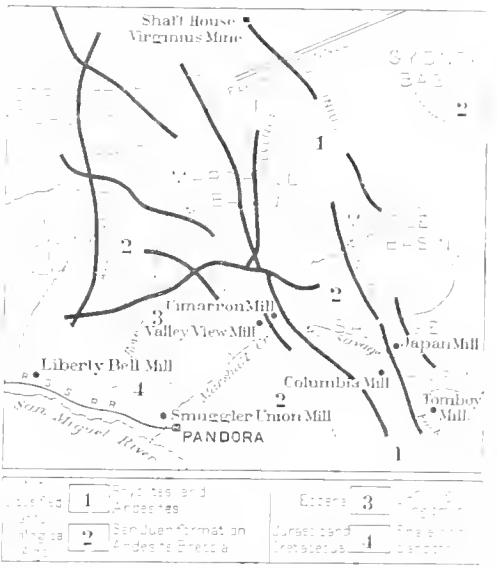

FIG. 1. GEOLOGICAL SKETCH MAP OF THE TELLURIDE DISTRICT, COLORADO.

ores is no doubt true, and some geologists even consider that most ores have been formed in this manner. On the other hand, it has been pointed out that most ore deposits are closely associated with igneous rocks, and in some cases with hot springs, and that therefore the former have served to open the way for heated waters and vapors whose solvent power is much greater than that of cold water. The advocates of the meteoric circulation theory believe that the waters have penetrated to the lower depths of the crust or bary-sphere, where metallic particles are considered to be abundant, and brought them toward the surface, where they were deposited. Those who consider the presence of igneous rocks to be an important factor in ore deposition also believe that the minerals may in some cases have been brought from a great depth in solution in the waters given off by the igneous magma, but that in some instances the igneous intrusion itself may have been the source of the minerals.

While all minerals are slightly soluble in cold water, this solvent power may be greatly increased by heat, pressure, and the presence of alkaline salts or other compounds. The metals may thus be leached out of the rock at some depth and out of contact with the air. When the solutions approach the surface or enter a cavity, the load of dissolved minerals is deposited either wholly or in part, as a consequence of cooling of the ore-bearing solution, decrease in pressure, and in some cases of the oxidizing effect of the atmosphere which converts certain soluble salts into an insoluble form. Iron compounds, for example, may go into solution in the form of carbonate, but on exposure to the air the latter

is rapidly changed to limonite, the hydrous oxide, which is insoluble. Since many ore deposits are formed in cavities, the question arises to what depth in the earth's crust cavities may extend. Investigations of Van Hise have pointed out that there can be recognized in the earth's crust two physico-chemical zones. In the upper one, which is close to the surface, the temperature and pressure in the rock are not great. In the lower zone, which is at some depth below the surface, both temperature and pressure are great, and consequently chemical reactions take place. This lower zone Van Hise divides into three parts, namely: an upper zone of fracture, in which the rocks are broken up by movements along the surface of the zones, but no movement in the zone itself; an intermediate zone of fracture and flowage; and a lower zone of flowage, in which a mashing or kneading action takes place, which involves every particle of rock. Within the last mentioned zone it would not be possible, therefore, for any cavities to exist, and Van Hise has figured out that approximately the maximum depths at which cavities can exist varies from 1625 feet in shales to 32,500 feet in firm granites.

The cavities in which the ores are precipitated have been formed in several different ways. The small ones, when existing in sedimentary rocks, are probably due to the presence of pores between the grains, or in the case of igneous rocks are gas cavities. More extensive ones may be caused by solution, especially in limestones, where caves are often formed by the solvent action of water, by contraction upon cooling or drying, which divides the rock along joint planes, or by folding or faulting of the strata, which may open fissures of considerable depth and length. The presence of cavities is not, however, necessary for the deposition of ore, since the conditions which are sometimes favorable to its precipitation may also favor the solution of other minerals, and thus the particles of a common rock may be slowly dissolved while ore is precipitated in its place. This process, which is known as replacement or metasomatism, is not uncommon, and often involves a large mass of rock, some deposits being formed wholly in this manner. The boundary of a deposit formed chiefly in a cavity may sometimes be indefinite because replacement of the walls by ore has taken place.

Form. Ore deposits vary greatly in their form, and this character has sometimes been used as the basis of classification. Certain forms are so numerous as to deserve special mention.

Veins are filled fissures sometimes extending vertically, but more often inclined toward the horizontal. They have commonly been filled by deposition from solution, and in this respect differ from dikes (q.v.). In the true fissure-vein the ore deposit, which is tubular in form, shows a banded structure due to the deposition of successive layers on the walls of the cavity. These layers or bands may represent different ores or consist of alternating layers of ore and gangue. At times, especially when the fissure is very narrow, the ore-bearing solutions may not only have filled the fissure, but have penetrated the wall rock as well, either filling the pores, or more often replacing portions of it, and then there will be a gradation from vein matter to the wall rock. Where the fissure is extremely narrow the ore owes its presence almost entirely to replacement; such veins lack a banded structure, being thereby distinguished from those formed by filling alone. If the vein is inclined the lower wall is spoken of as the foot-wall, and the upper one as the hanging wall. Veins often split, narrow (pinch), or widen (swell), and change their direction. In passing through hard, massive rocks like quartzite, the vein fissure is apt to be clean-cut, but where the fissure passes through soft rock like shale or some dikes it may split up into a number

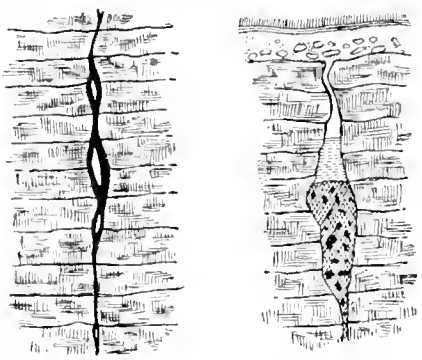

Fig. 2. Sections of Gash Veins, Fresh and Disintegrated. The heavy black shading indicates galena

of small stringers. A parallel series of closely spaced veins is termed a *lode*. Veins may often intersect, and of two which cross each other one may be of a later date and follow a fault plane which has broken and displaced the earlier one. The ore in such cases is apt to be much richer at the point of intersection. Even in a single vein the ore may follow certain streaks which are termed *shutes*, or again it may be restricted to pockets of great richness, which are known as *bonanzas*. Of the different gangue minerals found in veins, quartz is the commonest;

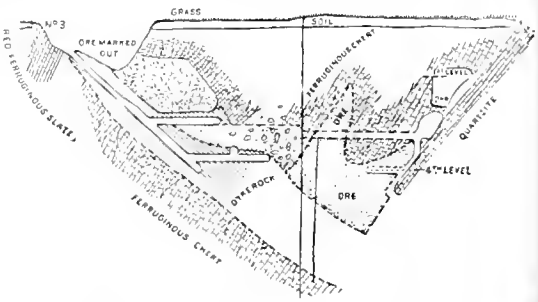

Fig. 3. Cross-section of Colby Mine, Penokee-Gogebic District, Michigan.

in some regions, as California, quartz veins are extremely abundant and often carry considerable gold. Since the quartz is commonly resistant to the weather, the wall rocks may often decompose and wash away, leaving the outcrop of the vein extending as a ledge or ridge along the surface. Veins vary in width from a few inches to several hundred feet and their outcrop or apex (q.v.) is sometimes traceable for a long distance. *Gash veins* are a special type of local extent, formed by the enlargement of joint fissures.

The manner in which fissure veins have been filled, and the source of the metals which they

contain, has been a subject of prolonged discussion among economic geologists. Some have argued for the theory of lateral secretion, considering that the waters which carried the

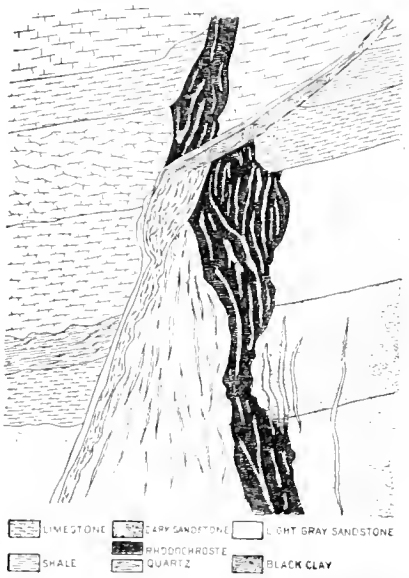

FIG. 4. THE JUMBO VEIN FAULTED BY A CROSS-VEIN.

metals had dissolved them from the immediate walls of the fissure on either side of the vein. Others combat this view and claim that the solutions had brought the metals from below and followed the fissure upward. This is known as the theory of ascension. The views held by most geologists at the present day are an amplification of the theory of lateral secretion, the idea having been first brought forward in studying the deposits of Leadville, Colo.

The term *impregnation* is applied to those deposits which have been formed by the deposition of ore in minute cavities of porous rock or in the crevices of a breccia. *Ore channels* are deposits formed along some path of easy access to the mineral solutions, as along the boundary between two kinds of rock. *Bedded deposits* are formed parallel to the stratification of sedimentary rocks. *Contact deposits*, as now defined, represent ore bodies formed along the contact of a mass of igneous and sedimentary rock, the ore having been derived wholly or in part from the intrusive masses. *Chamber deposits* include those formed in caves of solution. *Placer deposits* include a series of gravel deposits of sedimentary origin. These are widely distributed, especially in the Western States, and are a common source of gold, platinum, and sometimes tin.

WEATHERING. Most ore deposits have been changed superficially by weathering, the depth of this alteration varying from a few feet to several hundred: in the Rocky Mountains, 300 to 400 feet is not uncommon, and 1000 feet is extreme; in Chile a depth of 1500 has been recorded. Where the ore body contains iron-bearing minerals the oxidation of these may stain it heavily with limonite, and to this the name of *gossan* is often applied. At some localities the leaching out of the other minerals has naturally resulted in the concentration of the iron contents, so that the gossan can be worked as an ore of the latter mineral, while below the zone of weathering the deposit supplies a different type of ore, namely, that which originally predominated in it. The changes caused by weathering are both physical and chemical, or the same as would occur in

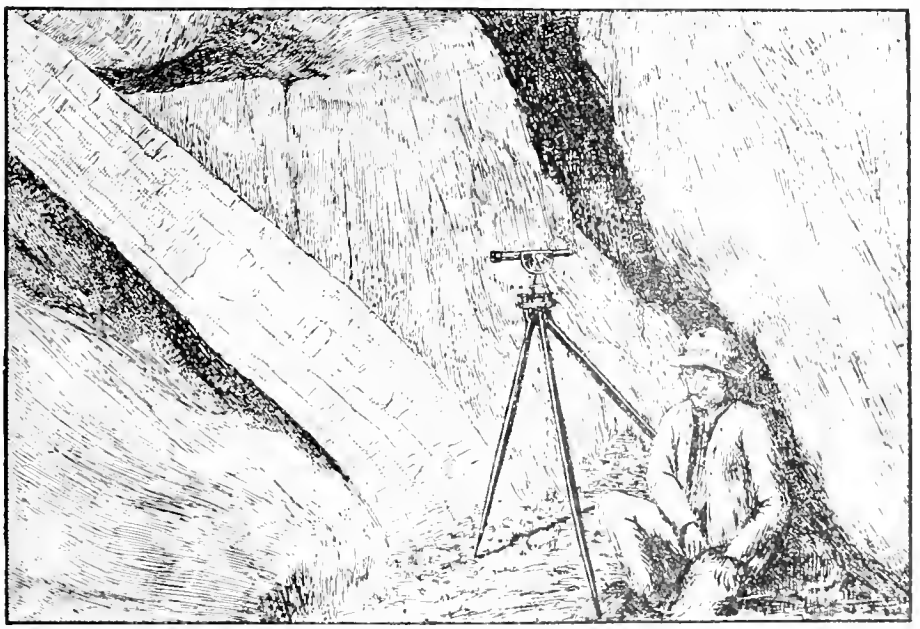

FIG. 5. GOLD QUARTZ VEIN IN MARYLAND MINE, GRASS VALLEY, CALIFORNIA, SITUATED ON 1450-FOOT LEVEL, 2½ FEET THICK AND VERY RICH.

rocks, the difference being that the metallic minerals are more easily affected. The physical changes involve a disintegration of the mass. The chemical effects include processes of oxidation, hydration, and solution. Sulphides are changed to sulphates and chlorides, oxides to carbonates and silicates. One result of this change is to convert many insoluble compounds into soluble ones; and these latter are taken up by percolating waters, carried to a lower depth and there deposited, in some cases producing a *zone of local enrichment* at the water-line, that is, at the boundary of the gossan, or oxidized part, and the unaltered portion of the ore body.

VALUE. The quantity of metal necessary to make mining operations profitable depends largely on the character of the ore. Lake Superior copper ores contain as little as 0.65 per cent. of native copper; and many copper sulphide ores running as low as 2 or 3 per cent. metallic copper are successfully worked. Many low-grade lead and zinc ores are profitably worked because their gold and silver contents more than pay the cost of metallurgical treatment. Gold ores alone, running as low as $2 to $3 per ton, can be successfully worked under favorable conditions. In nearly every case the metallic contents of the ore is increased by mechanical concentration or by roasting (in the case of sulphides), or both, before the ore is smelted.

CLASSIFICATION. Numerous attempts have been made to develop a suitable classification of ore deposits, and the schemes suggested have been based either on the form, mineral contents, or mode of origin of the ore body. The first is perhaps the most practical from the miners' standpoint. The second is undesirable because several kinds of ore may often be found in the same ore body. The third is probably the most scientific, and is of value to the mining geologist and mining engineer, as it serves as a guide toward judging the possible extent or irregularity of the ore masses under consideration. The classification proposed by W. H. Weed, which is given below, includes the most recent discoveries and ideas on the origin of ore deposits. This classification is based entirely on the origin of the ore mass.

GENETIC CLASSIFICATION OF ORE DEPOSITS.

I. Igneous (magmatic segregations).
  A. Siliceous: Aplitic masses, quartz veins of Alaska, etc.
  B. Basic: Peripheral masses and dikes.

II. Pneumatolytic Deposits (deposited by igneous emanations; the gases being above the critical point).
  A. Contact metamorphic deposits (characterized by gangue of garnet, epidote, actinolite, calcite, and other lime-alumina silicates).
  B. Veins. (Closely allied to magmatic veins and to Division IV.)

III. Fumarole Deposits (metallic oxides, etc., in clefts in lavas, of no commercial importance).

IV. Gas-Aqueous Deposits (igneous emanations mingled with ground waters).
  A. Filling Deposits: Fissure veins, impregnations of porous rock, and cementation deposits.
  B. Replacement Deposits: Veins, stocks, chimneys, etc., formed by replacement of wall rock.

V. Deposits from meteoric waters.
  A. Underground: Veins and replacements.
  B. Surficial: Bog ores, gold placers, etc.

Igneous ore deposits constituting the first division are those in which the metallic minerals have crystallized directly from the igneous magma during cooling. Such deposits may occur in dikes, or on the periphery of igneous masses; the collecting or gathering of the ore particles being the result sometimes of mutual attraction or again of convection currents set up during cooling. In pneumatolitic deposits it is considered that the conditions bear out the statement that the igneous mass during its intrusion and cooling may give off metallic minerals, siliceous compounds, and gases. Thus at San José, Tamaulipas, Mexico, a great laccolitic mass of andesitic rock has penetrated a Cretaceous limestone, the latter being a nearly pure carbonate of lime, and yet in the contact zones are found garnet, magnetite, pyrite, and chalcopyrite, all (except the garnet) containing matter foreign to the limestone. All of these must therefore have been emissions from the igneous magma. The gas-aqueous deposits include those which have been deposited from a mixture of water and steam, probably under pressure and at a high temperature. They may either fill true fissures or porous deposits, or replace the wall rock lining a narrow fissure. The last class recognized is the result of meteoric circulation, the waters carrying the ore particles to points of concentration; this may occur either underground or on the surface.

DISTRIBUTION. Ore deposits are not confined to any particular geological horizon, although the mechanically formed and some of the surficial ones are commonly of Pleistocene and less often Tertiary age. In the United States ore deposits are widely distributed, but, owing to their frequent association with igneous rocks, they predominate in the Cordilleran region, Black Hills, and the Appalachians, where igneous activity has been most pronounced. In other areas their accumulation seems to be chiefly the result of meteoric waters. Gold and silver ores are chiefly restricted to fissure veins, and hence predominate in the Cordilleran region, although additional vein deposits of gold are known in the Black Hills, Southern Appalachians, and Alaska.

Copper ores are known in large deposits in Keeweenaw Point, Mich., Bisbee, Ariz., and Butte, Mont. The Paleozoic limestones of Missouri, and the region covering the contact point of Iowa, Illinois, and Wisconsin, contain both lead and zinc, and large zinc deposits are mined in the Cambrian limestones of northwestern New Jersey. The hematite iron ores of the Lake Superior region are the largest deposits in the world, but others are known in the Silurian of the Appalachian region, and the metamorphic rocks of the Highland region. For further details regarding the distribution of ore deposits, see GOLD, SILVER, COPPER, etc., also the paragraphs on mining, under the different countries.

(ib., 1895); Vogt, "Ueber die relative Verbreitung der Elemente, besonders der Schwermetalle, und über die Concentration des fein vertheilten Metallgehaltes zur Erzlagerstätten," in the *Zeitschrift für praktische Geologie* (Berlin, 1898-99); Penrose, "The Superficial Alteration of Ore Deposits," in *Journal of Geology*, vol. ii. (Chicago, 1894), an excellent general article; Weed, "Contact Metamorphic and Other Ore Deposits Near Igneous Contacts," and "Vein Enrichment by Ascending Alkaline Waters," in *Engineering and Mining Journal*, vol. lxxiv. (New York, 1902). Also many articles in the *Transactions of the American Institute of Mining Engineers* (New York, 1900-02).

ORE DRESSING. The preparation of ore for the smelter by mechanical means, whereby the valuable minerals are concentrated into smaller bulk and weight by the separation of the waste, or whereby two valuable minerals are separated from each other. The object of ore dressing is to save handling so much barren or waste material in the subsequent metallurgical process of extraction. Ore dressing may be divided into two processes—crushing and separation. Crushing detaches the valuable minerals from the waste, but as they are still mixed in the resulting powder there has to be a further process of separation.

CRUSHING. Preliminary breaking of the ore is done by blasting in the mine, but crushing proper is performed on the surface. The crushing process may stop short at the production of coarse fragments, or it may be continued to the production of a fine powder by grinding. The various machines used for crushing and grinding ores are described in the article on GRINDING AND CRUSHING MACHINERY. The selection of the particular machines used depends upon the character of the ore and the method of extraction adopted. *Rolls* are the standard machines for crushing all brittle ores in preparation for concentration except where fine crushing is required. *Steam stamps* are the standard crushers for ores containing native copper. *Gravity stamps* are used most extensively for fine crushing, but various forms of *ball mills* are beginning to compete with them for this work. Generally the preliminary crushing is done by jaw or gyratory crushers, and from them the material passes to rolls or stamps. It is an advantage in most cases to crush first to a coarse size, then to separate as much of the waste as possible, and then to recrush the residue and again separate the waste. The sizes to be crushed and the number of repetitions vary for different ores.

SEPARATION. Having the ore crushed, the succeeding process is to separate the valuable ore from the waste. Some of the principal apparatus and methods for performing this operation are as follows: *Preliminary washers* are used to disintegrate and float adhering clay or fine stuff from the coarse particles, which is done by using running water aided by some stirring device. *Sizers* and *screens* are used for separating the coarse from the fine particles of the ore; they may be classified as: (1) stationary screens, (a) grizzlies or bar screens, (b) gravel screens of wire cloth, (c) perforated plate screens, and (2) moving screens, (a) oscillating bar screens, (b) plain shaking screens or riddles, and (c) revolving screens or trommels. *Classifiers* are devices for obtaining a series of products of diminishing size by means of currents of water. The most common form consists of a channel connecting a series of pockets. Water is supplied to each pocket so as to form an upward current, the force of the current in each pocket after the first being less than that in the preceding pocket. The effect produced is that grains which are heavy enough to settle against the upward current in each pocket can do so, while the lighter grains are carried on to succeeding pockets until they strike one where the current is mild enough to permit them to settle.

Hand picking is the process of separating the waste from the valuable ore by picking it out by hand. This work is usually done on 'tables.' There are five classes of picking tables in use: (1) stationary horizontal tables; (2) stationary sloping chutes; (3) shaking tables; (4) belt, rope, or plate conveyors; and (5) revolving circular tables. *Hydraulic jigs* operate through the action of two currents of water, an upward and downward, alternating with each other in quick succession, upon a bed of sand supported by a screen. The screen may be pushed up and down in a tank of water to bring about the necessary current action; or it may be stationary while a reciprocating motion is given to the water. In either case the effect is to separate the crushed material in layers according to the specific gravity of the particles.

Vanners consist essentially of an endless belt which is shaken rapidly either sidewise or endwise and which has a continuous slow motion uphill. The ore is fed onto the belt in the form of wet pulp. The agitation makes the ore bed so loose that particles of higher specific gravity rise to the upper layer. The travel of the belt draws the heavy minerals to the head end, while the water washes the light minerals down to the tail. *Buddling tables* operate much as do vanners, the bumping action separating the particles according to specific gravity and shaking the heavier particles to one side of the table while the water current carries the lighter particles to the other side. *Pulsating sizing tables* depend upon the relative transporting power of a film of water flowing on a quiet surface to set upon the particles of ore. As is well known, a film of water flowing over a quiet surface has an upper current which moves faster than the lower current, whose water is re-

tarded by friction; the heavier grains remain at rest in the slow bottom current, while the lighter grains are carried away by the quick top current. *Magnetic separators* utilize the action of an air current to separate particles of low specific gravity from those of higher specific gravity. For a comprehensive discussion of the methods and machinery used in crushing and separating ores, see Richard, *Ore Dressing* (New York, 1900); and for an annual record of current progress in this art, see the annual volumes of the *Mineral Industry* (New York).

OR'EGON (named from the *Oregon*, now the Columbia, River, probably an American Indian name). A western State of the United States, lying on the Pacific Slope, between latitudes 42° and 46° 18′ N., and between longitudes 116° 33′ and 124° 25′ W. It is bounded on the north by the State of Washington, on the east by Idaho, on the south by Nevada and California, and on the west by the Pacific Ocean. Its extreme length from east to west is 396 miles, and from north to south 300 miles. Its area is 96,030 square miles, of which 94,560 square miles, or 60,518,400 acres, are land surface. It ranks seventh in size among the States.

Topography. The salient features of the topography are the two mountain ranges extending parallel with the coast through the western part of the State, and the great inland plateau in the east. The coast is rocky and abrupt, and runs in an almost straight line north and south, with no very prominent inlets or headlands. There are, however, besides the wide mouth of the Columbia River on the north boundary, several small bays or harbors, such as Tillamook, Winchester, and Coos bays, all of which are landlocked, with narrow entrances. Near the southern boundary the coast runs out in an obtuse angle ending in Cape Blanco. The land rises immediately from the coast to the crest of the Coast Range, which is about 20 miles inland, and has a height of 1000 to 4000 feet. It is heavily forested, and though of irregular outline, with many transverse valleys, it is unbroken, save in two or three places, throughout the length of the State. The Cascade Mountains run parallel with the Coast Range about 120 miles from the coast. They are the prolongation of the Sierra Nevada, rise to an average height of over 6000 feet, and are crowned by a line of extinct volcanic cones, several of which are over 9000 feet high, while Mount Hood, the culminating point near the northern boundary, has an altitude of 11,225 feet. Like the Coast Range, the Cascades are heavily forested, and their summits are covered with snow. Between the two ranges extends a broad valley, divided by several spurs and cross ranges, and becoming rough and mountainous in the south, while the northern half forms the rolling prairie valley of the Willamette. The region lying east of the Cascades covers two-thirds of the area of the State, and consists of an elevated plateau. The southern half of this belongs to the Great American Basin, though its floor has an elevation of 5000 feet, rising to 6000 feet in the southeast. Several of the longitudinal Basin Ranges of Nevada extend into this plateau, and large areas are covered with lava flows. The northern half slopes northward toward the valley of the Columbia River. It is more undulating than the southern plateau, and is traversed in the northeast by the Blue Mountains, an irregular chain rising to a height of 7000 feet, and sending out side spurs flanked by deep valleys. Some of the rivers in this region have cut deep cañons, especially the Snake River on the northeastern boundary, whose cañon almost rivals that of the Colorado.

Hydrography. The Columbia River forms, with an interruption at the Falls of the Dalles, a large, navigable waterway for 300 miles along the northern boundary. Its chief tributaries in the State are the Willamette west of the Cascades, and on the eastern plateau the Deschutes, John Day, and Umatilla, whose branches form a considerable network of minor streams. The Snake River, which joins the Columbia in Washington, forms about one-half of the eastern boundary, and its chief tributary, the Owyhee, runs inside the boundary along the remaining half. The streams flowing directly into the ocean are mostly short, but two of them, the Umpqua and the Rogue, rise on the Cascades and break through the Coast Range. On the interior plateau there are a number of streams running into lakes which have no outlet. There are a number of lakes of considerable size in the south-central portion, the largest of which are Goose Lake, which lies partly in California; Klamath Lake, at the base of the Cascades, 30 miles long; and Malheur Lake, on the eastern plateau, 22 miles long.

Climate. In few places is the influence of topography on climate more apparent than in Oregon. The winds from the ocean are deprived of nearly all their moisture by the Coast and Cascade ranges, which also bar out the tempering influence of the sea, so that the portion west of the Cascades has a moist and equable insular climate, while east of the mountains the climate is dry and continental, with great extremes. On the coast winds from the sea temper the summer heat, and tend to reduce the cold of winter, while cold winds from the northeast are barred out by the mountains. Here the mean temperature for January is 42.2°, and for July 62.3°, while great extremes are rare. On the eastern plateau the mean temperature is 29.6° for January and 66.9° for July, while the extremes fall below zero every winter, sometimes nearly 30° below, and rise above 100° every summer, the maximum record being 119°. In regard to rainfall there is a still greater difference between the two regions. In the west the rainfall is abundant, and in some places excessive. West of the Coast Range it averages 89.6 inches, in the Willamette Valley it is 50.8 inches, while in Tillamook County it is nearly 140 inches. On the eastern plateau it is insufficient for the needs of agriculture, being on the average 12.7 inches, and in the south-central portion only 6.5 inches. More than three-fourths of the rainfall of the State occurs in the wet season from October to March. Thunderstorms are rare in Oregon, and never severe, while hurricanes are unknown.

Soil and Vegetation. The soil on the highlands and plateau consists of decomposed lava, and in the valleys it is a rich black alluvial deposit. With the exception of some extensive tracts of sand and of volcanic ashes and pumice in the east, the soil is everywhere of great fertility, and even in the east capable of yielding heavy crops when irrigated. The eastern plateau, however, consists largely of arid plains covered

with sage-brush, or with extensive salt marshes. The northern table-lands are covered with bunch-grasses suitable for grazing, and here are some junipers and pines. Western Oregon still contains one of the heaviest timber belts in the world. The entire western slope of the Cascades is covered with a belt of forest 20 miles wide, and the Coast Range is also densely forested. In the valleys are found cottonwoods, maple, ash, alder, dogwood, and wild cherry. There are seven species of oak, and the fragrant Oregon myrtle (*Oreodaphne Californica*) is a common tree. The coniferæ, however, predominate in the large forests, and include pines, spruces, firs, hemlocks, cedars, junipers, larch, and yew. Some characteristic species are the Oregon yellow pine (*Pinus ponderosa*), the Western arbor-vitæ (*Thuya gigantea*), the *Picea nobilis*, and the Oregon yew (*Taxus brevifolia*). For *Fauna*, see this section under UNITED STATES.

GEOLOGY. The most remarkable feature of the geological history of Oregon is the enormous volcanic eruption which took place principally in Miocene time, one of the most extensive lava flows in the world. The Cascade Mountains are entirely composed of lava and basaltic rocks, and a lava-sheet 1000 feet thick or more covers the whole eastern two-thirds of the State, together with large parts of Washington and Idaho. Some parts are much weathered and dissected, while others are more recent and smooth. The underlying rock formations are generally shown only where the rivers have cut through the lava. In the Snake River cañon in the northeast the rocks are ancient metamorphic granites, gneisses and mica-slate, while the Cascades are underlaid throughout with Cretaceous rocks covered for some distance (beneath the lava) with Eocene and Miocene strata. In the southwestern valley there is a belt of slates and serpentine, but the Coast Range is mainly an anticlinal whose surface consists of Tertiary sandstone.

MINERALOGY AND MINING. Oregon has a great wealth and variety of mineral resources, and, curiously enough, some of the richest mineral deposits are found in the valleys. Thus in the serpentine belt in the southwest there are lodes of chrome iron, copper, magnetite, and nickel. The nickel ore exists as a green hydrated nickel-magnesia silicate filling large irregular cavities in the serpentine. The deposit of this is supposed to be very extensive. Limonite, or brown hematite iron ore, is found in the Willamette region, and quartz veins bearing gold and silver occur in the slate belts east of the serpentine as well as in the Cascades and in eastern Oregon, where there are also deposits of zinc and cinnabar. Beds of lignite exist in the Cretaceous and perhaps in the Tertiary strata of the Coast Range, and the sandstones of the latter, as well as the limestones in the south and the volcanic rocks, furnish inexhaustible supplies of building stone. Other minerals found are mercury, platinum, iridium, lead, and antimony, as well as clay, salt, and alkali deposits. Gold is the only mineral extensively mined. It is produced chiefly in the Blue Mountain region in the northeastern part of the State. The annual output has latterly exceeded $1,000,000 in value, reaching $1,694,700 in 1900. Small quantities of silver, borax, and coal are mined, the coal being of the lignite variety.

FISHERIES. Salmon fishing and canning is one of the most important industries, and is unequaled by any other State. It began in 1866, and the value of the annual product since 1870 has fluctuated around $2,000,000, the maximum being reached in 1883. Over 5000 people, including many Chinese, have been employed most of this period. For a time reckless overfishing threatened exhaustion of the supply, but the enforcement of laws and the establishment of hatcheries have averted this danger. Sturgeon, halibut, oysters, and other varieties of fish are caught in less quantities. The erection of refrigerating and freezing plants and the increased use of refrigerator cars have made possible greater shipments of fresh fish and have thus tended to lessen the amount of the canned product.

AGRICULTURE. The different sections of the State, varying so distinctly in climate, topography, and soil, naturally vary in agricultural development. In the river valleys west of the Cascades almost every variety of crop common to the temperate zone is produced in great abundance. The Willamette Valley especially is noted for its great productivity. East of the Cascades, in the Columbia Valley, the rainfall is generally sufficient to justify the raising of some of the more hardy crops, the favorable years producing enough to cover the loss in the years of drought. Irrigation is possible in parts of this region and is being resorted to with success. Save in the centre of Oregon there are numerous rivers throughout the eastern half of the State which afford an extensive water supply that could be utilized for irrigation. But these sources have as yet been very little developed, owing largely to the remoteness from lines of transportation and markets. The irrigated area in the State increased from 177,944 acres in 1889 to 388,310 acres in 1899. Almost the whole of this is watered from streams, scarcely any from reservoirs or wells. The largest irrigated area is that north of Malheur and Harney lakes in Harney County. Simple methods are employed in irrigation, and the average cost of it per acre is low. In 1900 only 16.6 per cent. of the land area was included in farms. Of this 33 per cent. was improved. The average size of farms decreased until 1880, since which time, owing to the large additions made to ranges in the eastern part of the State, the average size has grown larger. It has, however, continued to decrease in the western counties.

The two leading crops are wheat and hay. The area devoted to wheat doubled between 1880 and 1900, the increase being almost wholly in the northeast counties, where one-half the crop is now grown. During the same period the acreage of hay and forage gained over threefold. Oats are grown principally in the Willamette Valley, and barley in the northeast counties. Oats have a large acreage. On account of the coolness of the nights, corn does not thrive, and but little is grown. Potatoes produce abundantly and are an important crop. Sugar beets are raised in Union County. The State ranks second in the production of hops, their culture being confined principally to the Willamette Valley. The region between the Cascade and Coast ranges, particularly Jackson and Douglas counties, has become noted for the production of fruit. The number of plum and prune trees in 1900 (2,517,523) was ten times that of 1890 and is only exceeded in California. The number of apple trees

(2,825,898) more than doubled in the same period. Other fruits grown include almost every variety common to the temperate zone.

The following table of acreages is self-explanatory:

CROP	1900	1890
Wheat	873,579	553,052
Hay and forage	731,823	467,061
Oats	261,406	218,736
Barley	60,375	37,722
Corn	16,992	12,101
Potatoes	30,035	17,965
Hops	15,454	3,130

Stock Raising. Horses, cattle, swine, and sheep are raised in numbers greater than is required to supply the home market. Large sections of the eastern portion of the State are fit only for grazing, and there are many large ranches in this region. The natural grasses cure on the ground and supply nutritive pasturage all the year. With the exception of 1860-70, each decade since 1850 has exhibited an increase in the number of every kind of domestic animal. The most significant increase from 1890 to 1900 was in cattle. The production of wool in that decade gained 83.8 per cent., while the average weight of fleeces increased from 6.3 pounds to 8.6 pounds, the latter record not being exceeded in any State. The following is a table of the leading holdings of stock:

	1900	1890
Dairy cows	122,147	111,156
Other cattle	577,856	407,492
Horses	287,352	224,962
Mules and asses	7,551	4,946
Sheep	1,961,355	1,780,312
Swine	281,406	208,259

Forest and Forest Products. The forests of Oregon are scarcely exceeded in extent and value by those of any other State. Except for limited districts already cleared, almost the whole of the region included between the Coast Range and the western slope of the Cascades is covered with forests, as is also a considerable portion of the eastern slope of the Cascades and the northeastern part of the State. The total woodland area has been estimated (1900) at 54,300 square miles, or 57 per cent. of the area of the State. Lane County has more timber than any other county, but is greatly exceeded by the corresponding area contained in the four counties in the northwest corner of the State. The coast forests are famous for their great density and the enormous growth attained by certain species of trees. Stands of 100,000 feet per acre for entire townships have been reported. The Douglas fir (red fir), which is one of the prevailing species of this section, sometimes attains a height of 300 feet. The average diameter of these trees cut is from 60 to 72 inches. Bridge timbers 110 feet in length and free from knots and other imperfections are obtained from these firs. The great strength of these timbers makes them very valuable for bridge use and also for spars or for framings for buildings. This species produces more commercial timber to the acre than any other tree on the continent. It is estimated that over five-sevenths of the timber is of this variety. The lumber product is constantly increasing in amount and value, the product for 1900 being worth $10,352,167. The pines and cedars are the most important species, both being large trees, and highly prized for finishing. The lumber cut in 1900 was estimated at 776,978,000 feet, as compared with 470,146,000 in 1890. The increase in value was proportionate. The remoteness of the region from the large lumber markets necessitates heavy freight expenditure and has tended to minimize the price of the product, and therefore limit its exploitation. The United States Government has recently set off over 4,500,000 acres as a forest reserve.

Manufactures. The manufacturing facilities are excellent. The natural resources include a supply of coal for fuel, and an abundant water power is attainable at The Dalles, Cascade Locks, and Oregon City. In the decade 1880-1890 there was for the first time a large development in the manufacturing industry, but the increase was only slight in the succeeding decade. In 1900 the value of manufactured products was $46,000,000, and 17,236 wage-earners, or 4.2 per cent. of the population, were then engaged in the industry. The forests are the most important source of raw materials, and the agricultural products rank second. The flouring and grist mill output amounted in 1900 to $6,364,000, being nearly a third greater than in 1890. The slaughtering and meat-packing output in the same year was valued at $1,638,480. Among other industries are the manufacture of woolen goods, canning and preserving of fish, car construction, and ship and boat building, including one establishment for the building of iron and steel vessels. About one-half of the total manufactured product of the State is accredited to Portland.

Transportation and Commerce. The Pacific Ocean, the Columbia River, and Snake River provide three sides of the State with the advantages of water communication. Along the coast there are nine inlets which offer harbor facilities. Most of the streams flowing into the Pacific are navigable for short distances. Large ocean-going vessels pass up the Columbia as far as Portland. Since the construction of a canal at Cascade Locks, river steamers can go as far as The Dalles, above which point the stream is again navigable. The Snake River is navigable beyond the point where it leaves the boundary. The Willamette, with the aid of canals, is navigable to Eugene, 150 miles from Portland. The developed portions of the State are adequately supplied with railroads, but the great arid region east of the Cascades is wholly without railroad accommodations, save in the northeastern corner. Oregon shows a remarkably low mileage, there being but 1.71 miles of railroad for every 100 square miles of territory. The total mileage was 1631 in 1899, or 43.59 miles for every 10,000 inhabitants. The Union Pacific and the Southern Pacific lines own the greater portion. The former, following the course of the Columbia, crosses the extreme northern portion of the State from east to west. The latter, following the course of the Willamette, crosses the western portion of the State from north to south. In the greater portion of eastern Oregon wagon roads are the only means of communication.

The State has United States customs districts and ports of entry: for southwestern Oregon, at Coos Bay, the headquarters of the coal and lumber trade in that section; for the Columbia

River, at Astoria; and for the Willamette, at Portland. The commercial importance of the water route is second only to that of the Mississippi. The commerce upon the Columbia and Willamette rivers has assumed great magnitude, due to the regular lines of steamers connecting with railways and canals around the falls. Smaller boats and rafting contribute largely to swell its volume.

Previous to 1868, the exports were mainly to the Sandwich Islands, Puget Sound, and San Francisco, and gold dust and ores formed three-fourths of the shipments. Since then the exports have reached almost every part of the globe, and consist largely of wheat and timber products. The foreign commerce of the State from 1890 to 1900 fluctuated between $5,600,000 and $15,000,000, about three-fourths being exports. The largest export countries were Great Britain, China, and Japan. The British East Indies and Japan supplied most of the imports. The State has a large interstate trade by rail and water, and a considerable portion of its products is distributed through San Francisco.

Banks. The Constitution of 1857 forbade any banks of issue, and also the incorporation of any banks by the Legislature. A private banking business was established in Portland in 1859. The First National Bank of Portland opened in 1865, being the oldest national bank west of the Rocky Mountains. The banking business remains unregulated. Since there is no banking law, banks, incorporated or private, are formed under the general corporation law, which limits the liability of the stockholders. Due to this condition, the national banks, being the more secure institutions, have preference over the State banks in popular confidence. The aggregate banking interests remained very insignificant until 1885, when there were only four State and nine national banks. Then came a sudden growth, and in 1894 there were more than forty banks. After the depression of 1893-95 the number somewhat declined. The condition of the banks in 1902 is shown in the following table:

	National Banks	State Banks	Private Banks
Number of banks	30	18	5
Capital	$2,420,000	$956,000	$50,000
Surplus	520,000	142,000	18,000
Cash, etc	2,586,000	334,000	21,000
Deposits	16,692,000	5,693,000	356,000
Loans	9,386,000	3,084,000	227,000

Government. The Constitution under which Oregon entered Statehood still continues in force. It was adopted by a vote of the people of the Territory in November, 1857. To amend it the amendment must pass two successive Legislatures and be approved by popular vote. While amendments agreed to by one Legislature are awaiting final decision, no other amendment can be proposed.

The Constitution authorizes any male citizen of the United States, twenty-one years old, and six months a resident of the State, to be a voter, and any like foreigner who shall declare his intention to become a citizen one year before an election and shall have been a resident of the State for six months. Oregon sends two members to the National House of Representatives.

Legislative. The Legislature consists of a Senate of not exceeding 30 members, elected for a term of four years, and a House of Representatives of not exceeding 60 members, elected for two years. The apportionment is by counties or groupings of contiguous counties, and is made every fifth year, a State census being taken every year ending in 5. General elections are held biennially on the first Monday of June of even years, and the Legislature convenes on the second Monday of the following September. The members of either House receive, besides mileage, $3 a day, but are limited to a $120 allowance for any session. Extra sessions are limited to 20 days' duration. Bills may originate in either House, except revenue bills, which must originate in the House of Representatives. In 1902 an initiative and referendum clause was added. By this, 8 per cent. of the voters may demand the submission of a law to the vote of the people, and 5 per cent. may demand that any law passed by the Legislature shall be submitted for popular approval.

Executive. The Governor's term of office is four years, and he is not eligible to this office more than eight years in any period of twelve. He has the right of veto, but his veto may be overridden by a two-thirds vote of each House. The people elect a Secretary of State (who is Auditor and Comptroller), and a State Treasurer, the term of office of each being four years. The former succeeds to the Governorship in case it becomes vacant. A State printer and a superintendent of public instruction are elected every four years.

Judicial. There is a Supreme Court of five judges, which number may be increased to seven. They have appellate jurisdiction, and are elected for six years. There are five circuit courts, presided over by one of the judges of the Supreme Court, having civil and criminal jurisdiction, and appellate jurisdiction from the county courts. There are county courts with one judge, elected for four years, who is also judge of probate. The Circuit Court judges are elected one-third every two years. There are also a United States District Court, and for Oregon, California, and Nevada, a United States Circuit Court. One or more justices of the peace are elected in every township or mining district, and municipal courts may be created. Judges of the Supreme Court can be removed by the Governor upon the joint resolution of two-thirds of the Legislature. The grand jury consists of seven men chosen by lot, five of whom must concur to find an indictment. Grand juries may be modified or abolished by the Legislature.

Local Government. Each county elects a clerk and a sheriff, who serve for two years. Attorneys are elected by districts composed of one or more counties. The Legislative Assembly may provide for the election of two commissioners to sit with the county judge when transacting county business in any or all the counties, or may provide a separate board for transacting such business. Other local officers may be provided for by law. Special laws may be enacted for municipal purposes.

Other Provisions.—The registration of voters is not required. New ballot laws, based on the Australian system, were adopted in 1891. The legal rate of interest is 8 per cent.; allowed by contract, 10 per cent. Women may practice law in Oregon, and a wife has sole control of property

owned by her at marriage or subsequently acquired. Chinamen are not allowed to hold real estate or work mining claims.

Finances. The Constitution prohibits the Legislature from contracting any State debt exceeding $50,000, or assuming the debt of any county, town, or corporation, except for purposes of war or to suppress an insurrection. Debts to the amount of $237,000 were contracted in 1864 in order to pay bounties to soldiers and for relief of discharged soldiers and officers. The bonds were rapidly redeemed and in 1870 only $90,000 were outstanding. In that year the Legislature authorized the issue of $200,000 for construction of a canal, to be redeemed from the proceeds of the sale of public lands. The Indian wars of 1877 and 1878 further increased the debt by about $175,000. Another debt was the 'indorsed and unpaid' warrants issued in 1873-75 and bearing 10 per cent. for construction of wagon roads and other purposes. These high interest bearing warrants were necessary because of the constitutional provision against bonds. Altogether about $350,000 of these warrants were issued. By 1878 the public debt amounted to $651,595; but the bonds and warrants were rapidly redeemed through a special tax on property. In 1886 the debt was reduced to $53,632 in bonds and warrants, which were advertised for but not presented for redemption. In 1903 the State had no funded debt except bonds to the amount of $2365 never presented and probably lost. The income of the State is derived mainly from a State tax and sale of public lands. In 1901 the total receipts were $1,772,808, of which 38 per cent. came from the State tax and 45 per cent. from sale of lands and payments on old sale-contracts and interest on the loans. The expenditures were $1,889,134, of which more than 50 per cent. went for educational purposes. Notwithstanding the deficit, the balance in the treasury on September 30, 1902, was $1,137,575.

Population. The population by decades was as follows: 1850, 13,294; 1860, 52,465; 1870, 90,923; 1880, 174,768; 1890, 313,767; 1900, 413,536. Oregon ranks 35th in population, and is exceeded by both of the other Pacific Coast States. The increase from 1890 to 1900 was 30.4, as compared with 20.7 for the United States. Over half of the population is located in the Willamette Valley. In 1900 the foreign-born numbered 65,748; Chinese, 10,397; and Indians taxed, 4951. The male sex exceeded the female by 52,000. The five places having a population exceeding 4000 each, contained together 27.6 per cent. of the population.

The Indians are collected largely on five reservations, namely, Grande Ronde, Klamath, Siletz, Umatilla, and Warm Springs. A limited amount of agriculture and stock-raising is carried on upon each of the reservations.

Cities. In 1900 Portland had 90,426 inhabitants; Astoria, 8381; and Baker City, 6663. Salem is the capital.

Religion. The leading denominations numerically are the Roman Catholic, Methodist Episcopal, Baptist, Disciples of Christ, Presbyterian, Congregational, Methodist Episcopal (South), Protestant Episcopal, and United Brethren.

Education. In 1900 only 3.3 per cent. of the population ten years of age and over were illiterate. The State Board of Education consists of the Governor, Secretary of State, and a superintendent of instruction. County superintendents are elected biennially, and officers of district boards every three years. Women are eligible to the office of school director, and widows with children to educate and owning taxable property in the district may vote in school meetings. Congress in 1848 gave Oregon sections 16 and 36 of all the public domain (3,387,520 acres) for public schools, 26 townships (500,000 acres) for a State university, and 90,000 acres for an agricultural college. From the proceeds of the sales of a portion of these lands an irreducible fund of $3,500,000 has been secured. The sparse settlement of a large part of the State makes the maintenance of schools difficult in many places. The Oregon law does not provide for district high schools, and rural communities are therefore without the advantages of secondary education. The length of school term, 123.9 days, is considerably below the average for the whole country. In 1899 there were 101,900 children between the ages of five and eighteen; the number enrolled was 88,485; the average attendance was 61,234. The public high schools numbered 15, and the private secondary schools 19. There are State normal schools at Monmouth, Drain, Ashland, Weston, and Gold Beach. The University of Oregon at Eugene was established in 1872. Pacific University and Tualatin Academy at Forest Grove are under Congregational control; Willamette University, Salem, is Methodist Episcopal; McMinnville College, McMinnville, Baptist; Portland University, University Park, Methodist Episcopal; Pacific College, Newberg, is a Friends institution; Philomath College, Philomath, a United Brethren; Corvallis College, Corvallis, Methodist Episcopal. Blue Mountain University is located at Lagrande. The State Agricultural College is at Corvallis. Willamette University gives instruction in law, and the University of Oregon has a law department at Portland, where also is situated the medical department of Willamette University. There is a successful Indian training school at Chemawa.

Charitable and Penal Institutions. There is a soldiers' home located at Roseburg, but the other State charitable institutions, in accordance with the requirements of the State Constitution, are located at the State capital. They are as follows: School for Deaf Mutes; Insane Asylum; School for the Blind; Boys' Reform School; and the State Penitentiary.

History. The accounts of the early exploration of the Pacific coast are conflicting and unreliable. The Spanish explorer Ferrelo possibly reached latitude 42°, the southern boundary of Oregon, in 1543, and the English flag was carried fifty or sixty miles north of this point in 1579 by Sir Francis Drake. The Spaniards Vizcaino and Aguilar reached 42° or just beyond in 1603. The fear of a Russian advance led Charles III. of Spain to order further explorations, and Perez in 1774 reached 55°, and on his return anchored in what has been identified by some as Nootka Sound. The next year Heceta, with Perez as second in command, observed the mouth of the Columbia, and a party landed at the modern Port Grenville, where several were killed by the Indians. One of the ships reached 58°. The English navigator Captain Cook in 1778 landed at Nootka Sound, which he so named. This English claim to possession was disputed by

the Spaniards in 1789, but Spain was forced to agree to give up exclusive claim to the region. (See NOOTKA SOUND.) The French navigator Lapérouse in 1786 sailed along the coast from 58° 37′ southward. The American claim began with the visit of J. Kendrick and Robert Gray, sent out by Boston merchants to seek for furs. The winter of 1788-89 was spent at Nootka. In 1791 Captain Gray returned, and on May 11, 1792, entered the mouth of the river Saint Roque, which he renamed the Columbia, from his ship. Another English expedition under Vancouver examined the coast in 1793. Fur traders entered the country in 1793, and in 1811 the Pacific Fur Company founded Astoria at the mouth of the Columbia. (See ASTOR, JOHN JACOB.) This was captured by the British, December 12, 1813, and renamed Fort George. It was restored to the United States in 1818, but abandoned by the owners. In 1824-25 Fort Vancouver was founded by John McLaughlin, chief factor of the United Hudson's Bay and Northwest Fur Companies, and he was practically Governor for many years.

The American claim rested upon the Louisiana Purchase in 1803 (the Spanish claim), and the discoveries of Captain Gray in 1792. From these grew the claim to all country drained by the Columbia. In 1805-06 Lewis and Clark explored much of the country. The northwestern boundary between the United States and Canada was fixed by the Convention of 1818 as the line of 49° from the Lake of the Woods to the Rocky Mountains. West of this point the territory was to be open to both parties, the United States and Canada, for ten years without prejudice to claims of either. (See NORTHWEST BOUNDARY DISPUTE.) By the Convention of 1827, ratified in 1828, joint occupation was continued indefinitely, but might be terminated by either party on twelve months' notice. The British were willing to concede 49° to the Columbia River, thence down it to the mouth, thus taking in a greater part of the present State of Washington, while the American claim, as before stated, was for all of the basin of the Columbia River, practically 42°-52°. The Oregon question occupied much of the attention of Congress after 1820, and the sentiment for demanding 'all of Oregon' grew. By the negotiations with Russia (1824-25) that country agreed to make no settlements south of 54° 40′, and the idea gained ground that this was the proper northern boundary. Immigration to the territory had begun in 1832; the Methodists founded a mission under Jason Lee in 1834, and the Presbyterians under Marcus Whitman in 1836. Every year after 1838 numbers of immigrants crossed the Rockies, and by 1845 the American population numbered nearly 3000. The settlement of the northeastern boundary had been unsatisfactory, and in 1844 a popular rallying cry of the Democrats was "Fifty-four forty, or fight." Several Senators favored war, but others held that the best method of gaining possession was by actual settlement, in which the Americans were far surpassing the British, who were hardly represented except by the trappers of the Hudson's Bay Company. It was finally agreed in 1846 that the boundary should be 49° to the channel between Vancouver and the mainland, thence down the middle of this channel, through the Straits of San Juan de Fuca to the sea. The story that Marcus Whitman (q.v.) in 1843 prevented the exchange of the northern part of the territory for fishing stations in Newfoundland is unfounded.

The American inhabitants in 1843 met and organized a Territorial government under an executive council. A Governor was chosen in 1845 and served until the organization of the region as a Territory of the United States. Oregon Territory, including the present Washington and much of Idaho, was organized on August 14, 1848, though the Governor did not arrive until the next year. The increase of population caused the inhabitants to hold a convention at Salem, August-September, 1857, which formed a State constitution and asked for admission. This instrument prohibited slavery, but forbade any free negro or mulatto "to come, reside, or be in the State, or hold real estate, or make any contract, or maintain any suit." The State was admitted February 14, 1859, with the present boundaries. Indian troubles were frequent from early times. In 1847 Whitman and twelve companions were massacred. There was constant trouble during the Civil War, and the Shoshone War (1866-68) and the Modoc War (1864-73) were serious. (See article MODOC.) All Indians are now confined within narrow reservations, or have been removed to Indian Territory. The Constitution has been seldom amended. The 'anti-negro' clause still stands, though, of course, inoperative. The State has been successful in securing large appropriations for improvement of rivers and harbors from the National Government. The Cascade Locks on the Columbia were the largest in the world when completed in 1896. The State has given its electoral vote for the Republican ticket except in 1868, and one vote in 1892, though usually by small majorities. In 1876 it was found that one of the Republican electors held a Federal office, and was consequently ineligible. The Democratic Governor issued a certificate to the leading minority candidate, but the two Republican electors filled the vacancy, and their position was sustained by the Electoral Commission. In 1892 the Democrats indorsed one Populist elector, and the vote that year was: Republican, 3; Populist, 1. Political squabbles have been frequent, notably in 1897, when the Lower House of the Legislature refused to organize on account of a contest for United States Senator.

GOVERNORS OF OREGON.

PROVISIONAL.

George Abernethy	1845-49

TERRITORIAL.

Joseph Lane	1849-50
Knitzing Pritchett (acting)	1850
John P. Gaines	1850-52
Joseph Lane	1853
George L. Curry	1853
John W. Davis	1853-54
George L. Curry	1854-59

STATE.

John Whiteaker	Democrat	1859-62
Addison C. Gibbs	Republican	1862-66
George L. Woods	"	1866-70
Lafayette Grover	Democrat	1870-77
S. F. Chadwick (acting)	"	1877-78
William W. Thayer	"	1878-82
Zenas F. Moody	Republican	1882-87
Sylvester Pennoyer	Democrat-Populist	1887-95
William P. Lord	Republican	1895-99
Theodore T. Geer	"	1899-1903
George E. Chamberlain	Democrat	1903—

OREGON. A city and the county-seat of Ogle County, Ill., 99 miles west of Chicago; on the Rock River, and on the Chicago, Burlington and Quincy Railroad (Map: Illinois, C 2). It has a public library with over 2400 volumes. Good water power is furnished by the river; and there are manufactures of pianos, street sprinklers, flour, foundry and machine-shop products, etc. Oregon is an attractive summer resort. Population, in 1890, 1566; in 1900, 1577.

OREGON, University of. A coeducational State institution at Eugene, Ore., founded in 1872 and opened in 1876. It forms an integral part of the public system of the State. It comprises the University Academy; the College of Literature, Science, and the Arts, with a school of commerce, and courses in law, journalism, and teaching; the College of Science and Engineering, with courses preparatory to medicine and dentistry; the School of Music; the Graduate School; and the schools of law and medicine, the last two at Portland. Admission to the university is based on examination or on certificates from accredited schools. The university had in 1902 an attendance of 470, 71 instructors, and a library of 15,500 volumes. The productive funds amounted to $200,000, and the income to $59,700.

OREGON BROOK-TROUT. The common brook-trout of the tributaries of the lower Columbia, and of coastwise streams of Oregon and Washington, a variety (*Iasconi*) of the rainbow trout (q.v.). The Dolly Varden trout of the same region is sometimes called the Oregon charr.

OREGON CITY. The county-seat of Clackamas County, Ore., 15 miles south-southeast of Portland; on the Willamette River, and on the Southern Pacific Railroad (Map: Oregon, C 4). It is developing as an industrial centre, its manufactures, which include paper and pulp, woolen goods, flour, lumber, soap, etc., being promoted by the immense water power derived from the falls of the Willamette, 40 feet in height, which are utilized also as a source of electrical power. The city is at the head of deep-water navigation on the river, but vessels pass above the falls by means of a system of locks. There are municipal water-works. Population, in 1890, 3062; in 1900, 3494.

OREGON QUESTION. The name given in American history to the dispute between the United States and Great Britain over the delimitation of their possessions on the Northwest coast, leading to the determination of the present boundary. See Oregon, paragraph *History:* Northwest Boundary Dispute.

OREGON RIVER. A river in North America. See Columbia River.

OREGON ROBIN. A thrush (*Merula nævia*) of the Columbia River Valley and northward, which is closely related to the Eastern robin (*Merula migratoria*), but very different in colors. It is dark bluish slate above, and orange-brown below, with a line of black from the bill backward below the eye and along the side of the neck, whence it curves forward into a broad, crescentic band across the breast. The bird breeds in British Columbia and Alaska, makes a strong nest in bushes, and lays eggs colored light greenish blue, and distinctly marked and spotted with blackish brown. It has a sweet song.

OREGON SNOWBIRD. A junco (*Junco Oregonus*) common in the Northwestern United States and Canada. It differs from the common Eastern junco (q.v.) in the blacker and more sharply defined hue of the head and neck, the absence of dark color under the wings, and the square patch of rufous brown on the upper part of the back. As in other juncos, white feathers appear in the tail. The male of this species has the second tail feather mostly white and the third partly so near the tip. The adult female's plumage differs from that of the male in being prevailingly brown.

OREGON STURGEON. The white sturgeon of the Pacific Coast. See Sturgeon.

OREGON TRAIL, The. A narrative of travel by Francis Parkman (1849). It is the account of a trip to the far West which he made in 1846, and first appeared in the *Knickerbocker Magazine* in 1849 as "The California and Oregon Trail."

O'REILLY, Count Alexander (c.1722-1794). An Irish soldier in the Spanish service. At an early age he went to Spain, where he entered the military service. After serving in Italy against the Austrians he entered their service in 1757, and fought in two campaigns against the Prussians. In 1759 he entered the French Army, but soon afterwards was induced to return to Spain, and in the campaign of 1762 against Portugal earned promotion to the rank of brigadier-general. He was made major-general, and was appointed Governor of Havana. There he rebuilt the fortifications which had been demolished by the British. In 1769, appointed Governor of Louisiana and sent with a large force to reduce the rebellious French colonists, he arrested and tried the leaders of the revolution, and had some of them shot, but having thus demonstrated his master's power, he then devoted himself to winning the affections of the colonists by the affability of his demeanor and the liberality of his policy. In 1770 he returned to Spain, where he was made Governor of Madrid. On the death of General Ricardos he was appointed commander of one of the armies operating against the French, and died while on his way to the frontier.

O'REILLY, John Boyle (1844-90). An Irish-American poet and journalist, born at Dowth Castle, county Meath, Ireland, June 28, 1844. He studied at a private school, learned to set type, and became a newspaper reporter. At the age of eighteen he went to London as an agent of the Fenian Society, and in 1865 enlisted in

the British Army for the purpose of inducing Irish soldiers to revolt. He was detected in 1866, tried for high treason, and sentenced to be shot, but the sentence was commuted to penal servitude for twenty years. In April, 1867, with the help of the Rev. Patrick McCabe, he escaped in a boat from Bunbury, Western Australia, was rescued by the *Gazelle*, an American whaler, and carried to the United States in November, 1869. He settled in Boston, and devoted himself to literary work and public activity. In 1870 he became editor of the *Pilot* and remained in that position till his death at Hull, Mass., August 10, 1890. He was the founder of the Papyrus Club of Boston, and was highly esteemed, especially by men of his own race, for his talents, social qualities, and his loyalty to the Fenians. His verse includes *Songs of the Southern Seas and Other Poems* (1873); *Songs, Legends, and Ballads* (1878); *Statues in the Block and Other Poems* (1881); *America* (1882); *In Bohemia* (1886). Volumes of prose are: *Moondyne: A Story from the Under World* (1879), a tale of penal life; *The Irish Question* (1886); *The Ethics of Boxing and Manly Sport* (1888); and *Stories and Sketches* (1888). Consult the *Life of John Boyle O'Reilly* (Boston, 1891), by James Jeffrey Roche.

O'REILLY, Miles. The pseudonym of the American soldier and poet Charles Graham Halpine (q.v.).

OREJONE, ō'rā-hō'nā (Sp., Big Ear). A name applied by the Spaniards to several unrelated tribes on account of their custom of stretching or distending the ear by heavy pendants. The principal tribe thus known, properly called *Coto*, ranges between the Putumayo and Napo rivers, in territory claimed both by Ecuador and Colombia. They are naked savages of repulsive appearance and fierce disposition, although carrying on some trade in hammocks and poison. Their huts are without doors, entrance being effected from the roof. They use stone hatchets and poisoned arrows, and stretch their ears, by the insertion of wooden plugs in the lobes, until they hang down to their shoulders. Their language is said to be related to the Ticuna.

Another tribe of the same name was described by the missionary Nicolas in 1739 as living in the ancient Province of Santa Marta, now the province of Magdalena, Colombia. They called themselves *Tomaco*. They were also fierce and brutal savages, going entirely naked, with bodies anointed with gum, and their long hair hanging loosely, sometimes crowned with feather turbans. Both men and women wore gold pendants in their ears and noses. They cultivated corn, but depended chiefly upon hunting for subsistence, using poisoned arrows. They were also accused of cannibalism. They were bitterly hostile to the Spaniards, very few of them having ever been brought under mission influence, and have probably long since disappeared.

OREL, ār-yōl'. A government of Central Russia, bounded by the governments of Smolensk, Kaluga, and Tula on the north, Voronezh on the east, Voronezh and Kursk on the south, and Tchernigov on the west (Map: Russia, E 4). Area, 18,060 square miles. It has a somewhat hilly surface intersected by numerous ravines and river valleys and sloping generally toward the west. The chief rivers are the Don (with its tributary the Sosna), the Oka, and the Desna.

The climate is moderate, the temperature averaging 45° F. at Orel, the capital. In the eastern part, where there is an abundance of black soil, agriculture is the principal occupation, and yields considerable quantities of grain for export and hemp for manufacturing. In the west the soil is generally sandy and sterile, and agriculture is only of secondary importance. Thousands of the peasants of that section annually go for a season of work to Saint Petersburg and Moscow, and especially to the southern parts of Russia. Stock-raising is important, and the Orel horses are classed among the best in Russia. In the forest regions timber, tar, and pitch are produced. The house industry is but slightly developed. The chief manufactures are iron rails, glass, oil, flour, hemp products, etc. Population, in 1897, 2,054,749, chiefly Great Russians.

OREL. The capital of the government of the same name in Central Russia, situated on the Oka, at its confluence with the Orlik, 238 miles south of Moscow, and at the junction of three railway lines (Map: Russia, E 4). It is built mostly of wood. It contains three gymnasia, a *Realschule*, a corps of cadets, a theological seminary, and a meteorological station. The chief products are candles, ropes, oil, and flour. The town was founded in 1564 as a frontier fortress against the Crimean Tatars. Population, in 1897, 69,858.

O'RELL' Max. A name assumed by Paul Blouet (1848-1903). A French satirist. He served in the Franco-German War (1870), went to England as a newspaper correspondent in 1872, and taught French at Saint Paul's School (1876-84), using experiences gathered then, and during a visit to the United States, for *John Bull and His Island* (1883); *John Bull's Daughters* (1884); *Friend MacDonald* (1887); *Jonathan and His Continent* (1889); *A Frenchman in America* (1891); *English Pharisees and French Crocodiles* (1892); *John Bull and Co.* (1894); and similar books that have had a wider circulation among English peoples than in France. His writings, first published in French and translated into English by his wife, are humorous and often truthful, but as studies of nations they are marked by no very careful investigation or depth of thought.

ORELLANA, ō'rā-lyä'nä, Francisco (-1545). The discoverer of the course of the Amazon River. He was born in Trujillo, Spain, and came to Peru in 1535. In 1537 he had a share in the founding of Guayaquil. In 1540 he accompanied Gonzalez Pizarro as second in command on an expedition across the Andes into the country beyond, which was reported to abound in gold, silver, and cinnamon. After many hardships and misfortunes the expedition reached the junction of the Coca and the Napo rivers. Their supplies being exhausted, Orellana with 50 men was ordered to sail down the Napo in search of provisions and signs of treasure. He descended the stream to its junction with the Amazon, but instead of returning proceeded down the great river in a vessel which he constructed for the purpose. The voyage to the mouth of the Amazon lasted nearly eight months and Orellana's party underwent severe privations. Many deaths occurred

from skirmishes with the natives, and mutinies broke out among the crew, which only the commander's firmness quelled. Orellana reached the coast in August, 1541. From the mouth of the river he sailed to the island of Cubagua, in Venezuela, and thence to Spain, carrying glowing accounts of El Dorado, and embellishing his story with descriptions of a marvelous race of female warriors, of whom the natives, as he understood them, had told him, and who were named from the classical analogy, Amazons. Gold there was in such plenty that the roofs of the temples were made of that metal. The King of Spain granted Orellana extensive possessions and a commission to colonize El Dorado. He set out with four ships and 400 men in May, 1544, but lost one ship and 150 men before reaching Teneriffe. He arrived at the mouth of the Amazon, but his fleet was wrecked, and he died shortly after of malarial fever. An account of Orellana's first voyage was written by Gaspar de Carvajal.

ORELLI, ō-rĕl'lē, Kaspar (1787-1849). A classical scholar, born at Zurich. He studied in the *Carolinum* at Zurich, and in 1806 was ordained as a clergyman. He spent some years as a pastor at Bergamo; and while there published, in 1810, two parts of a work entitled *Beitrage zur Geschichte der italienischen Poesie*. In 1811 he became a teacher in the cantonal school at Chur; in 1819 professor of eloquence and hermeneutics in Zurich; and after the foundation of the Zurich High School, in which he took an active part, he was one of its chief instructors. Orelli edited many classical authors with great learning, taste, and acute discrimination; in particular, his editions of Horace (Zurich, 1837-38), Tacitus (Zurich, 1846-47), and Cicero (Zurich, 1826-31) deserve mention; also an *Onomasticon Tullianum* (Zurich, 1836-38), executed in association with Baiter, and an *Inscriptionum Latinarum Selectarum Collectio* (2 vols., Zurich, 1828; 3d vol. with indices, by Henzen, ib., 1856). There is a fourth edition of Orelli's *Horace*, with a lexicon (Berlin, 1886-92).

ORENBURG, ōr'en-bûrg'. A government of Russia partly in Europe and partly in Asia, and bounded by the Government of Perm on the north, Tobolsk and Turgai on the east, Uralsk on the south, and Samara and Ufa on the west (Map: Russia, J 4). Area, about 73,900 square miles. It is mountainous in the centre and the north, being traversed by the Ural Mountains (q.v.) and their offshoots. It slopes toward the west, south, and east. The eastern and southern parts have the character of a steppe. The region belongs mainly to the basins of the Ural and Tobol. Lakes are very numerous, and some of them contain extensive deposits of salt.

The climate is healthful, but somewhat dry in the southeast. The average annual temperature at Orenburg, the capital, is 38.5° F. Orenburg is noted for its mineral deposits, which include gold, silver, copper, iron, platinum, and salt. Coal has also been discovered near Ietsk in the south. Gold, copper, iron, and salt are obtained on a large scale, the first being found mainly in the eastern slopes of the Ural chain. The mountainous region in the centre is well wooded, while the eastern steppe is mostly barren. The natural conditions are favorable for agriculture, but the soil has been to some extent exhausted by the wasteful methods which usually characterize agriculture in new countries. About three-sevenths of the total area of the district belongs to the Orenburg Cossacks, the original Russian settlers of the region, who are still maintained on a military basis and are very prosperous.

Stock-raising is extensive, especially among the Bashkirs. Animals and animal products are among the leading exports. The Bashkirs are particularly known for their kumiss, which forms an essential item in their diet. Manufacturing industries are as yet undeveloped. The best known products of the house industry are various felt products, and the 'Orenburg shawls,' prepared from goats' wool and largely exported. There is an extensive trade carried on with the Kirghiz of the steppes. Population, in 1897, 1,609,388, only about 70 per cent. Russians. The remainder are Bashkirs and other Mohammedans.

ORENBURG. The capital of the Government of Orenburg, in Eastern Russia, on the right bank of the Ural, 988 miles by rail southeast of Moscow (Map: Russia, J 4). It is a well-built city with an old fortress, an arsenal, two gymnasia, a corps of cadets, a seminary for priests and for teachers, a theatre, and a museum. In the extensive municipal abattoir great numbers of cattle are slaughtered annually for export purposes. A little over a mile from the city is the 'barter house' —an extensive bazaar in the shape of a fortress where herds of cattle are brought from the East and exchanged for manufactured articles. The barter trade, which was formerly very extensive, has decreased considerably since the construction of the Trans-Caspian Railway. Orenburg exports large quantities of frozen meat, tallow, hides and skins, butter, cheese, wool, and other animal products. The town was founded at the confluence of the Or with the Ural in 1735 and removed to its present site in 1742. It withstood a siege by Pugatcheff in 1773. Population, in 1897, 72,740, including 13,000 Mohammedans.

ORENSE, ō-rĕn'sā (Lat. *Aquæ Urentes*, hot springs). The capital of the Province of Orense, in Galicia, Northwestern Spain (Map: Spain, B 1). It is situated on the left bank of the Miño, in a mountain valley having a cloudy and stormy climate. The river is here crossed by a fine bridge of seven arches built in 1230, but the town itself has few features of interest. It has a Gothic cathedral, which is hemmed in by houses and narrow streets. The high school occupies a handsome building, and there are, besides, a seminary, a normal school, and the provincial library. The town manufactures leather and chocolate, and there are flour mills and iron foundries. At the foot of the hill on which the town lies are the hot springs of Las Burgas. Population, in 1887, 14,168; in 1900, 15,258.

O'REODAPH'NE (Neo-Lat., from Gk. ὄρος, *oros*, mountain + δάφνη, *daphnē*, laurel). A genus of trees (now called Ocotea) of the natural order Lauraceæ, sometimes called mountain laurel. The fruit is succulent, partly immersed in the deep thick calyx. *Ocotea opifera* is a native of the lower Amazon countries. A volatile oil obtained from the bark is used as a liniment, and when kept for a short time deposits a great quantity of camphor. *Ocotea cupularis*

(*Mespilodaphne cupularis* of some botanists) is a very large tree with strong-scented wood, the bark of which yields the cinnamon of Mauritius. It grows also in Réunion and Madagascar. *Oreodea fœtens*, a native of the Canaries, has wood (til-wood) of a most disagreeable odor. *Oreodea bullata*, found at the Cape of Good Hope, is also similarly remarkable and is locally called stink-wood. It is hard, durable, beautiful, takes an excellent polish, and is used in ship-building.

O'REODON (Neo-Lat., from Gk. *ὄρος*, *oros*, mountain + *ὀδούς*, *odous*, tooth). An extinct artiodactyl ungulate mammal, fossil remains of which are found in such great abundance in the Oreodon beds as to indicate that these animals roamed in extensive herds over the grassy plains of Colorado, the Dakotas, Nebraska, and Wyoming during Miocene times. The animal was of the size of the modern peccary, with four hoofed toes on each foot, and a very long slender tail. Leidy called it a 'ruminating hog.' An allied genus, Eporeodon, twice the size of Oreodon, is found in the Miocene deposits of the Pacific Coast, and other ancestral forms are found in the Eocene beds.

ORESTES, ô-rĕs'tēz (Lat., from Gk. *Ὀρέστης*). In Greek legend, a son of Agamemnon and Clytemnestra. According to the *Odyssey*, he was sent from Mycenæ by his mother when she yielded to the seductions of Ægisthus. Brought up at Athens, he returned eight years after the murder of his father by Ægisthus, slew the murderer, and recovered the kingdom. The death of Clytemnestra is implied, but there is no allusion to her murder by her son. In the later poets, apparently through the influence of Stesichorus, this became the prominent feature of the story, which was then closely connected with the worship of the Delphian Apollo, as a purifier from the guilt of blood. The theme was treated by the three great tragedians, by Æschylus in the Orestan trilogy, by Sophocles in the *Electra*, by Euripides in the *Electra*, *Orestes*, and *Iphigenia Among the Taurians*. The versions vary in the details according to the dramatic ideas which influenced the writers. After the murder of Agamemnon, Ægisthus and Clytemnestra ruled over Mycenæ, or Argos, without opposition. Electra, sister of Orestes, was harshly treated because she still mourned her father and longed for vengeance on his murderers. Orestes in Phocis hesitated to return until ordered by Apollo to revenge his father. He therefore went to the palace, revealed himself to Electra, by a stratagem secured admission and slew his mother, Clytemnestra, and her paramour. He then sought purification at Delphi, and in one version found it. Another story told how the Erinnyes (or Furies) pursued the matricide, and even Apollo could not help him, but sent him to Athens, where Athena established the high court of the Areopagus to hear the case. Orestes was acquitted by a tie vote, and the Furies were appeased by the establishment of their worship as the Eumenides at Athens. Euripides added the story that after the trial Orestes was freed only by voyaging to the Tauric Chersonese for the image of Artemis, thus freeing his sister Iphigenia (q.v.). The *Orestes* of Euripides has a unique version of a trial at Argos and condemnation. After his release from the Furies Orestes reigned at Argos or Sparta, and married Hermione, daughter of Menelaus, after killing at Delphi Neoptolemus, son of Achilles, who also claimed her hand. Scenes from this legend are common on vases and sarcophagi.

ORESTES AND ELEC'TRA. (1) The title commonly given to a marble group in the Villa Ludovisi, Rome. It is the work of the sculptor Menelaus and probably represents Theseus and Æthra, or Telemachus and Penelope. (2) An affecting group in the Museo Nazionale, Naples. It is in the archaic style revived by Pasiteles toward the end of the Roman Republic.

O'REUS (Lat., from Gk. *Ὄρεως*). A later name for the ancient Euboean city Histiæa (q.v.).

OREX'IN (from Gk. *ὄρεξις*, *orexis*, desire, appetite, from *ὀρέγειν*, *oregein*, to reach out, desire). A derivative of chinoline, chemically phenyl-di-hydro-quinazoline-hydrochlorate. It is a grayish, odorless, crystalline powder, with a bitter, pungent taste. It is soluble in water and in alcohol. It is used to increase the appetite by increasing the secretion of gastric juice, and should not be employed if there is actual disease of the stomach.

OR'FE (from Lat. *orphus*, from Gk. *ὄρφος*, *orphos*, sort of perch). A golden variety of the ide, bred for keeping in aquariums. See IDE.

ORFEO ED EURIDICE, ôr-fā'ô ĕd ā'ū-rē'-dē-chā. The title of an opera by Gluck, with libretto by Calsabigi. It was presented in 1762 in Vienna and in 1774 in Paris with a French libretto by Moline.

ORFILA, ôr'fē'lä', MATTHIEU JOSEPH BONAVENTURE (1787-1853). A French chemist, physician, and toxicologist. He was born at Mahon, in Minorca, and studied medicine at Valencia and Barcelona, receiving the degree of doctor of medicine in 1811. He immediately began a private course of lectures on chemistry, botany, and anatomy, and soon became a well-known and successful practitioner. In 1813 he published a treatise on poisons which materially increased his fame; in 1816 he became Court physician; in 1819 he was created a citizen of France, and became professor of medical jurisprudence; in 1823 he was transferred to the chair of chemistry, to which was added in 1831 the deanship of the faculty. From 1834 he was a member of the council of public instruction. He organized a clinical hospital, founded a new botanical garden, and a museum of comparative anatomy, which is now known by his name. He died in Paris. Orfila is regarded as the founder of the science of toxicology, and his great work on the subject, *Traité des poisons tirés des regnes minéral, vegetal et animal*, or *Toxicologie generale* (Paris, 1813), gained him world-wide recognition. His other works are: *Elements de chimie appliqués à la medecine* (1817; 8th ed. 1851); *Traité de médicine légale* (1823-25; 4th ed. 1847); *Memoires sur plusieurs questions medico-légales* (Paris, 1839); and *Recherches sur l'empoisonnement par l'acide arsenieux*, etc. (ib., 1841).

OR'FORD, Sir ROBERT WALPOLE, first Earl of. An English statesman. See WALPOLE, SIR ROBERT, first Earl of Orford.

ORGAN (AS. *organ*, *organa*, from Lat. *organum*, from Gk. *ὄργανον*, *organon*, instrument, organ; connected with *ἔργον*, *ergon*, work, Av. *varez*, to work, Goth. *gawaúrki*, OHG. *werch*, *weral*,

Gr. *Work*, AS. *weorc*, Eng. *work*). In biology, any part of a plant or animal that has a definite work to perform for the good of the whole being. In the possession of organs living creatures differ from mineral substances; consequently the former are called 'organisms,' and are said to be composed of organic matter, whereas the latter are morganic. Even in the lowliest one-celled creatures organs make their appearance. The nucleus may be regarded as the first or oldest organ in organisms. The cytoplasm as well as nucleoplasm must, however, be regarded as composed of a complex of primitive organs which we cannot indeed see, but with whose behavior we are acquainted. These are the 'biophores' or microsomes. In some of these organs, also called 'organoids,' seems to reside the control of the nutrition; in others that of locomotion; in others that of sensation. Visible structures are also developed, such as a framework and often cilia. Thus even in its most primitive form protoplasm is already possessed of many organs; it is *organized*. Of the origin of the most primitive organism, of the source of this fortunate concurrence of mutually operating organs, we are totally ignorant.

Although even the simplest protoplasm is organized, organization becomes more complex in the higher forms. The organs become more numerous and have different ranks. There are the organs of gross anatomy, such as the eye, the stomach, heart, and the limbs, tissues, etc., which are complexes of organs of a lower rank, and are in turn made up of the unit organs—the cells. All cells have the organized structure of protoplasm. The essence of organization is division of labor. In a great factory each worker does a single stage of the work, so that if one drops out the work of the others is stopped. In such a factory, therefore, extreme division of labor is found, on the whole, to be immensely advantageous to the amount and quality of the work done; so in the organism. Important is the fact that, despite the extreme division of labor in the organism, the whole rules over the parts. So that even if an organ fails to perform its function completely, the organism may still survive through a regulative capacity in the rest of the organism.

Undeveloped and Vestigial Organs. There are certain organs in nearly all animals which attain little development—some seem, indeed, to be retrogressively developing. This retrogression may take place in the development of the individual or of the race, and seems to be due to disuse. The organs that are becoming degenerate in the race appear in a more or less rudimentary condition even in the embryonic life of the individual. They may later disappear in the individual development or long persist as vestigial and apparently useless structures. Organs occasionally occur which are imperfect, incomplete in structure, as a result of faulty or arrested development. Thus rare cases of persistent gill-slits occur in man, the two halves of the upper lip fail to fuse, or the heart is imperfect in construction. See Disuse.

Correlation of Organs. Certain organs of the body are physiologically or morphologically so interdependent that any change in the one brings about certain changes in the others. Such close relations between organs we call correlation. For example, such a relation exists between the length of the right and left arms, and between the length of the arm and the stature.

Symmetry of Organs. Throughout all the animal kingdom, an external bilateral symmetry of organs very generally prevails in the two sides of the body. These similar sides are called 'antimeres.' This is the case in man and in all vertebrates. In the internal organs of the higher vertebrates, on the other hand, the two sides of the body present great diversities in the circulating, digestive, and other systems. This asymmetry has evolved from the symmetrical condition characteristic of the lower vertebrates. Even the external organs of the higher vertebrates, although similar on the two sides, are very imperfectly so. In the two hands, for example, the blood-vessels, nerves, and finger-points of one differ from those of the other. In Mollusca bilateral symmetry sometimes exists, and is sometimes entirely lost, the one side remaining relatively undeveloped. In the Arthropoda the symmetry is in general as perfect as in vertebrates, and in the internal structure even more so. In the Echinodermata and Coelenterata radial symmetry prevails, i.e. there are more than two similar antimeres (usually five) grouped around a chief axis. In sea-anemones there are usually five of these antimeres; in Hydromedusæ four. In the vegetable kingdom a radial symmetry appears in the regular distribution of sepals, petals, stamens, etc., around the centre of the flower; and also in the arrangement of organs around the chief axis of the plant. See Homology; Homoplasy; Morphology.

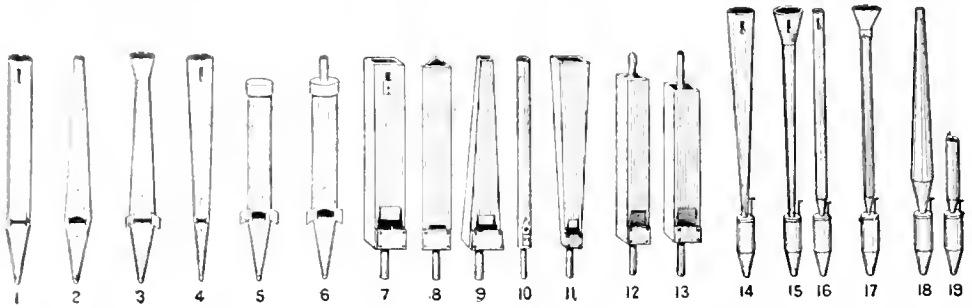
ORGAN. A wind instrument of large dimensions, whose earliest history cannot be exactly traced, though it is safe to assume that its predecessors were the bagpipes and Pan's pipes. The *organum hydraulicum* of Ctesibius, a native of Alexandria (c.250 B.C.), has been described by his pupil, Heron, also of Alexandria, from whom it would appear that organs were made in Greece and Italy with wind generated by bellows (air pumps), and also by means of water pressure. There is also extant a description (Greek) of an organ belonging to Julian the Apostate (fourth century A.D.), and there are other examples from Cassiodorus and Saint Augustine. Further data are obtained from ancient reliefs, representations, and accounts which would seem to indicate that the instrument was known in the West even before the Emperor Constantine (Copronymos) sent a gift of one to King Pepin in 757. These early instruments were naturally imperfect, rarely possessing more than from eight to fifteen pipes; while the keyboard consisted of small upright plates made of wood which the performer pressed upon. The sound of the pipe continued until the key plate was restored to its former position. The organ is said to have been first employed in the church during the time of Pope Vitalian I. (c.666 A.D.). Pepin placed the Constantine organ in the Church of Saint Corneille at Compiègne, and Charlemagne had one made at Aix-la-Chapelle, a model of the one at Compiègne. Caliph Harun al-Rashid presented Charlemagne with an organ built by Giafur, an Arab. In Europe at this period the organ-builders of Venice were considered the best, but in the following century both the French and the Germans made rapid strides. The great organ in Winchester

Cathedral, described by the monk Wulstan, was the first instrument of importance erected in England. It is described as having been operated by "two brethren of concordant spirit," and its tone is said to have "reverberated and echoed in every direction so that no one was able to draw near and hear the sound, but had to stop with his hands his gaping ears." Among the Anglo-Saxons of the tenth century the title 'Bumbulum' was applied to the organ. Up to this time the instrument was worked by means of slides, which, according as they were opened or closed, admitted wind to the pipes.

The modern keyboard (q.v.) grew out of the levers of this period, which have been well described as resembling those used by a railway signal switchman. The organ already mentioned at Winchester is said to have had four hundred pipes and two claviers, each of which had twenty keys (the compass of the Guido monochord), and also had ten pipes for each key, which were further reinforced in the octave and double octave. The special development of the twelfth century seems to have been the division into registers of the pipe-work, which, with its complicated mechanism, caused a great increase in the size of the instrument and made necessary such large keys that they had to be struck with the fists or elbows. The introduction of reed pipes occurred in the fifteenth century, subsequent to the invention of pedals in Germany about 1350. Improvements were also made in the keyboard so that fingers could be used instead of fists. Organ-building now became a regular trade. The father of the modern organ-building craft, so far as any authoritative account is concerned, was Albert van Os, who flourished in the first half of the twelfth century, and who is supposed to have been the inventor of pedals, although the idea is also attributed to Ludwig van Valbeke, of Brabant, and also to a German named Bernhard. Van Os built the celebrated organ of Saint Nicholas Church at Utrecht. From this time also dates the influence of the organist on the builder, for improved instruments made possible the skillful organist, and his reflex influence discovered and developed further improvements and possibilities in the instrument. Coming to the time of Bach, we find the organ the most thoroughly developed and possibly the most important musical instrument of the period. Saxony, which may be described as the birthplace of the magnificent instrument of to-day, boasts of over two hundred organ-builders between 1359 and 1780, including such world-famous workmen as the Silbermanns, Hildebrand, Gabler, Sommer, and Herbst. The difference between the French and the German systems had an important bearing on the development of the various pipes. The French gave the reeds to the instrument, while the Germans invented the gamba family and brought the small wooden pipe tone to great perfection. The next great and comparatively recent discovery was a method for equalizing the wind pressure, by the introduction of inverted ribs in the upper reservoirs of the bellows, an improvement which made possible a constant wind pressure and consequently an evenness of tone which had hitherto been unattainable. The 'hauptwerk' and 'oberwerk' of Germany correspond to the 'great' of the modern English and American organ; and similarly the 'brustwerk' is the equivalent of the English 'swell.' The 'ruckpositiv' corresponded to the English 'choir' or 'chair' organ. A distinctive feature of the German organs was their 'echo' organ, which contained stops reduplicating either the whole or the upper portion of some of the stops on the main organ. As they were built in an inclosed box, they produced the effect of distance. An English maker, Abraham Jordan, invented the simple contrivance of shutters about 1720, an invention which increased the tone of the echo stops and was practically the first real 'swell.' Other countries were somewhat slow to avail themselves of the English invention, for, according to Burney, no trace of it could be found anywhere on the Continent except in the Michelkirche at Hamburg, and even there it was so small as to be almost ineffective. In France the disposition of the stops in classes seems to have been the same as in Germany, Holland, and England. The organ of Saint Roch (1750) had four manuals, of which the great and choir communicated by means of a spring. The third manual was for the reed stops, and the fourth or upper for the echoes. The spring of communication was the predecessor of the modern coupler. Coming down to the nineteenth century, we find the efforts of the builders directed to still further improvements in the wind apparatus and the keyboard. An Englishman, C. S. Barker (1806-79), noticed that in the great organ at York Minster several pounds' pressure was necessary to force down any single key. In the search for a remedy the principle of the hydraulic press occurred to him, with the result that he devised a movement or mechanism by which the action was set in motion by the expansive power of compressed air, so that the key, instead of being a lever which had to move a complicated mechanism of back falls, rollers, springs, etc., became a valve lever whose only function was to admit or cut off a small quantity of air in order to obtain a result greater than had been possible before. Barker offered his discovery to the celebrated builders, Messrs. Hill, of London, when they were at work on the organ in the Birmingham Town Hall, but they rejected it. The equally celebrated Parisian builder, Cavaillé-Coll, was next approached, and promptly applied it to the organ of Saint Denis. Thus the three great inventions of the swell, the bellows, and the pneumatic lever belong to the English school of organ-building.

The Modern Organ. The modern organ is ordinarily several organs in one, the number varying according to the size of the complete instrument. In a large organ the order of claviers would be as follows: echo organ, solo organ, swell organ, great organ, choir organ, and pedal organ. The *great organ* contains the pipes of largest scale and most powerful tone, and does not ordinarily contain any soft stops unless the manual is required to serve as a choir as well as a great organ. The *swell organ* is that part of the instrument which is inclosed in a box. The pipes are usually of smaller scale than are those of the great organ, and where there are only two manuals, it usually includes several soft and fancy registers, and also the majority of the reed stops. The *choir organ* is used for soft accompaniment, and is made up largely of flute-tone stops, with possibly one or two reed stops. In the best organs they are inclosed in a swell box which opens on all four sides. The

solo organ contains the orchestral stops, some or all of which may be inclosed in a swell box. The *echo organ* is made up of stops of small scale and of delicately soft tone. They are sometimes included in the swell box of the swell organ, even though they have a separate manual. Where this is done, however, it is usual to inclose them in a box which must be not less than three inches in thickness. The *pedal organ*, as its name implies, belongs to the pedalboard and consists of ranks of pipes which practically are a continuation of the manuals. They are of more powerful tone, however, and are so designed as to afford a suitable bass or contrast to any stop upon the manuals.

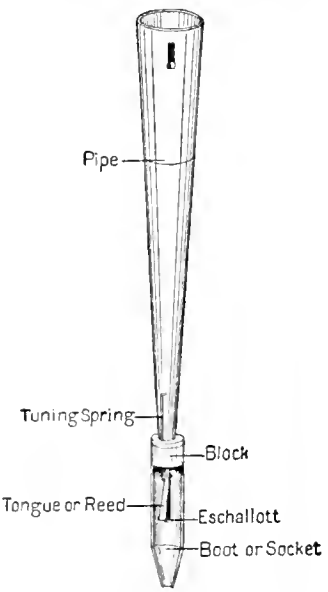


TYPICAL ORGAN PIPES.

1, open cylindrical metal flue pipe; 2, conical metal flue pipe; 3, conical metal flue pipe with bell; 4, inverted metal flue pipe; 5, stopped cylindrical metal flue pipe; 6, half stopped cylindrical metal flue pipe; 7, rectangular wood pipe; 8, triangular wood pipe; 9, pyramidal wood pipe; 10, cylindrical wood pipe; 11, inverted pyramidal wood pipe; 12, stopped rectangular wood pipe; 13, one-half rectangular reed metal pipe; 14, inverted conical reed metal pipe; 15, bell-topped inverted reed metal pipe; 16, cylindrical reed metal pipe; 17, cylindrical reed metal pipe with bell top; 18, conical reed metal pipe; 19, cylindrical half-stop reed metal pipe.

THE STOPS. Each stop includes a number of pipes which follow each other chromatically and extend over the entire keyboard or some portion of it. Each set of pipes consists of tubes producing the same quality of tone throughout; thus the German term *Stimme* (voice) for stop is singularly appropriate. Stops are classified as (a) complete stops, (b) incomplete stops, (c) short stops, (d) divided stops, (e) compound stops. Complete stops extend the entire length of the keyboard; incomplete stops do not do so. Short stops are those which cannot be completed by any other stop. Divided stops are those which divide the manual compass between them. Compound stops have two or more pipes to a note. (See MIXTURE.) The tone qualities of the pipes of an organ may be classified as follows: The *organ tone*, which is best represented by the English 16-foot and 8-foot open diapason octave works; the German 16-foot, 8-foot, and 4-foot principle; and the French 16-foot, 8-foot montre, and 4-foot prestant; the *flute* tone by the 16-foot bourdon, 8-foot stopped diapason, Gedeckt, Melodia, Clarabella, and the 8-foot and 4-foot flutes; the string tone by the 16-foot pedal violone, contra gamba, 8-foot violin, 'cello, gamba, keraulophon, salicional, viol d'amour; the reed tone by the trumpet, oboe, bassoon, clarinet, vox humana, trombone, etc. The structure of organ pipes consists of two general classes, viz. flue and reed pipes. The former derive their name from the method by which their tone is produced, i.e. the passing of air from the foot of the pipe through a *flue*, or narrow opening, across the mouth of the pipe. Such pipes are made of metal and wood. If of the former, they are cylindrical in form, and when of the latter material, they are either rectangular, triangular, or cylindrical. The pitch and quality of the tone depends on the length and general character of the flue pipe. Metal flue pipes may be either open cylindrical, conical, conical with bell at the top, conical inverted, stopped cylindrical, or half-stopped cylindrical. Wood pipes are either open four-sided, or rectangular; three-sided or triangular; pyramidal; inverted pyramidal; turned cylindrical; stopped rectangular; and half-stopped rectangular.

Reed pipes are of two kinds—the striking or impinging reed, in which the vibrator strikes against the reed or metal tube inserted in the block of metal which fits into the boot of the



REED PIPE.

pipe, and the free reed which in vibrating passes in and out of the opening freely and without touching or striking. This latter species, however, is seldom used. With the impinging reed the vibrating portion of the tongue may be lengthened or shortened, and made to vibrate

slower or faster by raising or lowering the tuning spring, and thus bringing it to the desired pitch. In the case of the free reed, the tongue vibrates in the opening on the face of the eschallott. Sometimes the tuning is regulated by thumb-knots on a threaded wire. Reed pipes are either of metal or wood; in the former case their shape is either inverted conical, the same surmounted with a bell, cylindrical, the same surmounted with a bell, conical, or cylindrical half stopped. With the lowest toned reeds the pipes are usually of wood, four-sided, and in some organs are thirty-two feet in length. Free reed pipes have their bodies usually made of wood. The peculiar quality of the reed tone is largely caused by the presence of harmonics, and is due chiefly to the curve of the tongue, and the scaling and length of the tube. As in the case of flues, reed pipes are occasionally made of double or half length. It was stated earlier in this article that the reeds were peculiarly French and that the Germans were strongly inclined to the flues. Locher speaks of this as nationally characteristic, and gives the two following examples: The Münster organ in Ulm (Walcker), as compared to the organ of the Trocadéro Palace, Paris (Cavaillé-Coll); and the organ of Saint Johanniskirche, Stuttgart (Weigle), as compared to the Münster organ, Geneva (Merklin). An ancient family name for such reed stops as the Geigenregal and the Jung-Fernregal is 'Regals,' which is still sometimes used.

The parts of the organ naturally fall into three divisions: the pipework, the mechanism for blowing (bellows, channels, wind chest, etc.), and the mechanism by which the wind is utilized. The pipes are arranged according to the stops to which they answer. Each pipe gives but one sound, so that the number of pipes must equal the number of sounds required, and if there is but one stop on the organ, there would have to be as many pipes as there are keys on the clavier. The pipes of each register are so placed that they can all at the same time be connected or shut off together by the action of the stop. The pulling out of a stop admits the wind to the chest, so that it is only necessary to press the key, which in its turn opens a small valve, to voice the pipe belonging to that key. The various manuals are connected together by couplers, manual and pedal. The frame ordinarily unites the manuals with the great organ, but in all large organs and the most recent small organs the manuals may be coupled among themselves; besides these there are the octave couplers, which unite every key with that of the upper or under octave, or both, in which latter case it is generally called the double-octave coupler. This coupler produces an exceedingly full tone. When we speak of *pneumatic action* we mean the mechanism which is used to operate the pallets and stops and their moving mechanism, the motive power being compressed air or atmospheric pressure rushing in to fill the vacuum. In every case the motor is a bellows, i.e. a device for generating wind, and of an extensible or collapsible design. Motors may be either near the keyboard transmitting their power in the desired direction by means of a long tracker, or they may be situated near the part upon which they act, in which case they are governed by other small motors situated near the keys and connected with the large motors by small tubes of indefinite length. In the first instance the transmission of power is by trackers, but in the latter instance it is by what is called tubular pneumatics. In the tubular pneumatic system the position of the motors inside of the wind chest enables the pressure of the wind, when the key is at rest, to have access also to the interior of the motor, so that the top is balanced by the pressure of the wind within and without. The ordinary pneumatic lever action may be said to work on the principle of the inflation of a feeder or motor. In this action the pressure of wind, or the size of the motor, must be so arranged as to be of sufficient power to draw the action attached to that portion of the motor which is free to move when the inflation takes place. While this action is exceedingly useful for large instruments, in which the complicated mechanism makes the touch too heavy for comfortable playing, it nevertheless lacks the exact precision of attack, and is fatal to correct phrasing and touch, in that there is no sharp edge to the cessation of tone. Tubular pneumatics, on the other hand, have been found to give a very prompt tone in pedal work, owing to the fact that the pallets instead of being hinged may open and close in parallel motion. If well made, this action will not easily get out of order, besides which it appeals to the player in that it lends itself easily to octave work. Its expense, however, is a serious item, owing to the weight and cost of the tubing and necessary apparatus. Electro-pneumatic actions, which are, as their name implies, a combination of electrics and pneumatics, have thus far satisfied all requirements except perhaps that of absolute reliability, although the advocates of the principle assert that that fault has been overcome. In this action a tiny disk valve is opened by electricity and admits the heavy pressure wind to the pneumatic movement near the pallet. The console or keyboard, through the various mechanical and electrical actions, may be placed in any position convenient to the player, quite independent of the location of the instrument. Numerous mechanical aids to registration are also important features of the modern organ.

Bellows of the simplest form are constructed after the manner of the smith's bellows, i.e. pump work. A distinction is made between horizontal and diagonal bellows. Of whatever shape or form they are but one thing is necessary, that they be ample for the full organ. Automatic organ-blowing engines or apparatus are now common, the manufacture of which is a trade by itself. The rule has been laid down that a water pressure of at least thirty-five pounds to the square inch is necessary for blowing by water. In this method two pairs of bellows are required, one pair (which is for the exclusive operation of the engine) having square rising feeders and an ordinary waste valve, and the other pair being specially provided with feeders so that in case of failure of the water or engine the bellows may be blown by hand. Electric and gas engines are not quite so economical, and suffer in comparison with water power from the fact that the electric engine is subject to disarrangement, and the gas engine is somewhat noisy by reason of the explosions.

Soundboards and wind chests are required to be of sufficient length and width to give the pipes plenty of speaking room. The wind chest is an air-tight box or chamber having channels above the valves or pallets, one for each note. In connection with the wind chest or soundboard is the slider. When the performer draws a stop the holes in the slide correspond to the holes in the table and upper board, and thus enable the wind to pass from the channels to the pipes. When the stop is returned, the slide is moved so that the holes do not correspond, and the plain surface closes the channels to the pipes. Valve pallets are about an inch in thickness and from eleven to sixteen inches in length. All the spaces between the lower edges of the partitions of the soundboard except those which the valves cover are packed with filling, and each valve is maintained in its place by a steel spring. When the valve is opened to admit the wind to a pipe it is pulled down about half an inch at one end, while the other end is held in place by a pin. The valves in the wind chests are worked by a mechanism which is connected with the keys.

The *key action* deals with the entire process of causing a pipe to speak, the simplest method of which perhaps is the lever or fan frame movement when the wind chest is built on semitonal principles; upright rods (*stickers*) are placed upon the inside ends of the keys, and the tops of these are inserted in one end of the levers, which are arranged perpendicularly over each respective key, the other ends converging under the pull-down wires of the wind chest. Should these wires be some distance from the keys, tracker action is used. Trackers are thin strips of wood capable of sustaining weight longitudinally; should the trackers be very long, guides are provided for their support. Thus when the key is depressed it causes an almost instantaneous action whereby the wind is permitted to reach the pipe and cause it to speak. The compass on an organ manual is usually from CC to G or A, although it is better extended to C, as is sometimes done, thus completing the five octaves. This latter is especially desirable where the pedal organ ranges from CCC to F (30 notes). The names of the more important stops will be found discussed under their own titles. See also HARMONIUM; MELODEON; VOICING; TEMPERAMENT; TREMULANT; TUNING.

ORGAN-BIRD. The name of two different song-birds, whose clear warbling notes suggest the tones of an organ. One is a wren (*Cyphorhinus cantans*) of the Amazon Valley; the other a piping crow (q.v.) of Tasmania (*Gymnorhina hyperleuca.*)

ORGANIC BASES. See ALKALOIDS; AMINES; and PTOMAINES.

ORGANIC CHEMISTRY. The chemistry of the compounds of carbon. See CARBON COMPOUNDS.

ORGANIC SENSATIONS. "Sensations adequately stimulated by changes in the condition of the bodily organs—muscles, joints, etc. In every case, the adequate stimulus consists of a change in the condition of the particular organ, and the organ itself is the peripheral seat of origin of the nervous excitation which is thus set up." (Külpe.) The only difference, then, between the 'sensations of special sense' and the organic sensations is that the organs of the former are stimulated from without, by some movement-process in the external world, while the latter are aroused by a bodily process within the organ itself. The distinction is convenient for purposes of classification, but has no psychological importance, since the sensations of the 'five senses' also presuppose a change in their organ; the 'stimulus' makes its impression on the brain by way of a bodily process in eye, ear, etc. Indeed, that there is no difference of kind between the two classes of sensations is shown by the attitude of popular psychology, which sometimes speaks of the 'five senses,' as if there were no more, but sometimes also adds a sixth sense, the 'muscle sense' (q.v.), to the five external senses.

The organic sensations, so far as they are known, fall into six principal groups. (1) We have, first, the group of 'kinæsthetic' sensations, the sensations which are excited by movements and similar stimuli (weight, resistance, position, etc.), and which furnish us with our bodily (non-visual) knowledge of the movement and position of the members. The specific quality of *muscular* sensation is a dull, dead pressure; that of *tendinous* sensation is strain; and that of *articular* sensation, the sensation set up by the rubbing or jamming of the joint surfaces, is a sharp pressure, which appears to be identical with the pressure obtained from the pressure-spots of the cutis. (See CUTANEOUS SENSATIONS.) These qualities have been identified, in the complex experiences within which they normally occur, partly by the laboratory method of elimination, and partly by the investigation of pathological cases. We can, e.g. by keeping the member unmoved and etherizing the skin, stimulate the muscle alone; or again, by etherizing the skin and muscle, stimulate the joint alone; or again, by passing a strong induction current through the joint, practically rule out the articular sensations. Since our sensitivity for lifted weights remains but little impaired when the sensations from skin and muscle are thus ruled out, we refer this function to the tendinous strain sensation, which remains clear in consciousness. Since a similar elimination does not affect our judgments of position and movement, while elimination of the joint sensations renders them

extremely uncertain, we refer these functions, in the same way, to the articular surfaces. On the pathological side, we find normal judgment of the position of the limbs compatible with anæsthesia of the external skin and muscles; whereas if the whole limb is insensitive there is no knowledge of its movement or place. Moreover, patients of the first class give the most accurate judgments of position and movement if the articular surfaces are closely pressed together.

(2) Of great importance in the economy of the organism are the alimentary organic sensations. These are three in number: the sensation of *hunger*, from the stomach; that of *thirst*, from the pharynx; and that of *nausea*, from the œsophagus. The adequate stimulus to hunger appears to consist in the drying and folding of the gastric mucous membrane, the lining of the 'wall' of the stomach, though hunger may be relieved by the injection of food into the large intestine. Thirst is set up by the drying of the pharyngeal mucous membrane, and may be relieved (though not permanently) by painting the back of the throat with a weak solution, e.g. of citric acid. The stimulus to nausea is, perhaps, the antiperistaltic movement of the œsophagus, which, in extreme form, passes over into the vomiting reflex. The experience of nausea usually includes sensations of taste, smell, and dizziness (see 6 below), so that the isolation of its specific quality is extremely difficult.

(3) There seems to be no doubt that *circulatory* sensations, stimulated by changed conditions of blood movement and blood supply, appear in certain organic complexes, though we cannot identify them with any degree of accuracy, or do more than guess at the conditions of their origin. Itching, tingling, formication, pins and needles, creeping, tickling, feverishness, etc., are the complexes in question. The sensation of cutaneous warmth that follows upon the pain of a smart blow upon the palm of the hand is possibly referable to circulatory sensations, though it may also be a true temperature sensation.

(4) Much the same thing must be said of the *respiratory* sensations. There seems to be a specific breathing quality in such experiences as panting, stuffiness, a bracing air, 'second wind,' breathlessness, etc.; and the lungs contain sensory nerve-endings. But of the number and nature of the respiratory qualities we are still ignorant.

(5) No systematic study has so far been made of *sexual* sensation. The sensation of lust is presumably the same in both sexes. We know, however, nothing in detail of its terminal organs, and little of its distribution over the organs of sex.

(6) The sensation of *dizziness* or giddiness is mediated by the semicircular canals of the internal ear, which are supplied by the vestibular branch of the auditory nerve. (See EAR.) The semicircular canals and vestibule constitute an organ which assists us, reflexly, to maintain our equilibrium and to orientate ourselves in space. Under certain conditions (for which see STATIC SENSE), in which there is disturbance or derangement of our space perceptions and relations, they serve as a sense-organ: and the sensation of dizziness, unpleasant as it is, plays a useful part as a warning of spatial disorientation.

The above list gives the full tale of organic qualities, so far as known, with the single exception of pain (q.v.). It is characteristic of the group that the sensations do not form closed systems of varied content, as do those of the most highly developed senses, sight and hearing, but stand out singly, as do the qualities of cutaneous and gustatory sensation in the external or 'special sense' group. Whether further analysis will bring with it a greater differentiation, so that there will prove to be a number of hunger qualities, a number of qualities of 'oppressed breathing,' etc., we cannot say; but such a result is improbable. Neither is it probable that qualities once separate have now fused, or that certain qualities have lapsed altogether. The organic sensations are processes of very ancient origin, which (like the sensations of pressure, temperature, and taste) have persisted with relatively little change as the organism has grown in complexity. They play an important part in systematic psychology. They form the constant background of the psychological self, and thus contribute largely toward the 'unity' or centralization of consciousness; they furnish the commonest sense-basis of the feelings; and they functionate in a surprisingly definite and authoritative way in recognition and reproduction (qq.v.).

It may be added that 'efferent' or 'innervation' sensations, in all probability, do not exist. The 'effort' that we put forth in lifting a heavy object is derived from memories, images, of previous liftings, and is not a new sensation accompanying the innervation of the arm muscles.

See COMMON SENSATION; MUSCLE SENSE.

ORGANISM. A living being, plant or animal, of which the essential constituent is protoplasm (q.v.; also ORGAN). The world of organisms or the 'organic world' is opposed to the mineral world—to lifeless things. There may be a degree of organization in a mineral, but it is a non-living, inorganic substance. An organism is a living being more or less differentiated into parts or organs, each with its peculiar formation.

ORGAN MOUNTAINS. The highest portion of the Brazilian Coast Range or Serra do Mar (q.v.).

ORGANOG'RAPHY (from Gk. ὄργανον, *organon*, organ + γράφειν, *graphein*, writing, from γράφω, *graphō*, to write). That division of biology which treats of the origin and cause of form. See LEAF; STEM; ROOT.

ORGANO-METALLIC COMPOUNDS. An interesting group of chemical compounds, in which organic radicles, such as methyl, CH_3, ethyl, C_2H_5, etc., are united to metals. Zinc-ethyl, which is a good example of the class, is obtained by digesting granulated zinc with ethyl iodide, C_2H_5I, at a temperature of about 600° F., for several hours. It is thus obtained in the form of a colorless, transparent, mobile liquid which

strongly refracts light, has a powerful, rather disagreeable odor, and is considerably heavier than water. Its boiling-point is 118° C. (244.4° F.). Chemically, it is very unstable, and when exposed to the air it takes fire spontaneously; it must, therefore, be handled with care and kept in vessels filled with carbonic acid gas. The properties of the other organo-metallic compounds of zinc, such as zinc-methyl, $Zn(CH_3)_2$, zinc-propyl, $Zn(C_3H_7)_2$, etc., are similar to those of zinc-ethyl, and so are the methods of preparing them. Among the corresponding compounds of lead must be mentioned lead tetra-ethyl, $Pb(C_2H_5)_4$, and lead tri-ethyl, which probably corresponds to the molecular formula $Pb_2(C_2H_5)_6$. The former of these may be obtained by the action of lead chloride on zinc-ethyl, the latter by the action of an alloy of 1 part of sodium and 3 parts of lead on ethyl iodide. It will be seen that while in its most stable inorganic compounds lead is divalent, in its organic compounds it is quadrivalent; in the case of its tetra-ethyl compound this is evident; but the tri-ethyl, too, probably has the constitution $(C_2H_5)_3Pb—Pb(C_2H_5)_3$, and hence contains lead in the quadrivalent state. Other metals capable of forming organic compounds include mercury, magnesium, cadmium, aluminum, thallium, and probably also sodium and potassium. In the case of metals whose atoms possess more than unit valency, compounds have been obtained in whose molecules a metallic atom is combined at the same time with organic radicles and with halogen atoms (like chlorine or iodine) or hydroxyl groups (OH). Thus the compound known as mercury-ethyl chloride has the formula C_2H_5HgCl, mercury-methyl iodide has the formula CH_3HgI, lead tri-methyl hydroxide has the formula $Pb(CH_3)_3OH$, etc. The hydroxyl-compounds, like that just mentioned, are strongly basic—about as strong, in fact, as caustic soda or caustic potash.

The organo-metallic compounds are useful in the synthetic preparation of a number of organic substances. They were discovered by Frankland, and it was while studying these compounds that Frankland first conceived the idea of valency, which has since formed the most important part of the atomic theory.

OR'GANON (Lat., from Gk. *ὄργανον*, instrument). The title under which the later Peripatetics included Aristotle's writings on the general subject of logic, as concerned with reasoning, the chief instrument of investigation.

OR'GANOTHER'APY (from Gk. *ὄργανον*, *organon*, organ + *θεραπεία*, *therapeia*, attendance, medical treatment, from *θεραπεύειν*, *therapeuein*, to attend, treat). The use of animal glands, or extracts made from them, as medicines. In his Hunterian lecture for 1902 in London, Davies claims that the use of animal remedial preparations dates from B.C. 1500. An enormous number of preparations of extracts from the human body and from animals is mentioned by William Salmon, in his work published in 1677. Modern organotherapy, however, dates from the lectures of Brown-Séquard in 1869. He advanced the hypothesis, "all glands of the body, whether they are excretory canals or not, give to the blood useful principles, the absence of which is felt when the glands are extirpated or destroyed by disease." Recent experiments confirm this view, and substantiate the claim of Brown-Séquard (q.v.). Besides spermatozoa, the testicles secrete a fluid which when absorbed into the system acts as a nerve stimulant and tonic. Brown-Séquard's 'elixir' is an extract of lambs' testicles. When administered hypodermically it produces an increase of hæmoglobin, an improvement in the cardiac force, exaltation of the vascular tone, and greater mental activity. Extravagant hopes were indulged by Brown-Séquard, and by some of his disciples, for testicular extract; and as the claims made were little short of ridiculous, his reputation suffered somewhat during the last years of his life. The extract has been employed, however, with varying results in hysteria, neurasthenia, locomotor ataxia, scurvy, marasmus, tuberculosis, epilepsy, and insanity. The active principle of this extract, *spermin*, is a leucomaine, and hence promotes oxidation in the body, probably relieving the nervous system to a certain extent of the results of auto-intoxication. Testicular extracts are variously termed spermin, testaden, didymin, testine, testidin, testin, orchidin, etc. Like all the animal medicinal products, testicular extract is prepared in powder and in liquid form. Ovarian extract is similar, though less powerful. It has been used in chlorosis, amenorrhœa following atrophy of the genitals, or after partial or entire extirpation of the ovaries, or during the menopause. It must be used with great caution. It is variously called ovadin, ovaraden, oöphorin, and ovulin. Thyroid extract is the most useful of all these preparations and is of distinct and definite value and causes no uncertain effects. It is prepared from the thyroid glands of sheep. It has been very successfully employed in psoriasis, eczema, lupus, sporadic cretinism, goitre, myxœdema, uterine fibroma, and obesity. It is named thyreoidin, thyroproteid, iodothyrin, thyraden, etc.

Thymus extract, prepared from the thymus glands of young sheep or pigs, has been successfully used in exophthalmic goitre and most of the conditions that are benefited by thyroid extract, except obesity. Suprarenal extract is prepared from the suprarenal (or adrenal) glands. It has been moderately successful in Addison's disease, diabetes insipidus, and neurasthenia. In certain other conditions brilliant results have followed its use. It is a valuable vaso-constrictor and cardiac tonic, and it has some value in certain heart diseases. When applied locally it is a powerful astringent, and its most important use is in checking hemorrhage, accomplishing this result whether administered internally or applied locally. It is called supradin or suprarenaden, and a fluid extract of the suprarenals is termed ojos-suprarenalin. A specially active preparation of the capsules made by Dr. Fraenkel is called sphygmogenia. The active principle of the capsules has been extracted by Takamine, by whom it has been named adrenalin. This preparation appears to be the most reliable and of most even strength of the preparations of the glands on the market. An extract prepared from the pituitary of the sheep has been used in a few instances by Marinesco, who claims success in the treatment of acromegaly (q.v.) with this agent. Preparations of the prostate gland of the bull have been used in cases of hypertrophy of the prostate in man. In dry form this extract is termed prostata. It is little known.

The term organotherapy has been expanded to

include the use of extracts prepared from various organs of the body, as well as the glands mentioned, in acquiescence with the extension by D'Arsonval of Brown-Séquard's hypothesis, as stated. While this use of the term is as deplorable as the ideas of D'Arsonval, for convenience sake it must be adopted. We find, therefore, extracts of the brain (cerebrin) recommended in neurasthenia, chorea, various psychoses, and conditions in which agoraphobia is present (see INSANITY); extracts of the kidney (renes, opo-renin, succus renalis) recommended in nephritis; spleen extract (linadin, nuclein, eurythol, neucleohiston) recommended in the treatment of anæmia, myxœdema, rickets, enlarged spleen, typhoid fever, goitre, leucocythæmia, and Hodgkin's disease; as well as musculine, extracted from the muscle of the ox; mammæ, extracted from the udder of the cow; and pulmonin, extracted from the lungs of calves. Most of these extracts from organs are apparently inert, some are useless. Nuclein alone seems really valuable. To the list should be added bone-marrow extract, which is a valuable preparation of the red marrow of bones, and chiefly made from the ribs and femur heads of calves. It is very successful in the treatment of anæmia and chlorosis.

ORGAN-POINT. A long sustained tone in one voice while the other voices proceed in independent harmonies. The name is derived from *organicus punctus*, which in the twelfth century, the time of the *organum* (q.v.), was a long sustained note of indefinite duration generally held by the tenor (whence the name of the voice), over which the other voices executed a florid counterpoint. Organ-point is also called *pedal-point*, because the pedal of the organ is best suited to sustain those long notes. But for etymological reasons it is best to use the name *organ-point*. The organ-point may occur in any voice. It seldom occurs in the middle voices, more frequently in the soprano, but generally in the bass. The modern tendency is to recognize the organ-point only in the bass; hence the sustaining of a long note in the soprano is called *holding note*. The laws governing the introduction of an organ-point in the bass are: (1) That the sustained note shall be either the tonic or dominant; (2) that it shall begin and end on a strong beat and form an essential part of the harmony of the beginning and closing chords. During the organ-point the other voices may proceed through any chords. Of course modulation of any length is excluded. An organ-point is generally introduced just before the end of a composition. Bach and Handel end many of their fugues on an organ-point. The following from the Scherzo of Beethoven's Ninth Symphony is an organ-point on the tonic:

In Fugue No. 4 from part I. of the *Well-tempered Clavichord* Bach introduces an organ-point on the dominant before the close which he constructs over an organ-point on the tonic, at the same time giving a holding note to the soprano.

A double organ-point on both tonic and dominant is often found in modern compositions, especially in those of a pastoral character. A fine example is found in the first movement of Beethoven's Pastoral Symphony (beginning at bar 29). There is also a *figured organ-point*, when the sustained note is varied, sometimes with a single note, sometimes with a group of notes. The following example from Beethoven's Seventh Symphony (Trio of Scherzo) illustrates this:

The longest organ-point that has ever been written consists of 138 bars and occurs at the beginning of the prelude to Wagner's *Rheingold*. See HARMONY.

ORGA'NUM (Lat., from Gk. ὄργανον, instrument, organ). In music, a term used to denote the primitive attempts at polyphony by leading the voices in open fifths. This succession of empty fifths is but a natural and logical step in the evolution of polyphony (q.v.). The first step (and this was already known to the

ancient Greeks) was the doubling of voices in the octave. Music remained at this point until in the latter half of the ninth century a second part was added a fifth below, and soon after a fourth below. Thus it is seen that only the *perfect* intervals were first used. Since then the evolution of music has been comparatively rapid. See HARMONY.

ORGANZINE (from It. *organzino*, organzine). A silk thread used chiefly for warp, in silk-weaving. It is formed by the union of two or more single threads, which are twisted separately in the same direction and are then doubled and retwisted in the opposite direction. See SILK.

ORGEYEV, ôr-gyā'yĕf. A district town in the Government of Bessarabia, Russia, situated 28 miles north of Kishinev. There are some ruins of the old Dacian fortress, the site of which is now occupied by the town. Agriculture and gardening are the chief occupations. Population, in 1897, 13,356.

ORGETORIX, ôr-jĕt'ô-rĭks (?-c.62 B.C.). A rich and powerful chief of the Helvetii, whose intrigues are recorded in Cæsar's *Commentaries* (book i.). He wished to possess himself of the chief power in his State, and therefore persuaded the Helvetii to emigrate to Gaul (B.C. 61). In consequence he was summoned to trial, but died, probably by his own hand, before the case could be heard. Consult Cæsar, *De Bello Gallico* (i. 2, 26); and Dion Cassius, xxviii. 31.

ORGIES, ôr'jĭz (Lat. *orgia*, from Gk. ὄργια, secret rites; probably connected with ἔργον, *ergon*, work, and ultimately with Eng. *work*). The name given in ancient Greece to the ceremonies connected with the worship of various divinities, particularly the wine god Dionysus or Bacchus. See MYSTERIES.

ORGUINETTE, ôr'gĭ-nĕt' (pseudo-French spelling of **organette*, diminutive of *organ*). A mechanical musical instrument, with sets of reeds, and an exhaust bellows, operated by a crank. A perforated strip of paper passes over the ends of the reeds, and the air (forced by the bellows through the perforations and into the reeds) produces certain musical tones. This instrument, in its present form, was developed from the inventions of Seytre, of France (1842), who is acknowledged to be the pioneer in the preparation of music on slotted paper, and Alexander Bain, of Scotland (1847), who obtained a patent for his own application of a sheet of slotted paper, or any flexible material, which acted as a moving valve. In 1848 Charles Dawson, of England, further experimented upon a music sheet similar to those of Seytre and Bain, but with a different arrangement of the air-chest and pipes. A further improvement was made by Pape, of France, in 1851, and also by Fourneaux (1863). In 1867 George Vanduzen used a slotted belt, but it was not until 1877, after the Centennial Exhibition, which seems to have given it an impetus, that Mason J. Mathews adjusted all difficulties; and E. P. Needham, who had also patented an instrument of this kind, and Newman R. Marsh commenced to manufacture orguinettes.

ORIAN'A. (1) The daughter of Lisuarte of England, beloved by Amadis of Gaul, and celebrated for her beauty and constancy. Queen Elizabeth is so called in the madrigals entitled *The Triumphs of Oriana*, collected by Thomas Morley (1603), and the name was given by Ben Jonson to Queen Anne, wife of James I. (2) The heroine of Fletcher's *Wild-Goose Chase*, Farquhar's *The Inconstant*, and Tennyson's ballad *Oriana*.

ORIANI, ô'rē-ä'nē, BARNABA (1752-1832). An Italian astronomer, born at Garegnano, near Milan, the son of poor peasants. Astronomy he learned from Lagrange; and in 1802 he was appointed director assistant in the Brera observatory in Milan. After the discovery of Uranus, Oriani showed that it was not a comet, as Herschel had supposed, but a planet. He edited *Effemeridi Astronomiche* (1778-1830), wrote much on astronomy, and made some important contributions to spherical trigonometry. His correspondence with Giuseppe Piazzi was edited by Cacciatore and Schiaparelli (Milan, 1875).

ORIBA'SIUS (Lat., from Ὀριβάσιος, *Oribasios*), OF PERGAMUM (c.325-c.400). The physician and adviser of the Emperor Julian the Apostate. After the death of Julian, Oribasius was banished by Valentinian and Valens, but was recalled about 370. Of his principal work, a medical encyclopædia, Συναγωγαὶ ἰατρικαί, in 70 books, less than half is preserved. It was written at the request of Julian, and though chiefly a compilation of earlier works, contains some important original matter; valuable explanations of many passages in Galen's works; and extracts from works not extant. In addition to this work, there are preserved Oribasius's abridgment (Σύνοψις) of the work, in nine books, and the Εἰσόρισια, also a medical treatise, in four books. The best edition is by Daremberg (Paris, 6 vols., 1851-76). Oribasius was the first to describe the salivary glands.

ORIBE, ô-rē'bĕ, MANUEL (c.1802-57). A South American general, President of Uruguay. He was born in Montevideo; entered the patriot army of Rio de la Plata when he was only a boy; and rose to high rank. In 1825 he was prominent in the rising against Brazil. He became Minister of War under Rivera in 1833 and was elected President two years afterwards. Rivera, as leader of the Colorado party, rebelled against Oribe in 1837, and succeeded in deposing him just before the end of his term. Oribe fled to Buenos Ayres, and with the help of Rosas began (1842) the Nine Years' War, an attempt to subjugate Uruguay to foreign rule. The interposition of France and Brazil forced him out of the country. Again in 1855 he led a revolt against Flores and would have made himself President but for the intervention of the Powers.

O'RIBI, or **OU'REBI** (South African name). A small antelope (*Neotragus scoparius*) which is closely allied to the grysbok, and inhabits Southeastern Africa, where it has become rare.

ORIEL COLLEGE. A college at Oxford, England. It was founded by Adam de Brome, Clerk in Chancery and Almoner of Edward II., in 1324, but almost immediately thereafter came into the hands of the King, and was refounded as the College of Saint Mary in Oxford. This in turn gave way to the present name, apparently on account of the society's moving into a house given it by Edward III., about 1328, called La Oriole. Oriel College consisted originally of a

provost and 10 fellows. Owing to the fact that the founder's will did not provide for close scholarships, or those confined to a family or district, as was the custom of the time, the open fellowships of Oriel, obtained as they were by competition, attracted many of the best men in the university in later years, and built up a strong and influential group of scholars who gave the college an enviable position in the academic world. After the changes of 1855 the college consisted of a provost, 12 fellows, a number of honorary fellows, college officers, and lecturers, about 15 scholars, 2 Bible clerks, and some 100 or more undergraduates in all. The buildings are picturesque, and the Hall is a very fine room. The college is particularly associated with that group of men who were most actively engaged in the Tractarian movement, Keble, Whately, Newman, Thomas, Arnold, and Pusey. Of other names may be mentioned William Langland (author of *Piers Plowman*), Barclay (author of *The Ship of Fools*), Sir Walter Raleigh, William Prynne, Bishops Butler, Wilberforce, and Hampden, White of Selborne, Dean Church, Thomas Hughes, Matthew Arnold, Clough, and Cecil Rhodes. The college presents to 15 livings. See OXFORD UNIVERSITY; OXFORD MOVEMENT.

ORIEL WINDOW (OF. *oriel*, from ML. *oriolum*, small room, *porch*, perhaps from Lat. *aureolus*, golden, from *aureus*, golden, from *aurum*, gold). A projecting window with three or more sides and commonly divided into bays by mullions. It is usually distinguished from a bay window, which projects from the base line of a building, by being applied to windows projecting from an upper story and connected with the flat wall below by some architectural feature such as a corbel or bracket. It is characteristic of late Gothic civil and domestic buildings, especially in France and England, and was not much used in the earlier Middle Ages.

ORIENTAL REGION (Lat *orientalis*, relating to the east, from *oriens*, pres. part. of *oriri*, to rise; connected with Gk. *ὄρνυναι*, *ornynai*, Skt. *ar*, to rise). A primary division in zoögeography, comprising Southeastern Asia and the adjacent islands as far as Wallace's line. (See DISTRIBUTION OF ANIMALS.) This "small, compact, but rich and varied" region, according to Wallace, consists of all India and China, south of the Himalayan highlands; all the Malay Peninsula and islands as far east as Java and Bali, Borneo and the Philippines; and Formosa. It is divided into four subregions: (1) Ceylonese, Southern India and Ceylon; (2) Indian, from about Madras to the foot of the Himalayas; (3) Indo-Chinese, Burma and Southern China; (4) Malayan, the Peninsula of Malacca and the Malay and Philippine Islands. This region possesses about a dozen peculiar families of vertebrates, and more than 200 exclusive genera among mammals and birds alone. Striking examples among these are orang-utans, gibbons, the proboscis monkey (the region is very rich in quadrumana), the tarsier and certain other lemurs; many bats and insectivores; most of the civets and many cats; the curious panda; two genera of bears; wild cattle, an elephant, and two or more species of rhinoceros. Among the birds, a great variety of small birds do not occur elsewhere; parrots and pigeons abound, and gallinaceous birds are more numerous and varied than anywhere else, the pheasants, jungle-fowls, and other groups being peculiar. In respect to insects, the region is hardly less rich than the Neotropical. The affinities between the Oriental and Ethiopian fauna have impressed naturalists strongly, and some have thought that India ought to be included in the latter region; but the weight of opinion seems to favor retaining the boundaries of the Oriental Region as they were made by Wallace. Consult Wallace, *Tropical Nature* (London, 1878).

ORIENTAL SEMINARIES. The name applied to certain European institutions established for the purpose of training young men for diplomatic and mercantile positions in Oriental countries. In these schools instruction is given, partly by European scholars of acknowledged eminence and partly by native teachers, in the principal languages of Asia, Malaysia, and Africa, and in the geography, history, civil and religious institutions of these countries. Practical instruction in modern European languages is also given, and lectures on law are usually added. With few exceptions they are under direct governmental control. The oldest institution of this sort is the *Kaiserlich-königliche Consular-Akademie* of Vienna, founded by the Austrian Government in 1754 for the education of promising candidates for the diplomatic service. It is under the direction of the Ministry of Foreign Affairs, and embraces both an Oriental and a Western section. In addition to the regular courses of instruction, the students, whose number is limited to twenty-five, are trained in gymnastics, swimming, horsemanship, fencing, and other accomplishments. The *Kaiserliche-Königliche öffentliche Lehranstalt für orientalische Sprachen*, established at Vienna in 1851, has a much wider scope and is open to all students looking forward to a career in the East, whether in a public or private capacity. Of similar character is the *Ecole spéciale des langues orientales vivantes* of Paris, founded in 1795, and now under the direction of the Ministry of Education. In this school special attention is paid to the languages spoken in the French colonial possessions in Africa and in the East. In Russia, an Oriental department has, since 1854, been attached to the University of Saint Petersburg, and courses are offered in the principal languages of Asia, including those of China, Korea, and Japan. The great extension, since 1870, of Germany's commercial interests in the East and the development of her colonial policy led to the establishment, in 1887, of the *Seminar für orientalische Sprachen* attached to the University of Berlin. Here the languages of Eastern Africa are taught in addition to those of Western Asia and the far East. In England instruction in modern Oriental languages has long been given at the University of Cambridge, and in London the School of Modern Oriental Languages, now incorporated with the University of London, has been in successful operation for some years. Special attention is paid to the languages spoken in the Indian Empire. The School of Tropical Medicine, founded through the interest of the Hon. Joseph Chamberlain, and the Oriental Faculty of the College of the Propaganda at Rome (see MISSIONS, CHRISTIAN) may also be mentioned in this connection. Several of these institutions issue publications of much value. The

Government of the United States has, as yet, taken no steps toward the establishment of a school for Oriental studies, but instruction in modern Oriental languages is given in some of the leading universities. At the Johns Hopkins University, Baltimore, courses in modern Arabic, Persian, and Turkish have been offered since 1891, and in the languages of the Philippine Islands since 1900. At Columbia University, New York, a chair of Chinese has recently been founded.

ORIENTAL SOCIETY, American. One of the oldest learned societies in America, founded September 7, 1842, and chartered under the laws of Massachusetts, with the object of promoting Oriental research in all its branches. It meets annually for the reading and discussion of papers and for the transaction of the general business of the society, and, by the terms of its constitution, at least one meeting in three years must be held in Massachusetts. At each meeting a special session is devoted to papers on the historical study of religions. The society possesses, at Yale University, a library comprising some 5000 volumes and a considerable number of manuscripts, and publishes a journal, issued annually in two parts, which contains many valuable contributions to Oriental philology, history, and archæology. Among the presidents of the society, which has exercised an important influence on the development of Oriental studies in America, have been the well-known scholars Theodore Dwight Woolsey and James Hadley of Yale, the celebrated Sanskritist W. D. Whitney, the eminent archæologist William Hayes Ward, of New York, and President Daniel C. Gilman, of the Carnegie Institution, Washington, D. C. In 1903 the society had a total membership of about 350.

ORIENTATION. Determination of the points of the compass with regard to the observer's position; and in ecclesiastical architecture, the arrangement of a sacred edifice in such manner that its axis may have a particular direction, usually toward the east. In a primitive state of culture, it was felt that especial efficacy attached to prayers made at dawn, and delivered toward the rising sun; hence in building temples, provision was often made for an entrance constructed to allow the first sunbeams to fall on the statue of the god, before which stood the altar. As the sun daily changes his place of appearance, choice might be made of his position at the time of the solstice or equinox. In Greek and Roman temples, although the eastward direction was most usual, exceptions occur, determined by various considerations. Hence the practice passed to Christianity, and it became customary so to arrange churches, especially among Oriental Christians. From the early centuries of the faith, it had been usual in prayer to face the east, and in burial the body was generally laid with the head to the west, so that in the resurrection the person might front the east. Such a practice is by no means peculiar to mediæval Christianity, but is common among savages as well.

ORIENTATION. A term, belonging partly to psychology and partly to physiology, which signifies a normal adjustment of the organism to its spatial environment. We are 'orientated' when we can govern the position of our body (stand up, sit down) with reference to changing spatial requirements, and when we 'have our bearings' as motor organisms, knowing right from left, and being able to move in any required direction. Orientation thus covers the maintenance of bodily equilibrium and the control of locomotion. The factors that determine it are manifold, and are both sensory (psychological) and reflex (physiological). We may mention sensations of vision, sensations from skin, joints and muscles of limbs and trunk—e.g. sensations from the soles of the feet, from the weight of the trunk pressing the hip sockets—reflexes of the eye muscles (attended in certain circumstances by muscle sensations), tactual and visual reflexes, and above all the sensory and reflex mechanism of the semicircular canals and vestibule of the internal ear. (See Static Sense.) As a rule, orientation is unconscious or at best but dimly conscious. Removal or derangement of any important factor, however, brings it definitely to consciousness: the effect of anæsthetizing the soles of the feet is very marked, and we all know the difficulty of keeping the head erect when we become drowsy. The governing reflexes may be disturbed by drugs, as in alcoholic intoxication; and in various forms of mental disorder the power of orientation is more or less completely abrogated.

Animals, in orientating themselves, are guided by their senses, and thus have the sense of direction. (See Tropism.) The dog finds his food mainly by the sense of smell, and this more than any other sense leads animals in their quest for food to move from one place to another. The sense of direction may also include the phenomena of migration, and the homing instincts of animals and the wonderful power exercised by savages and hunters in finding their way through a trackless forest or desert.

By means of the sense of touch we direct our attention to any part of our body which may receive a blow or any impression from without. The existence of a muscular sense is denied by Bonnet, who, however, calls in the existence of what he calls 'a sense of segmental attitudes,' which is the faculty we possess of knowing how instantly to orientate any single part of our body in relation to all the others. It is a primitive attribute of the tactile sense.

The tactile sense is the most generalized of all the senses, and tactile organs are to be found in all animals, in the shape of hairs, bristles, tentacles, and feelers of various sorts. The skin is especially sensitive to touch. Many of the lower and blind animals feel their way, as in the case of earthworms, the maggots of flies, and eyeless myriapods. In mollusks Nagel has found that certain eyeless bivalves and snails he experimented with showed a high degree of sensitiveness to light; some species reacted especially to diminution, others to increase of light.

The marginal tentacles of certain medusæ (q.v.), besides being organs of touch, also contain minute calcareous bodies (otoliths); in other medusæ corresponding organs have grown in or become invaginated, forming marginal sense-organs. The otoliths may either be situated at the end of a stalk, or remain free in the cavity containing them, which is called an 'otocyst.' These otocysts are organs of the sense of attitudes and of movements, and they also aid in directing the

movements of the body in approaching their prey or in escaping from their enemies.

Other kinds of organs of orientation which have excited much interest are the 'lateral organs' of salamanders, of which some contain otoliths, while those of the lateral line of fishes open externally or are closed. These organs, which occur only in aquatic animals, are supposed to afford a perception of variations of water pressure, and have by some been thought to be the organs of a sixth sense. They occur on the head and also along the side of the body. Like the marginal organs of medusæ, they tend to be invaginated and to form in their interior a liquid medium in which the movements peculiar to the animal may determine variations in pressure or of true friction between the sensible wall and the refractory liquid mass, by its fluidity and inertia immediately following the movement of the wall. These beatings or vibrations, impinging on the walls of the otocyst and causing movements of the delicately poised otolith, are the functional mode which takes place in the action of the canaliculär structures (lateral canals, labyrinth) from which have evolved the ear of fishes and other vertebrates. Instead of a series of sensorial papillæ more or less salient or invaginated, we first find a furrow, then a lateral canal, still in places in communication with the liquid exterior, and along whose wall may be distributed the papillæ of the lateral sense. We actually find in the otocyst of cephalopods furrows which are regarded as the precursors of the canals of the labyrinth of the ear, so that this sort of otocyst may be regarded as the prototype of the labyrinthine structures of vertebrates. But in the latter the organ of the lateral line is greatly developed. Each organ is an ectodermic papilla which has become invaginated and sunk down into the skin, whose growth converts the organ into a closed otocystic vesicle, in whose walls are new ingrowths of secondary papillæ with bent furrows formed like the furrow of the lateral line. These become curved canals comparable to canals of the lateral line, and produce an analytic decomposition of the slightest vibrations between the walls and the contained inert fluid, each furrow, each canal being very sensitive to the vibrations in one direction, and insensible to all the others. The pairs of sensitive cranial nerves sent to the lateral organs are the fifth, seventh, ninth, tenth, then the lateral continues. The eighth pair is wholly supplied to this marvelously differentiated lateral organ, which becomes the labyrinth of the fish's ear. In all the higher vertebrates the labyrinth of the ear consists of three canals, a sagittal, a transversal, and a horizontal one. Bonnet concludes by saying that in man the labyrinth of the ear, i.e. the apparatus of the semicircular canals, furnishes the notion of attitudes and of variations of attitudes of the head, together with a notion of the swiftness, direction, and duration of these variations. Moreover, it is not sufficient to know from what direction any sound reaches either of one's ears—it is also necessary for one to know the orientation of the two auditory fields, i.e. the position of one's head at this time so as objectively to orientate the origin of the sound.

Some authorities (Crum-Brown, Lloyd Morgan) believe that by means of the semicircular canals we can appreciate acceleration of rotatory motion, and also acceleration of movements of translation—forward or backward, up or down—while Morgan suggests that otocysts of invertebrates may be regarded as organs for the appreciation of changes of motion, "and the sense of hearing may be a refinement of the sense through which changes of motion are appreciated."

Consult: Bonnier, *Coriolisation* (Paris, 1900); Hartmann, *Die Orientierung* (Leipzig, 1902); Loeb, *Comparative Physiology of the Brain*, etc. (New York, 1902); Stratton, "Cutaneous Sensation," in *Psychological Review*, vol. iv. (New York, 1897).

ORIFLAMME, or'i-flam, or **AURIFLAMME** (Fr., from Ml., *aurea flamma*, from Lat. *aurī flamma*, flame of gold). A banner which originally belonged to the Abbey of Saint Denis, near Paris, and was borne by the counts of Vexin, patrons of that church, but which, after the County of Vexin was united with the French Crown, became the principal banner of the kingdom. It was charged with a saltire wavy, or with rays issuing from the centre crossways. In later times the oriflamme became the insignia of the French infantry. The name seems also to have been given to other flags; according to Nicolas, in his *History of the Battle of Agincourt* (London, 1827), the oriflamme then borne was an oblong red flag split into five parts. It does not seem to have been carried into war later than this battle (1415).

ORIGANUM. An herb. See MARJORAM.

ORIGEN (Lat. *Origenes*, from Gk. Ὠριγένης, probably Son of Horus, an Egyptian god), also called ADAMANTIUS (c.185–c.254). The most famous Christian writer and teacher of the third century. He was born in Alexandria about the year 185. His parents were Christians, and his father, Leonidas, suffered a martyr's death under Septimius Severus (202). Origen would gladly have died with him had he not been prevented by his mother. The boy was educated at the famous Alexandrian School, where he had Clement as his master. His remarkable abilities were early manifest, and at the age of eighteen he was appointed to succeed Clement as head of the catechetical school. In obedience, as he supposed, to the command of Matthew xix. 12, Origen made himself a eunuch, and his daily life was governed by an extreme asceticism. Leaving Alexandria during the persecution under Caracalla (216), he traveled widely, visiting Jerusalem and Cæsarea, where, at the invitation of the Bishops Alexander and Theoctistus, he lectured on the Scriptures, although he had not been ordained. This called forth a rebuke from Demetrius, Bishop of Alexandria, who summoned him to return home. For several years Origen devoted himself assiduously to teaching and writing, his reputation increasing rapidly. Jerome says that he wrote more books than other men can read, and Epiphanius places their total number at six thousand. During another visit to Palestine in 231, Origen was ordained presbyter by Alexander and Theoctistus, which aroused the bitter animosity of Demetrius. Jealousy mingled with theological antagonizing the suspicions of [illegible] some entertained against him, and [illegible] were held in Alexandria (231 et seq.) at which he was deposed from the priesthood [illegible] to return-

The churches of Palestine, Phœnicia, Arabia, and Achaia refused to recognize his deposition. Henceforward Origen resided in Cæsarea, where he succeeded in raising the school of that place almost to the height of fame which Alexandria had reached. During the persecution of the Emperor Decius (250 et seq.) he was imprisoned and tortured, and although he was released on the death of the Emperor, he died from the effects of his injuries about 254, being then in his seventieth year.

Origen was the greatest theologian and biblical scholar the Church up to that time had produced. He is sometimes called the father of the allegorical method of interpreting the Scriptures, for although the method did not originate with him, yet he, with Clement, perfected its Christian application, and gave it a far larger currency than it had ever had before. He taught the principle of the three-fold sense, corresponding to the three-fold division of man into body, soul, and spirit, which was then so common. As an exegete and student of the text, Origen did far greater service. In his *Hexapla* (q.v.) he presented the Old Testament in the original Hebrew, with a Greek transliteration, and the Greek versions of the Septuagint, Aquila, Symmachus, and Theodotion, all arranged in six parallel columns. His exegetical work was partly in the form of homilies, on both the Old and the New Testament, and partly in that of *Tomoi*, or commentaries in the stricter sense of the term, which covered a wide range. His theology was presented to the world in a treatise entitled Περὶ Ἀρχῶν, known to us in its completeness only in a Latin version made by Rufinus and entitled *De Principiis*. Unfortunately, Rufinus felt called upon to alter the text wherever it seemed to him heretical, so that what we have is not a translation, but a modified Latin version. Origen's theological views are further illustrated in his long apologetic work, *Against Celsus*, which is on the whole the most important Greek apology we possess.

Origen's greatest service to Christian doctrine lay in his development of the Logos Christology. In Jesus Christ we learn to know the Incarnate Word (Logos). But from this conception, through speculative thought, we rise to that of the Logos-not Incarnate, or the Pre-existent Logos, through whom in turn we mount to God Himself, the goal of all theology. To preserve the idea of God as absolute and eternal, whatever is closely related to Him—as the Son is, and as the creation is—must be pictured to our minds *sub specie æternitatis*, from the point of view of eternity or infinity. It is wrong to think of Christ as an emanation from God (the Gnostic doctrine), for that involves succession in time. We should rather think of Him as eternally projected. To illustrate his thought Origen used the metaphor of a torch and its light, or a mass of iron glowing with heat. In this fashion he avoided the two perils of Gnostic emanation, on the one hand, and Monarchian identification, on the other. (See GNOSTICISM; MONARCHIANS.) But while teaching that the Son was eternally begotten, a doctrine which was perpetuated in the dogma of the Trinity, Origen also taught that the Son was subordinate to the Father in power and dignity, and this idea was later used against him, after Arianism (see ARIUS) had appeared as a threatening heresy. Origen's doctrine of an eternal creation, with periodic cycles of decay and renewal for our world, was not generally accepted by the Church. Nor was his restorationism accepted, according to which all mankind should at last return to a state of innocency and be acceptable unto God, although something like it was afterwards taught by Gregory of Nyssa in the fourth century. The school of Origen, which included Dionysius of Alexandria, Gregory Thaumaturgus, Eusebius of Cæsarea, John of Jerusalem, Jerome (in his early period), and others, was very influential for many years, but in the fourth century it was attacked by Epiphanius, and the Origenists were thenceforward regarded as heretics and combated fiercely.

The best edition of Origen's works is that now in process of publication by the Berlin Academy in *Die griechischen christlichen Schriftsteller der ersten drei Jahrhunderte; Origenes Werke*, vols. i. and ii., edited by Koetschau (Leipzig, 1899). An older edition is by Lommatzsch (25 vols., Berlin, 1831-48). An English translation of the most important works is given in the *Ante-Nicene Fathers*, vols. iv. and ix., edited by Roberts and Donaldson (New York, 1887-96). In general, consult: Harnack, *History of Dogma*, vol. ii. (London, 1896); Krüger, *History of Early Christian Literature* (New York, 1897); Fairweather, *Origen and Greek Patristic Theology* (ib., 1901); Rainy, *The Ancient Catholic Church* (ib., 1902).

ORIGINAL PACKAGE (OF., Fr. *original*, *originel*, from Lat. *originalis*, original, from *origo*, origin, from *oriri*, to arise; connected with Gk. ὀρνύναι, *ornynai*, Skt. *ar*, to arise). With reference to interstate commerce, the package in which goods are shipped. The term has a special significance arising out of a line of decisions of the United States Supreme Court, deciding questions raised by the attempts of the various States to prohibit or regulate the sale of intoxicating liquors, cigarettes, and other commodities on the ground that they are injurious to public health and morals. The cases in which these questions were raised are known as the 'Original Package Cases.' The 'interstate commerce clause' of the United States Constitution provides that Congress shall have power "to regulate commerce with foreign nations, and among the several States," etc. A State can regulate the domestic manufacture and sale of commodities, under its police power, and, therefore, in the so-called 'prohibition States' the manufacture and sale of intoxicating liquors was practically prohibited. This led to the importation of liquors from other States, and seizures by the State officers. The United States courts held that where an article is imported into one State from another, it does not lose the protection of the interstate commerce clause until it has become intermingled and incorporated into the general mass of property of the former, but in such event it becomes subject to the laws of that State. Further, that while goods remained in the original packages, cases, barrels, etc., in which they had been shipped, and while in the hands of the importer, they had not become so intermingled, and remained subjects of interstate commerce protection. The importance of such decisions lies in the fact that such an interpretation of the law gives ample

opportunity to evade State laws, under the technicality of selling goods in the original packages directly to consumers. Such a sale deprives the goods of the protection above mentioned, but as the goods are thereby placed in the hands of the actual consumer, this is immaterial. After goods in original packages have been sold by the importer, they become subject to the State laws. However, a liberal interpretation of what constitutes an original package enables dealers to import the otherwise prohibited articles and retail them. For example, liquor in bottles has been held to be in original packages. However, if the bottles were inclosed in a case, the latter would be the original package, and the importer could not retail the bottles without conforming to the State laws. An original package was finally defined to be any covering, case, wrapping, or receptacle in which an article is inclosed for transportation.

By an act of Congress, approved August 8, 1890, known as the 'Wilson Law,' it was provided that all intoxicating liquors imported into a State shall on their arrival be subject to the laws and regulations of that State, enacted in the exercise of its police power, in the same manner as if they were produced there, and shall not be exempt by reason of having been introduced there in original packages. The purpose of this law was declared by the United States Supreme Court to be to prevent the sale of liquor in original packages in violation of State laws, and it effected a radical change in the law in this respect. However, a number of decisions have held that such State regulations must be strictly confined to the police powers of the State, such as requiring liquors to be sold within certain hours, etc. A license tax on imported liquors in original packages or otherwise, which seemed to have no other object than to provide revenue for the State, was held void, as being a tax on interstate commerce.

The law as to all other commodities in original packages remains the same as before the above act, and is still of great importance in its bearing upon laws prohibiting the sale of cigarettes, etc.

ORIGINAL SIN. The native corruption of man, resulting in universal sin, and itself conceived as partaking of the nature of sin. The period of elaborate discussion of this subject, eventuating in a comprehensive doctrine of sin, fell in the first third of the fifth century; but the elements of the doctrine had been held from the beginning in the Church both of the East and the West. The earliest fathers are full of expressions teaching the universality and persistence of sin, and ascribing it in some indefinite form to a deep-seated origin in the nature of man. An early difference appeared between the Latin and the Greek Church on account of the general emphasis which the latter laid upon the intellectual and the former upon the practical. The Greeks emphasize more the freedom of man, the Latins his practical bondage to evil. It has therefore often been said that the Greeks had no doctrine of original sin; but they teach an original state of righteousness, accept the fact of the fall, and view this as not only bringing man under the dominion of the devil, but as producing a tendency to sin. This tendency arises from the obscuration of the intellect, the weakness in reference to the good, and the ascendency of the sensuous nature over the higher powers and faculties, which have resulted from Adam's sin. At the same time, freedom is carefully guarded, and the more so because of the conflict which these early fathers were waging with the Gnostics. (See GNOSTICISM.) Man still has the power to choose the good as well as the evil. Otherwise he would not be responsible. Grace is necessary to repentance, but it is styled an 'assistance.' Origen referred the universality of sin to the self-corruption of all human spirits in a previous state of existence. The Latins, while in general acknowledging the same fundamental truths as the Greeks, throw the emphasis upon the concrete facts of sin and grace. Tertullian approached the later Latin view. The premises of the doctrine lie in his psychology (see TRADUCIANISM) and his doctrine of the original condition of man. Man was created good, but not perfect. By his sin he became corrupt, and this corruption propagates itself by natural generation among his descendants. Hence every child of Adam is impure and subject to death. Grace is no mere 'assistance,' but it is a creative and transforming power. In this general position the Latin fathers of this period generally concur.

The discussion was carried on in the fifth century by Pelagius and Augustine (qq.v.). The main positions of the latter were embodied in the result of the Council of Orange (529), which declared that by the sin of Adam free will has been so perverted and weakened that fallen man is incapable, without the initiative of divine grace, of performing meritorious acts leading to salvation, and hence this doctrine passed into the theology of the Middle Ages. A milder view sprang up immediately, which was termed the 'Semi-Pelagian' (q.v.), which gave the initiative in conversion now to man, and now to God, and hence greatly modified the doctrine of the effect of the fall upon the will. The doctrines of the Semi-Pelagians were condemned at the Council of Valence (530). The Council of Trent (q.v.) defined original sin in substantially the same way as the Council of Orange, but elaborated and expanded it, and its definition is the accepted doctrine of the Roman Catholic Church.

The Reformers adhered to the strict Augustinian doctrine, often surpassing Augustine by their extreme forms of statement. They were deeply impressed with the enormity and pervasiveness of sin, and with the entire dependence of man upon the grace of God for the creation within him of the least tendency toward good. The history of the doctrine presents, therefore, little but the reaffirmation of Augustinian positions, and may be summarized in the result formulated by the Westminster Confession (chap. vi.), which stands here for most of the Reformation creeds. "Our first parents . . . . by this sin . . . became dead in sin and wholly defiled in all the faculties and parts of soul and body. . . . The guilt of this sin was imputed and the same death in sin and corrupted nature conveyed to all their posterity. . . . This corruption of nature during this life doth remain in those that are regenerated; and although it be through Christ pardoned and mortified, yet both itself and all the motions thereof are truly and properly sin." Consult the literature under AUGUSTINE; also the Systems of Doctrine.

particularly Charles Hodge, *Systematic Theology* (New York, 1871-73); Landis, *The Doctrine of Original Sin* (Richmond, 1885).

ORIGINAL WRIT. In English legal practice, a writ issued under the great seal, and directed to the sheriff, requiring him to command an alleged wrong-doer to satisfy the complaint of his accuser or to appear in court and answer the complaint. These writs were formerly regarded as the direct mandate of the King (whence the name) issued through his chancellors; but they have been abolished in England, where the statutory process of summons is used to begin all civil actions. In the United States they have never been in use. The term is sometimes improperly given to the first writ or process issued in an action under the modern procedure, which is not an original writ, but a process of the court. See PROCEDURE: WRIT.

ORIGIN OF SPECIES. See DARWIN, CHARLES; NATURAL SELECTION.

ORIGNAL, ô'rê'nyäl' (probably of North American Indian origin). A French-Canadian name for the moose (q.v.).

ORIHUELA, ō'rē-wā'lä. A city of Southeastern Spain in the Province of Alicante (Map: Spain, E 3). It is situated 12 miles northeast of Murcia, on the banks of the Segura, in a plain remarkable alike for its beauty and fertility. It is a long and straggling city. Its palm-trees, square towers, and domes give it an Oriental appearance. It contains a small Gothic cathedral and a handsome bishop's palace. The manufactures include silk, linen goods, and hats; flour and oil mills and tanneries are in operation. Population (commune), in 1887, 24,364; 1900, 28,335.

ORIL'LIA. A town and summer resort of Simcoe County, Ontario, Canada, on the Grand Trunk Railway, at the head of Lake Couchiching (Map: Ontario, D 3). It has manufactures, carries on a thriving trade, and is frequented for its picturesque situation and the good angling the lake affords. It contains a provincial asylum and has two fine parks. A narrow strait connects Lake Couchiching with Lake Simcoe, and steamers ply on the lakes. Orillia is the seat of a United States consul. Population, in 1891, 4752; in 1901, 4907.

ORIL'LON (Fr., almonds of the ears, from *oreille*, ear, from Lat. *auricula*, diminutive of *auris*, ear). A term used in the earlier systems of fortification to describe a semicircular projection at the shoulder of a bastion, designed as a screen for guns and men posted on the flank. It is mostly found in the works of Pagan and Speckle.

ORIN'DA. THE MATCHLESS. The nickname of the English poet Katherine Philips (q.v.).

ORINOCO, ō'rē-nō'kō. The smallest of the three great rivers of South America (Map: Venezuela, D 2). The main stream runs wholly within Venezuelan territory, except for a short distance in its middle course, where it forms the boundary between Venezuela and Colombia. It rises on the Parima uplands near the Brazilian frontier, and flows first northwest to the Colombian boundary, then north into Central Venezuela, and finally eastward until it empties into the Atlantic Ocean through a large delta beginning near the boundary of British Guiana. The total length of the main stream is 1490 miles. Its course forms a large curve around the edge of the Parima plateau; hence its right banks are generally higher, and the tributaries received from that side smaller, while on the left side are the large plains or *llanos* (q.v.), and through these are received several tributaries equaling or exceeding the main stream. About 150 miles from its source and 920 feet above sea level the Orinoco branches, sending one-sixth of its volume into the Cassiquiare, which flows into the Rio Negro, an affluent of the Amazon. The remainder flows as a navigable river until it is broken by the romantic Maypures and Atures rapids, 870 miles from its mouth. These rapids are the only serious obstruction in the main stream, which below them flows with a very gentle current over a bed so nearly level that the tides are felt at Ciudad Bolivar, 260 miles from the sea. Though the country around the upper courses of the river and its tributaries is heavily forested, the lower reaches traverse open savannas where only the banks are lined with trees, and where the adjacent country is periodically flooded so that the natives are compelled to live in pile dwellings. The marshy but heavily forested delta occupies an area of 7000 square miles, and has a coast line of nearly 200 miles, through which upward of 50 channels enter the ocean. Many of these shift their beds, but seven are permanently navigable for large vessels. The principal navigable tributaries of the Orinoco are the Guaviare, the Meta, and the Apuré (qq.v.), and the total navigable length of the system is 4300 miles. This great waterway, however, is but little used, since the adjacent regions are thinly inhabited, and the great natural wealth practically untouched. In 1900 only one steamer of the Royal Mail Steamship Company plied once every two weeks between Trinidad and Ciudad Bolivar. Smaller steamers continue the service as far as Nutrias on the Apuré, but above the Apuré confluence there is no regular navigation. Consult: Humboldt, *Travels in South America*, trans., Bohn Library (London, 1877); Chassanjon, *L'Orénoque et le Caura* (Paris, 1889); Triand, *Down the Orinoco in a Canoe* (London, 1902); Guzman, "La exploración del Orinoco," in *La España Moderna*, vol. clxvi. (Madrid, 1902).

O'RIOLE (OF. *oriol*, from Lat. *aureolus*, golden). Any of several small birds whose plumage is yellow or orange and black. It was given first to the Old World family Oriolidæ, and was naturally transferred to the American hangnests by early English travelers and settlers on account of the similarity in colors. The American orioles belong to the family Icteridæ, and form the subfamily Icterinæ, in distinction from the blackbirds, bobolinks, and meadow larks, from which the orioles differ in the extremely acute, sometimes decurved bill, comparatively weak feet, and non-gregarious, arboreal habits. They are agreeable songsters, possess notably handsome plumage, and are renowned as architects. As their nests are usually pensile, the birds are often called 'hangnests.' They are especially characteristic of tropical America, where they go by the name of 'caciques,' or, in Jamaica, 'banana-birds.' The best-known species is the Baltimore oriole (*Icterus galbula*), which ranges in summer as far north as the southern provinces of Canada,

but winters in Central America. Its name was given to it by Linnæus, whose first specimen came from Maryland, in complimentary allusion to the fact that the colors of the male were those of the livery of Sir George Calvert, the first Lord Baltimore, then proprietor of that colony. The gay plumage has also caused it to be called 'golden robin,' 'fire-bird,' and 'fire-hang-bird.' The male is about eight inches long, brilliant fire-orange, with the whole head, neck, back, wings, and middle tail-feathers black, and with considerable white on the wings. The female is somewhat smaller, much paler, and with the black more or less obscured by olive. The young resemble the female, and do not assume their full plumage before the second year. The Baltimore oriole is one of the most conspicuous birds that the spring migrations bring into the Northern United States, not merely because of the splendor of his plumage, but because of his loud, musical whistle. The food consists chiefly of insects, although fruit and young peas and similar delicacies are eagerly accepted when in season, and ripening grapes are injured to a serious extent in the Hudson Valley and certain other localities. See Colored Plate of SONG-BIRDS with THRUSH.

The nest of the Baltimore oriole (see Plate with NIDIFICATION) is the bird's greatest claim to distinction. This admirable structure is woven into the tip of a branch, preferably the drooping limb of an elm or willow, from which it hangs at some distance from the ground: though other trees are frequently used, the elm is the favorite, as the long, drooping branches afford an ideal location for a hanging nest. The construction of the nest is mainly if not entirely the work of the female, the principal materials being grass, slender strips of bark, strings, hair, and vegetable fibres. These are all closely and very firmly interwoven into a pouch, four or five inches in depth. The eggs are four to six in number, not quite an inch long, white, spotted, scrawled in a curious manner with irregular lines of black or brownish.

Another oriole, which does not range quite so far north or west as the Baltimore, and which is much less conspicuous, though the male is very handsome, is the orchard oriole (*Icterus spurius*). A much quieter and more retiring bird than his showy cousin, the orchard oriole is not so often seen or heard, but his song is a more finished product and more melodious. The male is chestnut, with the head and fore parts of the body black, while the female is olive-green and dull yellow. The young resemble the female and the males do not assume full plumage until the third year. The nest is made of grasses, and is not so perfectly pendent as is the Baltimore oriole's. The eggs are similar to those of the latter, but are somewhat smaller and not so much scrawled. (See Plate of EGGS OF SONG BIRDS.) Of the remaining 35 or 40 species, prominent examples are the 'troopial' (*Icterus icterus*), a tropical species common in South America, about ten inches long, bright yellow and black; the black-headed oriole (*Icterus melanocephalus*), another large, rich yellow and black species, occurring in Mexico, a variety of which, known as Audubon's oriole, is found in the lower Rio Grande Valley; and Bullock's oriole (*Icterus Bullocki*), a species very similar to the Baltimore bird, which replaces that species in the Far West. See also CACIQUE—a closely allied group.

Consult Ridgway, *Birds of North and Middle America*, part ii. (Washington, 1902), and American ornithologies generally.

The orioles of the Old World are a small family of about 40 species, the Oriolidæ, related to the crows. They are characteristically Oriental and Australian, though several species occur in Africa, and one ranges throughout Europe. This is *the* 'golden' oriole (*Oriolus oriolus*), somewhat larger than the Baltimore oriole, and equally brilliant. The song is marvelously rich and flute-like, but very short. A very similar Oriental species is the familiar *Oriolus Kundoo*, or 'mango-bird.' The outward likeness between these Old World orioles and the American hangnests is increased by the fact that the former also build somewhat pensile nests. The 'mimicry' between them and certain honey-eaters (Meliphagidæ) is another very interesting circumstance, described at length by Wallace, Newton, and Salvadori. Consult Evans, *Birds* (London, 1900).

ORI'ON (Lat., from Gk. Ὠρίων). In Greek legend, a giant hunter; also the name of a constellation. In the Homeric poems Orion appears as the name of a constellation, conceived as a hunter who is watched by the bear, and of a handsome hero, beloved by Eos and slain by Artemis, but there is no hint of a connection between the two stories. Later writers preserve a multitude of local legends about Orion, which cannot be united into a consistent narrative. In Bœotia he enjoyed special fame, as a hunter of mighty strength, who, while reputed son of King Hyrieus, was borne from the earth by the intervention of three gods. A Cretan version made him the son of Euryale, daughter of Minos, and Poseidon, who gave him the power of traversing the sea. Here also he appears as a hunter and the chosen companion of Artemis and Leto. The Chians connected him with their local hero Œnopion, for whose daughter Merope he became a suitor. Here too he, with the aid of Artemis, cleared the land of wild beasts, but Œnopion still refused to give him his daughter, and finally by strategy blinded him; according to one version, because Orion in drunkenness had offered violence to Merope. Orion forced a boy to guide him to the rising sun, whose rays, falling full upon his eyes, restored their sight, or was helped to this cure by Hephæstus, and returned to take vengeance on Œnopion, who was saved by Poseidon. From the Homeric story of his death was developed a series of stories of his love for Artemis, who slew him when his passion became too violent, or she loved him and only killed him by accident, for Apollo, in his anger at her love, challenged her to hit a black spot on the sea: she shot her arrow and found only too late that it was the head of her lover, who was swimming. In general these myths seem to have no connection with the constellation, but in the following it is difficult not to see astronomical origin. Orion in Bœotia met Pleione and her daughters, and pursued them for five years till they were caught up into the sky as the Pleiades, who still seemed to flee before the giant. In Crete Orion boasted that he would kill all beasts upon the earth, whereupon Gæa sent a scorpion, who killed the hunter by stinging his heel. Artemis set both in the sky, and Orion still hastens to set as he sees the scorpion appear above the horizon.

ORIÓN, ō'rē-ōn'. A town of Luzon, Philippines, in the Province of Bataan, situated near the west shore of Manila Bay, four miles south of Balanga (Map: Luzon, D 8). Population, in 1896, 10,373.

ORIS'KANY, BATTLE OF. In American history, a battle fought about two miles west of Oriskany, N. Y., on August 6, 1777, during the Revolutionary War, between about 800 American militiamen under General Herkimer (q.v.) and an equal force of Loyalists and Indians under Sir John Johnson (q.v.) and Joseph Brant (q.v.). The Americans, while on their way to relieve Fort Schuyler (on the site of Rome, N. Y.), fell into an ambuscade in a deep ravine, but fought Indian fashion and with the utmost bravery for several hours, and finally drove the enemy from the field. The battle greatly crippled Saint Leger (q.v.), who soon afterwards, alarmed at the approach of Gen. Benedict Arnold, rapidly retreated into Canada, thus abandoning the plan of campaign which had been drawn up by General Carleton and which provided for his effecting a junction with General Burgoyne and General Howe or General Clinton at Albany. In proportion to the numbers engaged it was one of the bloodiest battles of the war, more than a third of the contestants being killed or wounded on each side. General Herkimer was mortally wounded early in the action and died several days later. Consult: Dawson, *Battles of the United States* (New York, 1858); and Stone, *Life of Joseph Brant, Including the Indian Wars of the American Revolution* (ib., 1838).

ORISKANY STAGE. A division of the Lower Devonian, named from the type occurrence at Oriskany, N. Y. It is found in the central and eastern parts of New York, and extends southward along the Appalachians into Virginia. It attains a thickness of 200 feet in many places, and consists of sandstones and calcareous shales. It is usually found in association with the Lower Helderberg rocks. The formation is of economic importance in Virginia, where it yields iron ore. See DEVONIAN SYSTEM; GEOLOGY.

ORIS'SA (Skt. *Odra*). A former kingdom on the east coast of Hindustan, which extended from Bengal—a part of which it included—on the north to the banks of the Godavari on the south, and from the coast on the east to Gondwana on the west, embracing an area much larger than that of the region which now bears the name. The authentic history of Orissa begins with the foundation of the Kesari, or Lion, dynasty, about A.D. 474. The Hindu rulers of the land were always Brahmanical rather than Buddhistic in religion, and they possessed a high degree of culture and civilization. Orissa maintained its position as an independent monarchy till the sixteenth century, when the Mohammedans began to harass the country. Finally, in 1568, the last independent King of Orissa was defeated by Soleiman, the Afghan King of Bengal, under the walls of Jaipur, and in 1578 the Afghans in their turn were forced to surrender Orissa to Akbar, and it remained a portion of the dominions of the Great Mogul until 1751. In 1742 the Mahrattas began wresting the country from the declining power of the Mogul emperors, and in 1751 Orissa became a Mahratta province. The Great Mogul ceded his rights to the East India Company in 1765. Under the Mahrattas the condition of the country was wretched in the extreme, and in addition to the distress caused by their lawlessness Orissa was ravaged by famine in 1770 and again in 1777. In 1803 the Mahratta power was crushed and Orissa became an English possession. Revolts took place in 1804 and in 1817-18. An agreement was made between the East India Company and the native chiefs and princes by which the former bound themselves to perform certain services for the country (as maintaining the river banks in good repair), while the latter engaged to pay a yearly tribute. Of the many principalities into which Orissa was divided, a large number fell into arrears with the Government, and the result was that numbers of the estates were sold, and the Government, as a rule, became the purchaser. Much of the territory originally forming a portion of this kingdom thus fell into the hands of the British. In 1865-66 a terrible famine visited the country. The present British commissionership of Orissa extends from a point a little west of the Hugli estuary to the borders of Madras, and includes the delta of the Mahanadi. It constitutes the southwesternmost portion of Bengal. The British districts have an area of 9841 square miles, and the native States of Orissa, 17 in number, embrace an area about once and a half as large. The British districts had a population, in 1891, of 4,047,352; in 1901, of 4,350,372. The native States have about 2,000,000 people. The hill districts, which nowhere present an elevation of more than 3000 feet, are inhabited by the Gonds, the Koles, the Sourahs, and the Khonds. The irrigation of a large portion of Orissa is provided for by an extensive and costly system of canals taken over by the Government in 1868. The chief towns are Cuttack, the capital, Balasor, an important seaport, and the holy city of Puri.

ORI'THY'IA (Lat., from Gk. *Ὠρείθυια, Oreithyia*. The daughter of the Athenian King Erechtheus. Boreas carried her off to Thrace, and she became the mother of Cleopatra, Calaïs, and Zetes.

ORIZABA, ō'rē-thä'bä (called by the Aztecs *Citlaltepetl*, 'Star Mountain'). One of the highest peaks of North America, exceeded seemingly only by Mount McKinley in Alaska. It is situated on the boundary between the States of Vera Cruz and Puebla, Mexico, 65 miles west of the city of Vera Cruz. It is a beautifully symmetrical volcanic cone rising to a height of 18,250 feet. Its summit is covered with perpetual snow, and in clear weather is visible from ships far out in the Gulf. Forests of oak and pine cover the lower and middle slopes, the former following upon the luxuriant tropical flora. The timberline is found at 13,500-14,000 feet. The summit crater, which is much smaller than that of Popocatepetl, is in a condition of full preservation, and from it at times issue sulphurous and other vapors. The volcano has been quiescent during the past half century. It was first ascended in 1848 by two American officers, Reynolds and Maynard.

ORIZABA. A city in the State of Vera Cruz, Mexico, situated 68 miles southwest of Vera Cruz, on the railroad between that city and Mexico (Map: Mexico, L 8). The town lies in a beautiful valley over 4000 feet above the sea, and partly surrounded by lofty mountains, among which towers the magnificent volcano of Orizaba

(q.v.), 20 miles distant to the northwest. In spite of the high altitude, the climate of the valley is tropical, and especially subject to hot winds from the south. The houses are mostly one-storied, and the town contains few objects of interest. The greater part of the valley is occupied by sugar plantations, and Orizaba is an important centre of the Mexican sugar industry. There are also a number of cotton and flour mills, most of the power being furnished by the Rio Blanco. Population, in 1895, 31,512. Orizaba was an ancient Indian town, and its present name is a corruption of the Nahuatl *Ahuializapan*, meaning 'pleasant waters.' It was for a number of years the capital of the State.

ORKHAN, ôr-kän' (1279-1359). A Turkish Sultan, son of Othman, founder of the Ottoman dynasty. He captured Brusa in 1326, and succeeded his father in the same year. He made Brusa his seat of government. Orkhan married Theodora, a daughter of the Byzantine Emperor John Palæologus, in 1347. He won a footing in Europe (1354), and made extensive gains in Asia Minor. Orkhan may be considered one of the greatest generals of the dynasty.

ORK'NEY ISLANDS. An archipelago lying north of Scotland, and separated from Caithness by the Pentland Firth (Map: Scotland, F 1). It consists of about 70 islands and islets, of which 29 are inhabited. The principal islands are Pomona or Mainland, Hoy, South and North Ronaldsay, Flotay, Burray, Ronsay, Shapinsay, Stronsay, Eday, Westray, and Sanday. The area of the islands is 375 square miles. With the exception of Hoy, which is mountainous, the islands are generally low, with an irregular, partly rocky, partly sandy coast line. The highest hill is the Ward of Hoy, 1555 feet. The rocks are of the Old Red Sandstone formation, except a small granite district near Stromness. The climate is mild owing to the proximity of the Gulf Stream. The annual rainfall varies from about 28 inches on the east side of the isles to 37 inches on the west. The soil is fertile and produces barley, oats, potatoes, and turnips. The inhabitants also engage in cattle, sheep, and poultry raising, and fishing. Live stock, sea food, poultry, and eggs are largely exported. Though Orkney is a separate county of Scotland, it combines with the Shetlands to return one member to Parliament. The only towns are Kirkwall (q.v.), the capital, and Stromness, with a fine harbor admitting the largest vessels, both in Pomona. The population of the islands was, in 1891, 30,450; in 1901, 26,698.

The *Orcades* (whence the modern adjective Orcadian) are mentioned by classical writers, but of their inhabitants almost nothing is known till the Middle Ages. They were probably of the same stock as the British Celts. From an early period, however, the Norsemen resorted to these islands, and in the tenth century they were ruled by independent Scandinavian jarls (earls), but in 1098 they were made subject to the Norwegian Crown. In 1231 the Scandinavian feudal lords were succeeded by Scotch nobles under the overlordship of the Norwegian kings. In 1468 the islands were given to James III. of Scotland as a security for the dowry of his wife, Margaret of Denmark. In 1590 Denmark formally resigned all pretensions to the sovereignty of the Orkneys. The present inhabitants are generally of Scandinavian and Scotch descent. The antiquities include the standing stones of Stennis, the Maeshowe tumulus, and an old Pictish fort.

Consult: Low, *A Tour Through the Islands of Orkney and Shetland* (Kirkwall, 1879); Tudor, *The Orkneys and Shetland* (London, 1883); Wallace, *Description of Orkney* (Edinburgh, 1883); Brand, *A Brief Description of Orkney, Zetland, Pightland Firth, and Caithness* (ib., 1883); Buckley and Haure-Brown, *Vertebrate Fauna of the Orkney Islands* (ib., 1891); Craven, *History of the Church in Orkney, 1662-88* (Kirkwall, 1893); id., *The Church in Orkney, 1688-1852* (ib., 1893).

ORLAN'DO. A city and the county seat of Orange County, Fla., 147 miles south of Jacksonville; on the Plant System and the Florida Central and Peninsular railroads (Map: Florida, G 3). It is a popular winter resort, situated in a healthful region, noted also for its hunting and fishing. There are some manufacturing establishments, but the city is more important as the centre of extensive fruit-growing interests. Population, in 1890, 2856; in 1900, 2481.

ORLAN'DO. (1) The Italian form of Roland, one of Charlemagne's paladins. (2) In Shakespeare's *As You Like It*, a son of Sir Rowland de Bois, brother to Oliver, and Rosalind's lover.

ORLAN'DO FURIO'SO. A famous poem by Ariosto, published in 1516, in forty cantos; revised by the author and enlarged to forty-six, 1532. It was a continuation of Boiardo's *Orlando innamorato* and is professedly a romance of chivalry, though a light irony, like that of Cervantes in *Don Quixote*, can be felt in the treatment. For the sources of the story, consult Rajna, *Le fonti dell' Orlando furioso* (Florence, 1876). See also ARIOSTO.

ORLANDO INNAMORATO, ôr-nä-mô-rä'tô. See BOIARDO.

ORLAN'DUS LAS'SUS. See LASSO, ORLANDO DI.

ORLE (OF. *orle*, *ourle*, Fr. *orle*, from ML. *orlus*, *orla*, diminutive of Lat. *ora*, border, coast). In heraldry (q.v.), one of the charges known under the name of subordinaries.

ORLÉANAIS. ôr'lā'ä'nā'. Formerly a province of Central France, on both sides of the Loire. It is now included mainly within the departments of Loiret, Loir-et-Cher and Eure-et-Cher, while smaller portions belong to the departments of Seine-et-Oise, Sarthe, Indre, Cher, Nièvre, and Yonne.

ORLÉANS. ôr'lā'äN'. The former capital of Orléanais, France, and now the capital of the Department of Loiret, situated on the right bank of the Loire, spanned here by a magnificent bridge, about 70 miles south-southwest of Paris (Map: France, H 4). Orléans lies on a forested plain. It is a well-constructed city, with spacious, regular streets and pleasant squares. The city lies in a compact form, extends along the river lined with quays, and is bordered by a semicircle of connected and broad boulevards of the most modern type occupying the site of the ancient fortifications. There is much curious old timber architecture to be found in the city. The noteworthy late Gothic Cathedral of Sainte Croix dates from 1601. Its impressive façade is of

of the town's attractions. The cathedral contains a decorative monument by Chapu.

The Hôtel de Ville is of brick and stone, dating from 1530. It was reconstructed and enlarged in the last century. In the old Hôtel de Ville are the municipal museums of painting and sculpture and a museum of natural history. In the ancient and artistic Hôtel de Cabut, formerly called in error the house of Diane de Poitiers, is the valuable Historical Museum of Orléans. The house of Agnes Sorel and the house where the Maid of Orleans lodged are still standing. The latter contains the highly interesting Musée Jeanne d'Arc. This collection includes tapestries, statues, portraits, banners, etc., all connected with or illustrating the history of the heroine. Other interesting buildings are the prefecture, the Palace of Justice (1821), and the Hôtel Dieu, which is considered the most attractive hospital in the Republic. Orléans has an equestrian statue of the Maid of Orleans, and a bronze statue of the Republic, erected in 1850. Orléans is on the site of *Genabum*, the Gallic town burned in B.C. 52 by Cæsar to avenge the murder of Roman traders. It was rebuilt by the Emperor Aurelian and named *Aurelianum*, whence its modern name. It was an important place under the Merovingians and continued to flourish under the kings of France; in 1309 it became the seat of a university. During the Hundred Years' War with the English it was distinguished for its loyalty. It was rebuilt by the English in 1428-29, and was relieved by the famous Maid of Orleans—Joan of Arc. It was a Huguenot stronghold during the religious wars, and while besieging it the Catholic leader, the Duke of Guise, was assassinated in 1563. In the Franco-German War of 1870-71 several sanguinary battles were fought in the neighborhood; in October, 1870, it was occupied by the Germans, who were driven out a month later by the French; in December, however, the city was recaptured by the Germans and held until the end of the war. Population, in 1901, 67,311.

ORLEANS, ôr'le-ânz. An island in the Saint Lawrence River, belonging to Montgomery County, Quebec, Canada, a few miles below the city of Quebec (Map: Quebec, F 4). It has an area of 69 square miles, with a population of about 5000. The surface is undulating and covered in some portions with extensive forests. The soil is rich, and in a high state of cultivation, fruit culture being of considerable importance. There are a number of villages. The island is a favorite picnic and summer resort. It was General Wolfe's camping ground prior to the siege of Quebec in 1759. Jacques Cartier, in 1535, named it Isle de Bacchus, owing to the abundance of its grape vines.

ORLEANS. The name borne by a cadet branch of the Valois and Bourbon houses of France. Philip, the fifth son of Philip VI. of France, was created Duke of Orleans in 1344. After his death, without issue, the duchy was bestowed (1392) on Louis, Count of Valois, the younger brother of Charles VI., who thus became the founder of the House of Orleans Valois. Louis was a man of exceptional gifts and great vices and played an important rôle during the tragic period of the Hundred Years' War, when the fortunes of France under its mad King, Charles VI., were at their lowest. He strove with Philip the Bold of Burgundy for the control of the King, and with his wife, Valentina Visconti, was suspected of plotting for the throne. After the death of Philip, Louis was for some time without a rival in the kingdom, enjoyed the favor of Queen Isabeau, but rendered himself unpopular by his extravagance and the licentiousness of his character. The contest against him was renewed by Philip's son, John the Fearless, whose wife Louis had seduced. A reconciliation between the two took place in November, 1407, and three days later Louis was assassinated at the instigation of John. He had eight children by Valentina Visconti and an illegitimate son, Dunois (q.v.), the celebrated bastard of Orleans. Louis's eldest son, Charles, Count of Angoulême and Duke of Orleans (1391-1465), carried on the struggle against the House of Burgundy as head of the party of the Armagnacs. He was taken prisoner by the English at Agincourt and spent twenty-five years in captivity. He was noted as a poet. (See CHARLES OF ORLÉANS.) His son Louis ascended the French throne as Louis XII. (q.v.), and reunited the Duchy of Orleans to the Crown. It was subsequently held by the younger sons of Francis I. and of Henry II. until 1574, when Henry, Duke of Anjou, the last male scion of the House of Valois, ascended the throne of France. Of the bearers of the title belonging to the House of Bourbon the following are the most important:

GASTON JEAN BAPTISTE, Duke of Orleans (1608-60), best known for his talents in conspiracy. He was the third son of Henry IV. of France and of Maria de' Medici, and was born at Fontainebleau, April 25, 1608, being known after 1611 as Monsieur. In 1626 he was made Duke of Orleans, and married Mary of Bourbon, Duchess of Montpensier, the richest heiress in France. In the same year he was involved in the conspiracy of Chalais against Richelieu (q.v.), and basely abandoned his accomplice to his fate. He never ceased, however, to intrigue against the great Minister, and in 1632 raised Languedoc against the King with the aid of the Maréchal de Montmorency. He deserted the latter at the battle of Castelnaudary (September 30, 1632), and made his peace with the Court, while Montmorency suffered torture and death. In 1636 he plotted with the Count of Soissons against the life of Richelieu, but his cowardice led to the discovery of the conspiracy, and Gaston purchased peace at the expense of his accomplices. He was concerned in the conspiracy of Cinq-Mars (q.v.), but upon the arrest of the latter (June 13, 1642) submitted and pleaded for pardon. He became Lieutenant-General of the Kingdom after the death of Louis XIII., and served with credit against Spain. During the Fronde (q.v.) he changed from the Court to the Parlement and to Condé, and in July, 1652, was named by the Parlement Lieutenant-General. With the triumph of Mazarin his political activity came to an end, and he spent the last year of his life in retirement at Blois. By his first wife, who died the year after their marriage, he was the father of the celebrated Grande Mademoiselle, Anne Marie Louise, Duchess of Montpensier (q.v.).

The title of Duke of Orleans was next borne by PHILIPPE, brother of Louis XIV. (1640-1701), the founder of the existing House of Orleans, who had two daughters by his first wife, Henri-

etta Anne of England, and a son and daughter by his second wife, Elizabeth, daughter of the Elector Palatine. The son, PHILIPPE, Duke of Orleans (1674-1723), was Regent of France during the minority of Louis XV. He possessed excellent talents, but his youth was passed in unbridled dissipation. Louis XIV. compelled him to marry his daughter, Mademoiselle de Blois, by Madame de Montespan (q.v.). He displayed great personal courage and military talent during the War of the Spanish Succession in Holland, Italy, and Spain; but his presence in Madrid after his victories (1708) was regarded with apprehension both by Philip V. and by Louis XIV. In consequence of this, he lived for some years in retirement from the Court, spending his time in debauchery and in the study and practice of the fine arts and of chemistry. Louis XIV., having legitimized the Duke of Maine and the Count of Toulouse, his sons by Madame de Montespan, appointed the Duke of Orleans president of the regency, but gave the guardianship of his heir and the command of the household troops to the Duke of Maine; but all this was set aside at his death, and the Duke of Orleans became sole Regent in 1715. He was popular, and his first measures increased his popularity; but the financial affairs of the kingdom were perplexing, and the Regent's adoption of the schemes of John Law (q.v.) led to disastrous results. (See MISSISSIPPI SCHEME.) He formed an alliance with England and Holland in 1717, and expelled the Stuarts from France. In the same year he held the celebrated *lit de justice*, in which he prohibited the Parlement of Paris from meddling with financial or political affairs, and declared the legitimized sons of Louis XIV. incapable of succeeding to the throne. His old tutor Dubois (q.v.), who still possessed an unhappy influence over his former pupil, became Prime Minister, and practically ruler of France; the Regent, who was really a man of high abilities, neglecting all duties and pursuing a course of profligacy perhaps unequaled in history. At the instigation of Dubois, the Regent sacrificed the Jansenists and compelled the Parlement in 1722 to recognize the bull Unigenitus. (See JANSENISM.) After the coronation of Louis XV., February 15, 1723, and the death of Cardinal Dubois in August of the same year, the Duke of Orleans, although disliking public affairs, consented to become Prime Minister, but he held office for only a few months, dying December 2, 1723, a victim of his incessant debauchery. He was succeeded by his son Louis (1703-52), who was followed by his son, Louis Philippe (1725-85).

LOUIS PHILIPPE JOSEPH, fifth Duke of Orleans, known as Egalité, born at Saint-Cloud, April 13, 1747. He was first known as the Duke of Montpensier, and after 1752 as the Duke of Chartres. He became Duke of Orleans after his father's death in 1785. Although possessed of good abilities, the young Duke early fell into a course of debauchery from which he never absolutely emerged. In 1769 he married a rich wife and used the money so acquired to strengthen his popularity with the masses. In 1771 he opposed the Chancellor Maupeou and was exiled from Court for a number of years. He returned in 1774, but failed to find favor with Louis XVI. and the Queen. He commanded the rear of the royal fleet at the naval combat near Ushant in 1778, and made himself popular by advocating the cause of America. His increasing popularity rendered him more and more obnoxious to the Court. In the Assembly of Notables in 1787 he declared against the Ministerial proposals; and when the King sought to overcome the resistance of the Parlement by a *lit de justice*, he protested against the proceeding. On the assembling of the States General, he took the popular side and voted with the extremists in the National Assembly. When the insurrectionary movements began in Paris in 1789 he promoted them by secret agents and money. The Court sent him on an ostensibly diplomatic mission to England, from which he returned after more than six months' absence, in July, 1790, and engaged in new intrigues hostile to the King. He began to find, however, that he was the mere tool of a party who availed themselves of his influence and wealth for their own purposes, and this discovery abated his revolutionary fervor. He withdrew from the Jacobins, was reconciled to the King, and appeared at Court; but was treated with such contempt by the courtiers that he turned once more to the cause of the Revolution. He joined Danton's party, renounced his titles, assumed the name of Philippe Egalité, and was returned to the Convention, in which he took his place with the party of the Mountain. He voted for the death of the King. The Jacobins were dissatisfied with him because he did not give up the whole of his immense wealth, and the baseness of his character alienated all his former supporters. On April 6, 1793, the Convention decreed the arrest of all the members of the Bourbon family, and the estates of the Orleans family were confiscated. Philippe Egalité, with his family, was thrown into prison at Marseilles, and in May was accused of high treason. He was acquitted, but in September was brought before the Revolutionary Tribunal in Paris; and on November 6, 1793, he was condemned, and by his own request was executed the same day. He faced death courageously. His son, the seventh Duke of Orleans, became King of France in 1830. See LOUIS PHILIPPE.

Louis Philippe's eldest son, FERDINAND, Duke of Orleans, was born in Palermo, September 3, 1810. In 1831-32 he served in Belgium, and in 1835-40 in Algeria, and he subsequently took a prominent part in the reorganization of the French army. While on his way from Paris to Neuilly, July 13, 1842, the horses of his carriage became unruly, and in jumping from it he fractured his skull. He was a prince of many amiable qualities, and his death was greatly deplored by the French people. He left two sons, Louis Philippe, Count de Paris (q.v.) and Robert Philippe, Duke de Chartres (q.v.). After the fall of the Empire, the Orleans Princes were permitted to return to France, whence they had been expelled in 1848, and for a time they exercised considerable influence on the politics of the day. They plotted the restoration of the July monarchy, but enjoyed little popularity owing to their close alliance with all the elements of reaction in France. In June, 1886, the Count de Paris, the Duke de Chartres, and the Duke d'Aumale were sent into exile, where the two former continued to plot with Boulanger (q.v.) for the overthrow of the Republic. The son of the Count de Paris, LOUIS PHILIPPE ROBERT, Duke of Orleans (1869—), is the Legitimist pretender to the Crown of France. Becoming

of age in 1890, he went to Paris and there offered himself for the customary military service, but was arrested under the Expulsion Bill of 1886, which prevents the direct heirs of former reigning families from residing in France. After being imprisoned for a few months, he was liberated by President Carnot, and escorted to the Swiss frontier by the French police. He afterwards lived in Brussels for a time. Between the years 1890 and 1895 he traveled in Asia. In 1896 he married an Austrian princess. He had early assumed the ducal title last used by his grandfather. He made a bid for popularity in connection with the Dreyfus affair in 1897 by upholding the army, but gained little by his interference. Until 1900 he resided in England, where he was well treated and received, but in that year he brought himself into great odium by publicly approving disgraceful caricatures of Queen Victoria, published in Paris. The other sons of King Louis Philippe were the Duke of Nemours, the Prince de Joinville, the Duke d'Aumale, and the Duke de Montpensier (qq.v.). In 1852 the Government confiscated a large part of the Orleans estate to the value of 50,000,000 francs.

(ib., 1864-65); Crétineau-Joly, *Histoire de Louis Philippe d'Orléans et de l'Orléanisme* (ib., 1862); Tournois, *Histoire de Louis Philippe Joseph d'Orléans et du parti d'Orléans dans ses rapports avec la révolution française* (ib., 1842-43, 1876); Ducoin, *Philippe d'Orléans Egalité* (ib., 1845-61).

ORLEANS, Charles, Duke of. A French poet. See Charles of Orleans.

ORLEANS, Hélène Louise Elisabeth, Duchess of (1814-58). She was born at Ludwigslust, daughter of the Grand Duke Frederick Louis of Mecklenburg-Schwerin. In 1837 she married the son of Louis Philippe, Prince Ferdinand of Orleans, who died in 1842. After the fall of Louis Philippe (1848) she attempted to seat her elder son, the Count of Paris, upon the throne, but was unsuccessful and had to leave France for England.

ORLEANS, Henri Philippe Marie, Prince d' (1867-1901). A French explorer, born at Ham, near Richmond, England, a son of Robert, Duke de Chartres (q.v.). In 1889-90 he accompanied Gabriel Bonvalot on a journey through Central Asia; two years later he explored Indo-China; and in 1895 discovered the sources of the Irrawaddy, an achievement for which he received the gold medal of the Société de Géographie de Paris and the cross of the Legion of Honor. In 1897 and in 1898 he visited Abyssinia, and in 1901 went to Anam, where he died. Among his writings are: *Une excursion en Indo-Chine* (1892); *Autour du Tonkin* (1894); *A Madagascar* (1895); and *Du Tonkin aux Indes* (1897).

ORLEY, ôr'lī, Bernaert, or Barend van (c.1492-1542). A Flemish painter, born at Brussels, hence also called Barend van Brussel. Probably a pupil of his father, Valentyn van Orley (1466-c.1530), he went to Rome after 1509 and became a successful imitator of Raphael, in whose school he studied. He was Court painter successively to Charles V., to Margaret of Austria, Regent of the Netherlands, and to her successor, Mary of Hungary. Van Orley stands next to Mabuse among the leaders of the tendency to 'Italianize' Flemish art. His coloring is sadly degenerate from the old Flemish masters, cool in general effect, yet gaudy, and although his early works show good composition and elevated sentiment, he afterwards lapsed into the mannered style of the later followers of Raphael. Flemish thought and practice are most observable in his "Pietà," in the Brussels Museum, which also contains the "Trials of Job" (1521), a "Holy Family," and two portraits. His most considerable work is probably the shrine with "The Trinity Worshiped by Saints," in Saint Mary's at Lübeck. Noteworthy, furthermore, are a "Holy Family," in Dresden; "Marriage of the Virgin," in the Louvre; "The Magdalen Reading," in the National Gallery, London; and "Repose in Egypt," in the Royal Institution at Liverpool. The large "Last Judgment," in the Church of Saint James, at Antwerp, is most indicative of his adopted Italian manner. Of his designs for tapestries, the best known are "The Life of Abraham," in Hampton Court, and "Maximilian's Hunt," in the Louvre. The windows with the portraits of Francis I., Charles V., and Mary of Hungary, in the Cathedral at Brussels, were also done from his cartoons. For his biography, consult Wauters (Paris, 1894).

OR'LOFF. The name of a prominent Russian family. Grigori (1734-83) was a grandson of Ivan, founder of the family. He won the love and favor of Catharine II., whom he helped put on the throne. His influence with the Empress, who bore him a son, the first Count Bobrinski, came to an end in 1772. His brother Alexei (1737-1808) also took part in the conspiracy of 1762, and with his own hands strangled Peter III., husband of Catharine II. For his victory over the Turks at Tchesme in 1770 he received the epithet Tchesmenski. He did much for the improvement of Russian horses. Alexei's nephew, named Alexei Fedorovitch (1787-1861), was a natural son of Fedor (1741-1796). He fought bravely in the wars with Napoleon, and in the Turkish campaign; was plenipotentiary at the signature of the Treaty of Adrianople (1829); and, after acting as Minister to Great Britain, negotiated the Peace of Unkiar-Skelessi in 1833. For a long time he was chief of the Russian police. In 1856 he was made prince when he was sent to Paris to represent Russia. His son, Nikolai (1827-85) was minister at Brussels (1860-70) and ambassador at Paris until 1882 and at Berlin. He wrote on the war of 1806 and urged the abolition of corporal punishment.

ORLOP (formerly also *overlope*, from Dutch *overloop*, orlop, a running over, from *over*, over + *loopen*, to run). The deck next below the berth deck in old-fashioned men-of-war. See Deck.

OR'MAZD, or **OR'MUZD** (Pers., from Phl. *Aûharmazd*, OPers. *Auramazda*, Av. *Ahura Mazda*, Lord Wisdom). In the Zoroastrian religion, the Supreme Being. In the Avesta (q.v.) he is repre-

sented as the head of the heavenly host and as sovereign over the realm of good, light, and truth. In the Old Persian Inscriptions, as well as in the Pahlavi texts and the Avesta, he is the creator of all that is good in the world. Ormazd is the guardian of mankind; he is a giver of rewards; but he may mete out punishment as well. His throne is in the heavens, in the realm of eternal light, where his presence is manifested by splendor and glory. This is the sense in which we must understand the Avesta when it alludes to Ahura Mazda's 'form.' Auramazda is represented on the sculptured rocks of Behistun as a crowned and bearded figure in a winged circle above the head of King Darius, a conception borrowed from Assyro-Babylonian art. In the Sassanian bas-reliefs, Ormazd is portrayed on horseback presenting the Imperial crown to Ardashir.

The spiritual side of Ahura Mazda is constantly dwelt upon in the Avesta. He creates through his 'Holy Spirit,' which is a 'spirit of intelligence' as contrasted with the ignorance and lack of prescience on the part of Ahriman (q.v.). In the philosophic development of Zoroastrianism this spiritual essence of Ahura Mazda is often conceived to be an emanation separate and apart from the divinity, acting in opposition to the Evil Spirit, Angra Mainyu, and yet of the same substance as Ormazd. From this transcendental Zoroastrian view it is possible to understand how the different Iranian sects early began to tend toward monotheism as opposed to the earlier dualism which made Ahriman self-existent, and coeval, though not coeternal, with Ormazd. This unifying tendency sometimes postulated Boundless Time, or Eternity, as the source alike of Ormazd and Ahriman; sometimes it is presupposed that the Holy Spirit and the Evil Spirit were the children of Ormazd, the wicked principle being due to a moment of doubt on the part of the great god. But in all cases Ormazd rises supreme as the acknowledged head and sovereign of the heavenly kingdom. Ahura Mazda is attended by a band of six (or seven) archangels, 'Immortal Holy Ones,' and also by a score or more of angels and a host of minor spirits.

In viewing the Zoroastrian conception of Ormazd we must also allow the existence of a few reminiscences of naturalistic ideas, a tinge here and there of the sky god warring against the serpent demon of the heavens. But these survivals are very slight. The same is true of the occasional Varuna of the Vedas, as an old Aryan conception of God. Ormazd as a deity stands far above both Hindu and Babylonian ideals, and approaches the Judæo-Christian conception of Jehovah.

ORME, ôrm, Philibert de l'. See De l'Orme, Philibert.

ORME, Robert (1728-1801). An Anglo-Indian historian. The son of Dr. Alexander Orme, physician and surgeon of the British army in Bombay, he was born at Anjengo, Travancore, India. He was educated at Harrow, England, and went back to India in 1742 as a writer in the employ of the East India Company. In 1752 he went to England in company with Captain Clive, afterwards Lord Clive, Baron of Plassey, his friend for many years. He returned again to India, and in 1754 became fourth member of the council at Fort Saint George, and rose to be a commissary and accountant-general (1757-58). He was influential in establishing the power of Great Britain in India, and active in the interest of his friend Clive, whom he succeeded in having appointed as military commander of that country. He returned to England finally in 1759, and became historiographer to the East India Company, retiring to Ealing in 1792, where he died on January 13, 1801. His works include *A History of the Military Transactions of the British Nation in Indostan* (5th ed., London, 1799); and *A General Idea of the Government and People of Indostan* (ib., 1811). Consult biographical memoir attached to his *Historical Fragments of the Mogul Empire* (2d ed., London, 1782).

OR'MEROD, Eleanor A. (1828-1901). An English naturalist and entomologist. She was born at Sedbury Park, Gloucestershire, and early devoted herself to the study of injurious insects. She was the first woman to receive a fellowship in the Meteorological Society (1878). The Royal Horticultural Society awarded her the Silver Floral Medal for her services to the science of economic entomology; and from Edinburgh University in 1900 she received the degree of LL.D. Her publications include: *Cobham Journals* (1879); *Manual of Injurious Insects* (1881); *Guide to Insect Life* (1884); and *Annual Reports of Observations on Injurious Farm Insects* (1877 et seq.).

ORMOC, ôr-môk'. A town of Leyte, Philippines, situated on the Bay of Ormoc, on the west coast of the island. It is surrounded by stone breastworks and three ruined forts, and is an important hemp port. Population, 8107.

OR'MOLU (Fr. *or moulu*, ground gold, from *or*, from Lat. *aurum*, gold, and *moulu*, p.p. of *moudre*, from Lat. *molere*, to grind). A gilded bronze, or fine brass, sometimes colored or lacquered, to give it additional brilliancy. It was used, especially during the Gothic and Renaissance periods, for mounting on furniture. It is also used for candelabra and other fine metal work.

ORMONDE, ôr'mond, James Butler, twelfth Earl and first Duke of (1610-1688). A British soldier and statesman, the first of the ancient Anglo-Irish family of Butler on whom the ducal title was conferred. He was born in London. On his father's death he became Viscount Thurles, and heir to the title. His grandfather, Walter, Earl of Ormonde, having displeased James I. and having been imprisoned, the young heir was seized as a royal ward, and placed under the guardianship of the Archbishop of Canterbury. In his twentieth year he married his cousin, Lady Elizabeth Preston, and in 1632 succeeded to the earldom and estates of Ormonde. On Strafford's recommendation Ormonde was appointed to the chief command of the army in Ireland in 1640, just before the outbreak of the great rebellion there. He repeatedly defeated

the insurgents. When, in 1643, he concluded an armistice, his policy was loudly condemned as well by the friends as by the enemies of the Royalist Party in England. During the long contest of Charles with the Parliament, Ormonde continued to uphold the royal interest in his Irish government. When the last crisis of the King's fortunes came, he resigned his Irish command, and retired to France, from which country he again returned to Ireland, with the all but desperate design of restoring the royal authority. After a gallant but unequal struggle, he was compelled, in 1650, to return once more to France. His services to the royal cause continued unremitting during his exile; and at the Restoration he accompanied Charles II. on his return, and was rewarded for his fidelity by the ducal title of Ormonde. His after life was less eventful, although he twice again returned to the government of Ireland. In 1670 occurred the well-known attempt by the notorious Colonel Blood (q.v.) upon the life of Ormonde. He escaped uninjured, and lived until the year 1688. His letters and papers were published under the title, *Original Letters and Papers Concerning the Affairs of England, 1641-60* (London, 1739). Consult Carte, *Life of the Duke of Ormonde* (last ed., Oxford, 1851).

ORMS'BY, JOHN (1829-95). An English author and traveler. He belonged to an English family that settled in Ireland in the reign of Queen Elizabeth, and he was born at the family-seat, Gortner Abbey, in the county of Mayo. After graduating B.A. from Trinity College, Dublin, he went to London, where he studied law at the Middle Temple, but he soon drifted into literature. To *Fraser's Magazine* and other periodicals he contributed many sketches of travel, some of which were collected under the title of *Autumn Rambles in North Africa* (1864) and *Stray Papers* (1876). Becoming interested in Spain and Spanish literature, he translated the *Cid* (1879) and *Don Quixote* (1885), both admirably. Consult the biographical sketch by Leslie Stephen in the *Alpine Journal* (London, 1896).

OR'MULUM, THE. An English poem written about 1200, by Orm or Ormin (a Danish word meaning 'worm'). Of the author nothing is directly known. He was probably of a Danish family dwelling in the northeastern part of the old Kingdom of Mercia, and he may have been an Augustinian monk. The poem, 'named Ormulum for that Orm it wrought,' is composed of a series of homilies (based on Ælfric, Bede, Gregory I., and Isidore), extending from the Annunciation into the Acts of the Apostles. It exists in only one manuscript (Bodleian Library), believed to be the author's own copy. The manuscript, containing more than 20,000 half lines, is, however, only a fragment, about one-eighth of the entire work as written by Orm. The poem has great linguistic value as a representative of the English a little more than a century after the Norman Conquest. Orm wrote his poem in the regular septenarius, an iambic line, divided into two sections of eight and seven syllables. A marked peculiarity of the orthography is the doubling of consonants for indicating short vowels and for other phonetic reasons. Consult the *Ormulum*, ed. by Holt (Oxford, 1878); and the bibliography of critical works on the poem in Körting's *Grundriss der Geschichte der englischen Litteratur* (Münster, 1899).

ORMUZ, ôr'mŭz, **ORMUS,** or **HORMUZ.** A small island in the entrance to the Persian Gulf, near the coast of Persia (Map: Persia, F 7). It contains the ruins of a city which in the thirteenth century was transferred hither from the mainland. It had long been the headquarters of the Persian trade with India, had a population of 40,000, and remained an important commercial centre after it was captured by the Portuguese in 1515. They retained it until 1622, when it was taken by the English and given to Shah Abbas of Persia, who destroyed the city and transferred its trade to the port of Bender Abbas on the mainland. The island still yields salt and sulphur.

ORMUZD. See OHRMAZD.

ORNAMENT (OF., Fr. *ornement*, from Lat. *ornamentum*, adornment, from *ornare*, to adorn, equip). In general, any adornment executed not for its own sake, but for that of the object or structure to which it is applied; in a narrower sense, any motive or element in a decorative scheme or pattern. Ornament has always been an important department of architectural design, because, however possible it may be theoretically to impart to buildings, by mere excellence of composition and proportion, that beauty without which they are merely works of engineering, in actual fact the arts of architecture and of industrial design have always depended chiefly for the beauty of their products upon the judicious use of ornament, and the various historic styles are most readily distinguished by the character of their ornament. Ornament has, in turn, in its historic developments followed the lead of architecture, and its styles are as clearly marked; for the decorator, however free in theory to design according to an unfettered fancy, has in all ages been dominated by the limitations of tradition, inheritance, custom, and circumstance, which have constrained him into habitual and established ways of designing.

Ornament is classified according to various categories. That which belongs to immovable structures is called *architectural* ornament; the ornament of movable structures (furniture) and objects is *industrial*. Ornament whose form is determined by structural features, or which is an inherent part of the structural framework, is called *structural* ornament; such are capitals and bases, moldings and cornices, finials and corbels. That which is added to a structure or object which has already received definite form is called *applied ornament*; such are all inlays, mosaic, painted ornament, and plaster-work. Ornament produced by relief or depression is called *plastic* or *glyptic* ornament, and includes all carved, engraved, chased, and molded ornament; while ornament by color, whether of mosaic, inlay, painting, enamel, or stained glass, is *chromatic* ornament. When the forms of ornament are purely geometric or fanciful, they are said to be *conventional*, as in Moorish and Saracenic decoration; when copied more or less closely from animal or vegetable forms, they are *naturalistic*; when natural forms are subjected to a decorative regularization, they constitute *conventionalized natural* ornament; such are the acanthus-leaves of the Corinthian capital and the foliage of early Gothic carving. *Grotesques* are deco-

rative combinations of heterogeneous natural forms, as in griffins, sphinxes, Gothic gargoyles, and the like.

Apparently all primitive and savage ornament and most ancient Oriental ornament was originally magical or fetishistic (see FETISHISM), and the artificial symbolism of classic and modern ornament is a survival of this primitive magical significance. Conventional ornament has arisen partly from the gradual 'decay' of originally symbolic forms, partly from the manipulations of pottery, basketry, weaving, and metal work. Structural ornament, which the Greeks were the first to develop into importance, has always derived many of its forms from obsolete structural processes—as the triglyph and dentil from obsolete systems of wooden construction. Structural ornament was carried to the highest perfection by the mediæval church-builders, who developed an entirely new system of decorative structural forms in working out the problem of a three-aisled vaulted structure of stone (see GOTHIC ARCHITECTURE); clustered shafts, capitals, vaulting-ribs, pinnacles, tracery, etc., were at once structural necessities and decorative embellishments; and all the minor details grew up as the result of this structural development. The Roman system, revived in the Renaissance and almost universally followed to-day, was to erect a structure of coarse materials and then clothe it in a decorative garment of marble incrustation, stucco, and applied ornament; and the Byzantines and the Mohammedan nations developed the use of applied color, by means of mosaic, stucco, tiles, etc., in different directions to a wonderful pitch of splendor. Ornament has in different lands and periods received notable developments outside of architecture, as in the textile arts, in pottery, china, and porcelain; in goldsmith's work and enamel; in furniture, in manuscript illumination, typography, and bookbinding. The Western nations have excelled, as a rule, in form; the Eastern nations in color. Chinese and Japanese art has never been surpassed in its handling of color ornament in porcelains and earthenwares, and it also excels in minute carvings in ivory and castings in bronze.

ORNAMENTS RUBRIC, THE. A rubric in the English Prayer-Book on the interpretation of which much of the ritual controversy has turned. It precedes the Order for Morning Prayer, and runs as follows: "And here it is to be noted that such ornaments of the Church and of the ministers thereof, at all times of their ministration, shall be retained and be in use as were in this Church of England, by the authority of Parliament, in the second year of the reign of King Edward the Sixth." By 'ornaments' are understood, according to an official decision of the Judicial Committee of the Privy Council, 'all articles used in divine service.' The rubric is simply a more emphatic form of that inserted in 1559 and again in 1604. It was deliberately retained in 1661, in spite of the opposition of the Puritans, and has held its present place since the final revision in 1662. Its interpretation rests upon the question whether it refers to the status of things under the first Prayer Book of Edward or to that immediately anterior to its issue, in the partially reformed services of 1548. The traditional view refers the words of the rubric to the first Prayer-Book. But this was not actually in use by authority of Parliament until the third year of Edward's reign. On the other hand, the wording, on the face of it, points to a certain year—the year before the introduction of the Prayer-Book. The difficulty of deciding between these views is increased by a clause in the Elizabethan Act of Uniformity. This provided for the retention of the ornaments "until other order be taken by the authority of the Queen's majesty with the advice of the Ecclesiastical Commissioners or of the Metropolitan of this realm," and the question arises whether further order was formally taken or not. There appears to have been little or no effort to enforce the observance of the rubric in Elizabeth's day. The times were troublous, and in some influential quarters there was no intention of using the ornaments. If 'other order' was taken it may have been through the 'Advertisements' (see ADVERTISEMENTS OF ELIZABETH) in 1566. But whether these could override the Elizabethan act or not is a very intricate historical point. Consult Parker, *The Ornaments Rubric* (Oxford, 1881); and see RITUALISM.

ORNE, ôrn. A department of France, formed of part of Normandy and bounded on the north by the Department of Calvados (Map: France, F 3). Area, 2372 square miles, more than one-half of which is cultivated land. A range of wooded hills, attaining a maximum altitude of 1370 feet, extends across the south of the department from east to west. North of this range the surface slopes toward the English Channel. The principal river is the Orne, which gives its name to the department. The climate is damp, though in general temperate. The soil is fertile, but agriculture is not in an advanced state; the chief crops are wheat, oats, and barley. There are several millions of apple and pear trees in the department, and cider is extensively made. Cattle, and horses of the purest Norman breed, are reared. Marble, granite, and other stones for building are quarried; and there are manufactures of textiles and pins. Capital, Alençon. Population, in 1896, 339,162; in 1901, 325,441.

ORNITHODELPHIA (Neo-Lat., from Gk. *ὄρνις, ornis*, bird + *δελφύς, delphys*, womb). A subclass of the Mammalia, the Prototheria (q.v.), distinguished by the bird-like arrangement of the reproductive organs. Compare DIDELPHIA; MONODELPHIA.

ORNITHOLOGISTS' UNION, AMERICAN. A society founded in New York in 1883, and incorporated under the laws of the District of Columbia in 1888, for the advancement of its members in ornithological science and for the publication of a journal of ornithology and other works relating to that science. The Union publishes *The Auk*, a quarterly journal of ornithology, the *American Ornithologists' Union Check-List of North American Birds*, and the *Code of Nomen-*

clature. The *Check-List* is a standard, and many of the principles of nomenclature adopted by the Union in 1885 are now used in other branches of zoological science. The membership of the Union consists of fellows, honorary fellows, corresponding fellows, members, associates, and patrons.

ORNITHOL'OGY (from Gk. ὄρνις, *ornis*, bird + λογία, *logia*, account, from λέγειν, *legein*, to say). The science of bird study. The word was first used, so far as is known, in 1670, in Blount's *Glossographia*, where it is mentioned as the title of a late book. The Hebrew scriptures (Jer. viii. 7, and Song of Solomon ii. 12) show that the Hebrew sages had noted the phenomena of the spring migration, and we are told that Solomon "spake also of beasts, and of fowl, and of creeping things, and of fishes." But hundreds of years before Solomon, Egyptian artists were noting birds and drawing and coloring their portraits so well that we may recognize species.

In the writings of Aristotle we find mention of about 170 species of bird, but only about four-fifths can be identified. Pliny the Elder devoted one volume of his writings to birds, much of the information in which was evidently taken from Aristotle, but after him down to the latter part of the seventeenth century there is hardly a work on birds that is anything more than an entertaining compilation of absurdities. The *Historia Animalium* of Gesner, published at Zurich (1551-58), and the *Historia Naturalium* of Aldrovandi, published at Bologna after his death in 1605, are characteristic of the superstitions and utterly unscientific trash which passed for natural history in those days. In 1676 there appeared in Latin Ray and Willughby's *Ornithologia*, and two years later an English revised edition. This book was really a foundation for modern ornithology. It divided birds into the two groups land-birds and water-birds, and the latter group was again divided into swimmers and those which frequent watery places. For 200 years these divisions were made use of by ornithologists, and it is only within very recent years that they have been discarded. In 1735 appeared the first edition of Linnæus's epoch-making work *Systema Naturæ*, in which chaos was reduced to order and the binomial system of nomenclature was propounded and used. The twelfth edition (1766) is the basis of modern systematic zoölogy. Linnæus followed quite closely the general classification of Ray. Following Linnæus are a long list of ornithologists, one of whom was M. J. Brisson, whose six-volume *Ornithologia* was one of the best works on birds published during the eighteenth century. As a descriptive ornithologist he is ranked among the best. Another Frenchman of note was Buffon, whose nine-volume *Histoire naturelle des oiseaux* is an extraordinary piece of work, especially when considered from a literary point of view. Then there is Latham, whose *General Synopsis of Birds* was completed in 1785, but afterwards appeared in several revised editions. The compilation by Gmelin in 1788 of a thirteenth edition of Linnæus's *Systema* was most important, but the rarity of the original has caused some confusion as to what is Linnæus's and what Gmelin's work. The next writer of importance is Cuvier, whose *Règne animal* of 1817 revolutionized zoölogical classification. Cuvier made use almost exclusively of external characters, particularly of the bill and feet. He grouped birds in six orders—Accipitres, Passeres, Scansores, Gallinæ, Grallatores, Natatores. This classification has been the foundation of the classification of birds adopted in natural histories, and even in many zoölogies, down to the present day. The advantages of this classification are clear, for the number of orders is small and they are based on obvious external differences. In addition to this, Cuvier's great reputation as a zoölogist gave weight to his views, and consequently the Cuvierian system has continued almost unbroken, the only very radical change being the recognition of the differences between the Carinatæ and Ratitæ, and the separation of the latter from the Grallatores.

With the opening of the nineteenth century there came a great increase in the number of bird students and the publication of ornithological literature. American ornithology has been wholly a growth of the past century. In England the publication of Gilbert White's *Natural History of Selborne* in 1789 did more to stimulate popular interest in ornithology than any other book ever has done. It has passed through more editions, by far, than any other work on natural history. Bewick's *History of British Birds* first appeared in two volumes, in 1797 and 1804. The next works of note are the magnificent monographs by John Gould (q.v.)—*Birds of Europe* (5 vols., 1832-37); *Rhamphastidæ* (1834); *Trogonidæ* (1838); *Birds of Australia* (7 vols., 1848); *Trochilidæ* (5 vols., 1849-61); *Odontophorinæ* (1850); *Birds of Asia* (7 vols., 1850-53); and *Birds of New Guinea* (1875-81). We mention all of these because of their wealth of illustration, which consists of more than 3000 colored plates. The works of Illiger, Vieillot, and Temminck appeared between 1810 and 1820, and all three were important leaders in the systematic zoölogy of their day. The works of C. L. Nitzsch deserve special mention because of his being the founder of the study of pterylosis (q.v.) by his *System der Pterylographie*.

Turning now to America, the first ornithologist of any reputation was William Bartram, who published in 1791 his *Travels Through North and South Carolina*, which has been called 'the starting point of American ornithology.' In 1808 appeared the first volume of Alexander Wilson's *American Ornithology*, the last two volumes of which were published in 1814 by Ord, Wilson's friend and editor. Wilson was one of our most remarkable ornithologists, and his great work contains an account of about 280 species of birds, which were not only faithfully described, but carefully figured in colors. Several editions of this classic have been published. After Wilson's death, his work was continued by Charles Lucien Bonaparte, who published in the years 1825-33 his four large volumes, uniform with Wilson's *Ornithology*. In 1831 appeared the bird volume of Richardson and Swainson's *Fauna Boreali-Americana*, a book of the greatest importance. The *Manual of Ornithology of the United States and Canada*, by Thomas Nuttall, appeared in 1832-34, and is a well-written and interesting treatise. The Audubon period followed, in which appeared that most magnificent of bird-books, the original folio edition of Audubon's *Birds of America*. Altogether there were 435 plates with more than 1000 figures. The text to accompany

this set of plates consisted of five volumes called *Ornithological Biography*, and is intensely interesting reading. These were not by any means the only books which Audubon (q.v.) wrote, but it is on these that his fame rests most securely. There can be no question, however, that much of Audubon's success was due to his keen Scotch friend William MacGillivray, who was an adept at avian anatomy.

The Audubonian period may be said to have passed into the Bairdian in the fifties; especially on the publication in 1858 of Vol. ix. of the Pacific Railroad Reports, devoted to the birds secured by the various parties making surveys for the proposed transcontinental railroad. In this volume Spencer F. Baird came to the front as an ornithologist, for although he was materially assisted by Cassin and Lawrence, the work was primarily his. It has well been said that this book "effected a revolution in classification and nomenclature," for the names used both for groups and species were a radical departure from those current in the Audubonian period. Baird was the leading American ornithologist of the third quarter of the nineteenth century, and his influence remains strong.

Since 1870 ornithology has progressed marvelously, and among those who advanced it Elliott Coues may be placed foremost because he first made really accessible to American students a knowledge of the bird fauna of their own country. Adding to his very extensive acquaintance with birds a wide knowledge of ornithological literature and history, and a charming literary style, he made his *Key to North American Birds* highly influential, and, at the period of its first publication (Boston, 1872), an indispensable guide to every bird-student. Revised editions were issued successively in 1884, 1887, 1890, and 1903. Dr. Coues was the author of numerous other books and papers, of which *Birds of the Northwest* (1874), and *Birds of the Colorado Valley*, part i. (1878), were most important. The critical bibliography begun in the later work and continued elsewhere constitutes a history of the development of American ornithology.

The names of Robert Ridgway and J. A. Allen belong, with that of Coues, in the front rank of American ornithologists of their period. The former spent his life in the service of the Smithsonian Institution, and was co-author with S. F. Baird and T. M. Brewer in the important *History of North American Birds*, of which the first three volumes (land birds) were issued in Boston in 1874, and the last two (water birds) in 1884. Besides many technical and faunal papers, he published a *Manual of North American Birds* (Philadelphia, 1887), which embodied the ideas and classification that prevailed at the National Museum. A second edition soon followed. In 1901 appeared the first part (Fringillidæ) of a most comprehensive treatise entitled *The Birds of North and Middle America*, written by Ridgway and published by the Smithsonian Institution as *Bulletin No. 50* of the United States National Museum. This work is purely technical, containing no account of the habits of the birds, but as a guide to American ornithology it is the most advanced and complete treatise of its time. The second part appeared in 1902 and others followed at intervals.

Dr. J. A. Allen (q.v.) contributed greatly to the philosophy of ornithology, and as editor of *The Auk* for many years exerted a constant and critical scientific influence. The latter part of his life was spent as curator of the department of birds in the American Museum of Natural History at New York, where his assistant was Frank M. Chapman, whose numerous books, especially his practical *Handbook*, vastly stimulated the growth of the popular interest and knowledge of birds which was so striking a feature of the intellectual development of the country toward the close of the nineteenth century. Since 1883 the controlling factor in the progress of the science of ornithology in America has been the American Ornithologists' Union (q.v.).

Cuvier's scheme of classification held its ground in popular books, with very little change, during the entire century. Since 1860, however, ornithologists have recognized that, however 'convenient' Cuvier's system may be, it is woefully unnatural, and many and varied have been the attempts to produce a 'natural' classification. Of these we can only mention the most important. In 1867 Huxley published his celebrated *Classification of Birds*, based very largely upon skeletal characters, especially those connected with the skull. His classification may be briefly summarized as follows:

Division A. Metacarpals not ankylosed together; tail longer than body; order SAURURÆ.

Division B. Metacarpals ankylosed; tail considerably shorter than body:

(*a*) Sternum devoid of a keel; order RATITÆ.

(*b*) Sternum provided with a keel; order CARINATÆ.

Order SAURURÆ. Archæopteryx only.

Order RATITÆ:

(*A*) Humerus short; 1 ungual phalanx.

(*a*) With a hallux, kiwis (Apteryx).

(*b*) No hallux; moas, cassowaries.

(*B*) Humerus long; 2 ungual phalanges.

(*a*) Ischia united beneath sacrum; pubes free; rheas.

(*b*) Ischia free; pubes united ventrally; ostriches.

Order CARINATÆ:

(*A*) Vomer broad behind and interposing between the pterygoids, the palatines, and the basi-sphenoidal rostrum; *Dromæognatha* (tinamous).

(*B*) Vomer narrow behind; pterygoids and palatines articulating largely with basi-sphenoidal rostrum.

(*a*) Maxillopalatines free.

(1) Vomer pointed in front; *Schizognatha*. (Plovers, shore-birds, gulls, penguins, cranes, hemipodes, fowls, sand-grouse, pigeons, hoactzin.)

(2) Vomer truncated in front; *Egithognatha*. (Passerines, swifts, woodpeckers.)

(*b*) Maxillopalatines united; *Desmognatha*. (Birds of prey, parrots, cuckoos, kingfishers, trogons, ducks, geese, flamingoes, storks, cormorants.)

This classification was the first important contribution to ornithology after the publication of the *Origin of Species*, and it is really the basis of later systems. The work of Garrod and Forbes on avian anatomy led to many changes in the relative position of certain birds and

groups [illegible] increased immensely our store of facts, [illegible] the systems which they proposed have never met with any general acceptance. Sclater's system, proposed in 1880, included some 26 orders, and has for that reason alone failed to meet any wide acceptance. The same criticism applies to his successors, and the complexity of the systems proposed by Reichenow, Stejneger, Fürbringer, Sharpe, and Gadow has militated against their general use. Indeed, it is a rather notable fact that no system that has yet been proposed has proved satisfactory. A very full history of the taxonomy of ornithology may be read in the 'Introduction' of Newton's *Dictionary of Birds* (New York, 1896).

The very latest scheme of arrangement having the sanction of authority is that adopted by Evans and the editors of the *Cambridge Natural History* in vol. ix. of that work, "Birds" (London, 1901). It divides all birds, fossil and recent, into sub-class I., Archæornithes (Archæopteryx alone) and sub-class II., Neornithes (all the remainder). The Neornithes are divided into – A, *Ratitæ*, birds with a keelless sternum; B, *Odontolcæ*, ratite birds, with teeth in the mandibles, set in grooves; and C, *Carinatæ*, birds with keeled sternums. This last sub-class is considered divisible into 14 groups, as follows: Ichthyornithes (Ichthyornis); Colymbiformes (loons and grebes); Sphenisciformes (penguins); Procellariiformes (petrels); Ciconiiformes (cormorants, etc., pelicans, herons, ibises, flamingoes); Anseriformes (ducks, geese, swans); Falconiformes (falcons, vultures); Tinamiformes (tinamous); Galliformes (game-birds, fowls, pheasants, hoactzin); Gruiformes (rails, cranes, bustards, sun bitterns, etc.); Charadriiformes (shore-birds, coursers, thick-knees, gulls, auks, sand-grouse, pigeons); Cuculiformes (cuckoos, parrots); Coraciiformes (rollers, motmots, kingfishers, hornbills, hoopoes, owls, nightjars, swifts, humming-birds, trogons, orioles, puff-birds, toucans, woodpeckers, and related forms); Passeriformes (passerine birds). The last immensely numerous group (see Passeres) is subdivided by Evans as follows:

Passeres Anisomyodæ.
- Subclamatores (Eurylæmidæ).
- Clamatores (pittas, tyrant fly-catchers, cotingas, tree-creepers, etc.).

Passeres Diacromyodæ.
- Suboscines (lyre-bird, Atrichornis).
- Oscines (singing birds generally, from larks up to finches).

The classification of birds, as of other groups of animals, adopted for the purposes of this Encyclopædia (see Classification of Animals), is that given in Parker & Haswell's *Text Book of Zoölogy* (London and New York, 1897), and is in outline as follows:

Class Aves.

Sub-class I. Archæornithes.

Extinct, long-tailed, toothed birds. Includes only Archæopteryx (q.v.).

Sub-class II. Neornithes.

Birds in which the greatly shortened tail usually ends in a pygostyle (see Neornithes); metacarpals fused with distal carpals.

Division A. Ratitæ.—Sternum without a keel; flightless birds.

Order 1. Megistanes (emeus, cassowaries, kiwis, and moas).

Order 2. Rheæ (Rheas).

Order 3. Struthiones (Ostriches).

Order 4. Æpyornithes (Æpyornis; extinct).

Order 5. Gastornithes (Gastornis and allied Eocene genera).

Division B. Carinatæ.—Sternum with a keel; flying birds.

Order 1. Stereornithes (Phororhacos and allied Eocene genera).

Order 2. Odontolcæ (Hesperornis and allied Cretaceous genera).

Order 3. Ichthyornithes (Ichthyornis, Apatornis and allies of the Eocene).

Order 4. Pygopodes (loons and grebes).

Order 5. Impennes (penguins).

Order 6. Tubinares (petrels, albatrosses, etc.).

Order 7. Steganopodes (cormorants, frigate-birds, pelicans, etc.).

Order 8. Herodiones (herons, ibises, etc.).

Order 9. Anseres (ducks, swans, screamers).

Order 10. Accipitres (vultures, falcons, secretary bird).

Order 11. Crypturi (tinamous).

Order 12. Gallinæ (fowls, game-birds, curassows, pheasants, and hoactzin).

Order 13. Grallæ (rails, cranes, bustards, etc.).

Order 14. Gaviæ (gulls, terns, and auks).

Order 15. Limicolæ (shore-birds, curlews, jaçanas, etc.).

Order 16. Pterocletes (sand-grouse).

Order 17. Columbæ (pigeons, dodo, etc.).

Order 18. Psittaci (parrots, cockatoos, etc.).

Order 19. Striges (owls).

Order 20. Picariæ (cuckoos, rollers, kingfishers, bee-eaters, hoopoes, nightjars, swifts, humming-birds, woodpeckers, hornbills, and allies).

Order 21. Passeres (lyre-birds and song-birds generally).

See Bird, and bibliography there given.

OR'NITHOPH'ILOUS PLANTS (from Gk. *ὄρνις*, *ornis*, bird + *φίλος*, *philos*, loving). Plants pollinated by means of birds, especially humming-birds. In Africa and some other parts of the world many species are so pollinated, but in most regions only a small number are fertilized in this way. The term is being replaced by bird-pollinated. See Pollination.

ORNITHOPODA. See Dinosauria.

ORNITHORHYNCHUS, ORNITHORHYNCHIDÆ. See Duckbill.

OR'NITHOSAU'RIA (Neo-Lat. nom. pl., from Gk. *ὄρνις*, *ornis*, bird + *σαῦρος*, *sauros*, lizard), or Pterosauria. An order of extinct flying lizards in which the bones are hollow, the fore limbs admirably developed as wings, and the head more or less bird-like in form. They appeared in Jurassic time and continued to the end of the Cretaceous. Among the members of the group are the greatest flying creatures known to have ever lived. The genera are Dimorphodon, Ornitho-stoma, Pteranodon, and Rhamphorhynchus. The principal types of this order are described in the article on Pterodactyl.

OR'NITHOS'TOMA (Neo-Lat., from Gk. *ὄρνις*, *ornis*, bird + *στόμα*, *stoma*, mouth). The greatest known flying creature that has ever lived, a winged reptile, found in the Cretaceous rocks of Kansas.

OR'OBUS (Neo-Lat., from Gk. *ὄροβος*, *orobos*, Lat. *ervum*, OHG. *araweiz*, *arwiz*, Ger. *Erbse*, vetch). A name formerly applied to a genus of plants of

the natural order Leguminosæ, allied to vetches, and sometimes called bitter vetch, but now merged with Lathyrus (q.v.). The species are perennial, chiefly natives of Europe. They afford good food for cattle. *Lathyrus montanus*, a European species, with racemes of purple flowers, is especially common in hilly districts. The stem is unbranched, erect, about a foot high, with narrow membranous wings, the root swelling out at irregular intervals into sweet liquorice-flavored tubers, which are boiled or roasted in Holland, Belgium, Scotland, and other countries.

OROCHONES, ō'rō-chō'nēz. A people of the eastern Amur in Asia, of the Tungus type. The term Orochon is said to be applied by the Manchus to the Tunguses in general.

OR'ODUS (Neo-Lat., from Gk. ὄρος, *oros*, mountain + ὀδούς, *odous*, tooth). Fossil shark teeth of Carboniferous age.

OR'OHIP'PUS (Neo-Lat., from Gk. ὄρος, *oros*, mountain + ἵππος, *hippos*, horse). An ancestor of the horse in the Middle Eocene period. See HORSE, FOSSIL.

O'ROIDE, or **O'REIDE** (from Fr. *or*, from Lat. *aurum*, gold + Gk. εἶδος, *eidos*, form). A variety of brass originally invented in France as a substitute for ormolu, and resembling gold. The substances used in making it are: Copper, 100 parts; tin or zinc, 17 parts; magnesia, 6 parts; ammonium chloride, 3.6 parts; lime, 1.8 parts; and crude argol, 9 parts. The copper is melted, then the magnesia, ammonium chloride, lime, and argol are added, little by little, and briskly stirred for about half an hour. The tin or zinc is added lastly in small quantities at a time until all is fused. The crucible is then covered and fusion is maintained for half an hour, when the dross is skimmed off, and after cooling the alloy is ready for use. Oroide has a fine grain, is malleable, and is capable of being brilliantly polished. It finds extensive use as a substitute for gold in the manufacture of cheap jewelry.

OROMA, ō-rō'mä. An African people. See GALLAS.

O'RONO. A town in Penobscot County, Maine, 8 miles northeast of Bangor, on the Penobscot River, and on the Maine Central Railroad (Map: Maine, F 6). It is the seat of the University of Maine (q.v.) and State Experiment Station, and has manufactures of lumber, pulp, and paper. Settled in 1774, Orono was incorporated first in 1806. The government is administered by town meetings. Population, in 1890, 2790; in 1900, 3257.

ORONTES, ō-rōn'tēz (Lat., from Gk. Ὀρόντης). The ancient name of a river in Syria, now called Nahr-el-Asi. It rises in the Lebanon Mountains and flows northward as far as the city of Antioch, and then westward to the Mediterranean Sea (Map: Turkey in Asia, F 4). Its length is about 250 miles. Its lower course is remarkably beautiful, with high rocky banks crowned with luxuriant foliage. Near its source stands an ancient monument.

ORONTIUS FINEUS, ō-rōn'-shi-ŭs fī-nē'ŭs (1494-1555). A French mathematician (named Oronce Fine, or Finé), born at Briançon. He was called the 'restorer of mathematical science' in France. A chair of mathematics was created for him in 1532 at the Collège de France. Here he wrote his most famous work, entitled *Protomathesis* (1532), consisting of four books on arithmetic, two on geometry, five on cosmography, and four on gnomonics.

OROOMIAH, ō'rōō-mē'ä. A town and lake in Persia. See URUMIAH.

O'ROONO'KO, OR THE ROYAL SLAVE, THE HISTORY OF. A novel by Mrs. Aphra Behn, about 1660. The hero was an African prince, a slave in Surinam, where the author knew him in her childhood. He was sold because of his marriage to Imoinda, a favorite of the King, but found her again a slave in the same colony. Oroonoko led an unsuccessful rising of the blacks, killed his wife, and was barbarously murdered by the colonists. A tragedy by Thomas Southerne, based on this novel, was performed in 1696.

ORO'PUS (Lat., from Gk. Ὠρωπός, *Ōrōpos*). A town in Northwestern Attica, on the border of Bœotia, celebrated for its temple and oracle of Amphiaraus. Its situation led to constant strife between the Thebans and the Athenians for its possession. The former held it B.C. 412-383 and 366-338. Subsequently the town seems to have been for a long time independent or reckoned in the Bœotian confederation. It had been restored to the Athenians before the second century A.D., for the traveler Pausanias includes it in Attica. The town lay on the seacoast in a little plain, but the temple of Amphiaraus was about four miles inland, in one of the beautiful wooded valleys which abound in this region, on a terrace above a little stream. It was excavated by the Greek Archæological Society in 1884-87. It contained a temple and altar, a colonnade, and small theatre, and we hear also of baths for men and women, and other buildings for the sick, who came to consult the god, but of these no certain remains have been found. Many inscriptions show the popularity of the place and throw light on the organization and ritual. It was a resort of the sick, for Amphiaraus was a god of healing, and, like Æsculapius, prescribed for his worshipers through dreams. He was also a seer and might be consulted on other affairs. The inquirer, after paying a fee and offering sacrifice, slept in the temple, and his dreams contained the answer to his question. The fame of the shrine was such that Sulla granted the dwellers on the territory of the god exemption from taxation, and his action was later (B.C. 73) confirmed by the Senate after a hearing by the consuls. See Preller, "Ueber Oropos und das Amphiareion," in *Berichte der sächsischen Gesellschaft der Wissenschaften* (Leipzig, 1852); Frazer, *Pausanias*, vol. ii. (London, 1898); Dürrbach, *De Oropo et Amphiarai Sacro* (Paris, 1890). The excavations are described and the inscriptions published in the *Praktika* of the Greek Archæological Society for 1884, 1887, 1890, and the *Ephēmeris Archaiologikē* (Athens, 1884-92).

OROSHAZA, ō'rōsh-hä-zō. A market town of Hungary, in the County of Békés, 33 miles northeast of Szegedin (Map: Hungary, G 5). The chief occupations are cattle-raising and viticulture. Population, in 1890, 20,000; in 1900, 21,385, mostly Magyars.

ORO'SIUS, PAULUS. A Spanish cleric and historian. He was born at Tarragona, in the latter part of the fourth century. He went to Africa in 415 to get the advice of Augustine at Hippo as to the suppression of heresy in

Spain, and thence, on Augustine's advice, to Palestine to consult Jerome, then living at Bethlehem. He went back to Africa in 416, and is heard from in 417, but the date and place of his death are unknown. His chief work, the *Adversus Paganos Historiarum Libri VII.*, was intended to refute the current notion that the misfortunes of the Roman Empire and the wretchedness of the masses were due to the anger of the gods at the abandonment of their worship and the profanation of their altars. The work is a trivial, inaccurate, uncritical miscellany of facts, yet it has obtained a place in literature from being a favorite text-book of universal history during the Middle Ages, and was translated into Anglo-Saxon by Alfred the Great (Eng. translation by Bosworth, London, 1858; also edited by Sweet, ib., 1883). Some manuscripts bear the title of *Hormesta* or *Ormista*, conjectured by some to be a corruption of Or. m. ista., i.e. *Orosii Mundi Historia* (Orosius's History of the World). The *editio princeps* of the work is Augsburg, 1471. Other works are attributed to Orosius. Those with best reason are *Liber Apologeticus de Arbitrii Libertate*, and the *Commonitorium de Errore Priscillianistarum et Origenistarum*, an explanation of religious affairs in Spain addressed to Augustine. These three works are reprinted in Migne, *Pat. Lat.*, xxxi., but the best critical editions are, of the *Historia* and *Liber Apologeticus* by Zangemeister (Vienna, 1882); of the former alone, id. (Leipzig, 1889); of the *Commonitorium* by Scheps in his edition of Priscillian (Vienna, 1889).

OROTAVA, ō'rō-tä'vä. A town near the north coast of Teneriffe, one of the Canary Islands. It is picturesquely situated at the foot of a peak, in a remarkably fertile and healthful region. It has a beautiful church and a botanical garden. Its harbor is an open roadstead. It nevertheless exports considerable quantities of wine and cochineal. Population, in 1900, 9002.

OROZCO Y BERRA, ō-rōs'kō ē bĕr'rä, Manuel (1816-81). A Mexican historian and archæologist. He was born in the City of Mexico; studied engineering and law; and in 1852 became director of archives. He suffered a short imprisonment under Juarez for accepting office from Maximilian. Journalism was his first step in literature, and in 1846 he had become editor of *El Parvenir*. He contributed to Andrade's *Diccionario universal de historia y geografia mexicana*, and wrote: *Noticia de la conjuración del Mariscal del valle* (1853); *Geografia de las lenguas y carta etnográfica de México* (1864); and *Historia antigua de Mexico* (1880-81).

ORPHAN, The. A play by Thomas Otway (1680), in blank verse, based upon the love of two brothers for Monimia, the orphan ward of their father. It is a cruel tragedy, as gloomy as anything of Ford's, and the horror is even deepened by the occasional contrast of a lighter strain.

ORPHANS' COURT. See Surrogate.

ORPHEUS, ôr'fūs (Lat., from Gk. *Ὀρφεύς*, of uncertain origin; possibly connected with the Skt. *Rbhus*, divine artists in the Vedas, or, perhaps with greater probability, with Gk. *ὀρφ-*, *orph-*, dark). A Greek legendary musician, whose prominence is largely due to his connection with a body of religious teaching. According to the common literary tradition, he was a Thracian, son of Œagros and Calliope or Polyhymnia, though some late writers name Apollo as his father. To him was attributed by some the invention of the lyre or of the cithara, while others held that these were given him by Apollo. Proverbial was the power of his music, which drew to him wild beasts, birds, and even fishes, calmed the winds and storms, stilled the raging of the sea, and turned back the course of rivers. His song also plays an important part in the stories connected with the voyage of the Argonauts, where he appears as priest and seer. Most famous, however, was his journey to the lower world to recover his wife, Eurydice, a legend which seems to have received its full development only in the late Alexandrian time. (See Eurydice.) According to one version, Orpheus killed himself in his grief at the second loss of Eurydice; others said he was smitten by the thunderbolt of Zeus because his music by its magic power was breaking down the laws of nature. The most common version was that he was torn in pieces by the Thracian women, in their orgiastic worship of Dionysus. His members were flung into the sea, whence they were collected by Calliope and the Muses for burial amid the lamentations of all nature and the now remorseful women. Only the head floated across the sea to Lesbos, where it gave oracular responses from the cleft in which it lodged. The wonderful lyre was placed among the stars by Zeus, or inherited by Musæus, or dedicated in a temple of Apollo. Orpheus himself in the other world delighted the shades with his song.

There seem to be no representations of Orpheus in ancient art before the red-figured Attic vases of the earlier fifth century, where he appears simply as a singer among the Thracians, or as murdered by the women. From that time, however, the representations become more frequent, though they are most numerous in the later Hellenistic and Roman periods. Among the scenes represented, two are especial favorites in the later art: (1) The rescue or loss of Eurydice, as in the beautiful Attic relief of which the best example is in Naples, and others in Rome and Paris, and (2) Orpheus playing on his lyre, surrounded by the wild beasts, of which several examples occur among the Pompeian paintings, while for some reason not yet satisfactorily stated it was a favorite theme in early Christian art.

The importance of Orpheus was largely due to the mass of religious literature which was attributed to him from the sixth century B.C. The origin and exact nature of these writings and the character of the Orphic sects are among the most intricate and perplexing questions in the history of Greek religious thought, nor is there any general agreement among scholars as to the detailed answers. It seems clear that, amid the general unrest which characterized Greek thought during the sixth century, leading to the speculations of the Ionian physicists and other early philosophers, to the practical maxims of the Seven Wise Men, and other manifestations of distrust as to the earlier beliefs, there sprang up teachers who professed to be able to purify the soul from the sins of this life, and secure it happiness in the world to come. Among the doctrines and rites for securing this happiness, those taught in poems attributed to Orpheus seem to

have enjoyed the widest popularity and to have influenced largely the thought and life of the time, furnishing more than mere suggestions to Pythagoras and Xenophanes. The votaries submitted to purification by various rites, including the sprinkling with blood, and were required to govern their lives by strict rules, which included abstinence from all animal food and beans, and forbade the wearing of any garment containing wool. Those who were initiated and followed the precepts of the master might hope to escape the horrors of Tartarus, and enjoy the bliss of the righteous, as described in a poem which narrated fully the journey of Orpheus to the other world, and the revelations there received by him. Gold plates containing verses from this poem have been found in graves in Lower Italy, obviously buried with believers to guide them in their journey to the world beyond. It is not clear that there was a large and organized Orphic sect. Rather the teachings and especially the rites seem to have been in the hands of wandering priests, many of whom possessed a very doubtful reputation among the thoughtful, who regarded them as impostors greedy only for gain. On the other hand, there can be little doubt that, according to the common practice among the Greeks, the believers in these teachings formed religious societies. There seems no satisfactory evidence that Orpheus was regarded as a god by these people, for their worship centred around Dionysus, and their beliefs and practices were based on a system which seems to have been set forth in a *Theogony*, attributed to Orpheus, and of which many fragmentary citations have been preserved. It is in part an effort to combine the Bacchic worship of Dionysus, the omnipresent god, with the Greek conception of the supremacy of Zeus. In the beginning were Chaos, Cronos (Time), and Æther. From Chaos and Æther Cronos produced a silver egg, from which came Phanes, the creator of all things, who is also Dionysus. After he had produced the heaven and earth and all things thereon, he retired from sight, but after the world of the gods had grown up Zeus swallowed Phanes, and thus this Dionysus became wholly a part of Zeus. The son of Zeus and Persephone was Dionysus Zagreus, who was to succeed his father, but who was enticed away by the hostile Titans, torn in pieces, roasted and eaten. The heart alone was rescued and brought by Athena to Zeus, who placed it in the third Dionysus, son of Semele. He also consumed the Titans with his thunderbolt, and scattered the ashes through the world, which thus became pervaded by Dionysus. The soul is immortal, and at death passes to Hades to be punished or rewarded, and then after a time to be reborn in animal or man, according as its former life has been evil or good. Through initiation and pure living the soul may safely pass the perils of the lower world and the judgment, and when it has three times been acquitted of all guilt, it is freed from the round of rebirths and passes to the Islands of the Blessed.

Of the large mass of literature which passed under the name of Orpheus, only a small collection of late pieces has survived, the so-called *Orphica*, including the *Argonautica*, a short hexameter poem of 1384 verses, on the voyage of the Argo, with special reference to the deeds of Orpheus; the *Lithica*, in 768 verses, containing a discourse of Orpheus on the wondrous properties of stones; and 88 hymns to gods and natural powers. The first two works can hardly be earlier than the fourth century A.D., and most of the hymns are also late, though they may well contain earlier elements.

The scientific treatment of the Orphic mysteries was begun by Lobeck, *Aglaophamus* (Königsberg, 1829), whose work is still of great value. Consult also: Kern, *De Orphei Epimenidis Pherecydis Theogoniis* (Berlin, 1888); Maass, *Orpheus* (Munich, 1895), to be used with great caution. For the *Orphica*, see Herrmann, *Neue Heidelberger Jahrbücher*, vi. (Heidelberg, 1896). For the *Orphica*, see Herrmann, *Orphica* (Leipzig, 1805); Abel, *Orphica* (Berlin, 1885); Dieterich, *De Hymnis Orphicis* (Marburg, 1891). Consult: Knapp, *Ueber Orpheusdarstellungen* (Tübingen, 1895); Heussner, *Die altchristlichen Orpheusdarstellungen* (Leipzig, 1893).

ORPHEUS C. KERR. The nom-de-plume of Robert Henry Newell, intended to represent the sound of 'office-seeker.'

ORPIMENT. See ARSENIC.

ORR, or, HUGH (1717-98). An American inventor. He was born in Lochwinoch, Renfrewshire, Scotland, but at the age of twenty emigrated to the United States, and in 1739 settled at Bridgewater, Mass., where he worked as a gunsmith and manufacturer of edged tools. The five hundred muskets produced by him for the province are said to have been the first of American make. During the Revolutionary War his foundry cast for the United States Government quantities of cannon and cannon-balls. Among his numerous inventions was a machine for the cleaning of flax.

ORR, JAMES (1844—). A Scotch theologian and Church historian, born and educated in Glasgow. From 1874 to 1891 he was pastor at Hawick, and for the ten years following was professor of Church history in the Theological College of the United Presbyterian Church, from which post he went to Glasgow College to a chair of apologetics and theology. He visited America in 1895 and lectured at Chicago on modern German theology, and again in 1897, when he lectured at Allegheny and Auburn Theological seminaries. Dr. Orr took a prominent part in promoting union between the Free and Presbyterian Churches. His publications include: *The Christian View of God and the World* (1893); *Ritschlian Theology and Evangelical Faith* (1897); *Neglected Factors in the Study of the Early Progress of Christianity* (1899); *Early Church History and Literature* (1901); and *Progress of Dogma* (1902).

ORR, JAMES LAWRENCE (1822-73). An American political leader, born at Craytonville, S. C. He graduated at the University of Virginia in 1841, and was admitted to the bar two years later. The next year he was elected to the State House of Representatives, and from 1849 to 1850 represented his district in Congress. During his last term at Washington, he was Speaker of the House, and used his power to favor the Lecompton Constitution of Kansas and other measures of the slave power. Though a strong partisan of State's rights, he dreaded the consequences to South Carolina which he foresaw would follow the ordinance of secession passed by the conven-

tion of 1860, of which he was a member. After its passage, however, he accepted the appointment as one of the three commissioners sent to Washington to treat for the transfer of Federal property within the State, and after his return organized and commanded Orr's Regiment of South Carolina Rifles. Before they had seen any real service, however, he resigned his commission in 1862 to enter the Confederate Senate, of which he continued to be a member until the end of the war, when he was elected Governor of South Carolina as a Republican. Later he was for a time United States Circuit Judge, and from 1873 until his death was United States Minister to Russia.

ORRENTE, ôr-rân'tâ, Pedro (c.1570-1644). A Spanish painter, born at Montealegre, Province of Murcia. He probably was a pupil of El Greco at Toledo, but was an imitator of Jacopo da Ponte, after whose manner he painted chiefly Scriptural subjects, in which animals and landscape could suitably be introduced. Hence he was called the Spanish Bassano. He worked at Toledo, Murcia, and Valencia, where he established a prosperous school, then at Cuenca, Madrid, and Seville. Although he treated all kinds of subjects, he is the chief painter, among the Spaniards, of cattle, sheep, and other animals. The best of eight pictures by him in the Madrid Museum include the "Sacrifice of Isaac," "Repose of Lot's Family," and "Adoration of the Shepherds." The Dresden Gallery contains "Jacob Lifting the Stone from the Well" and the Vienna Museum, "Christ Healing the Sick" and "John the Baptist." An excellent portrait of himself is in the Louvre.

OR'RERY. An astronomical instrument, showing the motions of the planets round the sun, and of the satellites round their planets, which was in high repute during the eighteenth and beginning of the nineteenth centuries, though now regarded as a mere toy. The orrery was probably invented by Graham, but named after Charles Boyle, Earl of Orrery in Ireland. It is a combination of the old planetarium (q.v.) with other machines which showed the motions of the earth, moon, and planetary satellites. Though the construction of a machine which would exhibit accurately the motions, distances, and magnitudes of the planets is impossible, yet an orrery is in some degree useful as giving a general notion of the way in which the planetary motions are performed.

ORRERY, Earls of. See Boyle.

ORRIS ROOT (probably a corruption of *Iris* root). The rootstock (rhizome) of certain European species of Iris (q.v.), namely Iris Florentina, Iris Pallida, and Iris Germanica, the first of which yields the principal supply. Orris root was formerly used in many medical preparations as a stimulant, but is now almost entirely disused. It is sometimes chewed to sweeten an offensive breath. In drying it acquires a pleasant smell of violets, on which account it is used in perfumery.

ORSAY, ôr'sâ'. Alfred Guillaume Gabriel, Comte d'. See D'Orsay, Alfred Guillaume Gabriel, Count.

ORSEILLE, ôr'sâ'y'. See Archil.

OR'SHA. A town in the Government of Mohilev, Russia, situated on the Dnieper, about 45 miles north of Mohilev. It trades in grain to a considerable extent. Population, in 1897, 13,161.

ORSI, ôr'sê, Achille d' (1845—). An Italian sculptor, born at Naples, where he studied at the Royal Institute, and in 1875 won a stipend which enabled him to supplement his artistic training in Rome. At the international art exhibition of 1877, in Naples, a life-size group, "The Parasites," attracted universal attention by its vigorous characterization and detailed realistic treatment. His "Proximus Tuus," representing an exhausted peasant, found its way into the National Gallery in Rome.

ORSINI, ôr-sê'nê. A noble family of Rome, celebrated as the champions of the Guelphic cause against their hereditary enemy, the Colonna (q.v.). They trace their origin to the early centuries of the Christian Era, but first appear prominently toward the end of the twelfth century, when a member of the house was elected to the Papal throne as Celestine III. Their strife with the Colonna frequently plunged the city into turmoil, and their rule, like that of their rivals, pressed heavily on the inhabitants. The line of the Orsini divided into the seven branches of Pitigliano, San Savino, Tagliacozzo, Anguillara, Oppido, Bracciano, and Mentana. The only surviving branch is that founded in Naples by Francesco, first Duke of Gravina. The members of the family who attained especial distinction were: Giovanni Gaetano Orsini, who became Pope as Nicholas III. and Pietro Francesco degli Orsini, who ascended the Papal chair as Benedict XIII.—Paolo Orsini was a famous condottiere of the first half of the fifteenth century, and fought against Ladislas of Naples and Francesco Sforza. Virginio Orsini (died 1497) fought for the Papacy under Sixtus IV., and against it under Alexander VI. He made common cause with Charles VIII. of France in 1494, and was punished by imprisonment at Naples, where he died. Renzo da Ceri (died 1536) was a general in the service of Francis I. of France, and fought against the Emperor, Charles V. He conducted the defense of Rome against the Imperialist troops in 1527, and after the storming of the city held out for some time in the Castle of Saint Angelo. Paolo Giordano Orsini, Duke of Bracciano, was the husband of the unfortunate Virginia Accoramboni (q.v.).—Anne Marie de la Trémoille (1635-1722), widow of Adrien Blaise de Talleyrand, Prince of Chalais, married, in 1675, Flavio Orsini, Duke of Bracciano, and became an ardent and skillful supporter of the French policy at the Papal court. In 1701 she went with Philip V. to Spain in the official capacity of mistress of the Queen's household, but in reality as the young King's adviser. She sought to establish the Bourbon throne in Spain on a firm basis by creating a national party in support of the new King, and with the exception of a short period of disgrace, exercised almost absolute power at the Spanish Court till the death of Philip's Queen. After the marriage of Philip V. to Elizabeth Farnese she retired from Madrid, and lived in Holland, Genoa, and Rome. Consult: Litta, *Famiglie celebri italiane*, vol. viii. (Milan, 1819 et seq.); Combes, *La princesse des Ursins* (Paris, 1858).

ORSINI, Felice (1819-58). An Italian revolutionist, born in Meldola, and known for his attempt on the life of Napoleon III. While a

youth he engaged in conspiracies for the liberation of Italy, and in 1844 was condemned to the galleys for life. He was released in 1846, and took an active part in the revolution of 1848-49, fighting at Rome and Venice, and carrying on the revolutionary propaganda at Genoa and in the Duchy of Modena. Forced to flee the country, he found refuge in England, where he supported himself by lecturing and published *The Austrian Dungeons in Italy* (1856). In 1857 he went to Paris with the intention of assassinating Napoleon III., whom Orsini regarded as the greatest obstacle to the liberation of Italy. On the evening of January 14, 1858, as the carriage containing the Emperor and the Empress was drawing up before the opera house, Orsini and three companions, Pieri, Rudio, and Gomez, exploded a number of bombs, killing ten of the bystanders and wounding one hundred and fifty. The Emperor and Empress escaped unhurt. The conspirators were seized, tried, and sentenced, Orsini, Pieri, and Rudio to death, and Gomez to imprisonment for life. Rudio's life was spared at the intercession of the Empress, but Orsini and Pieri were executed on March 13, 1858. Consult: *Memoirs of Felice Orsini, Written by Himself* (Edinburgh, 1857); Montazir, *Felice Orsini* (Turin, 1862).

ORSK, ôrsk. A town of Eastern Russia in the Government of Orenburg, situated on the Ural River, 140 miles east of Orenburg. It has brick-kilns and tanneries, and is a trade centre of some importance. Population, in 1897, 14,036.

ORSON. See VALENTINE AND ORSON.

ORSOVA, ôr'shô-vō. A frontier town of Hungary, situated on both sides of the Cerna at its confluence with the Danube, on the Rumanian boundary, 94 miles east of Belgrade (Map: Hungary, H 4). Old Orsova, on the west bank of the Cerna, has a new harbor, with quarantine station, and is a free port, a first-class port of entry, and one of the principal stations for the steamers on the Danube. Its population in 1900 was 4610. New Orsova, on the east bank, is inhabited chiefly by Turks, its population being about 3000, and was formerly a Turkish fortress, but has been held by Austria since 1878.

ORTEGAL, ôr'tâ-gäl'. CAPE. See CAPE ORTEGAL.

ORTE'LIUS, ORTEL, or **OERTEL**, ôr'tēl, ABRAHAM (1527-98). A Flemish geographer, born at Antwerp. He was the author of the famous atlas, *Theatrum Orbis Terrarum* (1570), long authoritative throughout Europe; *Thesaurus Geographicus* (1596); *Itinerarium per Nonnullas Galliæ Belgicæ Partes* (1584); and other geographical works. Philip II. of Spain recognized his merits, and appointed him royal geographer in 1573.

ORTH, ôrt, AUGUST (1828-1901). A German architect. He was born at Windhausen, Duchy of Brunswick, and educated at the Collegium Carolinum in Brunswick (1850-55), and at the Academy of Architecture in Berlin, where he also frequented the studio of Strack, and in 1856 won the Schinkel prize. After a visit to Italy in 1859, he was active principally in Berlin, where, besides such public buildings as the Görlitz railway station and the Cattle Market, the erection of several church edifices claimed more especially his attention. These comprise the "Zionskirche" (1866-73), the "Dankeskirche" (1884), the "Friedenskirche" (1891), the "Himmelfahrtskirche" (1891-93), and the "Emmauskirche" (1893), in all of which the architect endeavored to modify Romanesque forms of style according to modern proportions and exigencies.

ORTH, ôrth, GODLOVE STONER (1817-82). An American legislator, born in Lebanon County, Pa. He graduated at Pennsylvania College, studied law, was admitted to the bar in 1839, and in the same year began to practice in Indiana. He represented his district in the Indiana State Senate for six sessions (1842-48) and was for one year president of that body. In 1861 he represented Indiana at the Peace Conference. In the Civil War, as captain of volunteers, he commanded the ram *Horner* in defensive cruises along the Ohio in 1862. Elected to Congress from Indiana, he served from 1863 to 1871, and from 1873 to 1875; framed the 'Orth Bill,' which reorganized the diplomatic and consular systems; and resigned his seat to accept the mission to Austria. After his return he again served in Congress from 1879 until his death.

ORTH, JOHANN. See JOHN NEPOMUK SALVATOR.

ORTH, ôrt, JOHANNES (1847—). A German pathologist. He was born at Wallmerod, and studied under Rindfleisch at Bonn and Virchow in Berlin. In 1887 he became professor of pathology at Göttingen, and in 1902 succeeded Virchow at Berlin. His works are: *Compendium der pathologisch-anatomischen Diagnostik* (1876; 6th ed., 1900); *Cursus der normalen Histologie* (1878; 5th ed., 1888); *Lehrbuch der speziellen pathologischen Anatomie* (1887-93, incomplete); and *Medizinischer Unterricht und ärztliche Praxis* (1898).

ORTHERIS, STANLEY. A character in Kipling's *Soldiers Three*, and other tales of English army life in India. Mulvaney, Learoyd, and he are, in a way, 'Three Guardsmen' of to-day. In this little Londoner, Kipling has immortalized the Cockney, and given an actual type of the British soldier.

OR'THIS (Neo-Lat., from Gk. ὀρθός, *orthos*, straight, correct). An important extinct genus of hinged brachiopods very common in the Paleozoic formations of all parts of the world. The shells are usually rounded in outline, the valves generally convex, through the dorsal valve is flat in some genera, the cardinal area is well developed, and the hinge is a ball and socket mechanism. The several hundred known fossil species have been distributed among a number of new genera and subgenera, of which the more important are *Dalmanella testudinaria* of the Trenton limestone, *Bilobites biloba* of the Niagara beds of North America, and the Gotlandian beds of Europe, *Platystrophia biforata* of the Ordovician of America and Europe, *Rhipidomella vanuxemi* of the Hamilton group, and *Schizophoria striatula* of the Devonian. The period of greatest development of the orthids was during the Middle Paleozoic, and they died out toward the end of the Carboniferous period.

ORTHOCERAS, ôr-thŏs'ê-rās (Neo-Lat., from Gk. ὀρθός, *orthos*, straight, correct — κέρας, *keras*, horn). A genus of fossil nautiloid cephalopods, characterized by straight conic shells, whose surface may be either smooth or trans-

versely striated. The interior of the shells is divided into chambers by simple transverse septa, and there is a median siphuncle. The members of this genus, which range from the Silurian to the Triassic periods, are of much importance as index fossils. The limits of the genus as defined by the majority of writers have been so broad as to include almost all of the straight-shelled Paleozoic cephalopods, and the assemblage of species thus brought together was found by Hyatt and other investigators to contain species that belong more properly in a number of different families and several new genera. All of the straight-shelled forms are now classed together in an artificial group as orthoceracones, in distinction to the curved shells or cyrtoceracones. The orthoceracones are in general antecedent to the cyrtoceracones in each family or race. They appear first in the Upper Cambrian and are very abundant in the Ordovician rocks, where *Orthoceras titan* of the Black River limestone, with a length of about ten feet, is the largest known form of this group of cephalopods. During the Ordovician the orthoceracones gave rise to several derived genera of curved and coiled shells, and to shells with peculiarly restricted apertures. Some of these forms gave rise to side lines of evolution that flourished for variable periods of time, such as Cyrtoceras, Gyroceras, Lituites, Phragmoceras, and Ascoceras. Nautilus itself, which has persisted to the present day, was derived in early Ordovician times from one of these orthoceracones through a curved shell like Cyrtoceras. During the Silurian, Devonian, and Carboniferous periods the orthoceracones diminish in both size and number, and they disappear during the Trias. The derivation of Belemnites of the Mesozoic from some Paleozoic orthoceracones is considered by some authors to have taken place through the formation by the orthoceras of a heavy deposit of lime upon the apical portion of its shell, this serving as a post to anchor the shell in an upright position in the mud of the sea bottom. Consult: Ruedemann, "Professor Jaekel's Theses on the Mode of Existence of Orthoceras and Other Cephalopods," *American Geologist*, vol. xxxi. (Minneapolis, 1903); Von Zittel and Eastman, *Text-book of Paleontology*, vol. i. (New York and London, 1900). See CEPHALOPODA; NAUTILUS.

OR'THOCLASE (from Gk. *ὀρθός, orthos*, straight, correct + *κλᾶσις, klasis*, fracture, from *κλᾶν, klan*, to break). One of the monoclinic feldspars, composed of potassium-aluminum silicate. It has a vitreous lustre, and is either colorless or white, though occasionally light yellow or red, and sometimes green. It usually occurs in crystalline rocks, and is an essential constituent of granite, gneiss, syenite, porphyry, etc. The several varieties of orthoclase include *adularia*, a transparent or translucent variety that shows when polished chatoyant or pearly reflections, the best varieties of which are cut into gems and are known as 'moonstones;' *aventurine*, a similar variety with red and yellow internal reflections, due to minute scales of occluded minerals, the green varieties being known as 'sunstones;' *perthite*, a flesh-red variety containing layers of albite and often yielding bright golden-yellow reflections; and *variolite*, a dark-green variety, which takes its name from its supposed power to cure smallpox.

ORTHO'EPY (Gk. *ὀρθοέπεια, orthoepeia*, correct speaking, from *ὀρθοεπεῖν, orthoepein*, to speak correctly, from *ὀρθός, orthos*, straight, correct + *ἔπος, epos*, word). That part of grammar which treats of the correct pronunciation of the words of a language.

ORTHOGENESIS (Gk. *ὀρθός, orthos*, straight, correct + *γένεσις, genesis*, origin). Generation according to ordinary processes, as distinguished from such aberrant courses of development as parthenogenesis, alternation of generations, and other special modes.

ORTHOGONAL. See PROJECTION.

ORTHOG'RAPHY (Lat. *orthographia*, from Gk. *ὀρθογραφια*, correct writing, from *ὀρθός, orthos*, straight, correct + *γράφειν, graphein*, to write). The art of writing words correctly, as regards spelling. The word is seldom used in an absolute sense—that is, with the meaning of spelling which is scientifically correct—since outside of the discussions of phonetists (see PHONETICS) such spelling does not exist; it ordinarily signifies merely the art of spelling in accordance with accepted or prevailing usage, and also such customary spelling itself. See SPELLING and SPELLING REFORM.

ORTHOGRAPHY, FIGURES OF. Deviations from the ordinary accepted spelling of words. They are three in number; *archaism, crasis*, and *mimesis*. *Archaism* consists in spelling words according to a usage which is obsolete or obsolescent, as if one should write, "The *gret Kyng hathe* fifty fair *damyselles alle maydenes*." So Vergil has *olli* for *illi*, Horace *duellum* for *bellum*. *Crasis* (Gk. *κρᾶσις*, a mixing) in Greek grammar denoted the mixing of two words by the coalescence of their final and initial vowels into one long syllable. Thus *τὰ αὐτά* became *ταὐτά*. The occurrence of crasis is indicated by the *coronis* (᾽) placed over the vowel or diphthong of the resulting long syllable. In Latin grammar the term crasis was applied to the union of any two vowels into a long vowel or diphthong, and so became synonymous with contraction. Examples of crasis in Latin are *cogo* (for *coago*), *nil* (for *nihil*), *cors* (for *cohors*). *Mimesis* (Gk. *μιμησις*, imitation) consists in the representation of the improper pronunciation of words by means of false spelling. Mimesis is common in works which profess to represent the speech of the illiterate, or which introduce characters who use dialect, or negro speech.

OR'THOPÆ'DICS (from Gk. *ὀρθός, orthos*, straight, correct + *παῖς, pais*, child). The prevention or correction of deformity in the human body, especially in children. See CLUBFOOT; KNOCK-KNEE; LEG; POTT'S DISEASE; DEFORMITIES.

ORTHOP'ODA (Neo-Lat. nom. pl., from Gk. *ὀρθός, orthos*, straight, correct + *πούς, pous*, foot). An order of dinosaurs, in the system of Gadow, embracing the groups Stegosauria and Ornithopoda of Marsh. See the sections on these groups under DINOSAURIA.

ORTHOP'TERA (Neo-Lat. nom. pl., from Gk. *ὀρθόπτερος*, having upright wings, from *ὀρθός, orthos*, straight, correct + *πτερόν, pteron*, wing). A large and important group of insects comprising the forms known as the straight-winged insects, and including the grasshoppers or true locusts, long-horned grasshoppers (in-

cluding katydids), crickets, cockroaches, walking-sticks, and leaf-insects, and the praying mantis or rear-horse (qq.v.). The mouth parts are fitted for biting, and the metamorphoses are incomplete, the young when first hatched closely resembling the adult insects except in lacking wings. The eggs are few in number, and as a rule are laid in specialized egg-cases, although with some they are deposited without such cases, and with a few are scattered singly. The fore wings are somewhat thickened, but are not as tough as the wing-cases of beetles, and when at rest lie closed upon the back so as to protect the abdomen and the hind wings. They are known as 'tegmina.' The hind wings function in flight, and are delicate and usually folded like a fan. About 10,000 species exist, which makes it a small order when compared with the Hymenoptera, the Coleoptera, and the Lepidoptera, but, in spite of the comparatively small number of eggs, many of the species are tenacious of life and apparently very prolific, and swarm in enormous numbers of individuals, as in the case of the destructive and migratory locusts. One of the striking peculiarities of the order is that we find here most highly developed the ability to produce sounds of a more or less musical character, by rubbing one part of the body, modified for the purpose, upon another. This capability thus to make sounds is confined to the male sex, and its object is to attract the female; and this ability belongs only to the families which jump (the Saltatoria); the runners, walkers, and graspers (Cursoria, Gressoria, and Raptoria) make no sound, but in these groups the phenomena of protective and aggressive resemblances are very highly developed, especially in the tropical forms. In these groups the wings seem to be of little use as organs of flight, but they are of striking value in ornamentation and in concealment. This is especially true with the Phasmidæ and Mantidæ, where the effectiveness of color and pattern is extraordinary, the tegmina resembling plant structures with remarkable minuteness of detail. Even the eggs are so modified as to resemble the seeds of plants.

Orthoptera are among the oldest of fossil insects. Cockroaches were numerous and varied in Paleozoic time, and the other families are numerously represented in Mesozoic and Tertiary rocks.

Consult: Sharp, *Cambridge Natural History* (London, 1895); Comstock, *Manual for the Study of Insects* (Ithaca, 1898); Howard, *The Insect Book* (New York, 1902); Lugger, *Annual Report of the State Entomologist of Minnesota* (Minneapolis, 1898); Scudder, *North American Orthoptera* (Cambridge, 1897).

ORTIGUEIRA, ôr'tē-gā'ē-rā. A town in the Province of Coruña, Spain, picturesquely situated in a beautiful valley at the head of a land-locked bay 23 miles northeast of Ferrol. The harbor is well sheltered, but shallow, and has no wharves; the town is chiefly noted for its romantic surroundings and for the good seabathing afforded. Population (commune), in 1887, 17,563; in 1900, 18,975.

ORT'LER, or ORTLER SPITZE. The highest peak of the Austrian Empire, on the border of the Tyrol, 68 miles southwest of Innsbruck. It rises to a height of 12,790 feet from the northern portion of the Ortler group, in the chain of the Rhætian Alps. It was first ascended in 1804. The view from the summit is the most imposing of the Eastern Alps.

ORTOLAN (Fr. *ortolan*, from It. *ortulano*, ortolan, gardener, from Lat. *hortulanus*, gardener, from *hortus*, garden). A European bunting (*Emberiza hortulana*) having a plumage of mixed browns, black, and white. It appears in the autumn in great flocks on both coasts of the Mediterranean Sea, when it returns from its summer home and breeding places in the far north. No bird is so highly esteemed by epicures, and vast numbers are used for the table. It is taken chiefly by nets. See Plate of BUNTINGS.

In America the name is given to both the bobolink ('reed-bird') and the sora-rail, neither of which has the slightest relation to an ortolan, but both of which are small birds, much sought after in the fall in the Middle States, as a delicacy.

OR'TON, EDWARD (1829-99). An American educator and geologist. He was born in Deposit, N. Y., graduated at Hamilton College in 1848, and studied at Lane Theological Seminary, at the Lawrence Scientific School, Harvard, and at Andover Theological Seminary. He taught successively at the State Normal School, Albany, N. Y., at the Chester (N. Y.) Academy, and at Antioch College, of which he was also president in 1872-73. He was first president of the Ohio Agricultural and Mechanical College (now Ohio State University) (1873-81), and was professor of geology there from 1873 to 1899. He was an assistant State geologist (1869-82), was State geologist (1882-99), served for a time on the geological surveys of the United States, of Kentucky, and of Kansas, and was president of the Geological Society of America (1896), and of the American Association for the Advancement of Science (1898-99). He was essentially an economic geologist, and specialized in the study of oil and gas, developing several well-known theories, notably the 'anticlinal theory,' and becoming widely known as an authority on the nature and geological occurrence of these products. He wrote portions of vols. i., ii., and iii. of the *Reports* of the Ohio Geological Survey, and a large part of vols. v., vi., and vii., besides numerous papers in the geological magazines and papers on petroleum, gas, and asphalt in the *Kentucky Geological Reports* (1891), and in the *Report* of the United States Geological Survey (1887).

ORTON, JAMES (1830-77). An American naturalist, born at Seneca Falls, N. Y. He graduated at Williams College in 1855, and then studied theology at the Andover Seminary. In 1860 he returned from an extensive trip through Europe and Palestine, and was ordained a Congregational minister. He became professor of natural science in Rochester University in 1866, in the next year he took charge of a scientific expedition across South America, and in 1873 took part in an expedition to Lima and Lake Titicaca. From 1869 to the time of his death he was professor of natural history in Vassar College. He published *The Miner's Guide and Metallurgist's Directory* (1849); *The Andes and the Amazon* (1870); and *Comparative Zoölogy* (1875).

ORTONA, ôr-tō'nä. A town in the Province of Chieti, Italy, situated on the Adriatic, 12 miles east of Chieti (Map: Italy, J 5). It has a cathedral, a ruined castle, a harbor, and an

extensive trade in wine. Population, in 1881, 12,122; in 1901, 14,974.

ORTYGAN (Neo-Lat. *ortyx* (ortyg) + an, from Gk. ὄρτυξ, quail). A button-quail (q.v.) or bush-quail of the Old World genus Turnix, which includes a large number of diminutive game-birds of pleasing appearance and excellent qualities. These birds are called 'hemipods' in the older books.

ORTYGIA, ôr-tij'i-â. An ancient name of Delos (q.v.).

ÖRTZEN, ö'rt-sen, Georg, Baron (1829—). A German poet. He was born at Brunn, Mecklenburg-Strelitz; studied law, served in the Prussian Army (1850-55), and then entered the consular service. He was employed in New York (1879), Constantinople (1880), Marseilles (1881), and Christiania (1889), and retired in 1892. He wrote several volumes of verse, including: *Gedichte* (3d ed. 1861); *Aus den Kämpfen des Lebens* (1868); *Satiren und Glossen eines Weltmannes* (1874); *Epigramme und Epiloge in Prosa* (1880); *Eines Lyrikers Chronik* (1888); *Auf Schwarzwaldwegen* (1896); *Nacht* (1900); and *Symphonien des Windes* (1901). Under the pseudonym "Ludwig Robert" he published *Erlebnisse und Studien in der Gegenwart* (1875).

ORU'BA. An island of the Dutch West Indies. See Aruba.

ORURO, ô-rōō'rō. A western department of Bolivia, bounded by the Department of La Paz on the north, Cochabamba on the east, Potosi on the south, and by Chile on the west (Map: Bolivia, D 7). Area estimated at 21,321 square miles. The surface is an elevated plateau, a part of the great Titicaca basin, and is interspersed with marshes and arid plains. The climate is cold and the soil mostly unfit for agriculture, though some cattle-raising is carried on. The mineral deposits of the State are rich, including tin, silver, and copper, which are profitably mined. The civilized population was officially estimated in 1898 at 130,000, including over 90,000 Indians. The capital is Oruro.

ORURO. The capital of the Department of Oruro, Bolivia, situated 9 miles east of the Desaguadero River, in a valley bordering an arid plain, 12,200 feet above sea level, and 120 miles southeast of La Paz (Map: Bolivia, D 7). A portion of the city is in ruins, and its former fine public buildings are in a decayed condition. A railroad connecting the town with Antofagasta on the Chilean coast has somewhat revived its importance, which is derived mainly from the valuable tin mines in the neighborhood. Population, 16,000. Oruro was founded in 1606.

ORVIETO, ôr-vyā'tô. A town and episcopal see of Central Italy, in the Province of Perugia, with a station on the Rome-Florence Railroad, 60 miles northwest of Rome (Map: Italy, F 5). It occupies a strong position on a steep hill, 1165 feet high, accessible by an inclined railway, is well built, and is surrounded by walls. It has been the see of a bishop since A.D. 509. The cathedral, a beautiful specimen of the Italian Gothic, and one of the most richly decorated edifices in Italy, is of black and white marble; it was begun in 1290 and completed about the middle of the fourteenth century. The façade is unsurpassed in the beauty of its mosaics, sculptures, and elaborate ornamentation. The interior is also finely decorated with sculptures and paintings. There are several other churches, chief of which is the Gothic San Giovenale, dating from the eleventh century. Other interesting features are the castle with the public garden and amphitheatre, Saint Patrick's Well, and the former Papal palace, or Palazzo Soliano, with a museum containing mediæval works of art and a collection of antiquities, most of them found in an Etruscan necropolis between the town and the railroad station. The city trades in grain, cattle, silk, oil, and white wine. Population (commune), in 1881, 15,931; in 1901, 18,543. Orvieto, known in the Middle Ages as 'Urbs Vetus,' occupies the site of an ancient and wealthy Etruscan city. It was repeatedly a place of refuge for the popes.

ORYX, ō'riks (Lat., from Gk. ὄρυξ, *oryx*, gazelle, pickaxe, from ὀρύσσειν, *orysscin*, to dig). A large antelope of Northern Africa (*Oryx leucoryx*), distinguished by its uniform whitish color, often reddish on the under part, and by the sabre-like curve of the great horns, which may touch the rump when the head is thrown back. These horns are able to sweep around with immense force and effect, and hunters find oryxes dangerous animals to approach when wounded. This species, which is confined to the Eastern Sudan and Nubia, is known by the Arabs as 'abu harte,' and represents the genus which includes the gemsbok, addax, beatrix antelope, beisa (qq.v.), and some other species of the desert and plains regions of Africa. The word 'oryx' among the ancients was the name of an antelope often represented on the monuments of Egypt, usually in profile, so that it seems to have but one horn. It is evident that one or another species of this genus was portrayed; and the fable of the unicorn may have arisen from these mural paintings.

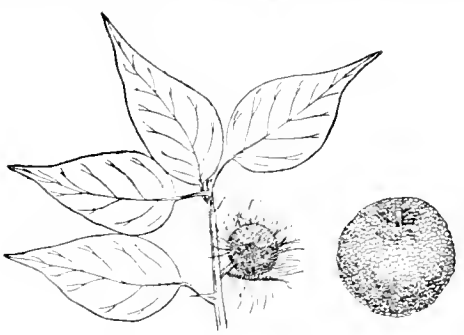
ORZESZKOWA, ôr'zhesh-kō'vâ, Eliza (1842—). A Polish novelist. She was born near Grodno; at sixteen married a Polish noble, who was banished to Siberia in 1863; and after that time devoted herself to literature and the advocacy of woman's rights. Her more important novels are: *Eli Makower* (1874), which treats of the relations of the Jews to the Polish nobility; *Meir Ezofowicz* (1878), which bears upon the contest between Talmudic orthodoxy and liberal theology in a rural setting; *Lost Souls* (1886), and *Cham* (1888), sketches of life in White Russia; *On the Niemen* (1888), and *Bene Nati* (1892), both descriptive of the lesser nobility; as well as the earlier and more typical *Pan Graba* (1872). More recently she published *The Argonauts* (1889) and *The Votaries of Power* (1900). Her collected works, with a biography by Chmielowsky, appeared at Warsaw (1899).

OSAGE, ô-sāj', *or* ō'sâj (properly *Ouasage*, the French form of *Washashe*, or *Wasash*, the name used by themselves). An important Indian tribe of Siouan stock (q.v.), formerly holding an extensive area between the Missouri and Arkansas rivers, in what is now Missouri, Arkansas, Kansas, and the Indian Territory, and at present gathered upon a reservation in northeastern Oklahoma. They are mentioned by Marquette as early as 1673, and through the colonial period generally acted as allies of the French against the other tribes, who seem almost without exception to have considered them as com-

mon enemies in whom no faith could be placed. Their principal wars were with the Cherokee and Chickasaw in the east and with the Kiowa, Cheyenne, Pawnee, and others on the plains. By successive cessions, beginning in 1808, they sold their original extensive territory until their removal to their present reservation in 1870, but through the aid of competent lawyers were able to secure such terms that they are now the richest tribe per capita in the United States, their annual income from invested funds and current leases being about $600,000, or over $300 for every man, woman, and child in the tribe. The result, however, has been rather detrimental than otherwise, tending to encourage dissipation and hinder industrial progress. From an estimated population of over 6000 a century ago they have diminished to 3000 in 1875 and 1790 in 1901, of whom only about 800 are full-bloods.

OSAGE. A city and the county-seat of Mitchell County, Iowa, 157 miles northwest of Dubuque, on the Red Cedar River, and on the Illinois Central and the Chicago Great Western railroads (Map: Iowa, E 1). It has the Sage Public Library, with 3000 volumes, and Cedar Valley Seminary; and near the city are the fair grounds of the County Agricultural Society. Osage is of considerable importance as the shipping point of a productive farming, stock-raising, and dairying section, and there are large nursery interests. The water-works are owned by the city. Population, in 1890, 1913; in 1900, 2734.

OSAGE ORANGE, or Bow Wood (so called from the Osage Mountains in Arkansas, of which it is a native), *Maclura aurantiaca*. A North American tree of the natural order Urticaceæ, which attains a height varying, according to soil and situation, from 20 to 60 feet. Its wood, which might probably be used for dyeing as a substitute for fustic (q.v.), is bright yellow, fine-



LEAVES AND FRUIT OF OSAGE ORANGE.

grained, and very elastic, and was much used by the North American Indians for making bows. The tree has been successfully used in many places as a hedge plant, its thorny stems forming an impenetrable barrier when properly trained. Its inedible fruit, which is about the size of a large orange, has a tuberculated surface of a golden color, and is filled internally with radiating somewhat woody fibres, and with a yellowish milky juice, the odor of which is generally disliked. The leaves of the Osage orange have been very successfully substituted for mulberry leaves in feeding silkworms.

OSAGE RIVER. A tributary of the Missouri. It rises in eastern Kansas, and flows in a winding course eastward through the State of Missouri, emptying into the Missouri River a few miles below Jefferson City (Map: Missouri, C 3). It is about 500 miles long, and navigable at high water for 200 miles.

OSAKA, ō-sä'kä, or **OZAKA**, ō-zä'kä (Jap., contraction of *Ō-ge-saka*, the great estuary hill, in allusion to the rising ground on which the castle stands). An important manufacturing and trading centre of Japan, and one of the three Imperial cities. It is situated on the island of Hondo, on both banks of the Yodo River, the outlet of Lake Biwa, and on the shores of Osaka Bay, in latitude 34° 42′ N., and longitude 135° 31′ E., 20 miles by rail from Kobé, and 27 from Kioto. It is built for the most part on low-lying level land. The city is intersected by the Yodo and numerous canals spanned by 1300 bridges, and has in consequence been styled the 'Venice of the East.' The streets are laid out with great regularity at right angles to each other, and are in the main narrow. The town has an average annual temperature of about 59° and a rather unhealthful climate.

Osaka has many industries, its principal manufactures being those of cotton, glass, and iron and steel products. Other important manufactures are boots and shoes, matches, tobacco products, clocks, etc. There is also considerable shipbuilding. A fine Government mint, for which 40 acres are used, was established here under foreign superintendence in 1871. In connection with it are a refinery and sulphuric acid works, which are a source of great profit to the Government. Osaka was opened in 1868 for foreign residence and trade, and a foreign settlement was laid out on the river island of Kawaguchi. The harbor, however, is poor and unsuited for large vessels, and Kobé has attracted most of the foreign trade, especially since the opening of the railway. The foreign settlement is, therefore, occupied for the most part by missionaries. Commercially Osaka is important chiefly in the internal trade, while in regard to foreign commerce it is only of slight importance in comparison with Yokohama and Kobé. The total foreign commerce of the port in 1901 amounted to over $11,000,000, the bulk of the trade being in cotton goods. Small steamers ply regularly between Osaka and the ports of Shikoku and the Inland Sea.

There are many temples and places of interest in the city and vicinity. The chief is the castle, which is one of the most famous in Japan. It stands on high ground in that part of the city known as the Upper Town. At the end of the fifteenth century its site was occupied by the monastery and temples of the Shin-shu sect of Buddhists, and was so strongly fortified by them that it defied the repeated attacks of the great general Nobunaga. In 1583 Hideyoshi (q.v.) made it the seat of his power and erected within the citadel a palace, which was, as some authorities believe, the most magnificent building the world ever saw. It survived the attack of Iyeyasu (q.v.) against Hideyori, Hideyoshi's son, but was burned by Tokugawa retainers in the civil war of 1868. It now contains the headquarters of the Osaka military district. Population of city, in 1898, 821,235; of the fu, 1,311,909.

OSAWAT'OMIE. A city in Miami County, Kan., 61 miles south by west of Kansas City, Mo., on the Missouri Pacific Railroad (Map:

Kansas, II 3). It derives its name from two streams near by, the Osage and Pottawatomie. It is the seat of the oldest and largest State insane hospital, with accommodations for about 1200 patients, dating from 1866, and has a Masonic temple, the Agnew Opera House, a city hall, and city library, and a monument commemorating the battle of Osawatomie. The city is in an agricultural and stock-raising region, and has a supply of natural gas. Division headquarters and shops of the Missouri Pacific Railroad are maintained here. The government is vested in a mayor, elected biennially, and a council. There are municipal water-works. Osawatomie was one of the 'free-State' settlements made by the Emigrant Aid Society in 1855, and was prominent in the contest between the pro-slavery and anti-slavery elements in Kansas. For a time John Brown lived in the immediate vicinity of the town. On August 30, 1856, it was the scene of a sharp skirmish between a band of pro-slavery men and John Brown and his followers, and, after the latter had been dispersed, was almost completely destroyed by the former. Osawatomie was chartered in 1883 and in 1890 became a second-class city. Population, in 1890, 2662; in 1900, 4191.

OSBALDISTONE. In Scott's *Rob Roy*, the name of two cousins, Francis and Rashleigh. Francis marries Di Vernon and Rashleigh, the villain of the story, is killed by Rob Roy.

OSBORN, ōz'bôrn, Henry Fairfield (1857—). An American geologist and paleontologist, born at Fairfield, Conn. He graduated at Princeton in 1877, and was appointed assistant professor of biology there in 1880, and professor of comparative anatomy in 1881. In 1890 he was made Da Costa professor of zoölogy in Columbia University, and was chosen curator of vertebrate paleontology in the American Museum of Natural History. Osborn's Western explorations resulted in great contributions to American paleontology and in remarkable additions to the collection of the American Museum. Of especial value are his reconstructions of prehistoric mammals, as painted by Charles Knight and displayed in the American Museum. In 1900 he was appointed paleontologist to the Canadian Geological Survey and to the United States Geological Survey. He wrote: *Evolution and Heredity* (1890); *From the Greeks to Darwin* (1894), an historical sketch of evolution; and *Hereditary Mechanism* (1895), and collaborated with W. B. Scott in the preparation of the work entitled *American Fossil Mammals*.

OSBORN, Sherard (1822-75). An English naval officer, explorer, and author, born in Madras, India. Entering the British Navy in 1837, he soon rose to a captaincy, and served in Malayan and Chinese waters. On two Arctic expeditions (in 1850-51 and 1852-54) in search of Sir John Franklin, he commanded a vessel, and during a part of the Crimean War he was senior officer in the Sea of Azov. Ordered to Hong Kong in 1857, he took a spirited part in the war at Canton (1857-58). In 1864 he commanded the armor-plated *Royal Sovereign*, and in 1873 became rear-admiral. His writings include: *Stray Leaves from an Arctic Journal* (1852); *Quedah; or, Stray Leaves from a Journal in Malayan Waters* (1857); and *The Career, Last Voyage, and Fate of Sir John Franklin* (1865).

OSBORNE, ōz'bôrn, Francis (1593-1659). An English author. He was the son of Sir John Osborne, of Chicksands, Bedfordshire, lived in London, where he was employed by his father, who was at the head of the office of the Lord Treasurer's remembrancer, and about 1650 removed from North Fambridge to Oxford. There he held minor office under the Commonwealth and lived uneventfully, gaining some fame and many influential friends in London after the publication of his *Advice to a Son* (1656-58). This popular work was published anonymously. It contained a series of pithy commonplaces somewhat in the manner of Lord Chesterfield. Besides several political pamphlets, Osborne wrote a *Miscellany of Sundry Essays, Paradoxes*, etc. (1659). His collected works were published in 1673, and in 1722 reached an eleventh edition.

OSBORNE HOUSE. A country residence of Queen Victoria on the Isle of Wight, in the neighborhood of the town of East Cowes. Osborne House was bought by the Queen in 1840. Here she died, January 22, 1901. After her death King Edward presented Osborne House to the English people.

OSBOURNE, ōz'bûrn, Lloyd (1868—). An American writer, son of Samuel Osbourne and Fanny Van de Grift (afterwards the wife of Robert Louis Stevenson). He was born in San Francisco, April 7, 1868, and studied at the University of Edinburgh with a view to becoming a civil engineer. With Stevenson he went to Samoa, where he was appointed vice-consul from the United States. In conjunction with Stevenson, he wrote: *The Wrong Box* (1889); *The Wrecker* (1892); and *Ebb Tide* (1894).

OS'CAN. One of the ancient languages of Italy. See Italic Languages.

OSCAR I. (1799-1859). King of Sweden and Norway from 1844 to 1859. He was born in Paris, July 4, 1799, being the son of Marshal Bernadotte. (See Charles XIV. John.) After the election of his father as Crown Prince of Sweden, Oscar received the title of Duke of Sudermania. In 1818 he entered the University of Upsala. He was accomplished in the fields of science, literature, and the fine arts, and was an enthusiastic student of music. He was in full sympathy with the Swedish nationalists. He succeeded his father March 8, 1844. His rule was distinguished for its justice; and many liberal measures, such as the removal of Jewish disabilities, freedom of manufactures and commerce, and parliamentary reform (the last mentioned being vigorously opposed by the nobility), were laid before the *Riksdag* by his orders. He advocated these changes with tact, and in many cases his policy was successful. In 1823 he married Josephine Beauharnais, the granddaughter of the Empress Josephine, by whom he had five children, the eldest of whom, on account of his father's failing health, was appointed Regent, September 25, 1857, and succeeded to the throne as Charles XV. on the death of Oscar, July 8, 1859. See Sweden.

OSCAR II. (1829—). King of Sweden and Norway after 1872. He was born in Stockholm, January 21, 1829, being the third son of Oscar I. In 1872 he succeeded his brother, Charles XV., on the throne. During his reign the development of the sister kingdoms was retarded by no for-

eign complications and received an effective stimulus in the efforts of the King, who showed himself a generous patron of industry, science, and the arts. On the question of the vexed relations between Sweden and Norway, arising from the latter kingdom's struggle for self-government, he firmly opposed all attempts looking toward the dissolution of the union between the kingdoms, but otherwise showed himself in favor of concessions to the Norwegians. He has also attained some note as a writer, the list of his works including: *Charles XII.; Prose Writings;* a number of volumes of lyric poetry, and a translation of Goethe's *Tasso*. His collected writings were published at Stockholm in 1885-94. In 1857 he married Princess Sophie of Nassau, by whom he had four sons.

OSCEOLA, ŏs'ē-ō'lȧ (Seminole *As-se-ho-hołar*, Black Drink) (c.1804-1838). A famous Seminole chief, born near the Chattahoochee River, Ga. His father was an English trader and his mother an Indian woman, the daughter of a Creek chief. Removing to Florida when very young, he there acquired great influence among the Seminoles, and took the lead in opposition to the territorial aggressions of the whites. In 1835 his wife, the half-breed daughter of a fugitive negro slave, was reclaimed as a slave by her mother's former owner, and Osceola, infuriated, threatened revenge, and was temporarily imprisoned. On being released, he began the attacks on the whites which opened the second Seminole War (see SEMINOLE), and in December he killed with his own hand the Indian agent Thompson. For two years he was in almost every important engagement, and, by his shrewdness, skill, and bravery, foiled several white generals in succession. Finally (October 31, 1837), he was treacherously seized while holding a conference under a flag of truce with Gen. Thomas S. Jessup, and was confined at Saint Augustine and Fort Moultrie until his death, January 20, 1838.

OSCHATZ, ō'shȧts. A town in the Kingdom of Saxony, on the Döllnitz, 32 miles west of Leipzig (Map: Germany, E 3). Its manufactures include sugar, felt, knitted goods, cloth, and leather. Population, in 1890, 9400; in 1900, 10,652.

OSCHERSLEBEN, ōsh'ĕrs-lā-bĕn. A town of the Province of Saxony, Prussia, on the Bode, a branch of the Saale, about 30 miles southwest of Magdeburg (Map: Prussia, D 2). It has sugar refineries, and manufactures agricultural implements, fertilizers, chocolate, bricks, and boilers. In the vicinity are lignite mines. Population, in 1890, 10,700; in 1900, 13,400.

OSCINES, ŏs'ĭ-nēz (Lat., singing birds). The great group of Passeres (q.v.) which includes the song birds. They are characterized by several distinct pairs of intrinsic muscles of the syrinx, inserted into the ends of the upper bronchial half-rings, and constituting thus a complex and effective vocal apparatus. Not all the Oscines sing, but all truly singing birds are Oscines. The side of the tarsus is usually covered with a horny plate, which forms a sharp ridge behind, with the corresponding plate of the other side. The primaries are nine or ten in number, but when ten the first is very short. The Oscines are the largest group of birds, and include about 5000 species of the 11,000 known birds. They are found in all parts of the world, but are perhaps most abundant in the temperate zones. Many of them are of very brilliant plumage, but as a rule the musical powers and intelligence are more noticeable than the beauty, and they are universally regarded as the most highly developed group of birds. Most of them are of comparatively small size, the very great majority being less than a foot in length. The raven (q.v.) is the largest of the suborder, while the kinglets (q.v.) are probably the smallest. Of our North American birds, about one-half are Oscines. For the anatomy and classification of the group, consult: Evans, *Birds* (New York, 1900); Newton, *Dictionary of Birds* (ib., 1893-96); Stejneger, *Standard Natural History*, vol. iv. (Boston, 1885).

OSCULATING CIRCLE. In geometry, a circle that has three, i.e., the greatest possible number, of consecutive points in common with a given curve. A curve can at any given point have more than one tangent circle, i.e. circles with which it may be imagined to have either one or two points in common; but it can, at any given point, have only one *osculating* circle, for only one circle can pass through three given points. The curvature of a curve at a given point is obviously identical with the curvature of its osculating circle at that point, and hence the osculating circle is often spoken of as the 'circle of curvature' of the curve at the given point.

OSCULATION (Lat. *osculatio*, a kissing, from *osculari*, to kiss, from *osculum*, kiss, little mouth, diminutive of *os*, Skt. *asya*, mouth). One curve is said to *osculate* another when the curves have several consecutive points in common, and the degree of osculation depends upon the number of points of contact; that is, the greater the number of consecutive points in contact, the higher the degree of osculation. The number of possible points of contact is determined by the number of *independent* arbitrary constants contained in the equation of the tangent curve. The same is true of a straight line and a curve. The equation of a straight line, being of the form $y = mx + c$, contains two arbitrary constants, m and c; hence a straight line can coincide with a curve in two consecutive points, and the contact is said to be of the first order. This straight line is the tangent at the point of contact. When a straight line, not a tangent, meets a curve, there is section instead of contact, and in that case only one point is common to the straight line and the curve. The general equation of the circle, $x^2 + y^2 + dx + ey + f = 0$, contains three arbitrary constants, d, e, and f, and therefore a circle can have three consecutive points in common with a curve, and the contact is of the second order. The circle is known as the circle of curvature or the *osculating* circle, and has for its radius the radius of curvature of that portion of the curve with which the circle is in contact. No other circle can have so high a degree of contact with a curve at any point as the osculating circle at that point. Surfaces and some twisted curves admit of spheres of osculation. See CURVE.

ÖSEL, ē'zl, or **OESEL**. A large island in the Baltic Sea, belonging to the Russian Government of Livonia, and situated at the entrance to

the Gulf of Riga (Map: Russia, B 3). It has an area of 995 square miles. It is irregular in outline, with a long and narrow peninsula extending southward toward the Domesnäs of Courland, and its coasts are indented with numerous small bays, offering, however, few harbors. The surface is undulating, in parts marshy and but sparsely forested. The soil is not unfertile, and the climate is mild enough to permit the cultivation of all the common cereals, including wheat. The chief occupations of the inhabitants are agriculture, fisheries, and the rearing of cattle and horses. The population, including that of some small dependent islands, was, in 1897, 56,869, chiefly Esthonians. The principal town is Arensburg, on the southeast coast, with a population, in 1897, of 4621. Oesel was occupied by the Knights Swordbearers early in the thirteenth century, and when their power was broken it was sold in 1559 by its bishop to Denmark. In 1645 it was ceded to Sweden, and in 1721 it came into the possession of Russia.

OS'GOOD, Frances Sargent (Locke) (1811-50). An American poetess, born in Boston. When but a girl she contributed poems to the "Juvenile Miscellany" of Lydia Maria Child and won some reputation, which she increased by other poems and by editorial work. In 1835 she married Samuel S. Osgood, a portrait painter, and visited England, where she published among other works a collection of poems called "A Wreath of Wild Flowers from New England" (1839), and a play written at the request of Sheridan Knowles, "The Happy Release, or The Triumphs of Love." A *Memorial* by friends, with an account of her life by Griswold, was printed in New York in 1851. A complete illustrated edition of her poems appeared in 1850.

OSGOOD, George Laurie (1844—). An American musician and director. He studied voice-culture under Sieber, Haupt, and Robert Franz in Germany, and under Lamperti in Italy. Largely through the success he had achieved in Germany, Theodore Thomas engaged him for a winter tour in America. In 1872 he took up his residence in Boston as a vocal teacher, and three years later became conductor of the Boylston Club. In 1890 he also took charge of the Boston Singers' Society. His anthems, choruses, part songs, and songs are well known. He published a *Guide in the Art of Singing*, which was favorably received.

OSGOOD, Samuel (1748-1813). An American soldier and politician, born in Andover, Mass. After graduation at Harvard College (1770), ill health compelled him to exchange a mercantile career for the theological studies already undertaken. Having been a delegate to the Essex County (Mass.) Convention (1774), and active in the Provincial Congress, in 1775 he served as captain of minute-men at Lexington and Concord. For a short time he was aide to General Artemas Ward, but left the army to reënter the Provincial Congress. From 1780 to 1784 he was a member of the Continental Congress, and from 1785 to 1789 first Commissioner of the United States Treasury. He was later Postmaster-General, Speaker of the New York Assembly, State supervisor, and naval officer of New York port.

OSGOOD, Samuel (1812-80). An American clergyman, born at Charlestown, Mass. He was graduated at Harvard College in 1832, and at the Cambridge Divinity School in 1835. In 1836-37 he edited the *Western Messenger* at Louisville, Ky. In 1837 he became pastor of the Unitarian Church at Nashua, N. H., in 1841 of the Westminster Church in Providence, R. I., and in 1849 of the Church of the Messiah in New York. In 1850-54 he was editor of the *Christian Inquirer* in New York. In 1870 he entered the Protestant Episcopal Church, but took no pastoral charge. He was the author of *Studies in Christian Biography* (1851); *God with Men* (1853); *The Hearthstone* (1854); *Milestones in Our Life Journey* (1855); *Student Life* (1860); *American Leaves* (1867); translations from Olshausen's *The History of the Passion* (1839), and De Wette's *Human Life* (1842).

OSH, ôsh. A town in the Territory of Ferghana, Russian Turkestan, situated about 60 miles east of Margelan. It consists of the old native town and the new Russian settlement, and is of some importance in the trade with China. Population, in 1897, 36,474, including over 34,000 Mohammedans.

O'SHAUGHNESSY, ô-shą'ne-sī, *or* ô-shąK'ne-sī, Arthur William Edgar (1844-81). An English poet, born in London, March 14, 1844. In 1861 he was appointed assistant in the library of the British Museum; two years later he was transferred to the department of natural history, a post which he held till his death, January 30, 1881. His verse comprises *The Epic of Women and Other Poems* (1870); *Lays of France* (1872), based upon the *lais* of Marie de France; *Music and Moonlight* (1874); and *Songs of a Worker* (posthumous, 1881). The first volume especially contains pieces of great beauty. O'Shaughnessy belonged to the Neo-Romantic School more completely represented by William Morris and Swinburne. In 1873 he married Eleanor, daughter of Westland Marston. She died in 1879. In collaboration with her he wrote *Toyland* (1875), a collection of tales for children. Consult Moulton, *O'Shaughnessy, His Life and His Work* (London and Chicago, 1894).

OSHAWA, ŏsh'ä-wä. A port of Ontario County, Ontario, Canada, on Lake Ontario and on the Grand Trunk Railway, 33 miles northeast of Toronto and 6½ miles east of Whitby (Map: Ontario, E 4). It has iron foundries and factories, flour mills, etc. Population, in 1891, 4066; in 1901, 4394.

O'SHEA, ô-shā', Michael Vincent (1866—). An American educator, born at LeRoy, N. Y. He graduated at Cornell University in 1892, taught for three years in the Mankato (Minn.) Normal School, and, after serving as professor of education in the Buffalo Teachers' College, in 1897 was appointed to a like chair in the University of Wisconsin. He became prominent in university extension work and as a lecturer on pedagogy. His publications include: *Aspects of Mental Economy* (1900); and, in a series under his editorial charge, *Education as Adjustment* (1903), and *Education for Efficiency: Chapters on Method and Management in Teaching* (1903).

OSHIMA, ō'shê-mä' (Jap., Big Island). The name of at least twenty places in Japan. The two most important are: (1) The most northerly of the "Seven Islands of Idzu," which stretch

southward for 100 miles toward the Bonin Islands, and is best known to foreigners as Vries Island. It is of volcanic origin, is eight miles long and five wide, has a good harbor, and an ever-smoking volcano, Mihara-Yama. It has a population of about 5000, living in six villages along the coast. No rice is produced, as the people live principally by fishing and exporting cherry-tree wood to the main islands of Japan. A little corn and sweet potatoes are raised. The women do most of the work, and, as in the Loochoos, carry their burdens on their heads. Their dress differs considerably from the dress of the women of the mainland; they wear petticoats, dress their hair differently, and do not blacken their teeth. The men dress as other Japanese. Concubinage does not exist; musical instruments are not found, and dancing is unknown. (2) Anami-Oshima, one of the large islands of the Loochoo Archipelago (see LOOCHOO), which came under the control of the Daimio of Satsuma in 1609. It is 34 miles long and 17 wide; is of volcanic origin, with steep shores, and hills rising to heights of 1400 to 1500 feet. Here in 1867 a modern sugar-refining plant was erected by some foreigners for the Daimio of Satsuma, but, not proving remunerative, it was later removed. The port is Naze, with a good harbor, on the north coast, latitude 28° 23′ N., longitude 129° 30′ E. The inhabitants suffer much from very poisonous snakes of the genus Trimeresurus, which infest even the houses.

OSH'KOSH. A city and the county-seat of Winnebago County, Wis., 80 miles northwest of Milwaukee; on Lake Winnebago, at the mouth of the Upper Fox River, and on the Wisconsin Central, the Chicago and Northwestern, and the Chicago, Milwaukee and Saint Paul railroads (Map: Wisconsin, E 5). It is the seat of a State normal school. In the suburbs, three miles distant, is the Northern Hospital for the Insane (State), and near it the County Asylum for the Incurable Insane and the County Poor Farm. The city has a public library, North, South, and Electric parks, and several bridges across the river. Among its notable structures are several public school buildings, the city hall, the county courthouse, and the United States Government building. Lake Winnebago is a popular resort for yachting, ice-boating, fishing, and hunting. Owing to the accessibility to valuable forests, Oshkosh has developed important lumber interests, and manufactures products of lumber in great variety—sash, doors, and blinds, matches, furniture, trunks, carriages and wagons, etc. Other manufactures are machinery, boilers, grass twine and matting, flour, tobacco, and malt liquors. The city's commercial interests are increasing, and include a large wholesale trade. The government is administered by a mayor, elected every two years, and a council, of which the executive is a member. The school board is independently elected by popular vote. Oshkosh was settled in 1836 and chartered in 1853. In 1859, 1866, 1874, and 1875 it suffered severely from fires. Population, in 1890, 22,836; in 1900, 28,284.

OSIANDER, ō'sē-ăn'dẽr, ANDREAS (1498-1552). A German reformer. He was born December 19, 1498, at Gunzenhausen, near Nuremberg. Osiander, whose real name was Hosemann, was educated at Ingolstadt and Wittenberg, and became a preacher at Nuremberg in 1522, where he was conspicuously active in introducing the Reformation. He advocated the views of Luther in his controversy with Zwingli, on the question of the Lord's Supper; took part in the conference held at Marburg (1529), and was present at the Diet of Augsburg (1530). In 1548 he was deprived of his office as preacher at Nuremberg, because he would not agree to the Augsburg Interim (see INTERIM); but was immediately invited by Albert, Duke of Prussia, to become the head of the theological faculty in the newly established University of Königsberg. He was hardly settled here when he became entangled in a theological strife that imbittered his naturally imperious and arrogant temper. In the treatises *De Lege et Evangelio* (1549) and *De Justificatione* (1550) Osiander asserted that the righteousness by which sinners are justified is not to be conceived as a mere justificatory or imputative act on the part of God, but as something inward and subjective, as the impartation of a real righteousness, springing in a mystical way from the union of Christ with man. The most notable of his opponents was Martin Chemnitz (q.v.). A seemingly amicable arrangement between the disputants was brought about by Duke Albert in 1551; but the strife was soon recommenced, Osiander publishing new writings in which he attacked Melanchthon; nor did his death in Königsberg, October 17, 1552, put a stop to the war of words. It was continued by his followers, called *Osiandrists*, who were finally extinguished by the *Corpus Doctrinæ Prutenicum* (in 1567), which caused their banishment from all parts of Prussia. The leader of the party, the Court preacher Johannes Funck, Osiander's son-in-law, was beheaded (1566). Consult the *Life of Osiander*, by Möller (Elberfeld, 1870).

OSIER (OF., Fr. *osier*, from Gk. *οἶσος, oisos, οἴσυον, oisyon, οἴσυα, oisya*, sort of osier; connected with Gk. *ιτέα, itea*, Lat. *vitex*, withy, *vitis*, vine, OPruss. *vitro*, OHG. *weda*, Ger. *Weide*, AS. *wīpig*, Eng. *withy*). The popular name of the bushy willows used for making wicker-work. Their long and slender branches are valuable in proportion to their length, slenderness, suppleness, and toughness. The common osier (*Salix viminalis*), a European species common in wet alluvial grounds, sometimes becomes a tree, although when cultivated for hoops and basket-making it is not permitted to do so. It is often planted to prevent the washing of river banks. It has several cultivated varieties much more useful than the original or wild species, which are apt to break, and therefore are of little value. More suitable for the fine kinds of basket-making are *Salix purpurea*, sometimes called the fine basket osier, and a variety known as the green-leaved osier or ornard, and *Salix triandra*, known to English osier cultivators and basket-makers as the Spaniard rod. *Salix alba*, which sometimes becomes a tree, is the golden osier or golden willow, remarkable for the bright yellow of its branches, as well as for their pliancy and toughness. There are other species, such as *Salix caprea*, *Salix lucida*, and *Salix fragilis*, which are also valuable; but the osiers chiefly cultivated belong to the species which have been named, or are very nearly allied to them. Since some of the European species do not stand the American climate very well, *Salix sericea*, *Salix petiolaris*, *Salix lasiandra*, and *Salix lævigata*,

all American species, are recommended for growing in the United States.

Osiers are extensively cultivated on alluvial soils, especially on the tide-flooded river basins of Holland, Belgium, and France, whence large quantities of rods are exported. Much depends on the closeness of planting, as when space is too abundant the shoots of many of the kinds branch more than is desirable. When osiers for the finest kinds of basket-work are desired, single-eye cuttings are planted close together, so as to obtain weak but fine shoots. For ordinary work, cuttings 15 to 16 inches long and of tolerably thick branches are planted in rows from 18 inches to two feet apart, and at distances of 15 to 18 inches in the row. Osier plantations in light soils continue productive for 15 or 20 years, and much longer in rich, alluvial soils. Clay soils are unsuitable. Usually no cultivation is required after planting, although shallow cultivation is recommended to keep down the weeds. The shoots are cut once a year, during the resting period. They are then sorted, and those intended for brown baskets are dried and stacked, out of danger of rain, care being also taken to prevent heating, to which, like hay, they are liable, and by which they would be rendered worthless. Osiers intended for white baskets cannot at once be peeled; but after being sorted, they are tied in bundles, placed upright in wide shallow trenches or rivulets in which there is about four inches of water, till they begin to bud and blossom in spring. They are then, in ordinary seasons, easily peeled by drawing them through an instrument called a 'break,' but in cold seasons it is sometimes necessary to lay them for a while under a quantity of litter. They may also be peeled by steaming or boiling the dried shoots. There are extensive plantations in the vicinity of Rochester and Liverpool, New York; Detroit, Michigan; Milwaukee, Wisconsin; Cincinnati, Ohio; and Baltimore, Md. In 1890 there was produced in the United States willow ware valued at $3,630,000, an increase of 61 per cent. over the production of 1880.

OSIMO, ō'zē-mō. A town of Central Italy in the Province of Ancona, situated eight miles south of Ancona (Map: Italy, H 4). It has a cathedral, a bishop's palace, a museum containing many statues and ancient inscriptions, and a library. The chief industry is silk-spinning. Osimo is the ancient *Auximum*, founded by the Romans in B.C. 157. Population (commune), in 1881, 17,346; in 1901, 18,529.

OSI'RIS (Lat., from Gk. Ὄσιρις, from Egypt. *Hesri, Ausar, Asiri*). One of the principal Egyptian deities, originally the local god of Abydos and Busiris, who early acquired a solar character and was identified with the setting sun. He thus came to be regarded as the ruler of the realm of the dead in the mysterious region below the western horizon. According to the legend, Osiris was the son of Seb (the earth) and Nût (the sky), and the husband of his sister Isis. When he came to rule over Egypt he found the people plunged in utter barbarism and raised them from their wretched condition by giving them laws, teaching them to till the ground, and instructing them in the worship of the gods. He then traveled over the whole world, spreading the blessings of civilization in every land. His wicked brother Set (Typhon), the enemy of all good, would have taken advantage of his absence to undo his work and subvert the order he had established, but was defeated by the watchfulness of Isis. When the King returned, however, Set plotted to destroy him by treachery. Having privily taken the measure of Osiris's body, he made a beautiful chest of like dimensions and brought it with him to a great feast, at which Osiris was present. As though in jest, he promised to give the chest to any one whose body should fit it exactly. After a number of the guests had tried in vain, Osiris got into the chest and lay down, when Set and his confederates quickly shut the lid and fastened it securely. They then cast it into the river, and it was borne out to sea by the Tanitic mouth of the Nile. Isis, after long wanderings, found her husband's body and brought it back to Egypt, but while she went to visit her young son Horus, it was discovered by Set, who tore it to pieces and scattered the fragments far and wide. Upon learning of this misfortune, Isis took a boat and carefully sought out the scattered members of her husband. Wherever she found a portion of the body, she buried it, and the spot was ever thereafter revered as sacred ground. When Horus grew up, he took vengeance upon the murderer, Set, and ascended his father's throne. Osiris, meantime, lived again in the under world and became the ruler of the dead. At a very early period the worship of Osiris was connected with the Egyptian doctrine of the immortality of the soul and became popular throughout Egypt. Abydos, where the head of the god was believed to be preserved, enjoyed the reputation of special sanctity, and bodies were brought from all parts of Egypt for burial in its sacred soil. Osiris is usually represented swathed in mummy cloths, holding in his hands the crook and the flail, symbols of royalty, and wearing upon his head the *Atef* crown, which was formed of the tall crown of Upper Egypt with a long feather on each side. Consult: Wiedemann, *Religion of the Ancient Egyptians* (New York, 1897); Erman, *Life in Ancient Egypt* (London, 1894). See also Isis; Horus; Serapis; Set; and the paragraph on *Religion* in the section on *Ancient Egypt*, and Plate of Egyptian Deities, under the title Egypt.

OSKALOOSA, ŏs'kȧ-lo͞o'sȧ. A city and the county-seat of Mahaska County, Ia., 60 miles southeast of Des Moines; on the Burlington Route, the Chicago, Rock Island and Pacific, and the Iowa Central railroads (Map: Iowa, E 3). It is the seat of Oskaloosa College (Christian) and Penn College (Friends), opened in 1873, and has a public library, and a United States Government post office building, erected at a cost of $65,000. The yearly meetings of the Society of Friends in Iowa are held here. The industrial interests of the city are represented by manufactures of wagons, steam and hot-water heaters, flour, packed meat, woolen goods, vitrified brick, and iron and brass goods. In the vicinity are deposits of coal, which is extensively mined, besides fire clay and limestone. There are also large agricultural and stock-raising interests. Settled in 1843, Oskaloosa was incorporated ten years later. The government is administered under a revised charter of 1885, which provides for a mayor, chosen every two years, and a council. Population, in 1890, 6558; in 1900, 9212.

OSLER, ŏs'lẽr, William (1849—). An American physician and author. He was born at

Bondhead, Ontario, was educated at Trinity University, Toronto, and at the medical faculty of McGill University, Montreal, where he graduated in 1872. He also studied at University College, London, England, and at Berlin and Vienna. In 1874 he returned to Canada and was appointed professor of physiology and pathology in McGill University; ten years afterwards he was called to the chair of clinical medicine in the University of Pennsylvania. In 1889 he was made professor of the principles and practice of medicine in Johns Hopkins University and chief physician to the Johns Hopkins Hospital. His chief publications include: *Clinical Notes on Smallpox* (1876); *Histology Notes* (1882); *Cerebral Palsies of Children* (1889); and *The Principles and Practice of Medicine* (1892 et seq.).

OSMAN, ŏs-män′. Founder of the Ottoman Empire. See OTHMAN.

OSMAN DIGNA, dig′nȧ (c.1836—). A follower of the Mahdi in the Sudan. He was born, according to some, at Suakin, while others give his birthplace as Rouen, France, and his father as a Scotchman named Nisbet. According to this latter account, the family moved to Alexandria, in 1849, where the father soon died, and the widow married a Turk named Osman, who adopted young Nisbet and called him Osman Ali. They went to Suakin and engaged in the slave trade. Osman continuing the traffic after the death of his stepfather. His business of slave-selling being broken up by the English, he took part in the revolt of Arabi Pasha (q.v.), and after the failure of that movement he attached himself to the cause of the Mahdi. About this time he received the name Digna because of the fullness of his beard; also the title of the 'Emir of the Dervishes of God.' He maintained himself at the head of a powerful army around Suakin and inflicted a severe defeat on Baker Pasha near Tokar, southeast of that place, on February 4, 1884. Immediately after this victory, however, he was defeated by General Graham near Tokar and at Tamanieb. As the Mahdi's ablest general he was largely responsible for the fate of Gordon and the loss of the Sudan to the English. In December, 1888, he suffered a bloody reverse at the hands of General Grenfell, but nevertheless continued his raiding expeditions in the Sudan. In 1899 he fought in the last campaign of the Mahdist forces, whose strength had been broken the previous year at Omdurman. On January 19, 1900, he was captured near Tokar and sent a prisoner to Rosetta.

OSMANIE, ŏs-mä′nē-ȧ, ORDER OF. A Turkish order conferred for conspicuous service to the State. It was established by Abd-ul-Aziz on his accession to the throne in 1861, and has four classes. The decoration is a green-enameled gold star with six points, suspended by the star and crescent from a green ribbon with red bands. In the centre of the star is a crescent on a red background.

OSMAN′LIS. See TURKEY.

OSMAN NURI PASHA, ŏs-män′ nōō′rē pȧ′shȧ′ (1837-1900). A Turkish general, called Ghazi (the victorious). He was born at Amasia, in Asia Minor. He was educated for the army at the Turkish military academy, became a subaltern officer in 1854, and fought in the Crimean War. He took part in the suppression of the rebellion of the Druses (1860), and in that of the Cretan insurrection of 1866-68. He was made a general of brigade in 1874, and in the following year a general of division. When Servia made war upon the Ottoman Empire in 1876, he was put in command of a corps of 35,000 men at Widin, and his successes won him the rank of marshal. In July, 1877, he took up a strongly fortified position at Plevna, thus arresting the advance of the Russians. He inflicted a severe defeat upon them on July 30th, and successfully withstood a desperate assault made by them and their Rumanian allies on September 11th. He held his position until his supplies failed him, and at last on December 10th made a gallant effort to break through the enemies' lines. Overpowered by superior numbers, he was forced to surrender. He was taken to Russia as a prisoner of war, but after the Treaty of San Stefano (1878) returned to Constantinople and became commander-in-chief of the Imperial Guard. He was Minister of War, 1878-85, and Grand Marshal of the Palace till his death, which occurred at Constantinople, April 4, 1900. Consult Levaux, *Ghazi Osman Pacha* (Paris, 1891). See RUSSO-TURKISH WAR.

OSMIUM (Neo-Lat., from Gk. *ὀσμή, osmē, ὀδμή, odmē*, odor, from *ὄζειν, ozein*, to smell). A metallic element discovered by Tennant in 1803. It is one of the platinum metals, and is found native alloyed with rhodium, ruthenium, and palladium. When *osmiridium*, which is found as a hard, crystalline substance (insoluble in aqua regia) in platinum ores, is heated to a white heat in porcelain tubes in a current of air, the volatile oxide of osmium (OsO_4) readily sublimes over. Metallic osmium may be obtained from the oxide by reducing the latter with hydrogen, carbonic oxide, or carbon.

Osmium (symbol, Os; atomic weight, 191) is a lustrous, blue-white metal with a specific gravity varying between 20 and 22.5. It is extremely difficult to fuse, much more so than platinum and iridium. Its compounds with oxygen include a monoxide (OsO), a sesquioxide (Os_2O_3), a dioxide (OsO_2), and the tetroxide (OsO_4) mentioned above. The tetroxide is the only one of the oxides that is volatile. Osmic acid, H_2OsO_4, has been obtained in the free state by the decomposition of its potassium salt (potassium osmate, K_2OsO_4) with water and precipitating with alcohol in a current of hydrogen.

OSMO′SIS (Neo-Lat., from Gk. *ὠσμος, ōsmos*, impulsion, from *ὠθεῖν, ōthein*, to push). This phenomenon, which is discussed in its fundamental form and from the physical point of view under SOLUTION, plays an important part in plant physiology. The plant cell, consisting of a mass of protoplasm, surrounded by a somewhat tough but flexible and elastic membrane, the cell wall, and inclosing a watery fluid, the cell sap, is an appropriate mechanism for an effective display of osmotic phenomena, which are fundamental to three important functions: (1) turgor (q.v.), (2) absorption and transfer of water, (3) absorption and transfer of dissolved substances. (See ABSORPTION IN PLANTS.) The general principles set forth under SOLUTION may be summarized with respect to plants as follows: (1) Dissolved substances diffuse to the limits of the solvent and exert an osmotic pressure [illegible] to gas pressure and manifesting the same [illegible]

(b) The osmotic pressure of several non-reacting substances in solution together equals the sum of the pressures of each solute upon the given volume of solvent. (c) Osmotic pressure may be made evident by interposing a membrane between solutions of unequal pressure, the solvent freely passing, while the solutes are hindered or prevented. (d) In plants water is the sole solvent. The plant cell is an osmotic apparatus. The cell wall is ordinarily permeable to both solvent and solutes, but the protoplasm is a semi-permeable membrane with respect to many solutes. Under normal conditions, therefore, when water is available, it enters the cell and allows the osmotic pressure of the solutes to manifest itself in pushing the protoplasmic membrane against the cell wall until the elastic resistance of the wall balances the pressure. A cell with wall distended is said to be turgid. The presence of solutes in the water within the semi-permeable membrane of protoplasm in the surface cells of the root demands the entrance of water from the outside until an equilibrium is reached. But the attainment or maintenance of equilibrium is constantly prevented by the evaporation of water from surfaces exposed to the air; for when water evaporates from a cell the elastic resistance of the cell wall is no longer equal to the osmotic pressure and water enters from a neighboring cell, and so on, corresponding action making possible the movement of water from more and more remote cells until the turgor is equalized by the entrance of water from without. (See CONDUCTION.) The absorption of solutes from water in contact with the plant is independent of the movement of water. If by removal from the cell sap, either by use or by transformation, the osmotic partial pressure of any solute within the cell be diminished, other molecules of this solute may gain entrance. Provided the protoplasm be permeable to it, the entrance of any solute depends on a disturbance of the equilibrium between the osmotic partial pressure of that substance inside and outside the cell.

Since the osmotic pressure of solutions of acids and salts (electrolytes) is greatly increased by their electrolytic dissociation (see DISSOCIATION), which occurs in watery solutions, this must be an important factor in plant life. Normally all the solutions surrounding the plant are dilute watery solutions in which the extent of such dissociation is considerable. The solutions within the plant cell, too, contain solutes in a state of electrolytic dissociation. In considering the osmotic phenomena within the plant, therefore, allowance must be made for the increase of osmotic pressure due to electrolytic dissociation.

OS'MUN, THOMAS EMBLEY, best known by his pseudonym, 'Alfred Ayres' (1834-1902). An American orthoëpist and critic. He was born in Montrose, Summit County, Ohio, and was educated at an academy in Cleveland, Ohio, at Oberlin College, and in Paris and Berlin, where he spent six years. Returning to America in 1859, he settled in New York, where he engaged in newspaper and magazine work and became well known as a dramatic critic. His extensive writings on orthoëpy and elocution were exceedingly popular, and so widely read as to give rise to the claim made for him by some that he had done more to better the condition of written and spoken English in America than any other man in his generation. In 1891-94 he was employed on the staff of the *Standard Dictionary*. Among his published works are: *The Orthoëpist* (1880); *The Verbalist* (1881); *The Mentor* (1884); *The Essentials of Elocution* (1886); *Acting and Actors* (1894); *Some Ill-used Words* (1901).

OSMUNDA (ML., water fern). A genus of ferns, distinguished by spore-cases in branched, stalked masses. The osmunda royal, royal or flowering fern (*Osmunda regalis*), is the noblest and most striking of North American ferns, found also in many parts of Europe. It has bipinnate fronds, and panicled spore-cases upon altered fronds, which appear as distinct stalks and simulate the general appearance of a phanerogamous plant. The sterile fronds sometimes rise to 5 feet in height. Its rootstocks were formerly employed in scrofula. The rootstocks abound in a mucilaginous substance, which is used in Northern Europe instead of starch. The cinnamon fern (*Osmunda cinnamomea*), another common North American species, is clothed with rusty wool when young, hence the name. *Osmunda claytoniana*, another American species common in low ground, has fertile fronds 2 to 4 feet in height.

OSNABRÜCK, ŏs'nä-brŭk (formerly called Osnaburg by English writers). An ancient town in the Province of Hanover, Prussia, situated on the Hase, about 30 miles northeast of Münster (Map: Prussia, B 2). It consists of the old, irregular town, surrounded by promenades laid out on the site of the ancient fortifications, and the new quarters regularly laid out and containing a number of handsome buildings. The Catholic cathedral is a partly Romanesque and partly Transitional building of the thirteenth century surmounted by three towers. The Gothic Marienkirche dates mainly from the fifteenth century and is of architectural merit. Among other noteworthy buildings is the Rathaus (fifteenth century), where the preliminary negotiations for the Peace of Westphalia were carried on.

The educational institutions comprise two gymnasia (of which one, the Gymnasium Carolinum, was founded by Charlemagne), a seminary for priests, two teachers' seminaries, a theatre, and a valuable museum. Industrially Osnabrück is among the most important towns of Hanover. It has extensive iron foundries, and manufactures various kinds of machinery, boilers, pipes, wire, nails, pianos, organs, rugs, cotton goods, paper, brick, tobacco, etc. In the vicinity are stone quarries and coal mines. The trade is important in local manufactures and agricultural and animal products. Population, in 1890, 39,900; in 1900, 51,574, including over 15,000 Roman Catholics.

Osnabrück received mint, market, and custom privileges as early as 888, and was surrounded with walls in 1082. Although constituting a part of the Bishopric of Osnabrück, founded by Charlemagne at the end of the eighth century, it enjoyed practical independence, and became a member of the Hanseatic League. In accordance with the provisions of the Peace of Westphalia, the Bishopric of Osnabrück was held alternately by Roman Catholics and Protestants until its secularization in 1803. In 1857 the Roman Catholic bishopric was reëstablished. Consult: Mithoff, *Kunstdenkmäler und Altertümer im Hannoverschen*, vol. vi. (Hanover, 1879); *Osnabrücker Geschichtsquellen*, edited by the His-

torischer Verein von Osnabrück (Osnabrück, 1891 et seq.); Würm, *Osnabruck, seine Geschichte*, etc. (ib., 1901).

OSORIO, ô-sō'rê-ō, Manoel Luiz (1808-79). A Brazilian general, born in Rio Grande do Sul, near Pelotas. In the civil war of 1839 to 1845 in his native province, he won his spurs; then served bravely in the Uruguayan campaign of 1851-52, and from 1865 to 1869, when he was disabled in action, took a prominent part in the war with Paraguay. During this war he was commander-in-chief (1865-66), and in 1867 was made lieutenant-general. Osorio entered politics, became Senator in 1877, and from 1878 to his death was Minister of War, but his great fame was as the brave and dashing cavalry leader who won from his soldiers the title of 'The Fabulous' (*O legendario*).

OSPREY (from OF. *orfraie*, from Lat. *ossifragus*, osprey, bone-breaker, from *os*, bone + *frangere*, to break), or Fish-Hawk. An accipitrine bird, which represents the genus Pandion and family Pandionidæ, and differs from the ordinary falcons in the reversible, owl-like outer toe, the lack of an aftershaft to the feathers, the long, closely feathered tibiæ, and other structural details, and in its habit of feeding exclusively on live fish, caught from the water. The osprey is cosmopolitan, except in some oceanic islands, but is everywhere local, as it is not able to live far from the shores of bodies of water or large rivers. The typical form is that of the Old World (*Pandion haliëtus*), of which the American fish-hawk and an Australian 'fishing eagle' are regarded as geographical races.

Our American fish-hawk is about two feet long. It is of a dark-brown color, variegated with white, gray, and black; the under parts are white except a light brown band across the breast. The bill is short, strong, broad, and very strongly hooked. The tail is rather long and the wings are very long. The soles of the feet are very rough and covered with small pointed scales which enable it to secure a firmer hold on its slippery prey, which it seizes with its talons alone and bears away to its nest or to a perch. It is often robbed of its gains by the bald eagle, which loves fish, but is unskillful in catching them.

The nest of the fish-hawk is a huge, stick-built affair (a load for a cart) placed on a sea-fronting cliff or in a tree—in the United States usually the latter; and the same structure may be repaired and reoccupied for many seasons. In favorable places colonies of fish-hawks may nest in company; and they have occasionally nested upon platforms placed upon tall poles for their accommodation. Another feature of interest is that other birds—notably the American grakles—often build their nests in the outer interstices of the osprey's rough structure, and dwell there undisturbed. The eggs (two to four) are white, blotched with claret-brown, purplish, and ochre. Excellent accounts of the fish-hawk are given in the books of Wilson, Nuttall, Audubon, and other of the older ornithologists, as well as in modern treatises on birds. See Plate of Eagles and Hawks.

OSSA (Lat., from Gk. Ὄσσα). The ancient name of a mountain in Northeastern Thessaly, separated from Olympus by the vale of Tempe. It is now called Kissavos. The conical summit is 6398 feet high. According to Homer, the young giants, Otus and Ephialtes, planned to pile Ossa on Olympus and Pelion on Ossa in order to reach heaven.

OSSEIN, ŏs'sē-in (from Lat. *os*, bone). A substance allied to gelatin and forming the organic part of bones. It is obtained by the prolonged action of dilute hydrochloric acid on bone, which dissolves all the inorganic matter. The material thus obtained retains the form of the bone without its hardness, and must be repeatedly washed with water, and treated with alcohol and ether to remove traces of salts, fat, etc. It is insoluble in water, but is converted into gelatin by the action of boiling water—a transformation which is much facilitated if a little acid be present. The ossein yielded by different kinds of animals requires different times for its conversion into gelatin, and that of young animals changes more rapidly than that of adults of the same species.

OSSETES, ŏs-sēts'. A people of the Kazbek region in the Central Caucasus. The Ossetes seem to be somewhat above the average in stature, with subbrachycephalic head-form, and largely without the prepossessing physical characters of some of the other peoples of the Caucasus. Ripley (1899) is inclined to regard the Ossetes as immigrants from the direction of Iran; their own tradition brings them from the region of the Don in Southeastern Russia. The Ossetes call themselves Iron, which has been identified with Iran (Eran). (See Ossetic Language.) Their religion is a mixture of Christianity and Islam. Family life is strong, but the married woman (though girls are consulted for marriage) has a rather servile position. Detailed information about the Ossetes will be found in Haxthausen, *Transcaucasia* (London, 1854); Von Erckert, *Der Kaukasus und seine Völker* (Leipzig, 1887); Chantre, *Recherches anthropologiques dans le Caucase* (Paris, 1885-87); and Kovalevski, "The Customs of the Ossetes," in the *Journal of the Royal Asiatic Society* for 1888. See Ossetic Language.

OSSE'TIC LANGUAGE. A modern Iranian language spoken in the central part of the Caucasus. In its phonology it resembles Armenian (q.v.) in many respects, but these similarities are to be regarded as accidental coincidences. In structure the language, like the other modern Indo-Iranian vernaculars, is analytic in type. The noun has ten cases, formed by postpositions (e.g. *lag*, 'man,' *laga*, 'to the man,' *laji*, 'of the man,' *lajima*, 'with the man,' while the plural *lagta*, 'men,' has the corresponding forms *lagtan*, *lagtj*, *lagtima*). The verb has three tenses, present, preterite, and future, and four modes, indicative, imperative, optative, and subjunctive. Compound tenses and a passive voice are formed, as in many other languages, by the participles and the verb *ŭnm*, 'to be' (e.g. *nudistāt*, 'ye were cursed'). Ossetish has two main dialects, Tagaurish, Ironish, or Irish in the northeast, with a subdialect Tualish in the south, and Digorish or Dugorish in the northwest. By far the most important linguistically is Tagaurish. The Ossetish has but a scanty literature, although rich in folk tales. The Psalms and most of the New Testament have been translated into it. The Russian alphabet is often employed, although the Armenian is the

more common. Consult: Spögren, *Ossetische Sprachlehre* (Saint Petersburg, 1844); Rosen, *Ossetische Sprachlehre* (Lemgo, 1846); Konkadze and Konayevym, *Osetinskoje teksty* (ed. by Schiefner, Saint Petersburg, 1868); Miller, *Osetinskije etyudy* (Moscow, 1881-87); id., *Digorskoi skazanniia* (ib., 1902); Stackelberg, *Beitrage zur Syntax des Ossetischen* (Strassburg, 1886); Hübschmann, *Etymologie und Lautlehre der Ossetischen Sprache* (ib., 1887).

OS'SETT. A municipal borough in Yorkshire, England, on the Calder, 3½ miles west of Wakefield (Map: England, E 3). Its staple industry is the manufacture of woolens. Coal is extensively mined in the neighborhood. The town owns its water supply and maintains a free library, technical school, and sewage works. It has a mechanics' institute. Population, in 1891, 11,100; in 1901, 12,300.

OS'SIAN, more correctly **OISÍN**, or **OSSÍN.** A legendary character of Irish literature, whose exploits are connected with historical events of the last days of heathendom in Ireland. As time went on poems about Ossin spread over Ireland and Scotland. The whole cycle underwent changes in individual poems. The tradition was embellished, and more and more it grew to resemble fairy lore. According to the evidence of these largely fragmentary or late poems and of the prose romances, Ossin belongs to the third century A.D. and to Ireland. King Cormac MacArt had a son-in-law Finn (or Fionn), who commanded the Fianna or Fenians, a sort of praetorian guard of the royal chieftain, among whom were Finn's son Ossin, his grandson Oscar, and another grandson Caoilte (or Caillte). Cormac is said to have died in 266. His successor, Carbery, thought the Fenians a danger to his throne. Civil war arose. Carbery slew Oscar. The Fenians were crushed in 293 at the battle of Gabhra. Ossin and his cousin Caoilte fled, and we find them, only 150 years later, in the company of Saint Patrick, through whose ministrations they die baptized, according to some forms of the legend. The "Story of Ossin in the Land of the Young" makes him pass long years in fairyland. It is possible to distinguish three periods in the Ossin cycle: (1) The ancient, recorded in fragments older than the twelfth century, of which there may be altogether some 100. (2) The mediæval, containing documents chiefly of the twelfth century, of which the most important is the *Agallamh na Senorach* or *Colloquy of the Elders*, a chaos of local legends, of prose and verse, the latter apparently the more ancient, and bearing somewhat the relation to the former, in diction, that the *Elder Edda* does to the *Younger*. The work of this period is more patriotic, chauvinistic even, than are the ancient fragments. It expresses hatred for the foreigner, under the guise of Fenian opposition to the Lochlannach. Another noteworthy characteristic is that woodcraft plays a greater part and there is more appreciation of nature than earlier. (3) The post-mediæval Ossinic documents are mainly in verse. The wilder forms of nature become prominent in them, and many of the songs are defiantly and dramatically pagan, as though in scorn of the sour fanaticism of Patrick, who is quite transformed from the genial saint of the earlier period. The first examples of the cycle in this stage are to be found in Dean McGregor's *Book of Lismore*, a compilation of 1518, or perhaps earlier. But Irish and Scotch tales of Ossin and the Fenians continued to be sung and told in the seventeenth, eighteenth, and even in the nineteenth century. The last deliberate contribution to the Ossin cycle was Michael Comyns's *Oisin in Tir na N-Og*, which, as it was written about 1750, is by an odd coincidence almost exactly contemporary with Macpherson's (q.v.) dislocated mosaic of phrases from Ossinic poems coupled with those of other cycles and set in a modern and rather cheap paste, which he published as "Ossian." Yet the reaction against Macpherson's poems has been too strong. In Macpherson's work landscape plays a very great part; in the Ossin cycle a very small one. It may be noted too that Macpherson confounds heroes of the cycle of Cuchullin with the Fenians and makes both contemporaries of the Northmen of the eighth century. (See MACPHERSON.) It is doubtful if any fragment of verse by Ossin remains. Poems are first attributed to him in twelfth-century manuscripts. Indeed, the origin, authorship, date, historical background, and even the existence of the hero, are all matters of uncertainty and debate. Consult: Ossianic Society publications (Dublin, 1854-61); Simpson, *Poems of Ossian* (London, 1857); J. F. Campbell, *Popular Tales of the West Highlands, Orally Collected, with a Translation* (ib., 1860-62); Mac Lauchlan, *The Book of the Dean of Lismore* (ib., 1862); Clerk, *The Poems of Ossian, with a Dissertation and Translation* (ib., 1870); Campbell, *Leabhar na Feinne* (ib., 1871); *Academy* for 1873—letters by Hennessy; Windisch, *Die altirische Sage und die Ossianischen Gedichte* (Leipzig, 1878); Windisch, *Irische Texte* (Leipzig, 1881-1900); Arbois de Jubainville, *La littérature ancienne d'Irlande et l'Ossian de Macpherson* (Paris, 1880); K. Meyer, *Cath Finntraga, or the Battle of Ventry* (Oxford, 1885); Campbell, *Fians* (London, 1891); O'Grady, *Silva Gadelica* (London, 1892), and *Silva Celtica* (London, 1895); Texte, *J. J. Rousseau et les origines du cosmopolitisme littéraire au XVIIIe siècle* (Paris, 1895, translated London, 1899); Nutt, *Ossian and the Ossianic Literature* (London, 1899); also the *Revue Celtique* (Paris, 1870 et seq.). See MACPHERSON, JAMES.

OSSIFICATION (from Lat. *os*, bone + *facere*, to make). The vital process by which calcareous matter is deposited in cartilage or membrane, giving rise to bone. At a very early period of embryonic life, as soon as any structural differences can be detected, the material from which the bones are to be formed becomes mapped out as a soft gelatinous substance, which may be distinguished from the other tissues by being rather less transparent, and soon becoming decidedly opaque. From this beginning the bones are formed in two ways: either the tissue just described becomes converted into cartilage, which is afterwards replaced by bone (*intracartilaginous ossification*), or a germinal membrane is formed, in which the ossifying process takes place (*intramembranous ossification*). The latter is the more simple and rapid mode of forming bone. When ossification commences, the membrane becomes more opaque, and exhibits a decided fibrous character, the fibres being arranged more or less in a reticulated manner. These fibres become more distinct and granular from impregnation with lime salts, and are converted into incipient bone, while the cells which are

scattered among them shoot out into the bone corpuscles, from which the canaliculi are extended, probably by resorption. The facial and cranial bones, with the exception of those at the base of the skull, are formed without the intervention of any cartilage.

In intracartilaginous ossification, at the point where ossification begins the cartilage cells arrange themselves into rows, and become separated by the growth of the matrix in which they lie. A deposit of calcareous material now takes place between the rows of cartilaginous cells, and the cartilage assumes a granular and opaque appearance. While this process is going on in the centre, a thin layer of bone is being formed between the surface of the cartilage and the vascular membrane covering it—the periosteum—by the agency of cells called osteoblasts, in much the same way that intramembranous ossification takes place. From this outer shell prolongations consisting of osteoblasts and blood-vessels penetrate toward the centre of the cartilage and form the permanent canals through which the bone is nourished. All the bones of the body except those of the face and the vault of the cranium are formed in cartilage. Certain bones at the base of the skull, as the occipital, are formed partly in cartilage and partly in membrane.

True ossification sometimes occurs as a pathological process; but in many cases the term is incorrectly used (especially in the case of blood-vessels) to designate a hard calcareous deposit, in which the characteristic microscopic appearances of true bone are absent. The osseous tissue that is formed in regeneration of destroyed or fractured bones may be regarded as due to a morbid, although a restorative action. Hypertrophy of bone is by no means rare, being sometimes local, forming a protuberance on the external surface, in which case it is termed an *exostosis*, and sometimes extending over the whole bone or over several bones, giving rise to the condition known as *hyperostosis*. Again, true osseous tissue occasionally occurs in parts in which, in the normal condition, no bone existed, as in the dura mater, in the so-called permanent cartilages (as those of the larynx, ribs, etc.), in the tendons of certain muscles, and in certain tumors. The causes of these osseous formations are not known.

OS'SINING (formerly Sing Sing). A village in Westchester County, N. Y., 31 miles north of New York City; on the east bank of the Hudson River, and on the New York Central and Hudson River Railroad (Map: New York, G 4). It is a popular residential place, beautifully situated at the widest part of the Hudson, Tappan Bay, and commanding from its elevated site fine views. It has a public library, several private boarding schools, and a soldiers' monument. The arch of the Croton Aqueduct, 88 feet in span and 70 feet above water, with a subjacent arched highway bridge, is an interesting feature. The Sing Sing State Prison, located here, is one of the most prominent in the United States. There are extensive manufactures of machinery, foundry products, porous plasters, pills, shoes and leather, etc. Under a revised charter of 1897 the government is vested in an annually elected president and board of trustees. There are municipal waterworks. Population, in 1900, 7939. Settled about 1700 on part of the Philipse Manor, Sing Sing, named probably from the Sin Sincks Indians, was incorporated as a village in 1813. In 1901 the name was changed to Ossining after several attempts had been made, the former name having become objectionable owing to its association with the prison. Consult Scharf, *History of Westchester County* (Philadelphia, 1886).

OS'SOLI, Marchioness. See Fuller, Sarah Margaret.

OSTADE, ōs'tä-de, Adriaen van (1610-85). One of the greatest of Dutch genre painters, he was born at Haarlem, December 10, 1610, and was a pupil of Frans Hals. He was, however, more influenced by his fellow-pupil Brouwer, in whose manner he painted tavern scenes from peasant life, during what may be called his first manner, which lasted till about 1640. He endeavored to render the artistic effect of the whole, giving little detail, and even caricaturing Brouwer's types. His second manner is characterized by chiaroscuro effects, which show, especially in his interiors, the influence of Rembrandt. The element of the landscape also enters his art, which had heretofore been confined to interiors. From 1650 to 1670 he was at the height of his powers, after which his pictures become cooler in tone, though the colors are brighter, and the execution is more detailed. He lived in prosperous circumstances, having been dean of the Painters' Guild and a member of the civic guard. He died at Haarlem, April 27, 1685.

Over five hundred of his paintings survive, of which there are numerous examples in the galleries of Northern Europe. Of the paintings of his first period, representing tavern scenes, there are good specimens in the private galleries of Vienna and Cassel, and in the public collections of Munich and Dresden. Among the works of his best period are the "Hurdy-Gurdy Man Before a Peasant's Cottage" (1640) and "Peasant Company," in the Berlin Museum; "Interior of a Cottage," (1642), "The Village School," and "The Schoolmaster," in the Louvre; "A Tavern Scene" (1660), "Peasants Smoking," "The Painter in His Studio," and others in the Dresden Gallery; and a number of excellent examples in Buckingham Palace, London. To his best period also belong a number of admirable single genre figures like the "Baker," "Fiddler," "Hurdy-Gurdy Man," and the three "Senses," at Saint Petersburg; the "Merchant," and "Man Reading," in the Louvre; "The Smoker" (Antwerp), and the "Herring Eater" (Brussels); and a fine portrait group wrongly supposed to be the painter and his family, in the Louvre. There are good examples of his later period at Amsterdam, The Hague, Cassel, and Dresden. Ostade was also an etcher of some distinction, having left about 50 plates treating of peasant subjects, most of them dated 1646 and 1647, a period at which he was under the influence of Rembrandt.

Consult: Van der Willigen, *Les artistes de Haarlem* (The Hague, 1870), and the biographies by Gaedertz (Lübeck, 1869), and Lemcke, in Dohme, *Kunst und Künstler* (Leipzig, 1878); also Bode, *Adriaen van Ostade als Zeichner und Maler* (Vienna, 1881); Van der Wiele, *Les frères van Ostade* (Paris, 1893); Rosenberg, *Adriaen und Isaak van Ostade* (Bielefeld, 1900); Springer, *Das radierte Werk von Adriaen van Ostade* (Berlin, 1899).

OSTADE, Isaak van (1621-49). A Dutch landscape and genre painter. He was born at

Haarlem, and was a younger brother and the principal pupil of Adriaen van Ostade, from whose works it is difficult to distinguish his early genre paintings, which are not signed. He soon developed an independent style, the chief characteristics of which are warmth and harmony of color and an admirable impasto, his best productions comparing favorably with his brother's. He left about 120 paintings, most of which are in private possession in England. In his independent paintings one of his favorite subjects is traveling parties, consisting of men and horses, resting before a tavern, in which the theme is always varied, the charming landscape being the most attractive feature. Of this subject there are five examples in the galleries of Amsterdam, Buckingham Palace (London), Berlin, the Louvre, and Saint Petersburg. His other chief specialty is winter scenes, represented in fine gray harmonies, in which he usually introduces the frozen canals with the national Dutch amusements of skating and sleighing. Of this variety there are three good examples in the Louvre, and others in the National Gallery, London, and in the Galleries of Antwerp, Saint Petersburg, and Dresden. A third subject, in which the figures rather than the landscapes are the principal part, are groups of peasants sitting in front of taverns or house doors, of which the chief examples are "The Spinner," in the Brussels Museum, and "The Fiddler," in Buckingham Palace. His drawings are no less excellent and carefully executed than his paintings. He died at the height of his power and was buried October 16, 1649, in Haarlem. Consult the authorities referred to under OSTADE, ADRIAEN VAN.

OSTA'RIOPHY'SI (Neo-Lat. nom. pl., from Gk. *ὀστάριον*, *ostarion*, little bone, diminutive *ὀστέον*, *osteon*, bone + *φῦσα*, *physa*, bladder). A group of teleost fishes, which includes the majority of the living fishes of the world. The group is characterized, according to Jordan, by the modification of the anterior vertebræ, which are coössified and have some of their lateral superior elements detached to form a chain of small bones, the Weberian ossicles, which connect the air-bladder with the ear. It is composed of three orders—Nematognathi, Plectospondyli (q.v.), and Scyphophori—which are regarded as descended from a common stock.

OSTASHKOV, ŏs-tăsh'kŏf. A town in the Government of Tver, Russia, on the eastern shore of Lake Seliger, 162 miles northwest of Tver (Map: Russia, D 3). Among its public institutions are a library and a theatre. It is especially known as a tanning centre and has extensive boot-making interests. Other industries are boat-building and the manufacture of hardware and agricultural implements. A steamer service is maintained on the lake, which also affords good fishing facilities. Population, in 1897, 10,457.

OSTEND, ŏs-tĕnd' (Flem. and Fr. *Ostende*). A famous watering place on the North Sea on the west coast of Belgium, in the Province of West Flanders, 14 miles from Bruges (Map: Belgium, A 3). It is the second port in the Kingdom, and is connected by canal with Bruges and Ghent. Ostend is the terminus of branch railway lines connecting with the great Continental systems, and is a station for daily steamers between England and the Continent. The traffic between London and Ostend is immense. In the season from June 1st to October 25th about 50,000 visitors annually flock to the town. It is beautifully laid out as a fashionable summer resort. The elegant Kursaal is the centre of life in the season. The magnificent stone sea wall is lined with splendid hotels. The harbor works are on a fine scale, embracing a number of basins, which are entered by a channel about 100 yards wide. Ostend has a large fishing fleet, and the culture of oysters is carried on in the so-called oyster parks. Ostend endured a memorable siege by the Spanish from 1601 to 1604, when it finally surrendered to Spinola. Population, in 1901, 39,541. Consult Beaucourt de Noortoelde, *Ostende sous Léopold (1865-1900) ou la reine des plages*, vols. i.-ii. (Ostend, 1900).

OSTEND COMPANY. A trading corporation founded by the Emperor Charles VI. in 1722, and chartered by him in the following year. As ruler of the former Spanish Netherlands, it was his ambition to make Ostend a great port on the northern waters, as Trieste was on the Mediterranean, and to obtain for the Empire a share in the lucrative trade with the East Indies; hoping, too, that the merchant marine thus created would become the nucleus of an imperial navy. Preliminary voyages had been made for some years before the establishment of the company, and soon after its incorporation as the Ostend East India Company settlements were founded at Covelong on the southeast coast of India and Bankipur on the Hugli. To further his schemes which, after the confirmation of the Pragmatic Sanction, was his favorite project, the Emperor sought the assistance of Spain, whose coöperation was obtained in the second treaty of Vienna (1725). The maritime powers, especially England and Holland, regarded this intrusion on their trade monopoly with resentment, and the Emperor in the preliminaries of Vienna (May, 1727) was compelled to suspend the operations of the company for seven years, a delay the second treaty of Vienna in 1731 to [illegible] it.

OSTEND MANIFESTO. A dispatch drawn up at Ostend, October 9, 1854, and signed by James Buchanan, John Y. Mason, and Pierre Soulé, at that time the United States Ministers to Great Britain, France, and Spain respectively, declaring that the sale of Cuba would be as advantageous and honorable to Spain as its purchase would be to the United States, but if Spain refused to sell, self-preservation required that it be wrested from her by force. Encouraged by the acquisition of Texas, the pro-slavery leaders had been affording ready assistance to filibustering expeditions directed against the islands of the Spanish West Indies, and especially Cuba. These expeditions and the probable future action of the Federal Government in regard to the island created anxiety in Europe, and in 1852 Great Britain and France addressed a joint note to the United States proposing a tripartite convention by which the three Powers should disclaim all intention to obtain possession of Cuba and should discountenance such attempts by any Power. Everett, then Secretary of State, replied, refusing to accede to such an arrangement, while declaring that this country would never question Spain's title to the island. President Pierce in August, 1854, directed the American ministers resident at London, Paris, and Madrid to meet at some convenient point for discussion of the Cuban question.

They met at Ostend, October 9th, and subsequently at Aix-la-Chapelle, though it was at the former place that the memorandum known as the Ostend Manifesto was prepared.

The declaration was not approved in the United States in the platforms of either party, and it was strongly condemned in Europe. Consult: Cluskey, *Political Text-book* (Philadelphia, 1860); also Wilson, *Rise and Fall of the Slave Power* (Boston, 1872-77).

OSTEN-SACKEN, ōs'ten-säk'ken. Baron CHARLES ROBERT (1828—). A Russian diplomatist and entomologist. He was born August 21, 1828, in Saint Petersburg, where he was educated, and in 1849 entered into the service of the Imperial Foreign Office. In 1856 he was appointed Secretary of Legation in Washington; in 1862 Consul-General of Russia in New York. He resigned his post in 1871, but remained in the United States until 1877, when he went to reside in Heidelberg. He devoted the best years of his life to working up the Diptera (flies) of North America, partly in collaboration with H. Loew, and otherwise exerted an immense influence in extending entomological studies in North America. Besides many papers of a systematic, critical, and historical nature, Baron Osten-Sacken has published two catalogues of North American Diptera, also elaborate monographs on different families of flies.

OSTEOL'EPIS (Neo-Lat., from Gk. ὀστέον, *osteon*, bone + λεπίς, *lepis*, scale). A fossil crossopterygian fish found in the Old Red Sandstone of the Scottish Devonian.

OSTEOLOGY (Gk. ὀστεολογία, from ὀστέον, *osteon*, bone + -λογία, *-logia*, account, from λέγειν, *legein*, to say). The science which treats of the anatomy, development, and relations of bones and bony tissue. See BONE; SKELETON.

OSTEOMALA'CIA (Neo-Lat., from Gk. ὀστέον, *osteon*, bone + μαλακία, *malakia*, softness, from μαλακός, *malakos*, soft). MOLLITIES OSSIUM, or MALACOSTEON. A disease of adult life, characterized by progressive softening of the various parts of the skeleton, with resulting deformities. It is very rarely seen in children or old persons. In the great majority of cases it affects women, chiefly those who have borne children or who are pregnant. It usually progresses from bad to worse, and after perhaps a number of years it causes death, chiefly from exhaustion or complicating disease of the lungs. It has been attributed to the action of many causes, such as defective nutrition, excess of lactic acid, disease of the trophic nerves, ovarian and uterine changes, etc.; in many cases the real exciting cause is uncertain.

The changes in the bony tissue are: Great increase in vascularity, with resulting hemorrhages; then there is degeneration of the medulla or the marrow of the bone, so that it finally becomes converted into a pulp-like substance; then there is destruction of the cancellous or spongy tissue of the bone, so that cavities or tumor-like enlargements result. The periosteum is ordinarily thicker and more vascular than normal, and serves as a protecting envelope to the broken-down bone. Fracture of the bone from no other cause than muscular action or a slight movement is of frequent occurrence, and deformity—sometimes very excessive and peculiar—is sure to be produced in other than the mildest cases.

Until deformity has occurred, or until at least the softening has advanced so far as to permit of the bone being bent, the diagnosis is difficult and uncertain, since the progress of the disease is for a long time an insidious one. Because of the early developed and persistent pain, the affection may be mistaken for rheumatism; but the multiplicity of painful areas, the sex of the patient, the existence of pregnancy, and the presence of large quantities of the salts of lime in the urine should direct suspicion to osteomalacia. Though this disease may not for a time exert any unfavorable influence upon life, the prognosis is grave, for the disease usually ends fatally. However, it occasionally ceases to advance, and it has even been overcome. Medical treatment—the use of phosphorus and the phosphates, the lime salts, cod-liver oil, etc.—has proved of little or no value. The best possible hygienic surroundings should be secured and the patient kept quiet and free from pain. Proper retentive dressing should be applied to prevent fracture and lessen deformity. It is reported that in some cases the removal of the ovaries and uterus has been beneficial. In any event pregnancy should be prevented, as childbearing exerts a powerful and deleterious influence upon the progress of the disease.

OSTEOMYELITIS (Neo-Lat., from Gk. ὀστέον, *osteon*, bone + μυελός, *myelos*, marrow). An inflammation, usually acute, of the marrow of the bone, extending to the bone itself, and due to infection by a pyogenic organism. It may follow a wound which exposes the medullary canal to the air, such as a compound fracture, a gunshot injury, or an amputation; or the infective material may be introduced through the blood. The entire shaft of the bone may be involved. The symptoms are severe aching pain, exquisite tenderness, and deep swelling of the soft parts [illegible] bone. A purulent discharge, containing [illegible] nts of dead bone and tissue—sloughs, makes [illegible] s. [illegible] earance. There is a high fever in severe [illegible] ses with chill and sweats.

Children are subject to an acute form of the disease, which is sometimes called acute epiphysitis because it begins at the epiphyseal line and involves the epiphysis. A strain occurs at this point, and an inflammation ensues. The femur and tibia are the bones oftenest affected, and the knee or hip-joint becomes involved and filled with pus. The disease may sometimes be mistaken for rheumatism.

The treatment of this malady, which is a very fatal one, is purely surgical. The affected bone is to be freely opened, dead bone removed, the medullary canal scraped and washed out with a strong antiseptic, packed with gauze, and drained. Amputation is sometimes necessary. The patient's strength should be supported by nourishing food and stimulants.

OSTEOPATHY (from Gk. ὀστέον, *osteon*, bone + πάθος, *pathos*, suffering, disease). A method of treating disease by manipulation, for which its adherents claim a universal curative power. It was invented by Andrew T. Still, of Kirksville, Mo., in 1893. The underlying principles of osteopathy are briefly as follows: The fluids of the human body contain greater or less amounts of all chemical substances, inorganic and organic, that are at all capable of existence, and hence carry a store of all drugs that may be required for checking and destroying any in-

inable disease; disease itself is nothing but an abnormal effect of the powers of life and presumably arises, along with the normal effect—motion—continually; only, under the influence of the drugs in the body, the activity of those powers is immediately redirected along normal channels, and so disease no sooner arises than it is counteracted and destroyed; the reëstablishment of health can be prevented by only one cause, viz. the slight displacement of some bone, which would naturally form an obstruction to the flow of the drug-carrying fluids; therefore, to effect the cure of any disease whatever, all we have to do is to localize the causative displacement of the bone or bones and remove it by appropriate manipulation. Mr. Riggs, of Boston, a lecturer on osteopathy, defines the methods as follows: "Osteopathy is a method of treating disease by manipulation, the purpose and result of which is to restore the normal condition of nerve control and blood supply to every organ of the body, by removing physical obstruction or by stimulating or inhibiting functional activity, as the condition may require."

The technical objections raised by the medical profession to the fundamental principles of osteopathy are numerous and have often been expressed in very strong terms. Even the more sober-minded members of the profession, while fully recognizing the value of methods like massage (q.v.) and Swedish movement (see MOVEMENT CURE) in certain cases, are very emphatic in denying that any such method can be applied in all cases without exception. Their objection is, therefore, not so much against the method itself as against its universal application, to the exclusion of medical diagnosis and of other therapeutic methods of recognized utility. In general, they object strongly to any but a person disciplined by several years' professional study taking full charge of cases in which the health, and perhaps the life, of human beings may be in great danger. Before the law the osteopath takes the position that he practices, not medicine, but osteopathy; that he cannot, therefore, be required to take a prolonged course of medical study; and that no law is in the way of his entering upon the practice of osteopathy after a few months of special training. This position has been often sustained by courts of justice, many judges defining the practice of medicine proper as the treatment of diseases by the use of drugs, while physicians generally define their practice as the treatment of diseases by any method whatever, whether involving the use of drugs, or the application of the methods of surgery, obstetrics, ophthalmology, hydrotherapy, etc.

Consult: Bonnet, "Attitude Toward Osteopaths," in *Columbus Medical Journal* (1902); "Education of Osteopaths," in *Southern Journal of Osteopathy* (1900).

OSTERHAUS, ōs'tẽr-hous, PETER JOSEPH (c.1820—). A German-American soldier, born in Coblenz, Germany. After serving for some time as a Prussian army officer, he emigrated to the United States and settled in Saint Louis. At the outbreak of the Civil War he was appointed a major of the Second Missouri Volunteers, and during the first year of the war was employed in Missouri and Arkansas, where he took a conspicuous part in the battles of Wilson's Creek (August 10, 1861) and Pea Ridge (March 7-8, 1862). In 1863 he commanded a division before Vicksburg, and at Chattanooga (November 23-25) he aided General Hooker in the capture of Lookout Mountain. He was then assigned to General Sherman's army, and after the capture of Atlanta received command of the Fifteenth Corps, one of the four corps into which the army was consolidated. He was mustered out of the service on January 15, 1866, and the same year was appointed United States Consul at Lyons, France, but subsequently made his home in Germany.

OSTERMANN, ōs'tẽr-män, ANDREI IVANOVITCH, Count (1686-1747). A Russian diplomat, born in Bochum, Westphalia, where he was christened Heinrich Johann Friedrich. He studied at Jena, whence he fled, because he had killed his opponent in a duel, to Holland, and there met Peter the Great and entered the new Russian Navy. He enjoyed Peter's favor, negotiated the treaties of the Pruth in 1711 and Nystad in 1721, became baron, and in 1725 Vice-Chancellor to Catharine I., who made him a member of the regency during Peter II.'s minority. Under the Empress Anna Ivanovna he was appointed Minister of Foreign Affairs (1730), and he kept the good will of Anna Leopoldovna when she became Regent, only to fall into disfavor with Elizabeth, who charged him with urging her exclusion from the succession and with the suppression of Catharine's will. He was sentenced to death, reprieved on the scaffold (1742), and banished to Siberia.

OSTERMANN-TOL'STOY, ALEXANDER IVANOVITCH (1770-1857). A Russian general. He entered the army when he was a boy, fought bravely in the Turkish campaign of 1790, and in 1805 commanded the Russian corps which, with Swedish and English divisions, attempted military operations in Northern Germany. As commander of the Fourth Army Corps in 1812 and 1813, he fought at Bautzen, where he was wounded, and he lost his left arm at Kulm.

OSTERODE, ōs'te-rō'de. A town in the Province of East Prussia, Germany, on Lake Drewenz, about 75 miles south-southwest of Königsberg (Map: Prussia, D 3). It is an ancient town with a castle built by Teutonic knights in 1270, a gymnasium, and a seminary for teachers. It has railway shops, machine works, saw mills, distilleries, a municipal slaughter-house, etc., and trades in grain, lumber, and cattle. Population, in 1900, 13,163.

OSTERODE. A town in the Province of Hanover, Prussia, situated in the Harz, 34 miles by rail northwest of Nordhausen. Its Church of Saint Ægidius, founded originally in the eighth century and rebuilt in 1578, contains interesting tombs of the princes of Grubenhagen. There is a large grain storehouse from which in times of scarcity the miners in the Harz Mountains are supplied at reduced prices. The manufactures of the town include woolen, cotton, and knit goods, machinery, metal works, cigars, leather, paint, etc. Population, in 1900, 7099.

OSTHOFF, ōst'hôf, HERMANN (1847—). A German comparative philologist, with Brugmann (q.v.) the head of the 'new grammarians.' He was born at Billmerich in Westphalia; studied at Bonn, Tübingen, and Berlin, and, after teaching in a gymnasium at Cassel, became in 1877 professor

of Sanskrit and comparative grammar at Heidelberg. He was one of the founders and editors of *Morphologische Untersuchungen auf dem Gebiete der indogermanischen Sprachen* (1878-90), and wrote: *Zur Geschichte des schwachen deutschen Adjectivums* (1876); *Das Verbum in der Nominalkomposition* (1878); *Zur Geschichte des Perfekts im Indogermanischen* (1884); *Vom Suppletivwesen der indogermanischen Sprachen* (1899); and *Etymologische Parerga* (1901).

OS'TIA. An ancient city of Latium, at the mouth of the Tiber, 15 miles from Rome. It is said to have been founded by Ancus Marcius, and was regarded as the oldest Roman colony. It first acquired importance from its salt works, the establishment of which is attributed to Ancus Marcius, and afterwards was the port where the Sicilian, Sardinian, and African corn shipped for Rome was landed. Its name first occurs during the Second Punic War. It was long the principal station of the Roman navy; but its harbor was exceedingly bad, and gradually the entrance became silted up with alluvial deposits, so that vessels could no longer approach it, but were compelled to ride at anchor and disembark their cargoes in the open road-tead. At length the Emperor Claudius dug a new harbor or basin two miles north of Ostia, and connected it with the Tiber by a canal. It was named the *Portus Augusti*, and around it soon sprang up a new town called *Portus Ostiensis*, *Portus Urbis*, *Portus Romæ*, and often simply *Portus* (modern Porto). The work of Claudius was carried further by Trajan. After the fall of the Roman Empire Ostia declined rapidly, and in the eighth century it was a mere ruin. During the Middle Ages a village—the modern Ostia—was built about half a mile above the site of the ancient town; but it has not more than about a thousand permanent inhabitants, who still carry on the manufacture of salt. Ostia has the reputation of being the seat of the earliest bishopric save that of Rome, and the Cardinal Bishop of Ostia (and Velletri) is Dean of the Sacred College. The ruins of the ancient Ostia extend for a mile and a half along the banks of the Tiber, and are nearly a mile in breadth.

OS'TIAKS. A name which seems to have been applied at first to the primitive Finnic peoples of the middle cis-Uralian upland valleys by the Russians and afterwards extended to trans-Uralian tribes as far as the Yenisei. The etymology of the name is uncertain, and its ethnological value has been different with different writers and at different periods. According to Sommier, the Ostiaks of the Obi are short in stature, spare in form as contrasted with the robuster or even fat Samoyeds, with brachycephalic headform and a considerable percentage of dolichocephaly. Their skin is quite white; the hair and eyes are brown. The Ostiaks are reported to be a disappearing people, their only resources being hunting and fishing. The Ostiaks of the region of the Narym, etc., are merely Samoyeds. The mass of the Ostiaks dwell between Obdorsk and Surgut—the Tas Ostiaks beyond Surgut are of mixed race. The Voguls and Ostiaks of the eastern slope of the Urals, who both call themselves Manzi, are very closely related by language, mythological ideas, and social institutions. Some intermixture with the Russian immigrants into Western Siberia has taken place. Consult: Seebohm, *Siberia in Asia* (London, 1882); Patkanoff, *Die Irtysch-Ostjaken und ihre Volkspoesie* (Saint Petersburg, 1897); Abercromby, *Prehistoric and Proto-Historic Finns, both Eastern and Western* (London, 1898); Martin, *Sibirica* (Stockholm, 1897).

OS TIA'RIUS (Lat., doorkeeper, sexton). The name of the lowest of the four minor orders in the Roman Catholic Church. In this definite sense, the earliest mention known of it occurs in a letter of Pope Cornelius of the year 251; it seems to have been included with the other minor orders by his predecessor, Pope Fabian (236-251). By the end of the sixth century the ordination of this office was symbolized by the bishop delivering to the candidate the keys of the church with the words, "So act as one that must give account to God for the things which these keys guard." The duties attached to the office are those which are now performed by the sacristan (q.v.).

OS'TIEN'SIS, PORTA (Lat., Gate of Ostia). A gate in the wall of Aurelian at Rome through which the Via Ostiensis passed. It dates from the time of Honorius, and its threshold is twelve feet above the level of the time of Aurelian, on account of the accumulation of rubbish leveled by Honorius. The gate was thrown open to the Goths by the Isaurians in 549. It was walled off in 1407 by King Ladislas of Naples, but was reopened in 1410, and is now the Porta di San Paolo.

OSTIENSIS, VIA (Lat., Road of Ostia). An ancient road leading from Rome to Ostia on the left bank of the Tiber, and continued southward as the Via Severiana, joining the Via Appia at Tarracina.

OSTINATO, ō'stē-nä'tō (It., stubborn). In music, a term applied to a constantly recurring short theme with constant changes in the other voices. Such themes are generally given to the bass, hence *basso ostinato*. It is a characteristic of the *chaconne* and *passacaglia* that they are always built upon such *basso ostinato*. In the compositions of the Gallo-Belgic school (see MUSIC, SCHOOLS OF COMPOSITION) the ostinato plays a very important part, as entire masses were written upon some short popular melody which as an *ostinato* was given to the tenor, while the other voices executed constantly new contrapuntal variations.

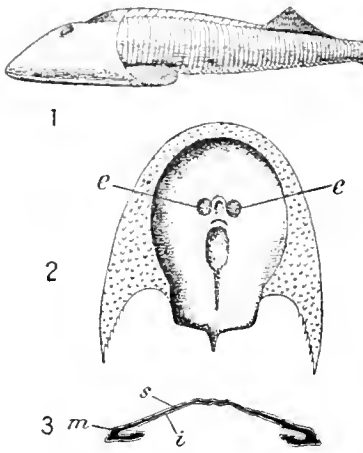
OSTRACISM (Gk. *ὀστρακισμός, ostrakismos*, from *ὀστρακίζειν, ostrakizein*, to ostracize, from *ὄστρακον, ostrakon*, potsherd). A method of political procedure in ancient Athens, whereby a citizen whose presence seemed dangerous to the State might be exiled for a time. It was said to have been introduced by Clisthenes in his reform of the Athenian constitution after the expulsion of Hippias (B.C. 510), but the first use of it seems to have been made in B.C. 488-487, when Hipparchus, son of Charmus of Collytus, was exiled, on account of his connection with the Pisistratidæ. Two others of this party followed, and in B.C. 485-484 Xanthippus, father of Pericles, was a victim, while a year or two later Aristides was banished. After the Persian wars the process was less frequently employed, though it was still used when party strife waxed hot and it seemed necessary to secure a definite verdict in favor of one policy. Among the ostracized were Themistocles, Cimon, Thucydides, son of Melesias, and Hyperbolus, whose ex-

ile really resulted in the abandonment of the system. The vote had been intended to decide between Nicias and Alcibiades, but they combined their forces against the much less influential Hyperbolus. Ostracism did not inflict any stigma upon a man, nor were his property or civil rights in any way disturbed. It simply required him to leave the country for ten years in order that he might exercise no influence on the course of politics. It thus afforded a means of deciding between rival leaders and their policies, and insured to the victor an opportunity to carry out his plans undisturbed by violent opposition. Every year, in the sixth prytany, the assembly voted whether a vote of ostracism should be taken during the year. If the decision was affirmative, a day was chosen in the eighth prytany, the market was fenced off, and through ten gates the members of the ten tribes entered to deposit the potsherds on which was written the name of the man whose ostracism was sought. To make the decision valid, at least 6000 votes were required, but of these a plurality seems to have sufficed to ostracize. Besides the Histories of Greece by Grote, Curtius, Busolt, Holm, and E. Meyer, consult: Gilbert, *The Constitutional Antiquities of Athens and Sparta*, English translation (London, 1895); Hermann, *Lehrbuch der griechischen Antiquitäten*, I., "Staatsaltertümer," by Thumser (Freiburg, 1892); Busolt, *Griechische Staats- und Rechtsaltertümer* (Munich, 1892).

OSTRAC'ODA (Neo-Lat. nom. pl., from Gk. *ὀστρακώδης, ostrakōdēs*, like a potsherd, from *ὄστρακον, ostrakon*, potsherd + *εἶδος, eidos*, form). An order of crustacea in which the body is compressed and wholly protected by a bivalved shell or carapace. Besides the two sessile eyes and a median one, the former sometimes wanting, there are two pairs of antennæ, a pair of mandibles, two pairs of maxillæ, and two pairs of legs. The body is not divided into segments and the abdomen is rudimentary. The two valves are closed by a two-headed adductor muscle, the valves being joined together along the hinge-margin by an elastic ligament. In swimming, or in walking over the bottom, the valves gape partly open, the slender legs protruding. Respiration is aided by a comb-like bristly plate attached to the first pair of maxillæ, but there are no true gills. The young of the fresh-water Cypris hatches in a modified nauplius stage, but already inclosed in a thin shell covering the entire body. In the marine forms there is no metamorphosis, development being direct. Ostracods feed on animal matter; they abound in the fresh water, but the larger number are marine, and exist at all depths. Many of the littoral as well as deep-sea forms are covered with thick shells more or less tuberculated, pitted, or otherwise ornamented. Fossil Ostracoda first appear in the Cambrian rocks. The order attained its maximum development in the Ordovician period, and in the Cretaceous modern forms began to appear. See CRUSTACEA.

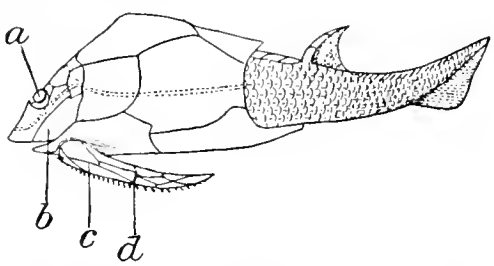
AN OSTRACOD (*Cypris*).

OSTRACODER'MI (Neo-Lat. nom. pl., from Gk. *ὀστρακόδερμος, ostrakodermos*, having a skin like a potsherd, from *ὄστρακον, ostrakon*, potsherd + *δέρμα, derma*, skin). A group of pleetognath fishes which are without spines in the dorsal fin, and have the body inclosed in an angular box, or carapace, formed by polygonal bony scutes firmly joined at their edges; they are the trunk-fishes (q.v.).



CEPHALASPIS.

1, restoration of *Cephalaspis Murchisoni*, about one-fourth natural size; 2, diagram of lower aspect of dorsal shield, showing inferior rim; *e, e*, position of eyes, with the interorbital ridge; 3, diagrammatic section of dorsal shield; *i*, inferior lamina; *m*, margin; *s*, superior lamina.



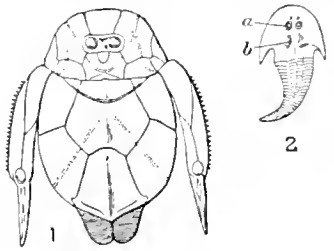
PTERICHTHYS.

Restoration of *Pterichthys Milleri*, of the Old Red Sandstone; *a*, orbit of eye; *b*, gill cover; *c*, one of the pair of lateral appendages; *d*, joint in appendage. The dotted lines indicate grooves for the sensory canal.

FOSSIL FORMS. Ostracoderms are the most primitive subclass of Paleozoic fossil fishes, characterized by the heavy calcareous plates that cover the head and forward part of the trunk, and by the absence of the lower jaw. These primitive fish-like vertebrates are supposed to be the ancestral forms from which the higher groups of fishes, and also all the other types of vertebrates, have descended by evolution. They appear first in the Upper Silurian rocks of Europe and North America, and they continue through to the top of the Devonian in both countries. The simplest forms are Cyathaspis and Palæaspis, found in the Upper Silurian and Devonian, and Pteraspis of the Devonian. Cephalaspis, one of the best known members of the group, has a horseshoe-shaped head-shield, and is found in the Silurian and Lower Devonian of Great Britain and in the Upper Devonian of Eastern Canada.

The highest members of the subclass, represented by Bothriolepis and Pterichthys, have dermal skeletons of far more complex nature than those seen in the other members of the group.

The heavy plates are more numerous and are symmetrically arranged, and attached to the sides of the head-shield is a pair of fin-like appendages, which are not, however, homologous to the fins of fish, though they closely resemble these latter. The hinder portion of the body was covered by small ganoid scales. Consult: Woodward, *Outlines of Vertebrate Palæontology for Students of Zoology* (Cambridge, 1898); Von Zittel and Eastman, *Text-book of Palæontology*, vol. ii. (New York, 1903). See CEPHALASPIS; CYATHASPIS; PTERASPIS; PTERICHTHYS.



OSTRACODERMI.

1, restoration of *Bothriolepis hydrophila* of the Old Red Sandstone; 2, *Auchenaspis Egertoni*: *a*, orbits; *b*, post-orbital depression.

OSTRAU, ôs'trou. Two neighboring towns of Austria. See MÄHRISCH-OSTRAU and POLNISCH-OSTRAU.

OSTRICH (OF. *ostruche*, *austruche*, Fr. *autruche*, Sp. *avestruz*, from Lat. *avis struthio*, ostrich bird, from *avis*, bird, and *struthio*, from Gk. *στρουθών*, *strouthiōn*, ostrich, *στρουθοκάμηλος*, *strouthiokamēlos*, ostrich, camel-sparrow, so called from the long neck of the bird, from *στρουθός*, *strouthos*, bird, sparrow). The ostrich is the largest of living birds, long renowned for its beautiful plumes and its remarkable speed. Whether all ostriches belong to the same species is still an open question, for although four have been described, the differences suggested are very slight and may prove inconstant. There is, however, only a single genus, Struthio, and a single family, the Struthionidæ. The relationship of this family to the rheas, emeus, cassowaries, etc. (qq.v.), is still undecided, but all are members of the order Ratitæ, distinguished from all other living birds by the absence of any 'keel' on the breastbone. (See RATITÆ.) Ostriches are natives of Africa and some parts at least of Southwestern Asia. The common ostrich or 'camel-bird' (*Struthio camelus*) is found on the dry open plains and deserts of Northern and Central Africa (except Egypt), while the ostriches of Southern Africa, Somaliland, and Asia have been described as distinct species. Fossil remains of the ostrich have been found in India.

The male is somewhat larger than the female, measures seven feet, more or less, in height, and weighs upward of 200 pounds. His plumage is strikingly loose, fluffy, and deep black in color; only the 'plumes' (quill feathers) of the wings and tail are white. The female is much less handsome (dull brownish gray), while the very young chicks are yellowish, marked with longitudinal streaks of blackish. The young male assumes his mature plumage in about three years. In the adult of both sexes the head and most of the neck are nearly bare, only a sparse down covering the skin. The feet and legs also are bare far up on the tibiæ. The bill is of moderate length, broad, flattened, and rounded at the tip, and with the nostrils opening considerably in front of the base. The ostrich is unique in several anatomical peculiarities: there are only two toes (the third and fourth), the outer of which is much smaller and has no claw; there is a small external tail; and the pubic bones unite in a ventral symphysis. The wings bear three digits, but are so small as to be useless for flight, though they assist greatly in running. The legs, however, are big and powerful, and able to deliver a kick almost equal to that of a horse. The alimentary canal has a very muscular gizzard, as well as a large crop. There is no gall bladder. The food of the ostrich is chiefly vegetable, though small mammals, reptiles, and insects are sometimes taken. Water can be spared from the diet for long periods of time, if melons or other juicy fruits are available. Coarse gravel and small stones are swallowed to assist in the grinding work of the gizzard. In spite of an imperfect syrinx, the ostrich has a loud voice, said to resemble the roar of the lion, though its most common sound is an angry hiss.

The ostrich is polygamous, one male consorting with from two to seven females. He scoops out a hollow in the sand in which his companions lay their eggs, each female laying about ten. The eggs are not left to the heat of the sand and sun, as is often stated, but are incubated during the greater part of the day by one of the females, and at night by the male. When the eggs are left during the heat of the day, they are covered up with sand. The eggs are large and thick-shelled, of a creamy-yellow shade, with numerous small pits in the otherwise very smooth surface. Each egg is about six inches long and weighs nearly three pounds, while its cubic contents approximates that of two dozen hen's eggs. The bird is extraordinarily keen-sighted, and on its native plains is extremely wary. Hunting the ostrich has been a popular sport with the Arabs from time immemorial. They rely on the speed of their horses and run the birds down, a feat which would be impossible were it not for the curious fact that the ostrich runs in more or less of a circle, and the horsemen are thus able to continue the pursuit while traveling only a fraction of the distance that the bird runs. At full speed the ostrich is said to make sixty miles an hour, and for a limited time it can completely distance the fleetest horse.

OSTRICH-FARMING. For many centuries ostriches have been partially tamed or domesticated on a small scale by some of the tribes of Central and Northern Africa, but it is only since about 1860 that any extensive efforts have been made to supply the demand for ostrich plumes from domesticated birds. First in Cape Colony, later in Algeria and Argentina, and finally in the Southwestern United States, ostrich-farming was taken up as a profitable employment, and at the opening of the present century millions of dollars' worth of fine ostrich plumes were sent to market annually from ostrich farms. A consular report in 1899 stated that 261,000 ostriches were owned in Cape Colony alone. The farms of Arizona and southern California long since passed the experimental stage. Their birds are either pastured in small flocks, or a cock and one or two hens are kept in areas inclosed with coarse wire-

netting fences six or seven feet high; these pastures are usually arranged in pairs, so that when the alfalfa, upon which the birds feed, is exhausted in one field, the birds may be driven into the other. They also receive grain. The birds rarely fall ill, and are quite prolific in captivity, a male and two females having been known to produce 188 eggs in a year, about 80 per cent. of which yielded chicks. Artificial incubation is usually practiced, ordinary incubators with unusually large trays being used. When six or seven months old, the birds undergo their first plucking, and thereafter at intervals of about seven months new crops of plumes may be gathered. The plumes are cut off, not pulled out, but after a few days the dead stumps are removed to make room for the new feathers. The price of the plumes varies very greatly with the quality, but each bird on a well-managed farm will yield from $30 to $60 worth at a plucking. As the ostrich lives to be as much as eighty years old, there is an opportunity for large profit from each one.

Consult: Mosenthal and Harting, *Ostriches and Ostrich Farming* (London, 1879); Martin, *Home Life on an Ostrich Farm* (London, 1891); Paul, "Ostrich Farming in California," in *Cosmopolitan Magazine*, vol. xi. (New York, 1891); Newton, *Dictionary of Birds* (New York, 1896), where many further references may be found.

OSTRICH FERN (*Struthiopteris*). A genus of ferns whose fertile fronds have somewhat the appearance of an ostrich plume, and whose sterile ones attain a height of even ten feet, the whole plant forming a beautiful vase-like cluster. There is one species (*Struthiopteris germanica* or *Onoclea struthiopteris*) known in America and Europe, and there is probably another in Japan. The American species thrives best in northern latitudes in alluvial soil.

OSTROG, ŏs-trôg'. A town in the Government of Volhynia, Russia, about 90 miles west of Zhitomir (Map: Russia, C 4). It has a gymnasium, a teachers' seminary, and ruins of an old castle. Leather is the chief product; there is some trade in grain, wool, and leather. Ostrog was formerly the residence town of a Polish principality of the same name, and is noted as the place where the first Bible in the Slavonic language was printed in 1581. The town came into the possession of Russia in 1795. Population, in 1897, 14,530, largely Jewish.

OSTROGOSH, ŏs-trō-gōsh'. A town of South-Central Russia, in the Government of Voronezh, situated 50 miles south of Voronezh. It has a high school and numerous churches, manufactures tobacco and soap, and carries on trade in cattle and agricultural products. Population, in 1897, 21,897.

OSTROGOTHS. See GOTHS.

OSTROLENKA, ŏ'strō-lyĕn'kȧ. A town in the Government of Lomza, Russian Poland, situated on the Narev, 22 miles southwest of Lomza (Map: Russia, B 4). Its chief industry is the manufacture of small articles from amber which is found in the vicinity. The town is noted as the scene of two important battles. On February 16, 1807, the Russians under Essen were defeated by the French under Savary, and during the uprising of 1830-31 the Poles were defeated by the Russians after an heroic struggle in which the former lost about 9000 men (May 26, 1831). Population, in 1897, 8697, chiefly Poles and Jews.

OSTROVSKI, ŏs-trôf'skĕ. ALEXANDER NIKOLAYEVITCH (1823-86). A Russian dramatist. He was born in Moscow. In 1843 he accepted a position in the Commercial Court, and to this is largely due his minute knowledge of mercantile scheming and fraud, which play such an important part in his comedies. After making his début with *Pictures of Family Happiness* in 1847, he attracted considerable attention by excerpts from his comedy *We Can Settle with Our Own People*, and left his post for literature. The complete work produced a sensation, and forty-three comedies followed. Yet, for many reasons, Ostrovski felt the pinch of need until shortly before his death, and, while idolized at Moscow, he found scant recognition at Saint Petersburg. Just before his death he was appointed director of the Moscow theatres. The dream of his life—to be at the head of a school for dramatic acting—was realized; but the inordinate zeal with which he threw himself into the work wrecked his constitution. Among his dramas the best are: *Do Not Get into Somebody Else's Sled; Poverty is Not a Fault; The Forest; A Profitable Position; The Guiltless Culprits;* and *The Storm* (1860). An English translation by Constance Storm of the last-named play, generally considered his masterpiece, was given in the spring of 1900 at the Carnegie Lyceum, New York, by an independent company. His plays embrace all types of the middle classes. These he was able to draw with striking accuracy, because of his perfect objectivity. His works were published in ten volumes (9th ed., Saint Petersburg, 1885), and with a biography by A. Nos (Moscow, 1890; 10th ed., 1896-97). His translations (2 vols., Saint Petersburg, 1886) are masterpieces of their kind, and especially noteworthy among them is Shakespeare's *The Taming of the Shrew*. Several plays of his have been translated into French by Durand Grenville.

OSTROWO, ŏs-trō'vō. A town in the Province of Posen, Prussia, 50 miles northeast of Breslau (Map: Prussia, G 3). It is an important grain-trading centre, and has saw mills and brick kilns. Population, in 1890, 9700; in 1900, 11,800.

OSTUNI, ŏs-tōō'nê. A city of Southern Italy, in the Province of Lecce, situated 19 miles northwest of Brindisi, on the Bari-Brindisi Railroad (Map: Italy, M 7). Several towers of the old city-wall are still to be seen. The city has a library containing a collection of antiquities. Oil and lime are manufactured. Population (commune), in 1881, 18,226; in 1901, 22,997.

OSTWALD, ŏst'vȧlt, WILHELM (1853—). An important German chemist, born at Riga. He was educated at Dorpat, became a lecturer there in 1878, in 1882 was a professor in the Polytechnicum of Riga, and in 1887 professor of chemistry in Leipzig. As an investigator in connection with physical chemistry and chemical affinity he became particularly well known. His researches have concerned, among numerous subjects, the electric conductivity of organic acids, the parallel existing between the volume of such acids and their power of chemical reaction, and the color of ions. Among his publications are his *Lehrbuch der allgemeinen Chemie* (2 vols.,

1885-88; 2d ed. 1891 et seq.); a *Grundriss der allgemeinen Chemie* (2d ed. 1890), *Elektrochemie* (1896), and *Volesungen uber Naturphilosophie* (1902). In 1887 he established with van't Hoff at Leipzig the *Zeitschrift fur physikalische Chemie*, and in 1901 became editor there of the *Annalen der Naturphilosophie*.

OSUNA, ō-sōō'nà. A town of Southern Spain, in the Province of Seville, situated in a fertile plain, 48 miles east of Seville (Map: Spain, C 4). It is well built, with plazas and promenades, and contains a large Gothic collegiate church. The chief manufactures are woolen textiles, soap, and hats. Population, in 1887, 19,376; in 1900, 17,826. Osuna is the ancient Urso, later Orsona, a Roman garrison town. It took the side of the Pompeians in the Civil War, and is noted for its long and brave defense against the soldiers of Cæsar.

OSUNA, Pedro Tellez y Giron, Duke of (1579-1624). A Spanish statesman. He was born at Valladolid, studied at Salamanca, and suffered exile in his youth for his liberal opinions. Under Philip III. he was appointed Viceroy of Sicily in 1611 and of Naples in 1616. He gave the country a wise administration, opposed the establishment of the Inquisition at Naples, and resisted the attempt of Venice to control the commerce of the Mediterranean. He was implicated in the conspiracy of Bedmar (q.v.) against Venice, and dispatched a fleet against that city in 1618, but met with defeat. He was recalled in 1620 on suspicion of planning to usurp the government of South Italy, was confined in the Castle of Alameda, and died there.

OS'WALD, Saint (c.605-642). King of the Northumbrians from 634 to 642. He was a son of Ethelfrid of Northumbria, and on the death of the latter in 617 he spent some years in exile with the Scots in Iona, during which time he was converted to Christianity. In time he and his brothers drove out the Anglian invaders, and after his brother Eanfrid was treacherously slain by the British King Caedwalla in 634, he ascended the throne after having defeated and slain his brother's murderer in battle. He married Cyneburh, a daughter of Cynegils, a West-Saxon King, and with her assistance and that of Saint Aidan (q.v.) introduced the Christian religion among the Anglo-Saxons. He was killed in a battle at Maserfelth against Penda, King of Mercia, and was canonized by the Roman Catholic Church.

OSWALD, Eleazer (1755-95). An American soldier and journalist. He was born in England. He became interested in the American Revolutionary cause and emigrated to America in 1770. In 1775 he served as captain under Arnold at Ticonderoga and at Quebec, where he assumed command and distinguished himself when Arnold was wounded. He was Arnold's secretary, and in 1777 was promoted to be lieutenant-colonel in Lamb's artillery regiment. He became a printer and publisher at Philadelphia and later at New York. In all political questions he was a bitter opponent of Hamilton. In 1792 the French Revolution enlisted his sympathy, and he commanded a regiment of artillery in the French army at the battle of Jemappes. After a fruitless secret mission to Ireland on behalf of the French Government, he returned to New York, where he died of yellow fever, September 30, 1795.

OSWALD, Richard (1705-84). A British diplomat. He was born in Scotland, and after spending several years in America became a London merchant. He was chosen by Lord Shelburne as one of England's representatives at the signing of articles of peace at the close of the Revolutionary War. He gave bail in the sum of £50,000 for Henry Laurens (q.v.).

OSWALDTWISTLE, -twis'l. A town in Lancashire, England, on the Leeds and Liverpool Canal, 3½ miles east-southeast of Blackburn (Map: England, D 3). It has manufactures of cottons and chemicals; there are collieries, potteries, and stone quarries. It owns its gas and water works and abattoirs, and maintains a technical school and an isolation hospital. Population in 1891, 13,300; in 1901, 14,200.

OSWALD VON WOLKENSTEIN, ōs'vält fon vōl'kĕn-stīn (1367-1445). A German poet. He was born at Gröden of a noble Tyrolese family, and lived an eventful life, fighting from boyhood until he was past fifty in almost every country of Europe, and in Persia and the Holy Land besides. The poetic manner of Oswald is sometimes strained and pedantic; and he is as much a predecessor of the *Meistergesang* as a follower of the Minnesingers. His poems were edited by Weber (1847). Consult: Weber, *Oswald von Wolkenstein und Friedrich mit der leeren Tasche* (Innsbruck, 1850); and Zingerle's biography and critique (Vienna, 1870).

OSWE'GO. A city and the county-seat of Labette County, Kan., 159 miles south of Topeka; on the Neosho River, and on the Saint Louis and San Francisco and the Missouri, Kansas and Texas railroads (Map: Kansas, G 4). It is in an agricultural and stock-raising region, and has fine water power. Flour is manufactured, and coal is mined in the vicinity. The Library Association, founded in 1878, has 4000 volumes. Population, in 1890, 2574; in 1900, 2208.

OSWEGO. A city, port of entry, and the county-seat of Oswego County, N. Y., 36 miles north by west of Syracuse; the terminus of the Oswego Canal, on Lake Ontario at the mouth of the Oswego River, and on the New York, Ontario and Western, the Delaware, Lackawanna and Western, and the Rome, Watertown and Ogdensburg railroads (Map: New York, D 2). It is finely situated at a slight elevation above the lake, and is laid out with regular and broad streets. Fine drives skirt both sides of the river and the shore of the lake. There are six public parks. Oswego is the seat of a State normal and training school, and has the Gerritt Smith Library. Other prominent structures are the city hall, court house, United States Government Building, and the State Arsenal. A United States life-saving station is here; and the old French fort possesses an historic interest. Fort Ontario defends the harbor, which consists of an outer and an inner haven, protected by breakwaters and accessible for large steamers. There are three immense trestles that facilitate the extensive coal trade carried on by the port. Considerable quantities of grain and lumber also are handled. The foreign commerce of Oswego in 1901 consisted of exports valued at $2,092,000, and imports to the amount of $644,000. The city has excellent water power, and is noted for its manufactures, which include starch, knit goods, shade

cloth, car springs, boilers and engines, malt, yarn, matches, oil-well supplies, etc. In the census year of 1900 an aggregate capital of $7,525,000 was invested in the various industries, which had a production valued at $8,138,000. Under the charter of 1896, the government is vested in a mayor, elected biennially, and a common council. The members of the department of fire and police are chosen by popular vote. Appointments to other important offices are controlled by the Mayor, whose nominations to some departments are made, however, subject to the consent of the council. Oswego owns and operates the water-works. Population, in 1890, 21,842; in 1900, 22,199.

Established as a military station and trading post about 1724, Oswego was incorporated as a village in 1828, and was chartered as a city in 1848. Owing to its location, it was an exceedingly important post in King George's War and the French and Indian War. In 1755 Colonel Mercer built two strong forts here, and in August, 1756, General Montcalm attacked and captured the place, and demolished the works, 30 men being killed or wounded on each side, and 1700 English prisoners being taken. In 1759 Oswego was the centre of military operations in this part of the country, and the point from which General Amherst with 10,000 men started to meet Wolfe at Quebec. In 1766 Pontiac here met Sir William Johnson and formally submitted to the English. On May 6, 1814, a strong English force captured the fort after a sharp engagement. Consult Churchill, Smith, and Child, *Landmarks of Oswego County* (Syracuse, N. Y., 1895).

OSWEGO BASS. A local name in New York State for the large-mouthed black bass.

OSWEGO TEA (*Monarda didyma*). An erect odorous herb of the natural order Labiatæ. It has bright red, showy flowers, much visited by bees, for which it is often planted as a pasturage; hence the name bee-balm.

OSWESTRY, ŏz'ĕs-trĭ. A municipal borough and market-town in Shropshire, England, 15 miles northwest of Shrewsbury (Map: England, C 4). The town has good public buildings. Its chief trade is agricultural: it has railway works, manufactures of machinery and agricultural implements, breweries, and tanneries. Coal mines and limestone quarries are worked in the neighborhood. It owns its water-works and markets, has installed a modern system of sewage disposal, and maintains a library, a gymnasium, and an isolation hospital. An early British town, it was the scene of frequent conflicts between Saxons and Welsh and Normans and Welsh. Oswald's Well and Old Oswestra, an early British encampment, are neighboring points of interest. Population, in 1891, 8500; in 1901, 9600. Consult: Spaull, "History of Oswestry Parish Church," in *Genealogical Magazine*, vol. i. (London, 1897); Lacey, "Municipal Work and Progress in Oswestry," in *Surveyor* (London, 1901).

OS'YMAN'DYAS (Lat., from Gk. *Ὀσυμανδύας*). The name of a King of Egypt who, according to Greek writers, invaded Asia with a large army, greatly distinguished himself by his victories, and conquered the Bactrians, who had revolted from him. Diodorus describes a magnificent monument, the Osymandeion, erected by this monarch in the Theban necropolis near the tombs of the concubines of Ammon. The name Osymandyas is merely a corrupt Greek form of *Usr-maʿ(t)-rē*, the prenomen of Rameses II., and there can be little doubt that the Osymandeion was in reality the Ramesseum, built by Rameses on the western bank of the Nile at Thebes. The exploits attributed to Osymandyas are as fabulous as those ascribed by the Greeks to Sesostris (q.v.). Consult: Diodorus, i., 47-49; Tzetzes, *Chiliades*, iii., 892; iv., 620; Budge, *A History of Egypt* (New York, 1902).

OTAGO, ō-tä'gō. The southernmost provincial district of South Island, New Zealand. It is bounded on the north by the Province of Canterbury, and on the west, east, and south by the Pacific Ocean (Map: New Zealand, B 6). Area, about 25,487 square miles. Population, in 1891, 153,097; in 1901, 173,111. The most important gold-fields of New Zealand are in this province. Capital, Dunedin.

OTAHEITE, ō-tä'hē-tē *or* ō'tä-hē'tē. The former name of an island in the South Pacific. See TAHITI.

OTAL'GIA (Neo-Lat., from Gk. *ὠταλγία*, earache, from *οὖς, ous*, ear + *ἄλγος, algos*, pain). Neuralgia of the ear. The pain is non-inflammatory, and occurs in all degrees of severity. It may arise from disease of the nerves of the ear, or may be transmitted to them reflexly from other sources. Decaying teeth are a fruitful source of otalgia; it is sometimes a symptom of ulcer or cancer of the tongue, rheumatism of the temporo-maxillary joint, etc. When patients complain of *earache*, the pain is far more commonly due to *otitis media*, or inflammation of the tympanic portion of the ear, a much more serious affection. See OTITIS MEDIA.

OTARU, ō-tä'rŭ. The second seaport of Yezo, Japan, situated on the western coast of the island, 22 miles by rail west of Sapporo (Map: Japan, G 2). It is important principally on account of its herring fisheries, which give occupation to a large proportion of the inhabitants. Some flint implements of Aino origin are the only trace of the aborigines. Population, in 1898, 56,961.

O'TARY (from Gk. *ὠτᾰρός, ōtaros*, large-eared, from *οἰς, ous*, ear). An eared seal. See SEAL.

OTAVALO, ō'tä-vä'lō. A town of the Province of Imbabura, Ecuador, 26 miles northwest of Quito, at an elevation of 8422 feet above the sea (Map: Ecuador, B 3). The town is well built and has some cotton and woolen mills. It was founded in 1534 and almost totally destroyed by an earthquake in 1868. Its population is about 6000.

OTCHAKOV, ŏ-chä'kŏf. A fortified seaport of Southern Russia, in the Government of Kherson, situated at the mouth of the Dnieper, 60 miles east of Odessa (Map: Russia, D 5). Its harbor is much frequented by coasting vessels. It was formerly an important Turkish fort, the last remnants of which were blown up by the Russians in the Crimean War. The present fortifications are modern, and command the entrance to the Dnieper. Population, in 1897, 10,784.

OTFRIED, ōt'frĕt (c.800-c.870). An Alsatian poet and theologian. As a student at the Abbey of Saint Gall he was a friend of Solomon, after-

wards Bishop of Constance; he then studied at Fulda under Rabanus Maurus. Next Otfried became priest and monk in the wealthy abbey of Weissenburg, where he acted as a notary (851). His fame is due wholly to his Frankish or Theodisc (Deutsch) poem on the Gospels. Not understanding Latin hymns, the Frankish folk kept up their heathen songs. Otfried made up his mind to do away with this habit by putting Christian songs into Frankish, declaring that he would break the Devil's wickedness, cast down foul legends, and rid his people of the songs that only awoke worldly longings, that wounded the ears of the righteous and saddened the heart. Otfried's *Liber Evangeliorum Domini Gratia Theodisce Conscriptus* begins with dedications to Louis the German and to Bishop Solomon in Frankish verses, and to Liutbert, Archbishop of Mainz, in Latin prose. The poem is fifteen thousand verses long and in strophes like the Latin hymns. It is remarkable because it uses rhyme instead of the alliteration customary in Old Germanic poetry, and because it has a regular, even a Latin rhythm. Poetically, it is inferior to the *Heliand*, a work of similar character. On the ground that we have five senses, and that each sense stirs us to its special sin, Otfried divided his poem into five parts: (1) The nativity of John the Baptist; (2) the meeting of the first disciples, the first miracles, the spread of Christ's teachings; (3) the story of astounding miracles that shook the Jewish faith; (4) the Passion; (5) the Resurrection, the Ascension, and the Judgment. It is doubtful whether this poem, ended in 856, ever accomplished Otfried's aim; yet it is for the philologist and the student of cultural history a work of great value. Of Otfried's other writings only a few bits are left. The best manuscript of his *Liber Evangeliorum* is at Vienna. Consult: Piper, *Otfrieds Evangelienbuch* (Freiburg, 1884); Kelle's *Text* (Regensburg, 1856-69); *Glossary* (ib., 1879-81); Erdmann's *Text* (Halle, 1882-83); translations by Rapp (Stuttgart, 1858), Rechenberg (Chemnitz, 1862), and Kelle (Prague, 1870). Consult also: Lachmann, in his *Kleinere Schriften* (Berlin, 1876); Schütze, *Beiträge zur Poetik Otfrieds* (Kiel, 1887); and Tesch, *Zur Entstehungsgeschichte des Evangelienbuches von Otfried* (Greifswald, 1890).

OTHEL'LO, THE MOOR OF VENICE. A tragedy by Shakespeare, written probably in 1604, printed in quarto 1622, and in folio 1623. It was produced probably in 1605, and positively in 1610 according to the diary of the Prince of Württemberg's secretary. Shakespeare found the story in "Un capitano moro," one of the Italian novels in Cinthio's *Hecatommithi*, a collection published in 1565. A French translation appeared in 1584, but no English version was extant. The general plan of the Italian story was followed in the tragedy, but none of the names were used except a modified form of Desdemona. The history of Venice gives an account of one Moro, a Governor of Cyprus, whose wife died on the return voyage under mysterious circumstances, and this may be the historical basis of the tale. The title Moor means an Arab.

OTHMAN, ŏth-män' (Ar. *'Uthmān, ibn 'Affān*). The third Caliph of the Moslems. He was born about 574. He belonged to the family of the Prophet, and was cousin german of Abu Sufyan. An early convert to Islam, he was one of its most zealous supporters, and linked himself still more strongly to Mohammed by becoming his son-in-law, marrying first his daughter, Rukaiya, and after her death, her younger sister, Umm Kulthum. He was elected to succeed Omar in the Caliphate late in the year 644. The choice was not made without much unseemly strife, Othman's most formidable opponent being Ali. The worldly motives that entered into the policy of Othman soon brought on serious difficulties. The able and energetic leaders who had been appointed by Omar were superseded by members of Othman's own family, and of that of Abu Sufyan. Egypt revolted, and the Caliph was compelled to reinstate Amru in the government of that country, and several other rebellions were only quelled by a similar restoration of the previous governors. Zealous Moslems deplored the folly of their chief, and were indignant at seeing the chair of the Prophet occupied by Othman while Abu-bekr, and even Omar, were accustomed to seat themselves two steps below it. Emboldened by the knowledge of his vacillating and cowardly disposition, they showered upon him reproaches and menaces; the bearer of their remonstrances having been bastinadoed by Othman's order, a general revolt ensued. Othman averted the crisis by unconditional submission; but having soon after attempted to put to death Mohammed, the son of Abu-bekr, the latter made his appearance at Medina at the head of a troop of malcontents, and forcing his way to the presence of Othman, stabbed him to the heart (656). It was under Othman that the second revision of the Koran was made, and an authentic copy prepared which served as the standard and prototype. See CALIPH; MOHAMMEDANISM.

OTHMAN or **OSMAN I.,** surnamed AL-GHAZI, i.e. the Conqueror (1259-1326). The founder of the Ottoman power. He was born in Bithynia, his father, Ertogrul, having been the chief of the Turks in Phrygia. On the death of the latter, in 1288, his tribe chose his son Othman (i.e. the 'young bustard') as his successor. Othman conquered all the west of Asia Minor—Nicæa (1304), Marmora (1307), and Brusa, taken just before his death by his son Orkhan (1326). He had the usual failing of Oriental despots, being of a dissimulating and treacherous nature when it served his aims. At the same time he was wise and politic. Othman held his Court at Kara-Hissar, and struck money in his own name, but it is doubtful whether he ever took the title of Sultan. From him are derived the terms Ottomans and Osmanlis, which are employed as synonymous with Turks. Consult Hammer-Purgstall, *Geschichte des osmanischen Reiches* (4 vols., 2d ed., Pesth, 1834-36). See TURKEY.

OTHMAN II. (1605-22). A Turkish Sultan, son of Achmet I. He succeeded his uncle, Mustapha I., in 1618, ruled with much energy, and made war on Sigismund III. of Poland. Defeated at Khotin, the Sultan swore to take vengeance on the Janizaries for the miscarriage of his plans, and was killed in a revolt of that body when he was only seventeen.

OTHO I., THE GREAT (912-73). The founder of the Holy Roman Empire of the German nation (*Heiliges römisches Reich deutscher Nation*). He was the eldest son of Henry the Fowl-

er, king of Germany, and was early recognized as the successor to the crown. In 936, on the death of his father, who left him the Duchy of Saxony, he was elected and crowned as King of the Germans, though his brother Henry, who had been born in the purple, was the favorite of many. Immediately upon the news of the death of King Henry, the various conquered Slavic tribes arose, and amid these foreign wars, civil strife soon raged, which centred around King Otho's brother Henry. Otho with the assistance of Hermann Billung repulsed the Slavs and Hungarians, leaving their total subjugation to a more favorable time. Meanwhile, however, Duke Eberhard of Franconia, feeling himself injured by Otho, conspired with Henry, the brother of Otho, Giselbert of Lorraine, and others, and was supported by Louis IV. of France. But, though the danger for a long time was great, Otho finally triumphed; in 939 Eberhard and Giselbert were killed, and Henry became reconciled to his brother. A new assignment of the duchies was thereupon carried out by Otho, who gave them to faithful relatives and devoted followers, and bound them closer to the Crown than they had ever been. Meanwhile Otho's fame had spread and he embraced the opportunity for interfering in Italian affairs when he was summoned by Queen Adelaide, the widow of King Lothair, to protect her from her importunate suitor, Berengar II. In 951 Otho answered the call, Berengar was defeated, and Adelaide became Otho's second wife. Berengar II. was permitted by Otho to rule as his feudatory. But though Otho thus was master of Northern Italy, he was unable to take Rome, which was held by Alberic II. (q.v.), and in 952 he returned to Germany, where a rebellion, incited by Lindolf, son of his first wife, soon threatened to overturn his throne, especially as the Hungarians, taking advantage of the internal strife, invaded Germany in 954. But the rebels were finally overcome, and the Hungarians were decisively defeated in 955 in the battle on the Lechfeld, which ended their raids forever.

In 954 Alberic II. died, and his son Octavian became Pope as John XII. Against him Berengar took up arms, whereupon Otho sent his son Liudolf into Italy. Liudolf died in 957, and four years later the German King himself crossed the Alps for the second time and put an end to the rule of Berengar. The gates of Rome were opened to him, and in 962 he received from John XII. the Imperial crown, thus founding the Holy Roman Empire of the German nation and establishing that close connection between Italy and Germany which formed so important a feature of mediæval history. Otho lost no time in asserting his Imperial prerogatives, and having called a council, effected the deposition of John, whose licentiousness had become a burden to Italy and a scandal to Christendom, and caused Leo VIII. to be elected in his place. This resulted in renewed wars, in all of which Otho was victorious. In order to obtain control over the whole of Italy, Otho sought the hand of the Greek princess Theophano for his son and presumptive successor. An embassy to Constantinople in 968 failed, as we know from the account of one of the ambassadors, Liudprand (q.v.). Thereupon Otho began to make inroads into the Italian provinces of the Byzantine Empire (Apulia and Calabria), which resulted, in 972, in the marriage of the later Otho II. and Theophano, though the coveted provinces were never surrendered. On May 7, 973, the great Emperor died, and was buried at Magdeburg, which he had made the seat of an archbishop. Otho had restored the prestige of the Imperial power, but it rested on no firm foundation. He was compelled, on account of the absence of a strong middle class, to depend on a party among the higher clergy and great nobles, who, under weaker successors, turned against the Crown. Consult: Vehse, *Kaiser Otto der Grosse* (3d ed., Leipzig, 1867); Köpke and Dönniges, *Jahrbücher des deutschen Reichs unter Otto I.* (Berlin, 1838-39); Köpke and Dümmler, *Kaiser Otto der Grosse* (Leipzig, 1876); Giesebrecht, *Geschichte der deutschen Kaiserzeit*, vol. i. (5th ed., Brunswick, 1881).

OTHO II. (955-83). Holy Roman Emperor from 973 to 983. He was a son of Otho the Great, during whose lifetime (967) he had been crowned as Emperor. In 972 he was married to the Byzantine Princess Theophano. At first Otho was content to rule under the regency of his mother, the Empress Adelaide; but differences having arisen between them, his mother withdrew from all share in the administration. Civil war broke out through the machinations of Henry II. of Bavaria, who formed a secret alliance against the young Emperor; but Otho put down the rebellion in 977. The next scene of war was Lorraine, which the French King, Lothair, had seized as a former appanage of his crown; but here, after a partial defeat, Otho succeeded in reasserting his power in 978, and not content with his advantage, devastated Champagne, pursued and captured Lothair, and advanced upon Paris, one of the suburbs of which he burned. Scarcely was this war ended when the disturbed condition of Italy called Otho across the Alps. His presence put a stop to the insurrection at Milan and Rome, where he reëstablished order; and having advanced into Lower Italy, he defeated the Saracens, drove back the Greeks, and after establishing his supremacy in Apulia and Calabria, which he claimed in right of his wife, Theophano, made himself master of Naples and Salerno, and finally of Taranto, in 982. The Greek Emperor, alarmed at the successful ambition of Otho, called the Saracens again into Italy, who gave him battle with overwhelming numbers. The result was a total defeat of the Emperor at Cotrone. Otho himself narrowly escaped capture by the Saracens, only to find himself on a Greek ship, where he was virtually a prisoner; but as the vessel neared Rossano, a friendly port, he contrived to escape. Otho now hastened to Verona, where a diet was held, which was numerously attended by the princes of Germany and Italy, and at which his infant son Otho was recognized as his successor. This diet is chiefly memorable for the confirmation by Otho of the franchises and privileges of the Republic of Venice, and the enactment of many new laws. Otho's death at Rome, December 7, 983, arrested the execution of the preparations against the Greeks and Saracens, which had been planned at the Diet of Verona, and left the Empire embroiled in wars and internal disturbances. Consult: Giesebrecht, *Jahrbücher des Deutschen Reichs unter der Herrschaft Kaiser Otto II.* (Berlin, 1840); and *Geschichte der deutschen Kaiserzeit*, vol. i. (5th ed., Brunswiek, 1881).

OTHO III. (980-1002). Holy Roman Emperor from 983 to 1002. He was the son of Otho II. and his wife, Theophano, and on his father's death, in 983, was immediately crowned King of the Germans at Aix-la-Chapelle. From this time till 996, when he received the Imperial crown at Rome, the government was administered with extraordinary skill and discretion by three female relatives of the boy King—viz. his mother, Theophano, who died in 991; his grandmother, Adelaide; and his aunt, Matilda, Abbess of Quedlinburg. The princes of the Imperial family disputed the right of these royal ladies to the custody of the young monarch. Henry of Bavaria, the nearest agnate, having seized the person of Otho, tried to usurp the supreme power; but, opposed by the majority of the other princes of the Empire, he was compelled to release him, in consideration of receiving back his forfeited duchy. Otho early showed that he had inherited the great qualities of his forefathers. In 996 he was crowned Emperor by his relative, Gregory V., whom he had raised to the Papal throne, and, having settled the affairs of Italy, returned to Germany. The rebellion of Crescentius, who drove Gregory from the Papal throne, compelled Otho to return to Italy, where success, as usual, attended his measures. Crescentius, who had thrown himself into Sant' Angelo, was seized and beheaded, together with twelve of his chief adherents; the Antipope, John XVI., imprisoned; Gregory restored; and on the speedy death of the latter, Otho's old tutor, Gerbert, Archbishop of Ravenna, raised to the Papacy under the title of Sylvester II., as the first Pope of French nationality. (See SYLVESTER II.) Otho, elated with his success, took up his residence in Rome, where he organized the Government, erected new buildings, and showed every disposition, notwithstanding the ill-concealed dissatisfaction of the Romans, to convert their city into the capital of the Western Empire. Together with Sylvester he dreamed of reëstablishing in full the old Roman Empire, but the insurrection of the Romans frustrated his plans, and, escaping from the city at the risk of his life, he withdrew to Ravenna to await the arrival of reinforcements from Germany; but before they had crossed the Alps, Otho died in 1002 at the age of twenty-two. Consult: Wilman, *Jahrbücher des Deutschen Reichs unter Kaiser Otto III.* (Berlin, 1840); Giesebrecht, *Geschichte der deutschen Kaiserzeit*, vol. i. (5th ed., Brunswick, 1881).

OTHO IV. (c.1175-1218). Holy Roman Emperor from 1198 to 1214. He was the son of Henry the Lion, Duke of Bavaria and Saxony, and Matilda, sister of Richard the Lion-hearted. His father was outlawed by Frederick Barbarossa in 1180, and in the following year was stripped of most of his dominions. Otho and his brother succeeded to a small fragment, the later Brunswick and Lüneburg. Otho was educated at the English Court and participated in Richard's wars against Philip Augustus of France. In 1197 the Emperor Henry VI. died, leaving an infant heir, Frederick II. A majority of the German princes offered the crown to Philip, Duke of Swabia, brother of Henry (1198), but the Guelphs set up Otho as rival King. A civil war resulted, and by 1206 Otho was apparently defeated, but Philip was assassinated in 1208 by Otho of Wittelsbach. Otho of Brunswick was recognized by Innocent III., who crowned him Holy Roman Emperor at Rome in 1209. In 1210 Otho was excommunicated by the Pope because he had seized some Papal territory, and in 1211 some of the German princes deposed Otho in favor of Frederick II., King of Sicily and Naples. After an unsuccessful struggle, and after the defeat at Bouvines (q.v.) by Philip Augustus in 1214, Otho withdrew to his estates in Brunswick, where he passed the last part of his life in penitential exercises. He died May 10, 1218. Consult Winkelmann, *Philip von Schwaben und Otto IV. von Braunschweig* (Leipzig, 1873-78).

OTHO, MARCUS SALVIUS (32-69). Emperor of Rome, from January 15 to April 17, A.D. 69. He was descended from an ancient Etruscan family. He was a favorite companion of Nero, who appointed him Governor of Lusitania, in which office he acquitted himself creditably. On the revolt of Galba against Nero (68), Otho joined himself to the former; but being disappointed in his hope of being proclaimed Galba's successor, he marched at the head of a small band of soldiers to the Forum, where he was proclaimed Emperor, and Galba was slain. Otho was recognized as Emperor over all the Roman possessions, with the exception of Germany, where a large army was stationed under Vitellius. The first few weeks of his reign were marked by an indulgence toward his personal enemies, and a devotion to business, which, though at total variance with his usual habits, excited in the minds of his subjects the most favorable hopes. But the tide of rebellion raised in Germany by Valens and Cæcina during the reign of Galba had by this time gathered strength, and, these commanders having prevailed upon Vitellius to join his forces to theirs, the combined army poured into Italy. Otho possessed several able generals, who repeatedly defeated the rebels; but the prudence of some among them in restraining the enthusiasm of their troops, who wished to follow up their victories, was considered as cowardice or treason, and produced dissensions in Otho's camp. This state of matters, becoming known to the generals of Vitellius, encouraged them to unite their armies and fall upon the forces of Otho. An obstinate engagement took place near the junction of the Adda and the Po, in which the army of Otho was completely routed, and the survivors went over on the following day to the side of the victor. Otho, though by no means reduced to extremity, resolved to make no further resistance, settled his affairs with the utmost deliberation, and stabbed himself, April 17, A.D. 69.

OTHO OF BAMBERG, bäm'bĕrk, SAINT (c.1069-1139). Apostle to the Pomeranians. He was born in the County of Bregenz, became Court chaplain to the Polish Duke Ladislas Hermann, and through his diplomatic duties made the acquaintance of the Emperor Henry IV., who made him his Chancellor, and in 1102 appointed him Bishop of Bamberg. He introduced Christianity into Pomerania, and after his death was canonized.

OTHO OF FREISING, frī'zĭng (c.1111-58). The greatest of the German chroniclers of the Middle Ages. He was an uncle of the Emperor Frederick Barbarossa, was educated at Paris, and, attracted by the ascetic life of the Cistercians, he entered their monastery at Morimond

in 1133. Four years thereafter he was elected abbot, and on the same day became also Bishop of Freising. He always labored hard for his diocese, but also participated in the politics of his day. He joined the Second Crusade, led by Conrad III. of Germany, and in 1150 returned to Europe. Between 1143 and 1146 he wrote his *Chronica*, to which he planned to add the *Gesta Friderici Imperatoris*, but died before the work was finished. His works have been edited by Wilman in the *Monumenta Germaniæ Historica, Scriptores*, vol. xx. (Hanover, 1868); consult, also, the German translation by Kohl in *Geschichtsschreiber der deutschen Vorzeit, XII. Jahrhundert*, vol ix. (Leipzig, 1894).

OTHO OF NORDHEIM, nōrt'hīm (?-1083). A well-known German noble, who played an active rôle in the struggles of the reign of Henry IV. Otho was descended from an old Saxon family, whose seat was near Göttingen. In 1061 Agnes of Poitiers, who was Regent during the minority of her son, Henry IV., gave the vacant Duchy of Bavaria to Otho, in order to gain his aid against the powerful interests arrayed against her. But the Empress was an incapable woman, and in consequence Otho of Nordheim united with the powerful prelates to bring about her downfall. The conspirators obtained possession in 1062 of the young ruler's person and deposed the Empress from the regency. Henry IV. never forgave this deed. When the young King assumed the government in person, Otho was one of the most powerful of the great nobles, and his downfall appeared necessary in order to permit the full development of the Imperial power. In 1070 Otho was suddenly charged with planning a new conspiracy in order to make himself King. Probably the accusation was false, but Otho was found guilty, deprived of his duchy, and was compelled to submit to Henry. He never gave up, however, the attempts to recover his lost territories, and hence was involved in and led the numerous uprisings of the Saxons against Henry IV. In 1077 Otho helped to elect Rudolph of Swabia as German King in opposition to Henry, and when Rudolph fell in battle, in 1080, he supported Hermann of Luxemburg, though he had hoped to obtain the election himself. Otho is important because he is typical of the entire class of great German nobles, who were ever ready to oppose any attempt on the part of the emperors to strengthen their government. Consult: Vogeler, *Otto von Nordheim* (Minden, 1880); Giesebrecht, *Geschichte der deutschen Kaiserzeit*, vol. iii. (5th ed., Leipzig, 1890).

OTIC GANGLION (from Gk. *ōtikós, ōtikos*, relating to the ear, from *oûs, ous*, ear). One of the four cranial sympathetic ganglia, the other three being Meckel's (q.v.), the ophthalmic (q.v.), and the submaxillary (q.v.). The otic or Arnold's ganglion is a small oval, flattened mass, of reddish gray color, situated immediately below the foramen ovale. It is connected with the inferior maxillary branch of the fifth nerve, from which it may receive a motor and possibly also a sensory root. It communicates with the glossopharyngeal nerve, from which it probably derives a sensory root, and with the facial nerve, from which it gets a motor root. Communication with the sympathetic is effected through a filament from a plexus surrounding the middle meningeal artery. It distributes branches to the tensor tympani and tensor palati muscles.

O'TIS, Bass (1784-1861). An American portrait painter, born in New England. He was probably self-taught, and at first painted portraits in New York City. Afterwards, in 1812, he settled in Philadelphia. His "Interior of a Smithy" (1819) is in the Pennsylvania Academy of Fine Arts. It is his only known genre picture. Most of his work was portraiture, and this includes President Jefferson, engraved for Delaplaine's *Portrait Gallery;* Alexander Lawson; the painter Jarvis; himself; and Dr. Physick, of which he made a mezzotint engraving.

OTIS, Elwell Stephen (1838—). An American soldier. He was born at Frederick, Md., but early removed with his family to a farm near Rochester, N. Y., and graduated at the University of Rochester in 1858. Three years later he graduated at the Harvard Law School, and then opened an office in Rochester; but in 1862 he entered the military service of the Federal Government as a captain in the 140th New York Volunteers, and served with them throughout the Civil War, rising to the rank of lieutenant-colonel. He participated in many of the battles of the Army of the Potomac, including Gettysburg and the Wilderness, and was mustered out in 1865 with the brevet rank of brigadier-general of volunteers. The next year he was appointed lieutenant-colonel of the Twenty-second Infantry in the Regular Army, and by successive promotions became colonel in 1880, brigadier-general in 1893, major-general of volunteers in 1898, and major-general in the Regular Army in 1900. In 1898 he was sent to the Philippines, where he relieved Major-General Wesley Merritt as commander of the United States forces and Military Governor of the islands, and in February, 1899, he was brevetted major-general in the Regular Army for "military skill and most distinguished services in the Philippines." He was a member of the first Philippines commission in 1899. In 1900 he was recalled to the United States and assigned to the command of the Department of the Lakes, and in March, 1902, was retired from the service.

OTIS, Fessenden Nott (1825-1900). An American surgeon, born at Ballston Spa, N. Y. He was educated at Union College and at the New York Medical College and the College of Physicians and Surgeons. In the latter institution he was lecturer on genito-urinary diseases (1862-71), and then clinical professor of that subject. He invented many surgical instruments, of which the more important are the urethrometer, the dilating catheter, and an evacuator for use after lithotrity. His works include many monographs on his especial branch, including *Urethral Strictures* (1877) and *Genito-Urinary Diseases* (1883).

OTIS, George Alexander (1830-81). An American military surgeon, born in Boston, Mass. He graduated at Princeton in 1849, and in medicine at the University of Pennsylvania in 1851. In September, 1861, he was appointed surgeon of the Twenty-seventh Massachusetts Volunteers. With them he served until 1864, when he was appointed surgeon of United States Volunteers, and was assigned to duty as curator of the Army Medical Museum and custodian of the Division of Surgical Records at Washington.

On the conclusion of peace he accepted an appointment as assistant surgeon in the medical corps, and continued his duties at the museum, which, owing to his zeal and energy, came to possess the most valuable surgical and anatomical collections in the world. He compiled the surgical volumes of the *Medical and Surgical History of the War* (1870-81), contributed frequently to medical publications, and for three years edited the *Richmond Medical Journal*. Among his writings are *Excision of the Head of the Femur for Gunshot Injury* (1869) and *Amputation of the Hip-Joint in Military Surgery* (1867).

OTIS, HARRISON GRAY (1765-1848). An American lawyer and politician. He was born in Boston, graduated at Harvard in 1783, was admitted to the bar three years later, and soon became one of Boston's most eloquent orators. In 1796 he was elected to the State Legislature, and the next year was sent to Congress as a Federalist. After the expiration of his term he was chosen to fill a number of State offices, and became one of the most popular politicians in Massachusetts. His popularity was greatly diminished, however, by the active part he took in the Hartford Convention (q.v.), though he was afterwards elected United States Senator (1817) and Mayor of Boston (1829). His brilliant oratorical powers made him a leader in the Senate, where he opposed the further extension of slavery. Criticism of the Hartford Convention led him to publish a series of *Letters in Defense of the Hartford Convention and the People of Massachusetts* (Boston, 1824). Consult Loring, *The Hundred Boston Orators* (Boston, 1854).

OTIS, JAMES (1725-83). An American statesman of the Revolutionary period. He was born, February 5, 1725, at West Barnstable, Mass.; graduated at Harvard in 1743, and studied law in the office of Jeremiah Gridley. He practiced for two years at Plymouth, but settled in 1748 in Boston, where he soon rose to the front rank in his profession. In 1761, when he was Advocate-General, application was made to the Massachusetts Supreme Court for writs of assistance, i.e. general search warrants for the discovery of smuggled goods imported into the colony. Otis was convinced of the illegality of these writs, and resigned his office rather than argue in their defense. He was immediately engaged to argue against them, which he did in a speech of great force and eloquence. It was of this speech that John Adams said "American independence was then and there born." The judges reserved their decision, but no more writs were enforced, though some were issued. The resignation of Otis and his plea in behalf of the popular side of the writs-of-assistance controversy gave him a high reputation for patriotism, ability, and eloquence, which he more than maintained in the Legislature, to which he was elected the same year. Taking an active part in the legislative discussions upon taxation and representation, he became still more conspicuous by publishing in the following year, 1762, his *Vindication of the Conduct of the House of Representatives*, which has been considered one of the sources from which all the arguments against Parliamentary taxation were later drawn, and the basis of all subsequent treatises on free speech in America and France. This was followed, in 1764, by his *Rights of the British Colonies Asserted and Proved*. His apparent recognition of Parliamentary supremacy in this pamphlet, however, served to quality the regard in which he had been held by the extremists. In a third pamphlet, entitled *Considerations on Behalf of the Colonists*, published the following year, he reëstablished himself in the esteem of the radicals. On June 6, 1765, he made a motion, which was carried, that a congress of representatives from the various colonies should be convened. In pursuance of this measure a circular letter was sent, inviting the colonies to join in a congress, and the Stamp Act Congress, which met in New York in the fall of 1765, was the result. Otis took part in the proceedings of this body, and served on the committee which framed an address to the House of Commons. He was chosen Speaker of the Massachusetts General Court in 1766, but the Governor interposed his negative then, as also in the following years. In 1768, after the passage through Parliament of Charles Townshend's bill for the taxation of the colonies, the Massachusetts General Court sent a second circular letter to the other colonies, calling on them to join in some common plan for protection. It was in answer to the message of Bernard, the Royal Governor, demanding that the circular be recalled, that Otis made a notable speech, condemned by the partisans of the Crown as "the most violent, insolent, abusive, and treasonable declaration that perhaps was ever delivered." Only seventeen members voted to recall the circular. In 1769 the customs commissioners accused him in England of treason. This coming to his notice, he publicly denounced the commissioners in the Boston *Gazette*. Meeting Robinson, one of the commissioners, in a coffee-room the next night, he became involved in a dispute with him. An affray resulted, in which Otis received a cut on the head, which is supposed to have been the cause of his subsequent insanity. He sued Robinson, and recovered £2000 damages, but relinquished this sum in consideration of a written apology from Robinson. After a short residence in the country for the benefit of his health, he returned to the Legislature in 1771. He was insane for the greater part of his subsequent life, with the exception of a short interval, when he went back to Boston and resumed the practice of his profession. The last two years of his life were spent at Andover, where he was killed by lightning, May 23, 1783. He published in 1760 a treatise on *The Rudiments of Latin Prosody; with a Dissertation on Letters and the Principles of Harmony in Poetic and Prosaic Composition*. Of his public career the elder Adams said: "I never knew a man whose love for his country was so sincere; never one who suffered so much; never one whose services for any ten years of his life were so important or so essential to the cause of his country as those of Mr. Otis from 1760 to 1770." His *Life* has been written by William Tudor (Boston, 1823); also by Francis Bowen (Boston, 1847). Also consult Tyler, *Literary History of the American Revolution* (New York, 1897).

OTI'TIS ME'DIA (Neo-Lat., inflammation of the middle ear). An inflammation of the structures of the tympanic cavity of the ear. It may be acute or chronic. There is an effusion of

fluid into the middle ear, which may be serous (the catarrhal form) or this may become infected with pus-producing organisms (the purulent forms). It arises from exposure to cold or wet, the introduction of fluids into the middle ear through the Eustachian tube while bathing, or through douching the nose, or by extension of inflammatory processes from the nose and throat. It often begins in this way during the course of the infectious fevers, particularly in scarlatina, when it is of the purulent type. The symptoms of the acute form are sudden and intense pain in the ear, increased by coughing, sneezing, or swallowing, *tinnitus aurium*, or singing or buzzing noises heard by the patient, and more or less deafness. If the disease goes on unchecked, suppuration takes place, and the membrance of the tympanum ulcerates, and allows of the discharge of pus. Inflammation of the dura mater and abscesses in the brain may result. The chronic form of the disease may be *catarrhal* (without suppuration) or *purulent*; in the latter there is a persistent discharge (see OTORRHŒA) of pus from the external ear. The catarrhal form often comes on insidiously and results in complete or partial deafness in the ear affected, unless arrested by treatment. The management of so serious an affection must be left solely in the hands of the medical practitioner. See EAR, section on *Diseases*.

OTO, ō'tō. A small tribe of Siouan stock formerly holding the territory west of the Missouri and south of the Platte, in southeastern Nebraska, and now residing, together with the Missouri, upon a reservation in eastern Oklahoma. The two tribes speak the same language and have been confederated since the early part of the nineteenth century. They formerly lived in circular earth-covered log houses, and about a century ago, before they were joined by the Missouri, had several villages, with an estimated population of 800. Both tribes have dwindled rapidly, the two together numbering only 460 in 1875 and 370 in 1900.

OTOCYON (Neo-Lat., from Gk. *oûs, ous*, ear + κύων, *kyōn*, dog). A genus of wild dogs, which differs from other genera of Canidæ primarily in having an additional molar in each jaw, and other peculiarities of dentition. The genus contains only one species, *Otocyon megalotis* of Africa. See LALANDES FOX-DOG.

OTOMACO, ō'tō-mä'kō. A savage tribe, apparently constituting a distinct linguistic stock, living in the forests of the Orinoco, about the junction of the Meta, in Central Venezuela. They are in a very low state of culture, but are monogamous and allow their women an equality in tribal ceremonies. They are addicted to the eating of a certain oily clay.

OTOMI, ō-tō'mē (Nahuatl *otomitl*, wanderer). An ancient people of Central Mexico, antedating the coming of the Aztec, by whom they were subjugated. They call themselves *Hia-hui*, and their tribes, constituting a distinct linguistic stock, occupied most of Querétaro and Guanajuato, with considerable portions of Hidalgo, Michoacán, and Mexico State. They are rather below medium stature and darker in color than the neighboring tribes, but appear to have been fully up to the standard in intelligence, living by agriculture, wearing cotton clothing of their own weaving, skillful in the working of gold, copper, and stone, and noted for their songs and musical ability, and their religious ceremonials. They defeated several Spanish expeditions against them and were not finally reduced to submission until 1715. They still form a considerable and valuable portion of the population of the States named, and retain their own language, which, by reason of its monosyllabic character and peculiar sounds, was at one time erroneously thought to be connected with the Chinese.

OTÓN, ō-tōn'. A town of Panay, Philippines, in the Province of Iloilo, situated on the south coast, six miles west of Iloilo (Map: Philippine Islands, G 9). Population, 13,363.

OTORRHŒ'A (Neo-Lat., from Gk. *oûs, ous*, ear + *roia, rhoia*, a flow, from *ῥεῖν, rhein*, to flow). A purulent or muco-purulent discharge from the external ear. It may be acute or chronic, and, while it may be due to a polypus or an abscess in the canal, it is, as a rule, an evidence of otitis media (q.v.). The treatment is that of the inflammation of the middle ear, which causes it. See EAR, section on *Diseases*.

OTRANTO, ō-trän'tō (Lat. *Hydruntum*). A town on the southeast coast of Italy, in the Province of Lecce, 24 miles southeast of Lecce by rail (Map: Italy, N 7). It has a cathedral, recently restored, and a castle. The chief industries are fishing and the manufacture of fishing nets and oil. During the Middle Ages it was the chief port of Italy on the Adriatic, whence passengers took ship for Greece. It was destroyed by the Turks in 1480. Population (commune), in 1901, 2401.

OTRANTO, STRAIT OF. The passage connecting the Adriatic with the Ionian Sea (Map: Italy, N 7). It is a construction of the large arm of the Mediterranean which separates the Italian from the Balkan Peninsula, and has a minimum width of 45 miles between the town of Otranto in Italy and Cape Linguetta in Turkey.

OTRANTO, THE CASTLE OF. A novel by Horace Walpole. See CASTLE OF OTRANTO.

O'TRIG'GER, Sir LUCIUS. In Sheridan's *Rivals*, an Irish fortune-hunter, honest and always ready for an opportunity to fight.

OTSE'GO BASS. A landlocked variety of the common whitefish (q.v.), found in Otsego Lake, at the head of the Susquehanna River.

OTSEGO LAKE. A small lake in Otsego County, central New York (Map: New York, E 3). It is the main source of the Susquehanna River. Cooperstown lies at its southern end.

OTTAVA RIMA, ôt-tä'vä rē'mä (It., octuple rhyme). The name given by the Italians to a stanza, composed of eight five-foot lines, rhyming ab ab ab cc. This stanza has been employed by English poets, notably by Fairfax in his translation of Tasso's *Jerusalem Delivered*, by Spenser in *Muiopotmos*, and by Byron in *Don Juan*. It is also the basis of two well-known English verse-schemes. The seven-line stanza (ab ab b cc) called rhyme royal, which was employed by Chaucer and his followers and was revived by later poets, as William Morris, is the *ottava rima* with the fifth line dropped out. The so-called Spenserian stanza—that of the *Faerie Queene*—is also a modification of the *ottava rima*. Consult Alden, *English Verse* (New York, 1903).

OTTAWA, ŏt'ă-wă. An important Algonquian tribe originally living about the upper Ottawa River, Canada, and carrying on an active trade by water between the Eastern tribes and those of the lakes. They were the allies and friends of the French and the Huron, by which they incurred the hatred of the Iroquois. After the dispersion of the Huron, about 1645, the Iroquois turned against the Ottawa, who were compelled to abandon their country and seek refuge on Manitoulin Island in Lake Huron. After a short stay there they removed, about 1660, to La Pointe (Wis.), on the south shore of Lake Superior, where the Huron had already preceded them. Here the Jesuits resumed their mission work, but a few years later the two tribes were again driven out by the Sioux, the Huron retiring to Mackinaw, while the Ottawa returned to Manitoulin Island. Within the next fifty years they had spread over the whole of Lower Michigan and into adjacent parts of Ohio and Illinois, besides holding Manitoulin and some territory on the Canadian side of Lake Huron. They took an active part on the French side in all the colonial wars, including that headed by Pontiac, who was himself of that tribe. They joined the English side against the Americans in the Revolution and War of 1812. Several smaller bands have been removed to the West, but the great body of those in the United States are still living in small settlements scattered over Lower Michigan, having no regular reservation. Those in Canada are all within Ontario Province.

In their general characteristics the Ottawa closely resemble the Ojibwa, and according to tradition these two tribes and the Potawatami formed one body before their westward migration. The number of their clans is disputed, but the principal one seems to have been the Otter. Owing to their being scattered in numerous small bands over a large territory, intermixed with other tribes, no reliable estimate of their separate population has ever been made, but it is probably at present about 5000.

OTTAWA. The capital of the Dominion of Canada and of Carleton County, Ontario, at the junction of the Ottawa and Rideau rivers, on the Canadian Pacific, the Canadian Atlantic, the Ottawa and New York, and several other railroads, 101 miles west of Montreal (Map: Canada, P 7). It communicates by steamer on the Ottawa with Montreal, and by the Rideau Canal with Lake Ontario at Kingston. At the west end of the city the Ottawa rushes over the magnificent cataract known as the Chaudière Falls; and at the northeast end, divided by Green Island, there are two other cataracts, over which the Rideau falls into the Ottawa. The scenery around Ottawa is scarcely surpassed by any in Canada. The immense water power is made use of in foundries, factories, flour-mills, and in several saw-mills, which give Ottawa its principal trade in enormous quantities of sawed timber. A railway bridge and a road bridge which has supplanted the suspension bridge over the Chaudière Falls connect Ottawa with Hull (q.v.), in the Province of Quebec. Four bridges span the Rideau River.

Ottawa's streets are wide and laid out at right angles. Among its chief features are the Parliament and departmental buildings on Parliament Hill, 125 feet above the river, magnificent structures built of Canadian and New York sandstone, which cover nearly four acres, and cost about $4,000,000. The style of architecture is the Italian Gothic; the south front of the quadrangle is formed by the Parliament building, 500 feet long. Other buildings include the Basilica or Roman Catholic Cathedral of Notre Dame, Christ Church Cathedral, the city hall, post-office, Rideau Hall, the Governor's residence, numerous churches, the Ottawa Roman Catholic University, the Coligny Ladies' College, a collegiate institute and normal school, and several charitable and benevolent institutions. The Public or Parliamentary Library contains over 200,000 volumes, and there are also an interesting museum and a national art gallery. The city maintains several fine parks, has water, gas, and electric lighting plants, electric street railroads, and a modern system of sewerage. It is the residence of the Governor-General of Canada, the seat of a United States consul-general, and the see of the Roman Catholic Archbishop of Ottawa, and of the Anglican Bishop of Ontario. Ottawa was founded in 1827 by Colonel By, from whom it was named Bytown; was incorporated as a city under its present name in 1854; and was selected by Queen Victoria as the capital of Canada in 1858. Population, in 1891, 44,156; in 1901, 59,902.

OTTAWA. A city and the county-seat of La Salle County, Ill., 85 miles southwest of Chicago; at the junction of the Fox and Illinois rivers, on the Illinois and Michigan Canal, and on the Chicago, Rock Island and Pacific and the Chicago, Burlington and Quincy railroads (Map: Illinois, D 2). It is the seat of Pleasant View College (Lutheran), and of Saint Francis Xavier Academy. It has a high school library, Illinois Appellate Court, Odd Fellows' and Reddick's public libraries; the Ryburn Memorial Hospital; and Washington, Shabbana, Ellis, and Allen parks. Ottawa controls important commercial interests, and possesses valuable natural advantages in deposits of coal, clay, and glass sand. Its extensive manufactures include glass ware, chimney glass, pottery, fire brick, tile, sewer pipe, organs, pianos, carriages, wagons, buggies, agricultural implements, collars and harness, etc. The government is administered, under a general law of 1871, by a mayor, elected every two years, and a council which confirms the executive's appointments of subordinate officers. The school officials are independently elected by popular vote. The municipality owns and operates the water-works and owns the electric light plant, the power being furnished by a private company. Ottawa was incorporated as a town in 1837. Population, in 1890, 9985; in 1900, 10,588.

OTTAWA. A city and the county-seat of Franklin County, Kan., 55 miles southwest of Kansas City; on the Marais des Cygnes River, and on the Atchison, Topeka and Santa Fe, the Southern Kansas, and the Missouri Pacific railroads (Map: Kansas, G 3). It is the seat of Ottawa University (Baptist), organized in 1865; and has a free Carnegie Library, Forest Park, and, among prominent buildings, the county courthouse, First Baptist Church, First Methodist Episcopal Church, and Rohrbaugh Theatre. The city controls important commercial interests in a trade in grain, wool, and live stock. The principal industrial plants are the railroad machine shops of the Southern Kansas, large nurseries,

flouring mills, grain elevators, a foundry, carriage factories, soap works, a creamery, etc. The government is administered under a charter of 1867, which provides for a mayor who holds office for two years, and a council. Population, in 1890, 6248; in 1900, 6934.

OTTAWA. A village and the county-seat of Putnam County, Ohio, 52 miles south-southwest of Toledo; on the Blanchard River, and on the Detroit Southern, the Cincinnati, Hamilton and Dayton, and the Findlay, Fort Wayne and Western railroads (Map: Ohio, B 3). It is the centre of a farming and stock-raising country which has valuable forests. There are manufactures of lumber in various products, flour, clay, shingles, etc. Population, in 1890, 1717; in 1900, 2322.

OTTAWA RIVER. The principal tributary of the Saint Lawrence. It rises 160 miles north of Ottawa, on the Laurentian divide, and flows first west, then southeast and east, until after a course of about 600 miles it falls into the Saint Lawrence by two mouths, which form the island of Montreal (Map: Canada, P 7). During its course it widens into numerous lakes of considerable size, and is fed by many important tributaries, such as the Madawasca and Rideau on the right, and the Gatineau and the Rivière du Lièvre on the left. These, with the Ottawa itself, form the means of transit for perhaps the largest lumber trade in the world, while the clearing of the lumber has opened the country for several thriving agricultural settlements. The navigation has been greatly improved, especially by the construction of dams and slides to facilitate the passage of timber over falls and rapids. The Ottawa is connected with Lake Ontario at Kingston by the Rideau Canal, and is navigable for 250 miles. For a great part of its course it forms the boundary between the provinces of Ontario and Quebec.

OTTENDORFER, Oswald (1826-1900). A German-American journalist. He was born at Zwittau, Moravia, studied jurisprudence at Vienna, and was among those German youth who, after participating in the revolutionary troubles of 1848, sought refuge in America. Coming to New York, he acquired control of the *New-Yorker Staats-Zeitung*, which, at first Democratic in politics, but after 1871 independent, has taken rank as the foremost German-American daily. He largely endowed various institutions in his native town of Zwittau, and to New York presented a fully equipped free library. Some years previous to his death ill health necessitated his retirement from active journalistic work.

OTTER (AS. *otor, ottor, oter*, OHG. *ottar*, Ger. *Otter*, otter; connected with OChurch Slav. *vydra*, Lith. *udra*, otter, Gk. *ὕδρος, hydros, ὕδρα, hydra*, water-snake, Skt. *udra*, otter, also with Gk. *ὕδωρ, hydōr*, Skt. *udan*, water, and ultimately with Eng. *water*). The otters are a small but cosmopolitan subfamily (Lutrinæ) of fur-bearing carnivores (Mustelidæ), with aquatic habits. The North American otter (*Lutra Canadensis*) is found in most parts of the continent north of Mexico, though no longer numerous in well-settled districts. It is about four feet in length, of which the tail is one-third. The color is rich brown. The body is long, and rather stout, the legs short with rounded webbed feet, the tail broad and horizontally flattened, and the skull wide and depressed. The eyes are small and supplied with a nictitating membrane. The teeth are strong and very sharp. The whole structure is thus adapted to an aquatic life and the capture of fish. The otter makes its home in some hole in the bank, or under the roots of a tree, furnished with a bed of leaves and grass, where the female brings forth from one to three young ones, in the early spring. Although ill-shaped for walking on land, otters wander about a great deal at night, crossing from one stream to another, and doing much hunting in the woods and thickets; and young and old are fond of romping games in grassy places in summer, as well as in the snowbanks of winter. The otter is one of the most playful of animals, and many writers have described its favorite pastime of sliding on the inclines of snow or in summer on some steep clayey slope entering a body of water. In either case the otter lies on its belly with its fore feet bent backward, and gives the body a shove by means of its hind feet. In a short time the sliding place becomes very slippery and the otters show great delight in sliding down and then climbing back to repeat the performance. In captivity otters are rather surly and snappish, and when brought to bay in their native haunts they will fight savagely, and it requires a special breed of dogs (see Hound) to hunt them successfully. In India and the Far East the otter is frequently kept in a half-domesticated state and used as a fish-catcher. A collar is placed around the neck and to this a long line is attached. The otter is then sent into the water, and as otters always bring their prey to shore to devour it, as soon as he has captured a fish he returns to his master with it.

The European otter (*Lutra vulgaris*) is widely distributed throughout Europe and Asia. It is much smaller than the American species and somewhat lighter in color. It is frequently seen along the seashore and fishes in the sea. Other species of Lutra occur in Southeastern Asia, in Africa, and in South America.

The fur of the otter is highly prized and is an important article of commerce. The flesh has a very fishy taste, and has been accounted by many Roman Catholics as fish and not meat, so that it might be used in Lent and on fast days. A discussion of this mediæval view is one of the entertaining disquisitions in Walton's *Compleat Angler*.

Consult British and East Indian books of zoology and sport; Thomas, *Proceedings of the Zoölogical Society* (London, 1889); Stone and Cram, *American Animals* (New York, 1902). See Plate of Minor Carnivores. Compare Coypu.

OTTER (or **ANCON**) **SHEEP.** An aberration or sport of the ordinary breed of sheep, which by artificial selection became the founder of a distinct breed. Seth Wright, a farmer of Dover, Mass., kept a flock of 15 ewes and one ram. In 1791 one of the ewes produced a male lamb, which after growing up was reserved for breeding purposes, the original ram being killed. In the first season "two lambs only were yeaned in his likeness," but the number grew, until there resulted a small flock of the strongly marked sport, called 'otter breed,' and named 'ancon,' by Dr. Shattuck, from the crookedness of its short fore legs, causing them while walking to appear like elbows. The body was longer than normal, the legs shorter and crooked, and the breed appears to have

been perpetuated on account of its being less able than ordinary sheep to jump over fences. The interest in this sport is due to the fact that one prepotent sire impressed his peculiarities on his offspring and became the founder of a new breed. When an ancon ewe was mated with a common ram, the increase resembled "wholly either the ewe or the ram." Moreover, frequent instances happened where common ewes had twins by ancon rams, when one exhibited the complete marks and features of the ewe, the other of the ram. The ancons were observed to keep together, separating themselves from the rest of the flock when put into inclosures with other sheep. This fact is a noteworthy instance both of the results of isolation (q.v.) and of preferential mating. After the introduction of Merinos, which are equally gregarious, quiet, and orderly, the ancon breed became extinct; in fact, it was difficult for Humphreys to procure one in 1813 for dissection by Dr. Shattuck. Without doubt the breed immediately after the above date was bred out or swamped by intercrossing with the ordinary breed of sheep. See CROSS-FERTILIZATION; PREPOTENCY. Consult D. Humphreys, "On a New Variety in the Breeds of Sheep," in the *Philosophical Transactions of the Royal Society* for 1813 (London, 1813).

OT'TER, WILLIAM DILLON (1843—). A Canadian soldier. He was born in the Province of Ontario, and was educated at Upper Canada College, Toronto. He saw service in the Fenian raids in 1866, and from 1883 to 1889 was commandant of the School of Infantry in Toronto. During the second Riel rebellion, in 1885, he commanded a column under General Middleton, and was in command at the battle of Cut Knife Creek. In 1886 he was appointed commanding officer of the Second District, and in 1896 an inspector of infantry. His most notable service was during the Boer War in South Africa, in which he was in command of the First Canadian contingent.

OT'TERBEIN, PHILIP WILLIAM (1726-1813). A clergyman, founder of the United Brethren in Christ (q.v.). He was born at Dillenburg, Germany, and studied the classics and theology at his father's school at Herborn. After being ordained at The Hague he sailed for America to take up the work of the ministry in the German Reformed Church. He first settled at Lancaster, Pa., where he remained till 1758. He then held pastorates at Tulpehocken, Pa., Frederick, Md., and York, Pa. In 1774 he accepted a call to a new congregation in Baltimore, and remained there until his death. In 1768 he became associated with Martin Boehm, a Mennonite preacher, and their labors resulted in the organization of the Church of the United Brethren in Christ. The common belief that he was its first bishop or superintendent is denied by Harbaugh (*Fathers of the German Reformed Church*, Lancaster, Pa., 1857), who maintains that Otterbein, who never really left the German Reformed Church, bears the same relation to the new organization that Wesley does to Methodism. Consult his *Life* by Drury (Dayton, Ohio, 1884).

OTTERBEIN UNIVERSITY. A coeducational college at Westerville, Ohio, founded in 1847, under the control of the United Brethren in Christ. It has a preparatory department, a college with two courses, classical and philosophical, and graduate, normal, art, and music departments. It had, in 1903, a library of 11,000 volumes, a student attendance of 365, and 29 instructors. Its endowment was about $100,000, and the gross income $60,000; the value of the college property was estimated at $250,000, and that of the buildings and grounds at $95,000.

OT'TERBURN, BATTLE OF. A battle commemorated by the ballad of Chevy Chase (q.v.).

OTTER CREEK. A stream rising in south-central Vermont, and flowing northwestward 90 miles through a picturesque country, emptying into Lake Champlain near its southern extremity (Map: Vermont, A 5). It is navigable eight miles to Vergennes, and supplies good water power.

OTTER-DOG, or OTTER-HOUND. See HOUND.

OTTER SHELL. A large edible mactroid clam (*Lutraria maxima*) of the Northwestern American coast.

OTTER SHREW. A West African insectivore or kind of shrew (*Potamogale velox*), which resembles an otter, lives in clear streams, and swims with great rapidity and strength, the union of the second and third toes serving the purpose of webbing. It is larger than a weasel, dark-brown in color, and has a long compressed tail, of much assistance in swimming. It has been described as living upon fish, but little is known of its habits or food. With a small and somewhat similar Madagascar animal (*Geogale aurita*) it constitutes the family Potamogalidæ.

ÖTTINGEN, ö'ting-en, ARTHUR VON (1836—). A German physicist and writer on the theory of music. He was born in Dorpat, and, after studying there and in Berlin, became professor (1865) of physics in the University of Dorpat, whence, in 1893, he went to Leipzig as docent, becoming full professor in 1894. While he was in Dorpat, Oettingen devoted himself especially to meteorology and thermometric studies; founded a meteorological observatory in 1866, and wrote: *Die Korrektion der Thermometer, insbesondere über Bessels Kalibriermethode* (1865); *Meteorologische Beobachtungen, 1866-75* (1868-77); and on musical theory, *Harmoniesystem in dualer Entwicklung* (1866). He was an editor of Oswald's *Klassiker der exakten Wissenschaften*, and, with Feddersen, of the third volume of Poggendorf's *Biographisch-litterarisches Handwörterbuch, 1858-93* (1898). His later work includes *Elemente des geometrisch-perspektivischen Zeichnens* (1901).

ÖTTINGER, ö'ting-er, EDUARD MARIA (1808-72). A German author and humorist, born in Breslau. He published several comic papers and wrote many novels, among which may be mentioned: *Der Ring des Nostradamus* (3d ed., 1853); *Ein Dolch oder Robespierre und seine Zeit* (3d ed., 1862); and *König Jerome Napoleon und sein Capri* (2d ed., 1861). He also published several historical and bibliographical works, including *Bibliographie biographique* (2d ed., 1854) and *Geschichte des dänischen Hofs* (1857-59).

OT'TO. The name of German rulers. See OTHO.

OTTO I. (1815-67). King of Greece from 1833 to 1862. He was the second son of Louis I., King of Bavaria, and was born at Salzburg, June

I. 1815. In August, 1832, the throne of Greece was offered to him by the Greek National Assembly, and in the following year he began his reign under a regency. In June, 1835, he assumed personal power, and in the following year he married in Germany the Princess Amalie of Oldenburg. A monetary crisis, which was provoked partly by false administrative measures, threw the affairs of Greece into confusion, and materially weakened the King's popularity. A national reaction against the Germanizing tendencies of the Court followed, and resulted, in 1843, in a military revolution, which forced a constitution upon the King. The Bavarian ministers were dismissed, but the King and his Greek advisers attempted in various ways to curtail the privileges which the new Constitution had conferred on the people. The equivocal position in which he was placed during the Crimean War between the allied powers on the one hand, and his subjects, who were strongly in favor of Russia, on the other, increased the difficulties of his situation. The Queen's pro-Russian sympathies made her for some time a favorite; but the belief that Otto's absolute measures were due to her instigation turned the tide of popular hatred so strongly against her that attempts were made on her life. The general discontent at last found vent in insurrections at Nauplia and Syra in 1862, which were soon suppressed. A more formidable insurrection in the districts of Acarnania, Achai, and elsewhere broke out in October of the same year, and in a few days extended to the whole of Greece. Otto fled to Salamis, from which place he issued a proclamation declaring that he quitted Greece to avoid civil war. He never formally renounced his right to the Greek throne. He died at Bamberg, July 26, 1867.

OTTO, Julius (1804-77). A German composer. He was born at Königstein, in Saxony, and studied music in Dresden and Leipzig. From 1830 to 1875 he was teacher of music and cantor at the Kreuzkirche in Dresden. His popular songs include the cycles for male voices, "Gesellen- und Burschenfahrten," and "Soldatenleben." He wrote three oratorios, *Des Heilands letzte Worte*, *Die Feier der Erlosten am Grabe Jesu*, and *Hiob;* but his male choruses and pianoforte compositions embody his best work.

OTTO, Paul (1846-93). A German sculptor, born in Berlin, where he frequented the Academy and the studio of Karl Begas. Having received the first prize in a competition for the Tegetthoff monument in Vienna, in 1873, he went to Italy, and during a thirteen-years' sojourn in Rome produced, among other works, the marble statues for Berlin of "Wilhelm von Humboldt" (garden in front of the University) and of "Chodowiecki" (Vestibule of Old Museum), and the polychrome statue of a "Vestal" (1886, National Gallery). His "Luther Monument," with many accessory figures (Neuer Markt, Berlin), in the competition for which he had carried off the first prize (1886), was completed after his death by Toberentz.

OTTOKAR II. (c.1230-78). King of Bohemia from 1253 to 1278. He was a son of Wenceslas I. and Princess Kunigunde of the House of Hohenstaufen. In 1251, after the extinction of the line of Babenberg, he obtained possession of the Duchy of Austria and married Margaret, the sister of the deceased Duke. He came to the Bohemian throne on the death of his father, and the next year he took part in a crusade against the heathen Prussians, whom he defeated; he founded Königsberg in their territory. In 1260 he gained a victory over the Hungarian King, Béla IV., on the Marchfeld, and annexed Styria in 1261. The same year he procured a divorce from Margaret, and married the Russian Princess Kunigunde, who was a grandchild of Béla. The duchies of Carniola and Carinthia fell to him in 1269, and he made some small additional acquisitions in 1271 and 1272. Ottokar was now one of the most powerful princes in Europe. When Rudolph of Hapsburg (q.v.) was elected Emperor, Ottokar refused to recognize him. After long negotiations he was put under the ban of the Empire and defeated in battle (1276), and was compelled to give up all his possessions except Bohemia and Moravia. He soon renewed the war and perished on the Marchfeld, August 26, 1278. Ottokar founded cities and encouraged commerce and manufacturing. He attempted to weaken the feudal nobility and to destroy their castles. Consult: Lorenz, *Geschichte Königs Ottokar II.* (Vienna, 1866); and Huber, *Geschichte Oesterreichs*, vol. i. (Gotha, 1885).

OTTOKAR OF STYRIA (c.1250-c.1310). A German chronicler, sometimes erroneously called Ottokar 'of Horneck.' He wrote in about eighty-three thousand verses, filled with descriptions of tourneys, fêtes, and battles, a very valuable history of Styria from 1230 to 1309, which has especial importance as supplementing our knowledge of Rudolph of Hapsburg, Ottokar of Bohemia, Adolphus of Nassau, and Albert I. It is edited by Seemüller in the *Monumenta Germaniæ Historica*, vol. v., pts. 1 and 2 (Hanover, 1890, 1893). Consult Busson, "Beiträge zur Kritik der steirischen Reimchronik," in the *Sitzungsberichte* of the Vienna Academy (1885-92).

OTTOMAN EMPIRE. A common designation for Turkey. The beginning of the Ottoman power is usually traced back to Ertogrul, chief of a Turkic tribe, who in the beginning of the thirteenth century established himself in the ancient Phrygia. From his son Othman, or Osman (1288-1326), the Empire derives its name. Notable successors of Othman were Amurath, or Murad I. (1359-89), who organized the Janizaries and took Adrianople in 1361; Bajazet I. (1389-1403), who was victorious over the Christians, but succumbed to Timur; Mohammed II. (1451-81), who took Constantinople in 1453; Bajazet II. (1481-1512), celebrated for his magnificence; his son Selim I. (1512-20), who conquered Syria and Egypt; Solyman II. (1520-66), under whom the Empire attained its zenith, and Mohammed IV. (1648-87), whose able minister, the celebrated Kiuprili (q.v.), by repeated victories, vigorously sustained the declining fortunes of the Empire. Under the succeeding monarchs the Empire underwent a rapid diminution before the steady advance of the Austrian and Russian armies, until its preservation in the nineteenth century came to depend upon the goodwill of certain European powers and the jealousies of all. The Ottoman Empire remains, with Russia, the only despotism in Europe in spite of reforms begun under Mahmud II. (1808-39), and the charter of liberties granted by his

successor Abd-ul Medjid in the celebrated Hatti-Sherif of Gulhane in 1839. See TURKEY.

OTTO OF ROSES. See ATTAR OF ROSES.

OTTUMWA, ŏ-tŭm'wȧ. A city and the county-seat of Wapello County, Iowa, 81 miles southeast of Des Moines, on the Des Moines River, and on the Iowa Central, the Wabash, the Chicago, Burlington and Quincy, the Chicago, Milwaukee and Saint Paul, the Chicago, Rock Island and Pacific, and other railroads (Map: Iowa, E 4). Among the notable structures of the city are the United States Government building, opera house, Y. M. C. A. building, the Union railway station, public library, the public school buildings, and the court-house. Ottumwa is the centre of productive coal fields, and has abundant water power—two important factors in the development of its extensive manufactures. The industrial establishments include iron works, foundries, a large pork-packing plant, agricultural and mining implement works, furniture factories, etc. The city has good transportation facilities and important commercial interests. Settled in 1849, Ottumwa was incorporated two years later. The government, under a charter of 1892, is vested in a mayor, biennially elected, and a council, a small minority of whose members are elected at large. Population, in 1890, 14,001; in 1900, 18,197.

OTUMBA, ŏ-tum'bȧ. A town of Mexico, in the State of Mexico, 31 miles northeast of the capital, on the Mexican Railway (Map: Mexico, K 8). It is on the site of the ancient Indian village Otompan, where Cortés, in one of the bloodiest battles of the Conquest, defeated the Aztecs after his disastrous retreat from the City of Mexico. Its population, in 1895, was about 2000.

OT'WAY, THOMAS (1652-85). An English dramatist, author of *The Orphan* and *Venice Preserved*, two plays long famous on the British stage. He was born March 3, 1652, at Trotton, near Midhurst, Sussex. Leaving Oxford without a degree, he went to London to seek his fortune in 1671. He appeared on the stage, but made a signal failure; next he applied himself to dramatic composition. In 1675 *Alcibiades*, his first tragedy, was printed; and in the following year he produced *Don Carlos*, a play which was extremely popular. His first comedy, *Friendship in Fashion*, appeared in 1678, and met with general appreciation. After a time spent with the army in Holland, he produced the tragedy of *Caius Marius* in 1680. In the same year *The Orphan* met with an extraordinary, and, in some respects, a deserved success. In 1681 *The Soldier of Fortune*, and in 1682 the finest of all his plays, *Venice Preserved*, were produced. From this time till his death, the poet had much to endure from poverty and neglect. Debts accumulating upon him, he retired to an obscure public-house on Tower Hill, for the purpose of avoiding his creditors, and here, at the early age of thirty-three, he died, April 14, 1685. Otway's power lay chiefly in depicting the pathos of affection, and he may have been inspired by his own unhappy infatuation for Mrs. Barry, the actress. Otherwise, although he achieved a brilliant reputation during his lifetime, and though he is described by Dryden as having a power of moving the passions which he himself did not possess, Otway's plots are artificial, and his work is of inferior artistic value. Consult: Johnson, *Lives of the Poets* (new ed., London, 1896); *The Works of Thomas Otway*, with *Life*, by Thomas Thornton (ib., 1813); Ward, *History of English Dramatic Literature* (ib., 1899); Gosse, *Seventeenth Century Studies* (ib., 1883); Noel, *Best Plays of Thomas Otway* (ib., 1888); De Gris-y, *Etude sur Thomas Otway* (Paris, 1868); Mosen, *Ueber Thomas Otways Leben und Werke* (Jena, 1875); Löwenberg, *Ueber Otways und Schillers "Don Carlos"* (Lippstadt, 1886).

OTZEN, ŏt'sen, JOHANNES (1839—). A German architect, born at Siesby, Schleswig. He studied architecture in Hanover, and from 1867 to 1870 was second clerk in the Board of Inspection of Public Works for the Province of Schleswig. In 1870-79 he was an architect in Berlin, in 1879 was appointed professor of mediæval art in the Polytechnic Institute there, and in 1885 director of an advanced course at the Academy. He designed numerous structures, particularly churches, in Berlin and elsewhere, including Saint John's at Altona (1873) and the Church of the Holy Cross in Berlin (1888), and published *Die Baukunst des Mittelalters* (1879-83), and other works.

OUAKARI (South American name), or **UAKARI,** wä-kä'rē. One of three species of Brazilian monkeys closely related to the sakis, distinguished by their long silky hair and stump-like tails. The best known species is the bald ouakari (*Brachyurus calva*), which is about eighteen inches in length, and has whitish fur, with the head nearly bald and the naked skin of the face brilliant scarlet. These monkeys inhabit forests of limited and local areas, often flooded for weeks at a time, and have exclusively arboreal habits, and subsist almost wholly upon fruits. Bates, in his *Naturalist on the Amazons* (London, 2d ed., 1892), gives a most interesting account of their habits and behavior in captivity. See MONKEY.

OUBLIETTE, ōō'blē-ĕt' (Fr., from *oublier*, to forget, from Lat. *oblivisci*, to forget). A deep pit or well under a dungeon, having an opening only at the top, into which prisoners were thrown to die. There are but few authenticated instances of its employment.

OUDE, oud. A province of British India. See OUDH.

OUDENARDE, or **OUDENAARDE,** ou'dē-närd' (Fr. *Audenarde*). A town in the Province of East Flanders, Belgium, on the east bank of the Scheldt, 15 miles southwest of Ghent (Map: Belgium, B 4). Its chief building is a fine Gothic council house built from 1525 to 1529. There are manufactories of linen and cotton and extensive tanneries. At Oudenarde, on July 11, 1708, the French under Vendôme were defeated by the Allies under Marlborough and Prince Eugene. Population, in 1900, 6204.

OUDH, oud, or **AJODHYA,** ȧ-jōd'yȧ. A suburb of Faizabad (q.v.), Oudh, India.

OUDH, or **OUDE,** oud (Hind. *Awadh*). A province of British India, forming a chief commissionership administratively connected with the United Provinces of Agra. It lies south of the Himalayas, one of whose minor ranges separates it from Nepal, while on the east, south, and west it is bounded by the United Provinces of Agra, the southern boundary being formed by

the Ganges (Map: India, D 3). Area, 24,217 square miles. The northern part, at the foot of the mountains, consists of dense and unhealthful forest jungle; the remainder belongs to the alluvial valley of the Ganges, several of whose large tributaries traverse the province lengthwise from northwest to southeast. Though there are hot and sultry months and a long rainy season, the climate is the most healthful in the Ganges Valley.

AGRICULTURE. Agriculture is the only extensively developed industry. The fertile plains produce abundantly when sufficiently watered. Nearly a third of the cultivated area, or 2,700,000 acres, is irrigated, the supply of water being drawn principally from wells and reservoirs. About one-fourth of the cultivated land is cropped twice during the year. Rice, wheat, millet, pulse, and other cereals constitute the greater portion of the crop acreage. Sugar cane, opium, and oil seeds cover a much less area, but are commercially important. Cattle and buffaloes are used as beasts of burden, and but few of the other domestic animals are raised.

TRANSPORTATION AND COMMERCE. A railway traverses the province from east to west. A branch line connects it with Cawnpore on the Ganges, and this point, although outside the province, is its chief collecting and distributing centre. Wheat, oil seeds, and opium are the most important exports. Some trade is maintained with the adjoining territory of Nepal on the north. Most of the manufactured products required are imported from European countries.

POPULATION. Oudh is one of the most densely populated portions of India, the number of inhabitants in 1901 having been 12,884,000, or 532 to the square mile. The Hindus outnumber the Mohammedans about 7 to 1. The Hindu and Mohammedan religions practically absorb the whole population; Christianity has not secured much hold, the census of 1901 returning 9312 Christians, of whom only 2274 were native converts. Lucknow, the capital, with a population (1901) of 263,900, is the fifth largest city of India, and the only large city in the province.

HISTORY. Oudh is believed by Sanskrit scholars to be the ancient *Kosala*, the oldest seat of civilization in India. The country was conquered by a Mohammedan army about 1195, was annexed to the realm of Delhi, and subsequently was made a province of the Mogul Empire. In the first half of the eighteenth century Oudh practically emancipated itself from the rule of the Great Mogul, and for over a century had its own dynasty. The Nawab Vizier, Sujah-ud-Dowlah, played a prominent rôle in the days of Clive and of Hastings. The misrule of the princes brought about the annexation of Oudh by the East India Company in 1856. When the mutiny of 1857 broke out, Oudh became one of the great centres of rebellion.

Consult: Butler, *Description of the Kingdom Oude* (London, 1853); Sleeman, *A Journey Through the Kingdom of Oude in 1849-50* (ib., 1858); *Gazetteer of Oude*, vols. i.-iii. (ib., 1877-78); Irwin, *The Garden of India; or Chapters on Oudh History and Affairs* (ib., 1880).

OUDINOT, ōō'dē'nō', CHARLES NICOLAS, Duke of Reggio (1767-1847). A Marshal of France. He was born at Bar-le-Duc, in the Department of Meuse, France, April 25, 1767. He entered the army at the age of seventeen, and distinguished himself in 1790 by suppressing a popular insurrection in his native district. He rose quickly, in 1794 became general of brigade, and added to his reputation in the war against Prussia and Austria. He became general of division in 1799, and received important commands from Napoleon. In 1805 he received the command of ten battalions of the reserve, afterwards known as the Oudinot Grenadiers. He was present at Austerlitz (1805) and Jena (1806), and defeated the Russians at Ostrolenka February 16, 1807. He contributed to the success of the French at Friedland, June 14th, and after the Peace of Tilsit was rewarded with the title of count and a large sum of money. At Wagram (July 6, 1809) he fully sustained his reputation as a general, and soon after was made Marshal of France and Duke of Reggio. In 1810 he was charged with the occupation of Holland. He was engaged in the disastrous Russian campaign of 1812, when he earned praise by his skillful tactics by which the crossing of the Beresina was protected. He subsequently took part in the various battles of 1813 between the French and the Allies, being defeated at Grossbeeren (August 23, 1813), and fighting valiantly at Leipzig. He was one of the last to abandon Napoleon. During the Hundred Days he remained on his estates. After the second Restoration he became a Minister of State, major-guard of the Royal and commander-in-chief of the National Guard, and a peer of France. In 1823 he commanded the First Army Corps in the invasion of Spain, and was for some time Governor of Madrid. After the Revolution of July, 1830, Oudinot retired to his estates, and only at rare intervals appeared in the Chamber of Peers. He died in Paris, September 13, 1847. His *Souvenirs* were published in 1894. His son, NICOLAS CHARLES VICTOR OUDINOT, Duke of Reggio (1791-1863), was a general in the French Army. He distinguished himself in Algeria and in the Revolution of 1848, and later became commander-in-chief of the Army of the Alps. In April, 1849, he was appointed general of the French expedition against Rome, and forced the city to surrender unconditionally on July 2. After the coup d'état, December 2, 1851, he was arrested and imprisoned. He was soon set at liberty, and spent the remainder of his life in retirement. He was the author of several books on military matters. He died July 7, 1863.

OUDRY, ōō'drē', JEAN BAPTISTE (1686-1755). A French painter, born in Paris. He studied under his father, Jacques Oudry, and under Serre and Largillière; was received at the Academy in 1719, and became a professor there in 1743. He was appointed animal painter to the King, Louis XV., and painted his favorite dogs and incidents of the chase. In 1734 Fagon put him in charge of the Beauvais factories, and afterwards he was made superintendent of the Gobelins, for which he executed many designs. Several of his works are to be found in the Louvre and in the provincial museums. He also painted historical scenes and portraits, but less successfully.

OUGHTRED, WILLIAM (1575-1660). An English divine and mathematician, born at Eton.

He entered King's College, Cambridge, in 1592, where he became a fellow in 1595. He was rector at Albury, near Guildford in Surrey (1610), and about 1628 engaged by the Earl of Arundel to tutor his son in mathematics. Oughtred was among the first to use modern symbols of operation, particularly × for multiplication and :: for equality in the algorism of proportion. Abbreviations for sine and cosine are found in his work on trigonometry. His principal mathematical works are: *Clavis Mathematicæ* (1631); *Trigonometria* (1657); *Solution of All Spherical Triangles* (1657); *Canones Sinuum, Tangentium, Secantium et Logarithmorum*, etc. (1657); *Opuscula Mathematica Hactenus inedita* (1677).

OUGREE, o͞o'grā'. A town of Belgium, in the Province of Liège, situated three miles south of Liège. It is an important industrial centre with coal mines, blast furnaces, rolling mills, and machine shops. Population, in 1900, 12,835.

OUIATCHOUAN, wē-ä'chwän. An affluent of Lake Saint John Canada.

OUIDA, o͞o-ē'dä. *Fr. pron.* o͞o'ē'dä'. An English authoress. See RAMÉE, LOUISE DE LA.

OULESS, o͞o'lĕs, WALTER WILLIAM (1848—). An English portrait painter, born at Saint Hélier, Jersey. He studied at the Royal Academy, began to exhibit there in 1873, and was elected a member in 1881. His work includes the portraits of many of his notable contemporaries, and he is ranked among the first of the English portrait painters.

OUNCE (Fr. *once*, Sp. *onza*, It. *onza*, *lonza*; perhaps, by loss of initial *l*, supposed to represent the definite article, from Lat. *lynx*, Gk. λύγξ, lynx; according to others the *l* is ultimately connected with Pers. *yōz*, panther). A large cat (*Felis uncia*), which resembles the leopard, but has much rougher and longer hair, and a longer and much more bushy tail; the general color is also paler, the rosette-like spots are less sharply defined, and there is a black spot behind the ears. Its range is very extensive, for it is found in Persia, Northern India, Tibet, China, Siberia, and even Saghalien. It frequents rocky ground, and is adapted to cold climates, so that in the warmer countries of its range it is found at considerable elevation. It feeds chiefly on goats, sheep, and other quadrupeds, but rarely attacks man. See Plate of WILD CATS, under CAT.

In South America 'ounce' and its equivalents usually refer to the jaguar (q.v.).

OUNCE. See WEIGHTS AND MEASURES.

OUR AMERICAN COUSIN. A comedy by Tom Taylor, produced in 1858. The leading characters are Lord Dundreary, created by Sothern, and Asa Trenchard, the Yankee, by Joseph Jefferson. At a performance of this play at Ford's Theatre, Washington, Lincoln was assasinated.

OURAY, o͞o'rā (1820-80). An Indian chief, born in Colorado, where his people, the Uncompahgre Utes, bore in their special tribal title, which is probably a corruption of 'un compadre,' the evidence of their friendship to the whites. Ouray himself was engaged in a fierce struggle with the Sioux in his early manhood, and his only son was captured by his enemies, never to be restored; but he was always the 'white man's friend,' spoke and wrote Spanish, and adopted civilized habits, living for many years on a farm which he cultivated himself. His influence with his people was firm, and the tribe never broke a treaty. Even in 1879 he was successful in his attempts to restrain them from rising at the time of Meeker's murder. Ouray visited Washington several times, and brought about the sale of the Ute reservation in Colorado.

OURIQUE, o͞o-rē'kĕ. A small town in Southern Portugal, noted for the great victory over the Moors won by Alfonso I. in 1139. This victory secured for him the kingship of Portugal. It afterwards became famous in legend. The Christian forces were said to have been 13,000, the Moorish 400,000. Christ was said to have appeared to Alfonso, promising victory and the royal title.

OUR MUTUAL FRIEND. A novel by Charles Dickens (1865). It contains two stories. The principal plot concerns John Harmon, who, under the disguise of Rokesmith, keeps watch of his large fortune and marries Bella Wilfer. The other story centres around Lizzie Hexam, the bargeman's daughter, and her lover, Eugene Wrayburn. Mr. Boffin, the 'Golden Dustman,' and his wife connect the two stories. The minor characters are Silas Wegg, Jenny Wren, and old Betty Higden.

OURO PRETO, o͞o'rō prā'tō (Port., black gold, from the color of the argentiferous rocks in the neighborhood). A city and formerly the capital of the State of Minas Geraes, Brazil, situated on the western slope of the Serra do Espinhaço, 170 miles north of Rio de Janeiro (Map: Brazil, J 8). It is a very picturesque town, with quaint buildings; but, being founded as a mining town, its location was selected only with a view to easy accessibility to the mines. It is built on the side of a very steep hill, and is shut in by a mountain on one side and a narrow gorge on the other, so that it has no room for expansion. For this reason the State Government was removed in 1894 to Bello Horizonte or Minas (q.v.). Its gold mines, which formerly yielded rich returns, are now almost abandoned, and the town has greatly declined. Previous to 1894 its population was 26,000; in 1899 it was only 14,000.

OUSE, o͞oz. The chief river of Yorkshire, England (Map: England, F 3). It rises by two headstreams in the Pennine Hills on the border of Westmoreland, and flows southeastward until it joins the Trent to form the Humber (q.v.). Its total length is 130 miles, and it is navigable for large vessels 45 miles to York.

OUSE, GREAT. A river of England, rising in Bedfordshire, and flowing northeast into the Wash at King's Lynn (Map: England, G 4). It is 160 miles in length, and navigable for about 50 miles.

OUSELEY, o͞oz'lĭ, FREDERICK ARTHUR GORE (1825-89). An English Church composer and musical theorist, born in London. After his graduation from Oxford, he entered holy orders and became a curate in London; after which he was appointed precentor of Hereford Cathedral in 1855, and incumbent of Saint Michael's, Tenbury, in 1856. He was one of the founders, and later warden, of Saint Michael's College, Tenbury, an institution for the instruction of boys

in classics and choral singing, and bequeathed to it his valuable music library. He took the degree of doctor of music at Oxford in 1854, and the next year became professor of music there. He published a number of musical collections, a *Treatise on Harmony* (1868), and *A Treatise on Counterpoint, Canon, and Fugue* (1869). He was also the author of the oratorios *The Martyrdom of Saint Polycarp* (1855) and *Hagar* (1873); considerable salon music; a number of anthems; and edited, with Dr. Monk, *Anglican Psalter Chants* (1872). He died at Hereford.

OUSELEY, GIDEON (1762-1839). The Wesleyan apostle of Ireland. He was born at Dunmore, Ireland, February 24, 1762, of a family distinguished in English history. In his youth he was reckless, but in 1791 became religious under the influence of Wesleyan soldiers stationed at his native place. He soon became an evangelist, preaching with fervor and boldness in the streets and churchyards, fairs and markets, and at the wake-houses. Without dismounting from his horse he preached from three to five times a day. After preaching thus for seven years, he was received into the Wesleyan Conference, and in 1799 appointed a missionary to Ireland. He was often roughly treated by the Irish, but being a master of the language, and thoroughly acquainted with the Irish character, he succeeded in converting thousands. At the age of seventy-four, after fifty years of devoted labor, he was still as active as ever on the highways and in the market-places, preaching fourteen, sixteen and sometimes twenty sermons a week. He was the author of several polemical publications, of which the most important is *A Short Defense of the Old Religion* (1812; reprinted as *Old Christianity Against Papal Novelties*, 5th ed. 1827). He died in Dublin, May 13, 1839. Consult his *Life* by Arthur (London, 1876).

OUSELEY, Sir WILLIAM (1767-1842). A British Orientalist. He was born of Irish parentage at Monmouthshire, England. He went to Paris in 1787, and there commenced his Oriental studies. In 1788 he entered the army as cornet of dragoons, and, after seeing active service under the Duke of York, in 1794 left the army to continue the study of Persian and other Oriental literature at the University of Leyden. The fruits of his studies were embodied in four works published between 1795 and 1804, the earliest of which gained for him in 1797 the honorary degree of LL.D. from Trinity College, Dublin, and of Ph.D. from the University of Rostock. In 1800 he received the honor of knighthood from the Viceroy of Ireland. He perfected his colloquial knowledge of Persian by several months of residence in the London household of the Persian Ambassador, Mirza Abul Hassan, and as private secretary to his brother, Sir Gore Ouseley, who had been appointed British Ambassador to Persia, went to that country in 1810, where he remained until 1813. He was elected member of several learned societies, and was a prolific contributor to the *Translations* of the Royal Society of Literature. He died at Boulogne. His principal works are: *Persian Miscellanies* (1795); *Oriental Collections* (1797-79); *Tales of the Bakhityar Nama and the Ten Virgins* (1801; new ed. 1883); and *Travels in Various Countries of the East, More Particularly Persia in 1810, 1811, 1812* (1819-23).

OUSTER (OF. *ouster, oster*, Fr. *ôter*, to remove, oust, from Lat. *haurire*, to draw). The deprivation or exclusion of the rightful owner from the possession or enjoyment of land. Such dispossession may be effected by an entry on the lands under a claim of title, or by a person remaining on lands after his title or right to possession of them has ceased, to the exclusion of the owner, or one next entitled to possession. The exclusion from possession or enjoyment of land of one tenant in common by a co-tenant would constitute an ouster. An ouster is distinguished from a trespass, which is a temporary encroachment on, or invasion of, the real estate of another, usually without a claim of right. The remedy for an ouster is an action to recover possession of the property. See DISSEISIN; EJECTMENT; TRESPASS.

OUTAGAMIES, o͞o'tȧ-gȧm'iz. The name given by the Ojibwas to the Fox Indians.

OUTCROP. A term applied in geology to the edges of strata which appear at the surface. The outcrop of a mineral vein is sometimes called the apex.

OUTLAWRY. An ancient common-law process for compelling the appearance of a person before a court of justice. Its origin dates back to the reign of King Alfred, and it was probably devised as the most efficient means of securing the punishment of a culprit. The courts and officers of the peace were not well organized at that time, and it was not difficult for a criminal to elude the King's officers. However, a decree of outlawry against an alleged criminal bound every honest person to attempt to capture him if he crossed his path. The outlaw was deprived of all rights as a citizen, or even as a human being. He was considered as a wild beast, the decree at a later date bearing the words, *Caput gerat lupinum* (Let him bear the wolf's head), which signified that it was the right, and even the duty, of any person to knock him on the head as if he were a wolf. To harbor or render assistance to an outlaw was a capital crime, punishable with death. Outlawry was, therefore, equivalent to a sentence of death, and, in addition, the outlaw was deprived of all property rights, his land escheated to the King, or under the feudal system to his lord, his chattels being always forfeited to the King. The law in this respect continued the same until the thirteenth century, when the reform of prohibiting the public from wantonly killing an alleged outlaw, unless in an attempt to capture him, was introduced. Even at that time, if on the trial the mere fact of outlawry was established, the sentence was death. However, toward the end of the thirteenth century, the penalty of death was no longer inflicted in cases of 'minor outlawry,' that is, where the process had issued in a civil cause, or in a prosecution for a crime less than felony or treason. The decree of outlawry at that time was issued in so many cases where the accused person had not intentionally disobeyed a summons from a court, or had never been informed that he was accused, that it became customary for the King, when such a case was brought to his attention, to 'inlaw' the person. This was effected by a decree removing the ban of outlawry, and the accused could then

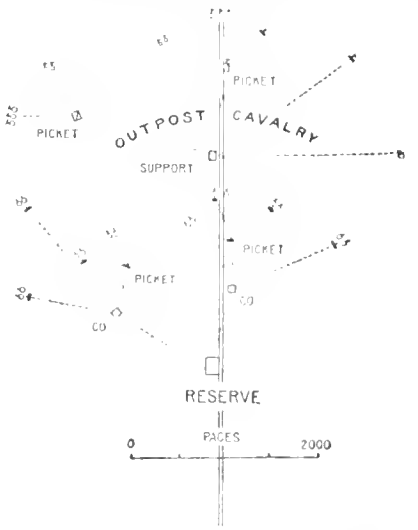
appear and stand trial for the offense originally alleged to have been committed by him. However, the person who thus again received the protection of the law was considered a new person, as if he had just been born, and was not thereby restored to his former property rights.

The outlaw's blood was said to be 'corrupt,' and a child born to him after the decree was incapable of inheriting, not only from the father, but from any one else. By the statute, 5 and 6 Edw. VI., c. 11, a person outlawed for treason while abroad was permitted to return to the country within a year and a day and stand trial, but no provision of this sort in regard to felony has ever been made. The 'Forfeitures Act,' 1870, 33 and 34 Vict., c. 23, reserved forfeitures of lands and chattels to the Crown in cases of outlawry for treason and felony. Outlawry for misdemeanors may still be imposed, but such a judgment amounts only to a conviction for contempt of court, although it entails a forfeiture of chattels to the Crown. The sovereign alone can pardon an outlaw. The process of outlawry has not been used in England since 1859, but the above statutes still remain in force.

The process of outlawry is entirely obsolete in the United States, and it is doubtful if it has ever been employed since the War of the Revolution. The term outlaw has been loosely applied in some criminal statutes to designate bandits or wandering marauders, who habitually live by crime, but it has not the signification it bears under the laws of England. See CRIME: FELONY. Consult Legge, *The Law of Outlawry* (London, 1779); Blackstone, *Commentaries*.

OUTPOSTS. The security of troops *at a halt*, that is, in camp, bivouac, or cantonment, is insured by means of outposts, or detachments thrown out from the main body to protect it from surprise. These are either separate detachments, at important points, or a continuous chain. The latter is rarely necessary in war, because the armies are seldom in such close contact as to require it. For a few days before and after a decisive engagement it may be necessary, but during the course of the operations between battles there is no such immediate danger, especially for the infantry. The cavalry is, of course, constantly in touch with the enemy, and the best protection for it is the patrols close up to the enemy, with the main body of cavalry retired a mile or so for rest, the reconnaissance squadrons remaining assembled out in front covered by a few posts and patrols in their immediate vicinity. If the distance to the reconnaissance squadrons is very great, *outpost squadrons* are sent out to cover the intervening space, and as a rule they will be sufficient. Only occasionally, as on the night after a battle, is it necessary to add an *outpost reserve*, or main body. Each outpost squadron has a particular section of ground assigned to it, for the security of which it is responsible, and for observation *pickets* are pushed out, from which *vedettes* are sent to the front as *sentinels*. In the arrangement of pickets and vedettes, particular attention is given to gaining a good outlook over the surrounding landscape and the main roads must be observed. In general, security is better insured by constant communication between the reconnaissance detachments and behind the pickets than it can be by a continuous line of posts; these outposts require no special outpost commander, the squadrons acting independently.

If the screening cavalry in this way insures its own safety, it necessarily relieves the other troops in rear from a great part of this duty. In many cases the troops in rear can entirely dispense with outposts; again, when there is no chance of a battle taking place within a day or so, each subdivision may be left to look after its



THEORETICAL DISPOSITION OF OUTPOSTS.

own security. The strength and energy of the enemy is always an important factor, as well as the feeling of the inhabitants of the country, and when the enemy is very near, a connected line of outposts is demanded, composed, in general, of mixed troops. At the end of a march the advance guard, either in whole or in part, takes charge of the outpost duty. On resuming the march a new advance guard is formed, the old being relieved after the new has advanced beyond its lines. See ADVANCE GUARD.

The entire outposts in this case are under one or more outpost commanders, depending on the length of the line and the character of the ground. The main line is composed of outpost companies or supports, for which a *reserve* is provided when necessary, and this is placed either in rear or on the same line, depending on the point where support is most desired. If there is no outpost cavalry available, patrols (q.v.) must be sent out by the outpost companies, but the latter must have a few cavalrymen as messengers, or in their stead cyclists. On coming into position a picket ahead on the road is usually sufficient, but at night other pickets and sentinels may be required.

OUTRAM, ōō'trăm, Sir JAMES (1803-63). A British Indian soldier and statesman. He was born at Butterley Hall, Derbyshire, and was educated at Udny, Aberdeenshire, and afterwards at Marischal College, Aberdeen. He received his commission, and was sent to India as a cadet in 1819. He gained distinction in his conduct of the campaign of the wild Bhils of Khandesh

against the Dang tribes; the restoration of order in the Mahi Kanta; the Afghan campaign of 1839, during which he acted as aide-de-camp to Lord Keane, and in which he performed his famous perilous ride from Khelat, through the Bolan Pass. He was political agent at Gujarat, and afterwards commissioner in Sindh, and upon the annexation of Oudh was made resident and commissioner, by Lord Dalhousie. Owing to ill health, he returned to England in 1856, but with the outbreak of the Persian War he was sent with the British forces to the Persian Gulf, with diplomatic powers as a commissioner—after which he returned to India. At the commencement of the Indian Mutiny in 1857 he was commissioned to take charge of the forces marching to the relief of Lucknow, but refused to take precedence of his friend Havelock, and took up only his civil appointment as chief commissioner of Oudh, serving under Havelock as a volunteer. After the relief of Lucknow he led a skillful movement up the left bank of the river Gumti, which led to a final and complete victory over the insurgents. He was next made chief commissioner of Oudh, in 1858 was made lieutenant-general, and in 1860 received the thanks of Parliament. He took his seat as a member of the Supreme Council of India in Calcutta, but was compelled by ill health to return in 1860 to England. India founded an institution in his honor and presented him with valuable gifts, besides erecting a statue of him at Calcutta. He died at Pau, France, March 11, 1863. He is known as the 'Bayard of India,' and was conspicuous for his fair play and generous championship of the natives of India.

OUTRE-MER, o͞o'tr'mâr, A Pilgrimage Beyond the Sea. Sketches of foreign travel by H. W. Longfellow (1835).

OUVRARD, o͞o'vrär', Gabriel Julien (1770-1846). A French financier, born near Clisson, in the Department of Loire-Inférieure. During the early years of the French Revolution he amassed a large fortune, and under the Directory he became one of the principal creditors of the State. Contracts with the Spanish Government netted him immense profits and his income from other sources was enormous. Between 1802 and 1804 his loans to the Government amounted to nearly 300,000,000 francs. He subsequently furnished the means for Napoleon's great military undertakings. The enmity of the Emperor brought about the dissolution of the company of which Ouvrard was the head and the arrest of the banker, who from 1810 to 1813 remained in prison. Later in life he suffered imprisonment for illegal transactions on the Bourse, and after his release went to England, where he died. His *Mémoires* appeared in Paris in 1826.

OUZEL, o͞o'z'l, or **OUSEL** (AS. *osle*, OHG. *amsala, amusla*, Ger. *Amsel*, ouzel, of uncertain etymology). An old name of the English blackbird. It is also applied to other birds, chiefly of the thrush family. Thus, one British thrush (*Merula torquata*) is called the 'ring-ouzel.' The European dipper is very generally known as the 'water ouzel,' and in the United States the term is restricted to our dipper (q.v.) of the Rocky Mountain region.

OVALLE, ô-väl'yâ. The capital town of the province of the same name, Chile, on the right bank of the Limarí River, 170 miles north of Valparaiso, and on the railway from La Serena to San Marco (Map: Chile, C 10). It is a well-built town, in a well-irrigated valley, and was founded in 1831. Its population, in 1885, was 5426.

OVALS OF CASSINI, kâs-sē'nê. See Cassinian Oval.

OVALS OF DESCARTES, dâ-kärt'. See Cartesians.

OVAMPO, ô-väm'pô. A Bantu people living on the northern boundary of German Southwest Africa. They are divided into a number of tribal groups each ruled by an hereditary chief. They are tall, robust, well-proportioned, with regular features; they are very peaceful and kind in disposition and superior in intelligence to other South African tribes. They do not live in villages, but in family communities. The houses are very low, conical structures, designed mainly for sleeping purposes. They also have granaries and chicken houses set up on posts. They raise corn and have great herds of cattle. The men go naked; the head is shaved except a small lock. They wear sandals like the Bechuana. The women wear a waist cloth and a small apron. Their hair is impasted with grease mixed with red clay. Beads and large brass rings are worn as ornaments. To the women fall the duty of building the houses and a large part of the agricultural work. The men hunt wild animals and work in iron and copper, in which art they are very skillful. They are fond of dancing to the music of a drum and a kind of guitar. In ceremonial greeting of friends they anoint the face and breast of the visitor with butter.

Consult: Andersen, *The Okovango River* (London, 1861); Stanford, *Africa* (London, 1895).

OVANDO, ô-vän'dô, Nicolas de (c.1460-c.1518). A Spanish Governor of the West Indies, born in Valladolid. He was a commander of the religious Order of Alcántara, stood high in the favor of King Ferdinand and Queen Isabella, and in September, 1501, was appointed to succeed Francisco de Bobadilla (q.v.) as Governor of the West Indies. Leaving the port of San Lucar, February 13, 1502, with a company of 2500 persons—the largest company which had hitherto been sent to the West Indies—he arrived at Santo Domingo April 15th, and remained as Governor until replaced by Diego Columbus in 1509. He proved a successful ruler over the Spaniards, founded a number of new settlements, and did much to restrain turbulence and disorder. Toward the Indians, however, he was despotic and cruel. He prosecuted several ruthless wars against them, his soldiers putting captives to death after subjecting them to hideous tortures; and virtually enslaved many thousands of them, through the establishment of the *encomienda* system, whereby they were distributed in lots of 50 or 100 among the Spaniards.

OVAR, ô-vär'. A town of Portugal, in the Province of Beira, 20 miles south of Oporto, at the head of one of the branches of the curious lagoon or bay called Rio d'Aveiro (Map: Portugal, A 2). (See Aveiro.) It is a prosperous and increasing town and carries on an extensive fishery and a considerable trade in wine, grain, and fruit. Population, in 1900, 10,582.

O'VARIOT'OMY. See Ovary.

OVARY (from Lat. *ovum*, egg; connected with Gk. *ᾠόν*, *ōon*, OChurch Slav. *aye*, *yaye*, OHG. *ei*, Ger. *Ei*, AS. *æg*, Eng. *egg*). One of the pair of organs which in the female of any species produce the *ova*, or female reproductive bodies. They are analogous to the testes in the male. They may be described as two oval flattened bodies, an inch and a quarter to an inch and a half long, three-quarters of an inch in width, and nearly half an inch thick, in the human subject, situated on either side of the uterus, to which they are connected by ligaments and by the Fallopian tubes. On making a section of an ovary, numerous vesicles are observed in its interior. These are the ovisacs of the future *ova* or germs, and are termed the *Graafian vesicles*. Before impregnation they vary in number from 10 to 20, and in size from that of a pin-head to that of a pea; but on microscopic examination great numbers of minute undeveloped vesicles are also found to be present. At each monthly period a ripe Graafian vesicle bursts and the ovum contained in it makes its way by the ciliary motion of the epithelial lining of the tube along the Fallopian tube to the uterus, where if not impregnated it is disintegrated or passes off with the menstrual discharge.

Of the morbid conditions to which the ovary is liable by far the most important is the formation of tumors. These may be either solid tumors or cystic tumors. The cystic tumors, which consist of a sac containing a fluid or semi-fluid substance, are of much more frequent occurrence than the solid tumors. They are known as *ovarian cysts*. Two principal varieties of cysts are usually encountered, the first of which is a small cyst which has its origin from degeneration of the Graafian follicle. It usually grows to the size of a fist and but rarely attains the size of a man's head. The second variety is the large multilocular cyst made up of innumerable cysts of small size which as they grow partially fuse together and form the larger loculi or subdivisions which compose the fully developed tumor. This variety of cyst has its origin from abnormal growth and development of the glandular epithelium of the ovary. Besides these two varieties of cysts a third variety of cyst, known as the *dermoid cyst*, also occurs not infrequently. It presents when opened a characteristic pulpy substance with which are mingled hair, nails, teeth, and pieces of cartilage, bone, etc.

Of the solid tumors of the ovary carcinomata and sarcomata are the most important.

The modern treatment of ovarian tumors is by ovariotomy, a surgical operation for removal of the tumors, as soon as their existence is recognized. Tapping of ovarian cysts by puncture is now only occasionally employed, and then only as a palliative measure.

OVARY. In flowering plants (angiosperms), that usually bulbous portion of the pistil which contains the ovules. The name was given under the mistaken impression that the ovules correspond to eggs, for which reason the term ovulary has been suggested to avoid confusion with the ovary of animals, a totally different structure. See FLOWER.

OVATION. See TRIUMPH.

OVEN-BIRD. A bird that builds a domed nest somewhat like an old-fashioned outdoor oven. The name belongs primarily to certain species of South American tree-creepers of the genus Furnarius and family Dendrocolaptidæ, which are small, non-oscine, passerine birds with short wings, feeble power of flight, and plain brownish colors. These birds are numerous in Argentina, and are familiar about village gardens and farms. Both sexes take part in the construction of the nest, which is generally in an exposed situation, remarkably large and of the shape of a dome, with a small entrance on one side. It is made of clay, mixed with a little hair or grass, well plastered together, and becomes quite firm as the clay dries in the sun. Its building sometimes requires several months. Internally, it is divided into two chambers by a partition reaching nearly to the roof, the eggs (pure white) being placed in the inner chamber on a bed of soft grass and feathers. The outer chamber seems to be intended for the male. Such nests are made by *Furnarius rufus* (the hornero or 'baker') and some others, and a new one is constructed each year; but other species of the same genus nest quite differently.

In the United States the name 'oven-bird' is given to the golden-crowned 'water-thrush' (q.v.) (*Seiurus aurocapillus*), one of the larger wood warblers. It is rather more than six inches long, olive green above, white, streaked with black, beneath, and with the centre of the crown pale rufous. During the summer it is found throughout North America, except west of the Rocky Mountains, and it winters from Florida and Texas southward. The nest is rather large, roofed over, with the entrance on one side. It is composed of rootlets, grasses, leaves, etc., and is made on the ground. The eggs are four or five, white, spotted with brown. The oven-bird is remarkable for uttering a sweet chattering song in the air at twilight, after the manner of the skylark; but it is better known by its customary accelerated call. Another peculiarity of the bird is that it walks with a see-sawing motion accompanied by a rhythmical nodding of the head. Consult for the South American oven-bird, Hudson, *The Naturalist in La Plata* (London, 1892); Sclater and Hudson, *Argentine Ornithology* (London, 1888); Newton, *Dictionary of Birds* (New York, 1893-96); and for the American oven-bird, standard ornithologies and Burroughs, *Wake Robin* (Boston, 1872, and later).

O'VERBECK, JOHANNES ADOLF (1826-95). A German archæologist and art-historian; nephew of Friedrich Overbeck, the painter. He was born at Antwerp, and studied at Bonn, where he was privat docent from 1850 to 1853. From the latter year until his death he was professor of archæology and director of the archæological museum at Leipzig. His publications include: *Kunstarchæologische Vorlesungen* (1853); *Pompeji in seinen Gebäuden, Alterthümern und Kunstwerken* (1855); *Die Geschichte der griechischen Plastik* (1857-58; 4th ed. 1894); *Die antiken Schriftquellen zur Geschichte der bildenden Künste bei den Griechen* (1868); and *Griechische Kunstmythologie* (1871-89).

OVERBECK, JOHANN FRIEDRICH (1789-1869). A German historical painter, the leader of the revival of Christian art in the nineteenth century. He was born at Lübeck, July 4 1789, received a careful education, and in 1806 went to Vienna to study at the Academy. His opposition to the pseudo-classic notions then prevailing at

that institution resulted in his expulsion in 1810, in company with several like-minded fellow students. They proceeded to Rome, where they became known as the Nazarites, because of their artistic views. (See PRE-RAPHAELITES.) To Overbeck, the high priest of this creed, art was a religious question, and he held that "the true home of art is within the soul before the altar of the Church." Becoming more and more absorbed in this ecclesiastic romanticism, he embraced the Catholic faith and dedicated his life to Christian art. As his part of a commission from the Prussian Consul Bartholdi to decorate a room in his house with frescoes illustrating "The History of Joseph," Overbeck painted "Joseph Sold by His Brethren" and the "Seven Years of Famine." The entire cycle was successfully transferred to the National Gallery in Berlin in 1887. Its success brought a new commission to decorate the Villa Massimi with scenes from Dante, Ariosto, and Tasso, of which Overbeck painted "Jerusalem Delivered" (completed by his devoted disciple Führich). Of his oil paintings of this period the New Pinakothek in Munich possesses three: "Italia and Germania" (1820), "Portrait of Vittoria Caldoni" (1822), and a "Holy Family" (1825). The latter, an inspired transcript of Raphaelesque forms, is one of Overbeck's most charming compositions. More important and on a larger scale is "Christ's Entry into Jerusalem," painted intermittently from 1809 to 1824, and now in the Marienkirche at Lübeck. In this composition Flemish influence appears curiously blended with the Pre-Raphaelite, a healthy realistic element being added by the introduction of contemporary portraits of relations, fellow-artists, and friends.

Meanwhile a large school gathered around him, the influence of which extended throughout Europe. A sojourn at Perugia occasioned his finest and largest fresco, "The Vision of Saint Francis" (1830), in the Church of Santa Maria degli Angeli, near Assisi, suggestive, in its purity and rare charm, of the best Pre-Raphaelites. Among the fruits of the painter's first return to his native land in 1831 were "The Triumph of Religion in the Arts" (1831-40, Städel Institute, Frankfort), accompanied by a written explanation containing a confession of his art faith, and the "Assumption" (1846-55, Cologne Museum). The impressive "Pietà" (1846, Marienkirche, Lübeck) was the outgrowth of a father's grief over the death in 1840 of his only son, a promising lad of eighteen.

Overbeck's greatness is, however, to be sought not in his paintings, but in his drawings, the most noteworthy including "Christ Blessing Little Children," "The Preaching of Saint John," "Repose in Egypt," "The Raising of Lazarus," and especially the cycles of "The Gospels" (40 cartoons, 1843-52), "Via Crucis," or "The Stations" (14 water-color drawings, 1857), and "The Seven Sacraments" (7 cartoons, 1861). Productive to the last, he died peacefully at Rome, November 12, 1869, and was buried in the Church of San Bernardo.

Overbeck's work cannot be judged by ordinary standards. His artistic creed, that the mental conception constitutes the chief merit of an art work, that outline or form is the direct vehicle of such idea, and that color and its accessories are subordinate elements, shows conclusively that he must not be viewed as a colorist. Yet in spite of its defects his art is vital in thought, form, and composition, and his works are undeniably the most perfect artistic manifestations of the great Catholic reaction dating from the beginning of the nineteenth century. Consult the biographies by Atkinson (London, 1882) and Howitt (Freiburg, 1886); also Valentine, in Dohme, *Kunst und Künstler des 19. Jahrhunderts* (Leipzig, 1883-85); Zahn, in *Zeitschrift für bildende Kunst* (ib., 1871); Pecht, in *Allgemeine deutsche Biographie*, xxv. (ib., 1887); Portig, "Friedrich Overbeck und die religiöse Malerei der Neuzeit," in *Unsere Zeit* (ib., 1887); and Rosenberg, *Geschichte der modernen Kunst*, ii. (ib., 1889).

O'VERBURY, Sir THOMAS (1581-1613). An English author and courtier, whose mysterious death has given a peculiar interest to his history. He was the son of Sir Nicholas Overbury, and was educated at Queen's College, Oxford, from which he graduated in 1598. While on a visit to Scotland in 1601 he met Robert Carr, who became the favorite of James I. of England. Through his influence Overbury rapidly rose in power. He wrote poems, the best of which is one called "A Wife." Among his intimates were men like Ben Jonson. About 1610 Carr, who had meanwhile become Viscount Rochester, fell in love with Frances Howard, Countess of Essex. Overbury was opposed to Rochester's marrying this abandoned woman, and in consequence she intrigued, until in 1613 Overbury was arrested and placed in the Tower. In this place he was poisoned by Richard Weston, a tool of the Countess, and died September 14, 1613. Rochester married the divorced Countess in December, 1613. The murder became public in 1616, and the guilty parties were imprisoned for several years. There is an edition of Overbury's works by Rimbault (London, 1856).

OVERCOMERS. A name given to a peculiar religious society which originated in Chicago about twenty-five years ago and emigrated to Jerusalem, where they are now living. They do not use the name Overcomers themselves, but prefer to be called the 'American Colony in Jerusalem.' They reject marriage and hold communistic views about property; the Bible, they claim, has been always misunderstood, and the true interpretation of it, which they alone possess, will regenerate the world. They have made a small number of converts, chiefly from the foreign population of Western States.

OVER DARWEN. ō'vẽr där'wen. A town in England. See DARWEN.

OVERFLOW BUG. A carabid beetle (*Platynus maculicollis*) of California, which occasionally becomes so numerous as to be a nuisance, although from its carnivorous habits it is ordinarily beneficial. In 1880 they were extremely abundant throughout central and southern California, and the name overflow bug was probably given to them at that time. When crushed they gave off an offensive odor, and were called in some parts of California 'grease-bugs.'

OVERLAND ROUTE. A popular term for the shortest route from Great Britain to India. The itinerary is via Paris, Lyons, the Mount Cenis Tunnel, Modena, to Brindisi, thence by steamer to Port Said, through the Suez Canal and the Red Sea to Bombay, the time occupied being about twenty or twenty-one days.

OVERSEERS OF THE POOR. Unpaid parish officers in England, whose chief duty it is to assess the poor rates and collect them. Overseers were first authorized in 1572 (14 Eliz., ch. 5), but no specific duties were assigned. In 18 Eliz. they are called "collectors and governors of the poor." In 1597 (39 Eliz., ch. 3) it was enacted that in each parish the church warden, ex-officio, and "four other substantial householders" be appointed overseers, to assess the poor rates and oversee their distribution. In 1601 (43 Eliz., ch. 2, the foundation of the present poor law) the number was placed at from two to four, and the time of appointment, Easter. This was later changed to March 25th, or within fourteen days thereafter. The duties assigned them were: (1) to raise the necessary means for poor relief by taxation of the inhabitants; (2) to undertake the entire work of relief; and (3) to carry out all other measures necessary for executing the law.

For nearly a century after the reign of Elizabeth the overseers were the sole poor law authorities. Gradually it was found necessary to place them under the supervision of the justices, and to compel them to make public reports of their doings. By Gilbert's Act (22 George III., ch. 83) paid guardians of the poor were created to have charge of actual relief, and only the function of assessing and collecting the poor rate was left to the overseers. In 1819 the Select Vestry Act (59 George III., ch. 12) authorized parishes to control the overseers by appointing select vestries and to employ paid assistant overseers. Many parishes availed themselves of this permission. The Poor Law Amendment Act (4 and 5 William IV., ch. 76) made radical changes in the poor law and in its administration, but it continued both the overseers and the guardians, subjecting the overseers to the legal and reasonable orders of the guardians and of the justices. Overseers are appointed by the justices of the peace, and service is compulsory and unpaid. Certain persons, however, are exempt from appointment. Among them are members of Parliament, clergymen, barristers and solicitors, physicians, and officers of the army and navy. Overseers must be householders in the parish.

In discharging their function of assessment and collection of the poor rate the overseers are required each year to list the property of the parish and specify the amount due from each household. The assessment is signed by two justices of the peace and then collected. Rarely, save in emergency cases, do the overseers now have anything to do with the distribution of the money. Accounts are audited yearly by a paid official, the poor law auditor.

Miscellaneous duties have been imposed upon the overseers in recent years. They make lists of voters for members of Parliament and lists of persons qualified to serve as constables. They appoint persons to enforce the compulsory vaccination acts, to see to the burial of dead paupers and of bodies cast on the shore, and they carry out the nuisance removal act where there is no local board of health, etc. See PAUPERISM, section on *England*. Consult for detailed history of overseers of the poor, Nicholls, *History of the English Poor Law* (London, 1854; vol. iii. by Mackay, London and New York, 1899).

O'VERSKOU, THOMAS (1798-1873). A Danish dramatist, born at Copenhagen. He was an actor in his youth, and early began to write for the stage. After a failure with a comedy, he successfully produced three dramas, followed by other plays, some of which are still performed. Of these, *Oestergade og Vestergade* and *Capricciosa* are the best known. He also wrote a history of the Danish Theatre, *Den danske Skueplads i dens Historie fra dens Begyndelse til vor Tid* (1854-76).

O'VERSTONE, SAMUEL JONES LOYD, Baron (1796-1883). One of the ablest authorities on banking whom England has produced. He was educated at Eton and Cambridge. On completing his studies he entered the banking and mercantile firms of Lubbock, Forster & Co., and Lubbock & Co., of which his father was the head, and upon the retirement of his father became the head of the house, which was later merged in the London and Westminster Bank. He entered Parliament in 1816 as a member for Hythe and continued to represent this constituency till 1823. In 1833 he was defeated in his candidacy for Parliament at Manchester, and did not seek to reënter public life. During his Parliamentary career Loyd had shown himself a careful student of banking questions, and in 1833 he was examined at length before a Parliamentary committee on banks of issue. He published his testimony and followed it in 1837 with a pamphlet of *Reflections Upon the State of the Currency*. In these writings he gave forcible expression to the opinions which have been known to economists as those of the Currency School. The essence of this doctrine is that the issue of bank notes cannot be left to free competition, that it should be strictly limited to institutions offering a definite guaranty of solvency in a definite coin reserve duly provided by law and attested by publication of balance sheets. The views which he expressed were not popular, but they won many adherents and eventually found expression in the Bank Act of 1844. In 1848 and in 1857, after the suspensions of the Bank Act, he was called upon to defend the act before Parliamentary committees. In 1850 he was raised to the peerage under the title of Baron Overstone and Frothingay.

OVERT ACT (OF., open). In criminal law, an open or positive act in furtherance of an intention to commit a crime, which will apparently result in the crime, unless prevented or interrupted by circumstances not foreseen by the person doing the act. A mere intention to commit crime, except in case of a conspiracy, is not a penal offense, and therefore it is always necessary to show some overt act in order to sustain a criminal prosecution. An overt act is to be distinguished from a mere preparation to commit a crime, which in the absence of statute is not a criminal offense. For example, the purchase of a gun with intention of killing another is an act of such an uncertain nature that it cannot be said that it would directly result in murder if not prevented or circumvented in some way, and would not be considered an overt act. But pointing a loaded gun at another and pulling the trigger would be an unmistakable attempt to kill, even if the powder failed to explode, as the design would be effected but for an accident. In order to maintain a prosecution for treason in England some overt act must be shown, a treasonable intention not being sufficient to constitute the offense. In order to convict one so accused it is

necessary to prove the act by at least two witnesses. See CRIME; TREASON. Consult the authorities referred to under CRIMINAL LAW; CONSPIRACY.

OVERTONE. See HARMONICS.

OVERTURE (OF. *overture*, Fr. *ouverture*, opening, from OF. *overt*, Fr. *ouvert*, open, from OF. *ovrir*, Fr. *ouvrir*, to open, from OF. *aovrir*, *aüvrir*, to open, from Lat. *ad*, to + *deoperire*, to open, from *de*, off + *operire*, to cover, from *ob*, before + **verire*, to open; connected with Lith. *vert*, OChurch Slav. *vrĕti*, Skt. *var*, to open, Oscan *vēru*, gate; the OF. *ovrir* may, however, be a variant of *avrir*, to open, from Lat. *aperire*, to open). In a general sense, an introduction, especially to an opera. The first operas had no overtures. They either began directly with the action or were preceded by a prologue which was sung. With the development of instruments it became customary to open an operatic performance with an instrumental prelude. These introductions, however, were nothing more than arrangements of popular madrigals for instruments. The oldest form of the overture originated in France, and here we can distinctly see the influence of the vocal style. Lully (1633-87) established this. Alessandro Scarlatti (1659-1725) began with an *Allegro*, which was followed by a *Grave* and ended with another *Allegro* or *Presto*. This form is known as the *Italian overture*. At that time, however, it was simply designated as *Sinfonia*. Such *Sinfonie* were soon used for concert performances, and composers began to write instrumental *Sinfonie*. It was but a step to the separation of the three parts into as many distinct *movements*. Hence the modern *Symphony* (q.v.). The modern overture may be divided into three distinct classes. (1) The *concert overture*, a work in sonata-form. But there is *no* repetition of the first, or exposition section. To this class belong the overtures of Beethoven, such as *Egmont*, *Coriolanus*. (2) The *opera overture*, consisting of a combination of various (generally the most melodious) themes from the opera. This was chiefly cultivated by Rossini, but with a more serious and artistic purpose by Weber. (3) An overture built upon themes from the opera, but with the definite purpose of giving a résumé of the action. The most famous example of this kind of overture is that to *Tannhäuser*, in which Wagner makes use of two principal themes, the chorus of the elder Pilgrims and the Venus-music. In this third class of overtures we may also place the preludes of Wagner's later dramas, which they lead directly, without a close, into the first act. See LEITMOTIV; PRELUDE.

OVERWEG, ō'vĕr-vāk, ADOLF (1822-52). A German explorer. He was born in Hamburg, and studied geology at the universities of Bonn and Berlin. In 1850 he joined Barth and Richardson in their explorations of Central Africa. He reached Lake Chad with a boat which had been brought overland from Tripoli, and devoted five weeks to exploring that lake, being the first European who had ever sailed upon its waters. He then tried to penetrate the country of Yakoba, northwest of the Benue, but his health was shattered and he returned to Kuka, near which place he died. His reports appeared in *Monatsberichte der Gesellschaft für Erdkunde* (1851-52), and in *Zeitschrift für Allgemeine Erdkunde* (1853).

OVID (PUBLIUS OVIDIUS NASO) (B.C. 43-A.D. 18). A Roman poet. He was a descendant of an old equestrian family, and was born on March 20, B.C. 43, at Sulmo (now Sulmona), in the country of the Pæligni. He was educated for the bar, and under his masters, Arellius Fuscus and Porcius Latro, he became highly proficient in the art of declamation. His genius, however, was essentially that of the poet, and the writing of verses began to absorb the time he was supposed to spend in the study of jurisprudence. By the death of his elder brother, Ovid inherited all his father's property, and went, for the completion of his education, to Athens. He afterwards made a tour of Asia and Sicily with the poet Macer. It is uncertain whether, on his return to Rome, he ever practiced as advocate. Although by birth entitled to aspire to the dignity, he never entered the Senate; his weakness of body and indolence of habit prevented him from ever rising higher than the position of a decemvir, who convoked and presided over the court of the centumviri. While his public life was unimportant, his private life was that of a gay and licentious man of letters. The restraint of marriage was always distasteful to him; twice married in early life, he soon divorced each of his wives; while he carried on an intrigue with a lady whom he celebrated as Corinna, and who has been thought to have been no other than Julia, the accomplished daughter of Augustus. Before his thirtieth year, he married a third time, and became the father of Perilla, of whom he was tenderly fond. Up to his fiftieth year he resided chiefly at Rome, in a house near the Capitol, and occasionally visited his Pælignan estate. His society was much courted, and his large circle of distinguished friends included Augustus and the Imperial family. By an edict of the Emperor, however, he was, in A.D. 8, commanded to leave Rome for Tomi, a town near the delta of the Danube, and on the very boundary of the Empire. The sentence did not condemn him to an *exsilium*, but to a *relegatio*—or, in other words, he did not lose his citizenship, and he was not cut off from all hope of a return. The cause of this sudden banishment is a mystery, since the reason assigned in the edict—the publication of his *Ars Amatoria*—was a mere pretext, the poem having been in circulation for ten years before. His cognizance of a love affair of Julia's daughter, and the consequent displeasure of Augustus or of Livia, have been adduced with various degrees of plausibility as the cause of a sentence to which Ovid himself only mysteriously refers. The misery of his life on the inhospitable and barbarous shore of the Euxine is commemorated by the poems in the composition of which he found his solace. He became a favorite with the people of Tomi, before whom he publicly recited some poems in honor of Augustus. But his devotion to the Emperor, and the entreaties addressed to the Imperial Court by himself and his friends, failed to shorten the term or to change the scene of his banishment, and he died, an honored citizen of Tomi, A.D. 18, in his sixtieth year. His works which have come down to us, either in whole or in part, appeared in the following order: (1) *Amorum Libri III.*, a revised and abridged edition of an early series. (2) Twenty-one *Epistolæ Heroidum*. (3) The *Ars Amatoria*. (4) *Remedia Amoris*. (5) *Nux*,

the remonstrance of a nut-tree against the ill-treatment it received from the wayfarer, and even from its owner. (6) *Metamorphoseon Libri XV.* This is deservedly Ovid's best known work. It seems to have been written between the poet's fortieth and fiftieth years, and treats of all the transformations recorded in legend from the creation down to the time of Julius Cæsar, whose change into a star forms the last of the series. (7) *Fastorum Libri XII.*, the first six of which are all that remain. The poem is a Roman calendar versified, and describes the appropriate festivals and mythic legends from materials supplied by the old annalists. (8) *Tristium Libri V.*, written during the first four years of the poet's banishment. They are mainly descriptive of his miserable fate, and are full of appeals to the clemency of Augustus. (9) *Epistolarum ex Ponto Libri IV.*, similar in substance to the *Tristia*. (10) *Ibis*, a short satire against some traducer of Ovid. (11) *Consolatio ad Liviam Augustam*, held spurious by some critics. (12) *Medicaminia Faciei* and *Halieuticon*, dubiously genuine, of which we possess but fragments. Several of his works are entirely lost, the one best known to antiquity being *Medea*, a tragedy.

The poetical genius of Ovid has always been admired. A masterly facility of composition, a fancy vigorous and rarely at fault, a fine eye for color, and a versification very musical in its flow, are the merits which have made him a favorite, in spite of his occasional slovenliness and falsity of thought. The best early edition of Ovid's entire works is Burmann's (Amsterdam, 1728). Of modern editions, the best is that of Merkel revised by Ehwald (Leipzig, 1889-94). The editions of single poems, especially the *Metamorphoses*, are very numerous. An important edition of the *Heroides*, with ample commentary and Greek translation by Planudes, by Palmer, should be mentioned (Oxford, 1898). Ovid has been a favorite with English translators; the *Amores* were done into English verse by Christopher Marlowe; the *Ars Amatoria* by Congreve and Dryden; the *Tristia* by Arden (New York, 1821); and many translations of the *Metamorphoses* were collected by Garth (1st ed., London, 1810, frequently reprinted).

OVIDIO, ō-vē'dē-ō, Francesco d'. See d' Ovidio.

OVIDUCTS. See Fallopian Tubes.

OVIEDO, ō'vē-ā'dō. The capital of the Province of Oviedo (the ancient Asturias, q.v.), in Northern Spain (Map: Spain, C 1). It is situated on the railroad between Leon and Gijon, 16 miles southwest of the latter. The town has been much modernized, fine wide streets have been laid out, and in the new suburb to the north of the old town there are parks, gardens, and promenades, and many attractive buildings. The principal building and the pride of the Oviedans is the cathedral, the beautiful Gothic tower of which dominates the whole city. The educational institutions include the university, with faculties of law, philosophy, and science. In 1900 there were 234 students in attendance. It occupies a square, one-story building, and has a well-equipped meteorological observatory and a museum of natural history. Besides the university there are a provincial institute, a seminary, a school of arts, a normal school, a provincial archæological museum, and a public library of 40,000 volumes. The industries are represented by a large number of tanneries, and manufactures of cloth, chocolate, flour, and bricks. There are large national establishments for the manufacture of firearms, as well as gunpowder factories and cannon foundries. Population, in 1887, 42,716; in 1900, 48,374.

OVIEDO Y VALDÉS, ō vāl-dās', Gonzalo Fernandez de (1478-1557). A Spanish chronicler, born in Madrid. He was sent by Ferdinand to Santo Domingo, in the West Indies, in 1514, as intendant and inspector-general of the trade of the New World. During his long residence in Santo Domingo he spent his leisure in acquiring an extensive knowledge of the West Indies. After his return to Spain he published at Toledo, in 1528, a *Sumario de la historia general y natural de las Indias Occidentales*, and dedicated it to Charles V. He afterwards made some additions to the work, which was republished at Seville in 1535, in twenty-one volumes, under the title *La historia general y natural de las Indias Occidentales*. He left some other books in manuscript, including incomplete manuscripts of Chronicles of Ferdinand and Isabella and of Charles V. An edition of the *Historia general* was published by the Academy, under the editorship of Amador de los Rios (1851-55). Oviedo died in Valladolid. Besides his *History of the West Indies*, we mention *Las quinquagenas*, a valuable gossiping and anecdotical account of all the principal personages of Spain in his time. This still remains in manuscript in the royal library at Madrid. A *Life of Cardinal Ximenes* is also attributed to him.

OVIPAROUS ANIMALS (Lat. *oviparus*, producing eggs, from *ovum*, egg + *parere*, to bring forth). Animals that deposit their eggs either before or immediately after fertilization, so that development of the embryo takes place outside of the body. The term was formerly used in contrast with 'viviparous,' or bearing the young 'alive.' This distinction is no longer maintained, partly because the egg is also alive, and partly because there are all possible gradations between oviparity and viviparity, even inside of the group of mammals; for the lowest mammals (duckbill and echidna) lay slightly developed eggs provided with a tough membrane or 'egg shell.' Thus arose the term 'ovoviviparous,' applied to animals of which the egg is hatched within the body of the mother, so that the young is excluded alive, although the fœtus has been inclosed in an egg almost to the time of parturition. Some fishes are 'ovoviviparous,' and so are some reptiles. These distinctions are much less important than was formerly supposed.

OVIS, OVINÆ. See Sheep.

OVISACS. See Ovary.

O'VOLO (It., from ML. *ovolum*, diminutive of Lat. *ovum*, egg). A convex molding much used in classic architecture and in succeeding styles. (See Molding.) In Roman architecture, the ovolo is an exact quarter of a circle; in Greek architecture, the curve is sharper at the top and quirked.

OVULATION. See Ovary.

OVULE (Fr. *ovule*, from ML. *ovulum*, little egg). The structure which in seed-plants (spermatophytes) becomes a seed. The name refers to the old mistaken belief that the ovule of a

plant represents the egg of an animal, and that it is fertilized and so produces a new plant. The name has been so long in use that it is still retained, although its real meaning makes it very inappropriate. Really it is a spore-case (sporangium, q.v.), and is entirely sexless. In gymnosperms (pines and their allies) the ovules are freely exposed, while in angiosperms (flowering plants) they are inclosed in the bulbous part (ovary) of the pistil, but in both cases their structure is the same. The central body of an ovule (Fig. 1) is the *nucellus*, and enwrapping it there are one or two coats called the *integuments*. At the apex of the nucellus the integuments leave a small passageway (*micropyle*, 'little gate') for the entrance of the pollen-tube (see FERTILIZATION); and near the base of the ovule they become indistinguishable from the nucellus, this region of blending being called the *chalaza*. Frequently the ovule has a slender stalk, called the *funiculus*. Within the nucellus a single large spore (*megaspore*, q.v.) is formed, which still bears its old name *embryo-sac*. This spore is peculiar in not being shed from its sporangium (ovule), and this fact results in making a seed out of the ovule. It is the business of this spore to germinate and produce a female plant (gametophyte), that is, a plant which produces eggs. This female plant thus imprisoned within the seed was long ago named the *endosperm* (Fig. 2). See SEED.

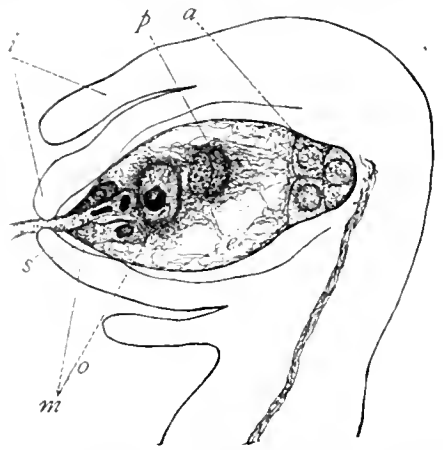


FIG. 1 OVULE.
Showing integuments (*i*), embryo-sac (*e*), antipodal cells (*a*), polar nuclei fusing (*p*), synergids (*s*), egg (*o*), and pollen tube (*m*) containing male cells.

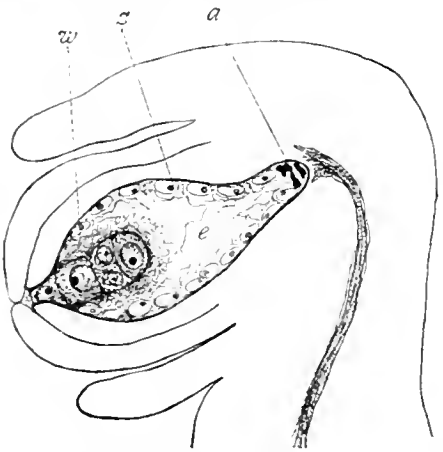

FIG. 2. AN OLDER OVULE.
Showing embryo-sac (*e*), antipodal cells degenerating (*a*), the developing endosperm (*z*), and young embryo (*w*).

In the true flowering plants (angiosperms) the ovules are exceedingly variable as to number and position within the ovary, which may contain one or a very large number of ovules, and these may be attached to the wall of the ovary, in which case they usually occur in definite lines; or they may be found attached to a central axis which projects more or less into the ovary cavity. Three well-marked forms of ovules have been distinguished, and they are usually characteristic of great groups of plants. The most common form is the *anatropous* (inverted) ovule, in which the ovule has completely turned over and its funiculus (stalk) appears as a ridge along one side of it, the micropyle (apex of ovule) thus being directed toward the base of the funiculus. Another form is the *campylotropous* ovule, in which the body of the ovule itself has become curved, the micropyle thus being directed downward. The third form is the *orthotropous* ovule, in which there is no inversion or curving, but the axis of the ovule continues that of the funiculus, and the micropyle is directed upward.

OVUM, FERTILIZATION OF. See EMBRYOLOGY.

OWARI, ō-wä'rē, or **BISHIU,** bē'shōō'. A populous and wealthy province of Japan, in the island of Hondo, one of the group known as the Tokaido or 'East Sea Circuit.' It lies south of Mino, west of Mikawa, east of Omi and Isé, and is bounded on the south by Owari Bay, into which the Kisogawa, which flows through the province, empties its waters. It has a fertile soil and is noted for its rich beds of clay, which are much used in the ceramic industries for which the province is noted. Near Nagoya (q.v.), the chief town, lies the village of Seto, where in 1297 the ceramic art of Japan had its origin, having been introduced by a native of the village, one Kato Shirozayemon (or briefly Toshiro), who had studied in China. From this circumstance *Setomono*, or 'Seto articles,' has become a synonym for all kinds of Japanese ceramic ware, just as 'chinaware' is synonymous with 'porcelain' wherever produced. Large quantities of blue ware are still produced at Seto. The province is also noted for its shippo or cloisonné enamels. Owari is included in the Ken or Prefecture of Aichi.

O'WATON'NA. A city and the county-seat of Steele County, Minn., 68 miles south of Saint Paul; on the Straight River, and on the Chicago, Milwaukee, and Saint Paul, the Chicago and Northwestern, and the Burlington, Cedar Rapids and Northern railroads (Map: Minnesota, E 6). It has Pillsbury Academy, Sacred Heart Academy, and the State Public School for Dependent and Neglected Children. Other fine structures are the court house, public library with 6300 volumes, the public schools, the opera house, and the city hospital. There are four steel bridges, and three parks: Central, Mineral Spring, and Dartt's. A productive farming district is tributary to Owatonna, and the city has also

noteworthy industrial interests, its plants including flouring mills, foundries and machine shops, a butter-tub factory, soap works, nurseries, and establishments manufacturing churns, gasoline engines, seeders, fanning mills, wagons, sleighs, automobiles, etc. Settled in 1855 and incorporated ten years later, Owatonna is governed, under a charter of 1875, by a mayor, elected annually, and a council. There are municipal water-works. Population, in 1890, 3849; in 1900, 5561.

OWE'GO. A village and the county-seat of Tioga County, N. Y., 21 miles west of Binghamton, at the confluence of the Susquehanna River and Owego Creek, and on the Erie, the Lackawanna, and the Lehigh Valley railroads (Map: New York, D 3). It is a summer resort and an attractive residential place, the home of several well-known men. It has a handsome court house, and the Coburn Free Library, containing over 8000 volumes. Considerable trade is carried on in farm produce and lumber. There are creameries, and manufactories of wagons, steel bridges, flour, silk and leather gloves, shirts, harness, and mica chimneys. The village, first incorporated in 1827, is governed under a charter of 1851, as amended in 1891, which provides for an annually elected president and council. Owego, meaning 'the place where the valley widens,' occupies the site of a small Indian village which was destroyed by General Clinton in 1779. In 1786 the first white settler came. Population, in 1900, 5039.

OWEN, ō'ĕn, DAVID DALE (1807-60). The second son of Robert Owen; born in Scotland. He came to the United States in 1823, took a degree from the Ohio Medical College, and for some years studied his profession and scientific branches in Europe. In 1833 he returned to the United States and was soon appointed State geologist of Indiana. Under the direction of the Legislature he made a geological survey of the State, and in 1839 was employed by the United States Government to make a survey of the mineral lands of Iowa, and in 1848 made similar surveys in Minnesota and adjoining Territories. The results of his work were published by order of Congress. He was employed from 1852 to 1857 in surveys of the same nature in Kentucky, and in 1857 was appointed State geologist of Arkansas.

OWEN (Lat. *Audoenus*), JOHN (c.1560-1622). An English epigrammatist. He was born at Llanarmon (Carnarvonshire), was educated at Winchester and at New College, Oxford, where in 1584 he became fellow, and from 1591 to about 1594 was a schoolmaster at Trelleck (Monmouthshire). Appointed then to the headmastership of the free school of King Henry VIII. at Warwick, he soon became known for his felicitous Latin epigrams, the first collection of which he published in 1606 as *Joannis Audoeni Epigrammatum Libri Tres*. He found a patron in John Williams, Bishop of Lincoln and Lord Keeper of the Great Seal. His work is uneven in quality, but at its best is caustically shrewd and pointed, and exceedingly skillful in its use of Latin idiom. What is perhaps his most frequently quoted line,

Tempora mutantur, nos et mutamur in illis

(bk. viii., 58, 1), is derived from Matthias Borbonius's compilation, *Delitiæ Poetarum Germanorum* (Frankfort, 1612), where in the form 'Omnia mutantur,' etc., it is attributed to the Emperor Lothair I. The best edition of the collected epigrams is by Renouard (Paris, 1794). There are English renderings by Vicars (1619), Hayman (1628), Harflete (1658), Pecke (1659), and Harvey (1677-78).

OWEN, JOHN (1616-83). An eminent nonconformist divine. He was born at Stadhampton, Oxfordshire, in 1616, of an ancient Welsh family. In 1631 he matriculated at Queen's College, Oxford, but in 1637 he was forced to leave the university because of opposition to Laud's statutes. When the Civil War broke out he warmly espoused the cause of the Parliament. He removed to London and published his *Display of Arminianism* (1643), which proved very acceptable to the Puritan party, and secured him the living of Fordham in Essex. From here he removed to Coggeshall, a neighboring vicarage. His views of Church government underwent a change, and from a Presbyterian he became an Independent, modeled his church on congregational principles, and wrote in advocacy of the latter. He preached before Parliament on the day following the execution of the King, but discreetly avoided a vindication of the act. In 1651 the House of Commons appointed him dean of Christ Church, Oxford, and the following year he was admitted vice-chancellor of the university. He was also returned to Parliament, but was unseated because of his orders. After Cromwell's death he was ejected from his deanery; but he had powerful friends at Court, and was allowed to preach, notwithstanding the Conventicle Act and the revocation of the Declaration of Indulgence, and in 1673 became pastor of a large Independent congregation in Leadenhall Street, London. In 1663 Owen was called to the First Church of Boston, Mass., but declined the call then, and when it was renewed in 1665. In 1669 he joined several other dissenting ministers in a protest against the treatment of the Baptists in Massachusetts, and in 1672 recommended a president for Harvard College, to which he had himself been called in 1670. Among his publications may be mentioned: *A Discourse Concerning Liturgies and Their Imposition* (1662); *Exercitations on the Epistle to the Hebrews* (1668-84), usually considered Owen's greatest work; *Truth and Innocence Vindicated* (1669), a reply to Parker's *Discourse on Ecclesiastical Polity; Justification by Faith* (1677); *Christologia* (1679). His works have been edited by Russell, with *Life* by Orme (28 vols., London, 1826), and by Goold, with *Life* by Thomson (24 vols., London, 1850-53).

OWEN, Sir RICHARD (1804-92). An English comparative anatomist, born at Lancaster, England, July 20, 1804. He studied medicine in Edinburgh, London, and also under Cuvier in Paris. He became a member of the Royal College of Surgeons in 1826, and practiced his profession in London, but was soon appointed assistant curator of the Hunterian Museum, and began to devote himself to the anatomy of animals. In 1834 he was appointed to the chair of comparative anatomy at Saint Bartholomew's Hospital, and in 1836 became the first Hunterian professor of anatomy and physiology in the College of Surgeons. This position involved the delivery of twenty-four annual lectures, but gave

him time for much original research, the published results of which brought him much renown, and won him the friendship of the most distinguished of his contemporaries, from the Queen and Prince Albert down. The last forty years of his life were spent at Sheen Lodge in Richmond Park, which was given him by the Queen.

The second period of his career began in 1856, when he resigned his professorship, and took the new post of superintendent of the natural history departments of the British Museum, which had previously been under the care of literary men with no special scientific training. He soon found that definite activity in the administration of the Museum was neither expected nor desired, and accordingly devoted himself with great energy to original research, making full use of the splendid collections under his hand. Having now little opportunity for dissection he spent most of his time on osteology and especially paleontology. A large amount of highly important work was accomplished, including the arrangement and revision of Hunter's manuscripts, and his own great book on the *Anatomy and Physiology of the Vertebrates* (1866-88). Owen is justly regarded as the greatest English comparative anatomist and paleontologist, and during the greater part of his life was considered Cuvier's successor in these fields. In 1883 he left the Museum, to which he had rendered priceless services, and spent the remaining years in retirement. He was made a K.C.B. in 1884. Of the innumerable works published during a literary activity of sixty-two years, at least the following should be mentioned: *Odontography* (1840-45); *Comparative Anatomy of the Invertebrate Animals* (1843); *British Fossil Mammals and Birds* (1846); *British Fossil Reptiles* (1849-84); *Experimental Physiology* (1882). Consult his *Life* by his grandson (London, 1894), which gives a complete list of his minor writings.

OWEN, Robert (1771-1858). An English social reformer, born May 14, 1771, at Newtown, Montgomeryshire, North Wales. He was the son of poor parents, and was apprenticed at ten years of age to a draper. He developed an unusual power of organization, and at nineteen years of age became manager of a cotton mill employing 500 hands. The enterprise was successful and Owen soon organized the Chorlton Twist Company, which later bought the large cotton mills at New Lanark of David Dale, whose daughter Owen married in 1799. Owen assumed the management in 1800, and New Lanark soon achieved wide reputation both for its industrial success and the prosperity of the employees. It was visited by the most prominent men of Europe. Owen opened pleasure resorts for the employees, stopped the employment of young children, and introduced a system of education far in advance of his time; improved the houses; furnished provisions at fair prices; and established insurance funds for sickness and old age. In 1813 he published his *New Views of Society, or Essays upon the Formation of the Human Character*, in which he held that character is wholly the result of the environment. Called before a Parliamentary committee in 1817 to testify regarding the causes of poverty and the means of avoiding it, he outlined the plan of a coöperative village, in which some 1200 persons should live in one large building with public kitchens and dining rooms, each family having its own private apartments and the entire care of its children until the age of three, after which they should be brought up by the community. Work and the enjoyment of its results were to be in common. Federations of such cooperative townships were to embrace the world in one great republic. From this time it was his constant dream to found an ideal community. Disciples of Owen started a colony at Motherwell, and later at Orbiston and other places, but all failed. In 1824 Owen came to America and founded at his own expense a community in Indiana at New Harmony (q.v.). This likewise failed. In 1828 Owen went to Mexico, hoping there to carry out his schemes, but was disappointed. His connection with New Lanark ceased in the same year. In 1832 he sought to establish at London a "National Labor Equitable Exchange," but this did not prove a success. In 1835 he wrote the *New Moral World*. For the rest of his life he was an advocate of Socialism, and in his old age he became a believer in Spiritualism. He was not discouraged by his failures, but labored throughout his life to better conditions, expending his entire fortune on his social schemes. The words Socialism and Socialist were used during the discussions in connection with the association of all classes of all men founded under the auspices of Owen in 1835. Owen died in his native town, November 19, 1858. Consult his autobiography (London, 1857); Booth, *Robert Owen* (London, 1869); Sargent, *Owen and His Social Philosophy* (London, 1860); Jones, *Life of Robert Owen* (London, 1892).

OWEN, Robert Dale (1801-77). A social reformer, son of Robert Owen (q.v.); born at Glasgow, Scotland, November 9, 1801. He was educated at home and in Switzerland. He came to the United States in 1825, aided his father to found New Harmony in Indiana, went back, on the failure of that scheme, to England, but presently returned and became a citizen of the United States. From 1828 to 1832 he published with Francis Wright in New York *The Free Inquirer*, a socialistic and anti-Christian weekly. He then went to New Harmony, and in 1835 was elected to the Indiana Legislature, where he distinguished himself by securing appropriations for the public school system. He was a member of Congress in 1843-47 and took a leading part in the settlement of the Northwestern boundary, in the Oregon question, and in founding the Smithsonian Institution. Failing reëlection in 1847, he took an active part in State politics, especially in furthering the legal rights of married women to property. From 1853 to 1858 he was chargé d'affaires and Minister at Naples. During the Civil War he served in the Ordnance Commission and the Freedmen's Bureau, and published an important open letter to Lincoln on emancipation. Owen was also a zealous advocate of Spiritualism. His chief publications, besides those mentioned above, are: *Outlines of the System of Education at New Lanark* (1824); *Moral Physiology* (1831); *Discussion with Origen Bachelor on the Personality of God and the Authority of the Bible* (1832); *Footfalls on the Boundary of Another World* (1859), perhaps his best-known work; *The Wrong of Slavery* (1864); *Beyond the Breakers* (1870); *Debatable Land Between This World and the Next*

(1872); and the autobiographical *Threading My Way* (1874), which deals with the first twenty-seven years of his life. He died at his summer residence on Lake George, N. Y., June 17, 1877.

OWENS, ō'ĕnz, JOHN EDWARD (1824-86). An American comedian; born in Liverpool, England, but taken to the United States when three years old. He began his stage career in Philadelphia in 1841, and within a few years his popularity won him a fortune. His *Solon Shingle* (1864) was famous both in the United States and in England; among his other favorite characters were Dr. Pangloss and the old man in *Esmeralda*, in which he last appeared in New York. Owens died at his home near Towson, Md., December 7, 1886.

OWENSBORO, ō'ĕnz-bŭr-ō. A city and the county-seat of Daviess County, Ky., 112 miles southwest of Louisville; on the Ohio River, and on the Louisville and Nashville, the Louisville, Henderson and Saint Louis, and the Illinois Central railroads (Map: Kentucky, D 3). It is the seat of the Owensboro Female College (non-sectarian), opened in 1890, and of Saint Francis Academy. Prominent features of the city are a fine United States Government building, the high school, the county jail, and the county court-house. Owensboro is surrounded by a farming and stock-raising country, and in the vicinity are valuable forests and deposits of coal, clay, building stone, iron, zinc, and lead ores. Oil wells are in operation near the city. Owensboro has steamboat communication with important points on the river, and has developed extensive commercial interests, particularly in tobacco, being one of the largest leaf and strip tobacco markets in the United States. Its manufactures are extensive and varied. There are numerous tobacco factories, whisky and brandy distilleries, buggy, carriage, and wagon factories, a wheel factory, and a cellulose factory. The government, under a legislative charter, is vested in a mayor, who holds office for four years, and a council. Administrative officials are chosen by popular vote. The electric light plant is owned and operated by the city, and $200,000 has been appropriated for a new municipal water-works system. Population, in 1890, 9837; in 1900, 13,189.

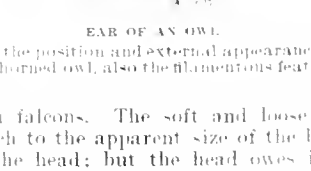
OWENS COLLEGE. A college at Manchester, England. It was founded in 1851 under the will of John Owens, a merchant of that city, who left £100,000 for the instruction of young men "in such branches of science and learning as were then and might be thereafter usually taught in English universities." Handsome new buildings have been erected, and the college has now a staff of about 50 professors and lecturers in the departments of art, science, law, and medicine. There are about 30 scholarships and prizes, and a valuable fellowship. Owens College has been constituted a college of Victoria University, chartered in 1880, a federation of colleges, having its seat in Manchester.

OWENS LAKE. A lake of California situated at the eastern base of Mount Whitney in the Sierra Nevada, 90 miles east of Tulare Lake (Map: California, E 3). It is 18 miles long and 8 miles wide, receives the Owens River (q.v.), but has no outlet. Its water is excessively saline.

OWEN SOUND. The capital of Grey County, Ontario, Canada; and a port of entry on Georgian Bay, Lake Huron, at the mouth of the Sydenham River and on the Canadian Pacific and the Grand Trunk railroads, 99 miles northwest of Toronto (Map: Ontario, C 3). It has an excellent harbor with a dry dock 300 feet long, and is surrounded on three sides by wood-crowned heights. Its public buildings include a town hall, court house, and high school. It has a trade in agricultural produce and lumber, and manufactures of mill machinery, turbine water wheels, agricultural implements, engines, sewing machines, bricks, and leather. The United States is represented by a consular agent. Population, in 1891, 7497; in 1901, 8777.

OWENS RIVER. A river of eastern California (Map: California, D 3). It rises in the Yosemite National Park, and flows southeast through an exceedingly rugged valley along the eastern base of the Sierra Nevada. It discharges into Owens Lake (q.v.) after a course of 175 miles.

OWL (AS. *ule*, *ule*, *uule*, *uula*, *huvela*, Ger. *Eule*, owl; probably onomatopoetic in origin). Any of a numerous and well-defined group of birds, the nocturnal birds of prey, constituting the Linnæan genus Strix, now the suborder Striges. Although they were formerly placed unhesitatingly in the order Raptores, of recent years there has been some tendency to separate them from the other birds of prey and place them near the nightjars, which they resemble to a remarkable degree. In appearance the owls are distinguished from all other birds by the large size of their heads and their great eyes, which are directed forward and surrounded by more or less perfect disks of feathers radiating outward and nearly hiding the small hooked bill. The claws are sharp and curved, but, like the bill, less powerful than in the Falconidæ. The outer toe is generally reversible at pleasure, so that the toes can be opposed two and two, to give greater security of grasp. The wings, although generally long, are less adapted for rapid and sustained flight than those of the diurnal birds of prey, and the bony framework by which they are supported, and the muscles which move them, are less powerful. The owls in general take their prey, not by pursuit, but by surprise, to which there is a beautiful adaptation in the softness of their plumage and their consequently noiseless flight, the feathers even of the wings being downy, and not offering as firm a resisting surface to the

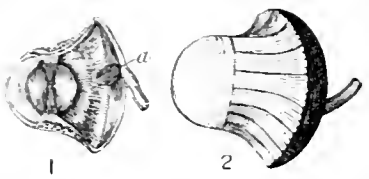


EAR OF AN OWL.

Showing the position and external appearance of the ear of a great horned owl, also the filamentous feathers about the beak.

air as in falcons. The soft and loose plumage adds much to the apparent size of the body, and also of the head; but the head owes its really large size to cavities in the skull between its outer and inner 'tables' or bony layers which cavities communicate with the ear, and are supposed to increase the sense of hearing. This sense is certainly very acute, and the ear is, in

many of the species, very large, and has a concealed yet external conch, which is found in few other birds. The feathers immediately surrounding the ear are often arranged in a kind of cone, serving a purpose like that of an ear-trumpet. Owls can see well in twilight or moonlight, but poorly in the glare of the day. The eye itself is highly perfected, and the pupil remarkably



EYE OF AN OWL.

1, Section of the eye, showing the interior parts of the globe at the insertion of the optic nerve (a) by which the vision is regulated under the great possible expansion and contraction of the eye. 2, Sclerotic coat, showing the stave-like pieces, connected by elastic tissue permitting great expansion and contraction.

contractile. The legs and feet of owls are usually feathered to the toes, and in many species even to the claws.

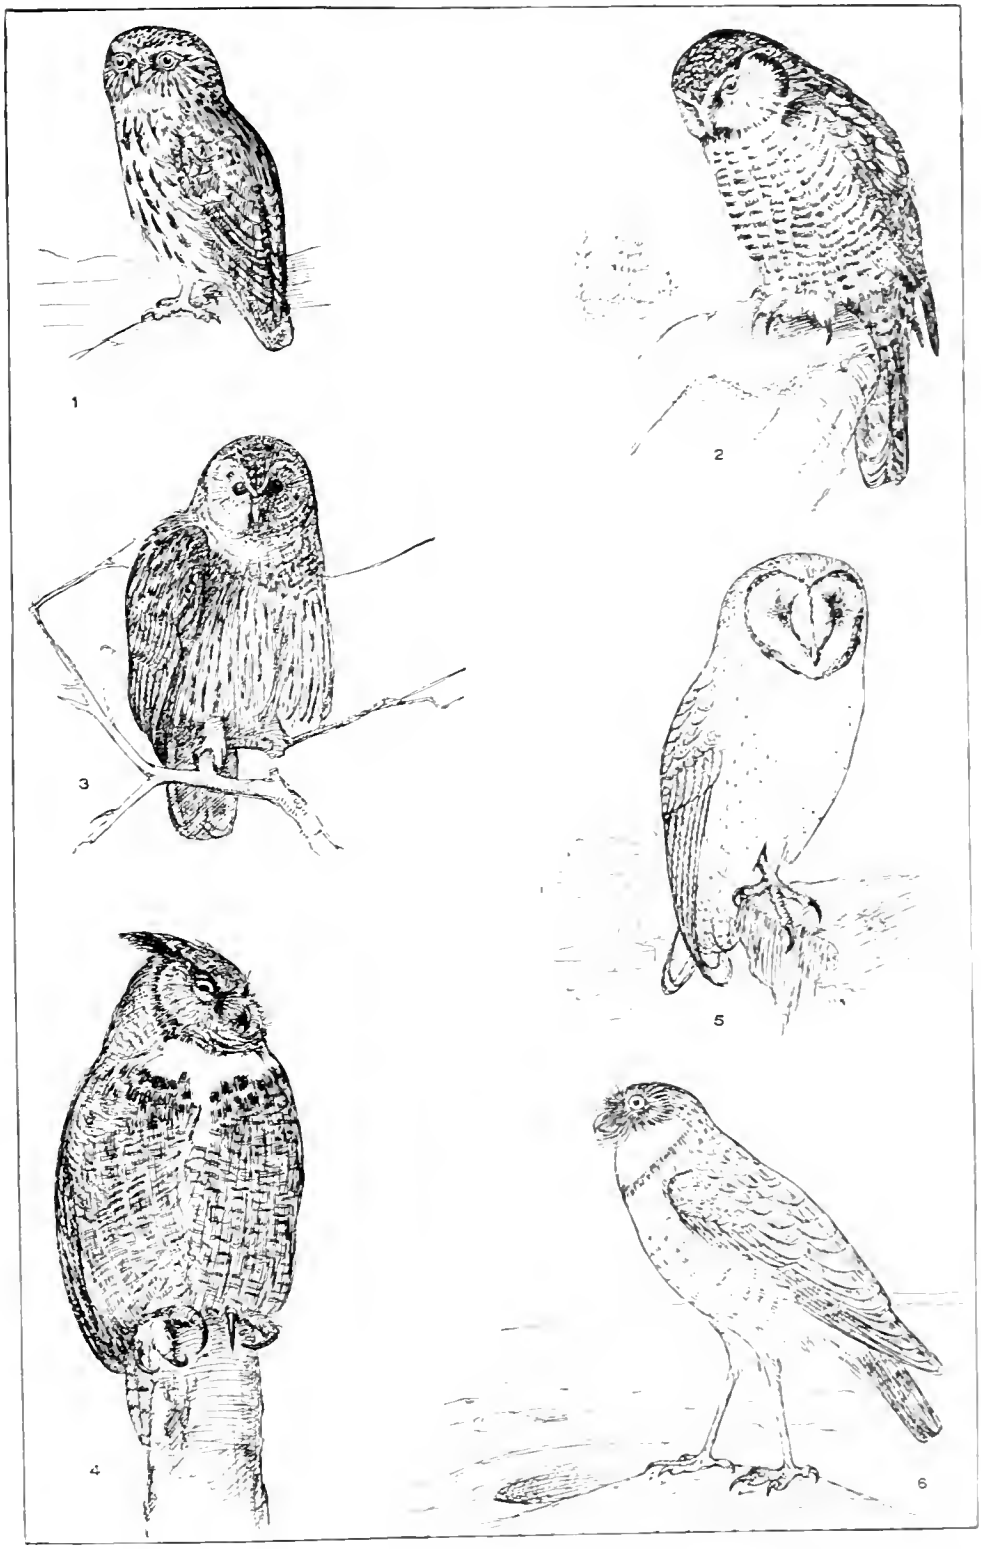
The digestive organs much resemble those of the Falconidæ, but there is no crop and the stomach is more muscular. The gullet is very wide throughout, and owls swallow their prey either entire or in very large morsels, the indigestible parts gathering into little lumps or 'pellets,' which are ejected after a time. These pellets are to be found numerously where owls roost or nestle, and their examination reveals the bird's bill of fare. The largest species feed on hares, fawns, and gallinaceous birds; others on small mammals, reptiles, birds, and large insects. Although they capture many small birds, mice form the principal element in their diet, and the owls are thus highly beneficial to agriculture, and should everywhere be protected and encouraged by farmers. Some owls also feed largely on fish (see KETUPA), crabs, and the like, which they catch for themselves.

The owl family (Strigidæ) falls into two divisions—the Strigine and the Bubonine, which are distinguished by differences in structure especially marked in the shoulder-girdle (consult Evans, *Birds*, New York, 1900). The former group is typified by the barn owl, the latter by our big barred or 'eat' owl. In size, owls vary greatly. The largest known species is the circumpolar gray owl (*Syrnium* or *Scotiaptex nebulosum*), from 27 to 28 inches long and more than 5 feet across the wings. The smallest known owl is the curious elf-owl (*Micrathene Whitneyi*) of Arizona, which is less than six inches long, and is further remarkable as having only 10 tail feathers; all other owls, so far as known, have 12. All owls have a general likeness in colors—a mixture of browns, whites, and yellows, as becomes nocturnal marauders who wish to remain unobserved, especially during the day when they are at rest. The Arctic owl becomes pure white in winter, but is brown in the summer plumage. There is little difference between the sexes, and the young, called 'owlets' or 'howlets,' resemble the adults. Owls are found in all parts of the world and in all climates, and rather more than 200 species are known. Of these 17 occur in North America, besides a dozen more or less recognizable subspecies; and about 15 species are natives of Europe. Some have a very wide geographical range, especially those of northern regions, and it is doubtful whether several species separately named in Europe and North America are really distinct, e.g. the barn-owl (q.v.). Another very widely distributed bird is the short-eared owl (*Asio accipitrinus*), which occurs in nearly all parts of the world. It is fifteen inches long, variegated tawny and dark brown, with short ear-tufts of few feathers. It is common in the United States, is somewhat migratory, and is occasionally seen in small flocks. A closely related species, rather more common generally, with long ear-tufts, is the American long-eared owl (*Asio Wilsoniana*). The hawk-owl, snowy owl, and great horned or eagle owl (qq.v.) are other handsome circumpolar species.

Other well-known American owls are the screech-owls (*Megascops asio*, with half a dozen subspecies). They are little owls, only nine to ten inches long, with ear-tufts, and are found in all parts of the United States and Canada. They are of special interest because of their remarkable dichromatism (q.v.), some of the birds having the prevailing tint gray, while others are rusty red. The barred owl, without ear-tufts, is a large species, also common throughout the United States. In the Southwestern States are found several species of little owls, which feed largely on insects, and are known as 'gnome-owls' and 'elf-owls.' They are only six or seven inches long and are not specially nocturnal. They belong to the genera Glaucidium and Micrathene. Another peculiar and interesting species is the burrowing owl (q.v.) of the Plains. It is not the only owl which inhabits holes in the ground. The boobook of Australia (*Ninox boobook*) is a species of owl, which frequently repeats during the night the cry represented by its name, as if it were a nocturnal cuckoo, as the inhabitants generally believe.

Of British species, one of the most common and familiar, and the one most often referred to in literature, is the 'tawny,' 'brown,' or 'ivy' owl (*Syrnium aluco*), which is of medium size, and mottled ash-gray and brown, with the under parts lighter. It inhabits church belfries, ruins, ivied walls, and like places, often in a semi-domestic condition. One of the best accounts of it (and of the next named species) is to be found in Charles Waterton's *Essays*. Another generally interesting species is the 'little' owl of Southern Europe, called 'chevêche' by the French and 'civetta' by the Italians, which is the one regarded by the ancients as the familiar of Minerva, a symbol of wisdom, and hence became the emblem of Athens. It is the *Carine noctua* of modern ornithology. This small species is brown, mottled with white oval spots, has no 'horns,' and its great eyes are surrounded by horizontally oval disks, like big spectacles, giving it a very 'knowing' expression. It is numerous, comparatively tame, and lives well in aviaries.

The owl has from early times been deemed a bird of evil omen, and has been an object of dislike and dread to the superstitious. This is perhaps partly to be ascribed to the manner with which it is often seen, then as suddenly lost to view, when the twilight is deepening into night; partly to the fact that some of the best known ones frequent ruined buildings, while others haunt



1. LITTLE OWL of Europe (Carine noctua); symbol of Pallas Athene
2. HAWK OWL (Surnia ulula)
3. BARRED OWL (Syrnium, or Scotiaptex nebulosum).

5. BARN OWL (Strix flammea)
6. BURROWING OWL (Speotyto cunicularia)

the deepest solitudes of woods; but, no doubt, chiefly to the cry of some of the species, hollow and lugubrious, but loud and startling, heard during the hours of darkness, and often by the lonely wanderer. It is evidently from this cry that the word 'owl' is derived, as well as many of its synonyms in other languages, and of the names appropriated in different countries to particular species, in most of which the sound *oo* or *ow* is predominant. Nevertheless the notes of some of the smaller ones, as our common American 'mottled owl,' are low and melodious—a pleasant rippling ululation. Many of the owls have also another and very different cry, which has gained for more than one of them the appellation 'screech-owl,' and to which, probably, the Latin name *strix* and some other names are to be referred. The superstitions concerning owls persist and belong to savage as well as to civilized peoples. The folk-lore of the uncivilized world is full of such notions. European peasants connect the birds with death-signs; the Andalusians say they are the Devil's birds and drink the oil from the lamps in saints' shrines; and the Malagasy consider them embodiments of the spirits of the wicked. Even the birds and squirrels of the woods mob the owl unmercifully when one is discovered dozing in its retreat; but this is merely in recognition of a natural enemy taken at a disadvantage.

Bibliography. See standard ornithologies and faunal works, especially Newton, *Dictionary of Birds* (New York, 1893), and Evans, *Birds* (New York, 1900). For North America, consult the writings of Wilson, Audubon, Nuttall, Coues, and recent ornithologists, especially Fisher, *Hawks and Owls of the United States* (Washington, 1893). For superstitions, etc., consult: Brehm, *Naturgeschichte der Vögel Deutschlands* (Ilmenau, 1831; trans. into English as *Bird Life*, London, 1874); De Gubernatis, *Zoological Mythology* (London, 1872); De Kay, *Bird Gods* (New York, 1898); and authorities cited under Folk-Lore.

OWLET-MOTH. Any one of the night-flying moths of the family Noctuidæ. This is a large assemblage of moths of rather strikingly characteristic and rather uniform appearance, comprising in the United States more than 2100 species, which are almost without exception injurious to vegetation. The moths, as a rule, are of sombre colors, averaging perhaps 1.50 inch in wing expanse. The fore wings are comparatively narrow, rather short and stout, and crossed by a series of wavy lines, with two usually darker or paler spots near the centre of the wing. The hind wings are usually without markings, and when at rest are concealed by the fore wings, which overlap and cover them, either flat upon the back or roof-like. The body is large in proportion to the size of the wings. The thorax is heavy and quite stout, and in some species the scales on the upper surface are turned up, forming tufts. The abdomen is conical and extends beyond the inner angle of the hind wings when these are spread. The popular name, *owlet-moth*, is derived from the nocturnal habits of these insects, and from the fact that often when they are in obscurity their eyes shine brightly.

Some of the caterpillars are hairy, but the more typical ones are naked, and perhaps the most characteristic are the forms commonly known as cutworms (q.v.). They range from an inch to an inch and a half in length and have dull colors, ranging from dirty gray to dirty brown with a few longitudinal stripes. They hide during the day a little below the surface of the ground and often at the base of the plants upon which they feed, and during the night come out to eat whatever vegetation they can find. The eggs are laid on trees, stones, or leaves, and the larvæ hatch, as a rule, late in the summer, and pass the winter in a half-grown condition hidden beneath stones or logs or under the surface of the ground. In the spring they come out after this long fast and devour the new vegetation with avidity. Some of them will climb trees and are known as 'climbing cutworms.'

The army-worm (q.v.) is a famous member of this family, as are also the wheat-head army-worm, the fall army-worm, the cotton caterpillar of the South, and the tomato-worm. The best remedy consists in ridding the land prepared for gardens before setting out the plants, by distributing here and there bunches of freshly cut grass or other vegetation which has previously been poisoned with Paris green.

OWLGLASS. See Eulenspiegel.

OWL-PARROT. See Kakapo.

OWNERSHIP. Although not strictly a legal term, 'ownership' is used frequently by legal writers to denote the highest degree or kind of property one can have in anything. 'Owner' is often used to denote one who has such property, as contradistinguished from the various terms used to signify one who has only a partial or temporary interest in property as lessee, tenant, licensee, bailee, or one having custody or possession. Strictly speaking, complete ownership at English law consists of title and possession united in the same person, although in common practice one is said to be the owner who has title, although he may not have actual possession of the property. In general, one who is the owner of property has absolute control over it and the right to do with it as he will so long as he does not interfere with the legal rights of others. See Dominium; Property; Real Property; Possession, Law of.

OWOS'SO. A city in Shiawassee County, Mich., 79 miles northwest of Detroit; on the Shiawassee River, and on the Ann Arbor, the Chicago and Grand Trunk, and the Michigan Central railroads (Map: Michigan, J 5). It is situated on both sides of the river, and has a ladies' library and several fine churches and school buildings. The Federal Government has made an appropriation for a new post-office building here. There are manufactures of furniture, caskets, door and window screens, dining-room tables, spokes, carriages, cars, packed meats, butter, machine shop products, hickory handles, knit goods, rugs, breakfast food, snow shovels, etc. The city is also the centre of an extensive sugar-beet industry, and has a large beet-sugar factory. Settled about 1832, Owosso was chartered as a city in 1859. The government is administered under a charter of 1895, which provides for a mayor, annually elected, and a council. The city

owns and operates the water-works. Population, in 1890, 6564; in 1900, 8696.

OX (AS. *oxa*, Goth. *aühsa*, *aühsus*, OHG. *ohso*, Ger. *Ochse*, *Ochs*, Welsh *ych*, Skt. *ukṣan*, ox, from *uks*, to sprinkle, or *ukṣ*, to be strong; in the latter case ultimately connected with Gk. *ἀέξειν*, *αὔξειν*, OHG. *wahsan*, Ger. *wachsen*, AS. *weaxan*, Eng. *wax*, to grow). The male of a bovine animal, especially one of the domestic races of cattle. The word in certain connections, as 'oxen' or 'ox tribe,' has come to stand for cattle in general. (See CATTLE.) An uncastrated male is a 'bull;' a young male a 'steer,' but the latter word, especially in the Western United States, is now used for beef-cattle in general, regardless of age or sex.

OXAL'IC ACID (from Lat. *oxalis*, from Gk. *ὀξαλίς*, sorrel, from *ὀξύς*, *oxys*, sharp, acid), $C_2H_2O_4.2H_2O$. A colorless crystalline substance with an intensely sour taste. It is soluble in nine parts of cold water, and much more freely in boiling water. When heated to 212° F., the crystals lose their two equivalents of water, and the residue, consisting of the anhydrous acid, $C_2H_2O_4$, becomes opaque. The anhydrous acid may be sublimed partly undecomposed by heating gradually and carefully. When heated rapidly it decomposes into carbonic and formic acids, the latter acid further breaking up into carbon dioxide, carbon monoxide, and water. When warmed with strong sulphuric acid, oxalic acid is decomposed into equal volumes of carbonic acid and carbonic oxide gases and water, according to the equation:

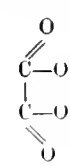
$C_2H_2O_4$	=	CO_2	+	CO	+	H_2O
Oxalic acid		Carbonic acid gas		Carbonic oxide		Water

This reaction affords one of the best means of obtaining carbonic oxide for use in the laboratory. Oxidizing agents, such as manganese dioxide, peroxide of lead, nitric acid, etc., convert oxalic into carbonic acid, and on this property is based a good method of determining the commercial value of the black oxide of manganese.

Oxalic acid is one of the most powerful of the organic acids, and expels carbonic acid and many other acids from their salts. The acid itself and its soluble salts are poisonous. This acid is very widely diffused throughout the vegetable kingdom. Sometimes it occurs in a free state (as in *Boletus sulphureus*), but much more frequently as a salt, either of potash, as in the different species of Oxalis (from which genus the acid was originally obtained and derives its name) and of Rumex; or of soda, as in various species of Salicornia and Salsola; or of lime, as in rhubarb and many lichens. In the animal kingdom it never occurs except in minute quantity and in combination with lime. Oxalate of lime is found in a crystalline shape, both in healthy and morbid urine, and is the chief constituent of the urinary calculus known from its rough exterior as the mulberry calculus.

Oxalic acid is produced by the action either of hydrate of potash or of nitric acid upon most organic compounds of natural occurrence. Its most common mode of preparation is by the oxidation of starch or sugar by nitric acid. The organic compound and the nitric acid are heated in a flask till all effervescence has ceased, after which the solution is evaporated, and the oxalic acid separates in crystals on cooling.

The molecule of oxalic acid is composed of two carboxyl groups (COOH) and is represented graphically by the following formula:



Oxalic acid

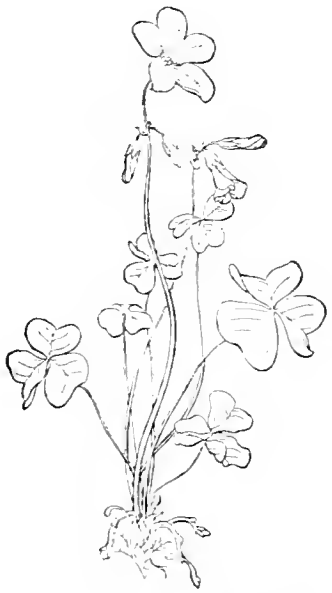
Of the numerous *oxalates* the most important are the oxalate of lime (in consequence of its physiological and pathological relations); the neutral oxalate of ammonia, which is the best test for the detection of lime in solution (in consequence of the extreme insolubility of the resulting oxalate of lime); and the acid oxalate of potash, which is employed in various manufacturing processes, as well as for removing ink and rust stains. When the neutral oxalate of potash is mixed with sulphate of iron, a double oxalate of iron and potassium is produced. This compound is a strong reducing agent, and has the power of separating metals (for instance, silver) from their salts; this property is made use of in photography.

The best test for oxalic acid is the production of a white precipitate (of oxalate of lime), on the addition of any soluble salt of calcium. The precipitate is insoluble in water, in solution of potash, and in acetic acid, but dissolves in the mineral acids. A solution of nitrate of silver also gives a white precipitate of oxalate of silver, which explodes when heated.

In consequence of its employment in printing cotton, bleaching straw, etc., oxalic acid is more accessible to the general public than many other poisons, and on this account instances of suicide from the swallowing of this acid are by no means uncommon. Cases of accidental poisoning, moreover, sometimes occur by its being sold by mistake for Epsom salts. Large doses destroy life very rapidly. The symptoms of oxalic acid poisoning are a burning acid taste, with a sense of constriction or suffocation; vomiting, great pain in the region of the stomach, convulsions, cold perspirations, and general collapse speedily follow; and respiration shortly before death becomes slow and spasmodic. With the view of converting the free acid in the stomach into an insoluble and inert salt, chalk, whiting, or lime water, with full draughts of milk, should be administered with the least possible delay. Salt of sorrel is almost as poisonous as the pure acid. See ANTIDOTE.

OXALIS (Lat., from Gk. *ὀξαλίς*, sorrel). A genus of the natural order Geraniaceæ, according to Bentham and Hooker, including herbs and shrubs with generally compound alternate digitate or ternate, rarely simple or pinnate leaves. There are upward of 200 known species, natives of warm and temperate climates, particularly abundant in North America and at the Cape of Good Hope. The genus Oxalis has a capsular fruit, and the seeds have an elastic integument, which, bursting open, projects the seed to a distance. The stems and leaves generally contain a notable quantity of binoxalate of potash, and have, therefore, a sour taste. The common wood sorrel (*Oxalis Acetosella*), very

abundant in shady woods and groves in most parts of Europe, a native also of North America, is a beautiful little plant, often covering the ground with its green leaves, amid which the white or slightly roseate flowers appear. Its leaves all grow from the rootstock, a long leaf-stalk bearing three obovate leaflets, the scape a



VIOLET WOOD SORREL (*Oxalis violacea*).

single flower. On account of their grateful acid taste, due to oxalic acid (q.v.), the leaves are used in salads and sauces. The plant is extremely abundant in Lapland, and is much used by the Laplanders. *Oxalis corniculata*, a plant of very extensive distribution, being found in Europe, North America, India, Japan, and some of the African islands, has a branched stem, with decumbent branches, leaves very similar to those of the common wood sorrel, and yellow flowers. Its properties agree with those of the common wood sorrel. Many other species resemble these in general appearance and properties. The leaves of some of the species exhibit an irritability like that of the sensitive plant, generally in a slight degree, and notably only in hot sunshine, but *Oxalis sensitiva* or *Biophytum sensitivum*, an East Indian species, with pinnate leaves, possesses this property in a high degree. Some species, as *Oxalis cernua*, a native of South Africa, are remarkable for producing large bulbels in the axils of the lower leaves. Several species have tuberous roots, and are cultivated on account of their tubers, as *Oxalis crenata* and *Oxalis tuberosa*, natives of Peru and Bolivia, where they are much esteemed, both receiving the name oca. The tubers when cooked become mealy like potatoes. They have a slightly acid taste. *Oxalis crenata* has been cultivated in gardens for many years, but continues to be almost exclusively an object of curiosity, being too tender for temperate climates and its product very inconsiderable in quantity. Its tubers are yellow, in size and shape like small potatoes. The succulent stalks of the leaves abound in a pleasant acid juice, and make excellent tarts and preserves. *Oxalis tuberosa* produces numerous small tubers. The Bolivians often expose them for a long time to the sun, by which they lose acidity, become saccharine, and acquire a taste and consistence like dried figs. *Oxalis Deppei* is a Mexican species, with a root somewhat like a small parsnip, quite free of acidity. It is much cultivated in its native country, and succeeds well in the southern parts of England. *Oxalis tetraphylla* and *Oxalis crassicaulis*, natives of Mexico, and *Oxalis enneaphylla*, a native of the Falkland Islands, also have edible roots. Many species of Oxalis are much esteemed as ornaments of gardens and greenhouses.

OXALURIA (Neo-Lat., from Eng. *oxal-ic* + Gk. *οὖρον*, *ouron*, urine), or OXALIC ACID DIATHESIS. A morbid condition of the system, in which one of the most prominent symptoms is the persistent occurrence of an excess of crystals of oxalate of lime in the urine. Oxalate of lime is normally present in the urine, held in solution by the acid sodium phosphate. The amount excreted daily varies greatly within the limits of health, being largely increased by eating tomatoes, rhubarb, cranberries, and the like. The diet, therefore, must always be taken into account in estimating the pathological importance of an excess of the oxalates. When present in excess for a considerable period of time, the condition is known as oxaluria. The accompanying train of symptoms are depression, irritability, nervous indigestion, hypochondriasis, melancholia. There may be neuralgic pains, a sense of weight across the loins, and the characteristic symptoms of neurasthenia. The causes of oxaluria are not quite clear, but the trouble is believed to be due to faulty assimilation and imperfect oxidation of certain foods. It occurs in lithæmia, and is thought to be related to gout. The persistent occurrence of large amounts of calcium oxalate in the urine is also of special interest, because the crystals may be deposited before the urine is voided, and form the so-called mulberry calculi in the bladder or the pelvis of the kidney.

The treatment of this condition should look toward building up the general health, and improving the digestion by outdoor exercise and the administration of bitter tonics and the mineral acids. Articles of diet containing oxalic acid should be avoided, as should also the starches and sugars, which consume all the available oxygen and interfere with albuminous transformation.

OX-BIRD, or OX-EYE. The dunlin (q.v.).

OX'ENBRIDGE, JOHN (1608-74). An English nonconformist divine. He was born at Daventry, Northamptonshire. He was educated at Oxford and Cambridge, taking his degree at the latter university in 1631; was tutor of Magdalen Hall, Oxford, but was deprived of the position in 1634 for persuading the students to subscribe certain religious articles prepared by himself. He was ordained a minister of the Church of England, and spent the next few years as a missionary in the Bermuda Islands. In 1641 he returned to England and preached in various places; in 1652 he was chosen fellow of Eton College, ejected in 1660, and settled at Berwick-on-Tweed, where he preached till in 1662 he was silenced for non-conformity by the Act of Uniformity. He then went as a missionary to Guiana, and in 1669 went to Boston, where he

was installed in 1670 as colleague of the Rev. James Allen over the first church of that city. His publications are: *A Double Watchword* (1661), *A Seasonable Proposition of Propagating the Gospel by Christian Colonies in the Continent of Guiana* (1670); *Election Sermon* (1672); and *A Sermon on the Seasonable Seeking of God*.

OX'ENDEN, Ashton (1808-92). Metropolitan of Canada. He was born at Broome Park, near Canterbury, and was educated at University College, London; he was rector of Pluckley with Pevington, in Kent (1849-69). In 1864 he became honorary canon of Canterbury Cathedral, and in 1869 was chosen Bishop of Montreal, and Primate and Metropolitan of Canada. He resigned his bishopric in 1878 because of age, and was vicar of Saint Stephen's, Canterbury, and also rural dean of Canterbury (1879-84). Among his publications may be mentioned: *The Cottage Library* (6 vols., 1846-51); *The Pathway of Safety* (1856); *Cottage Readings* (1859); *The Home Beyond* (1861); *The Parables of Our Lord Explained* (1864); *A Plain History of the Christian Church* (1864); *My First Year in Canada* (1871); *A Simple Exposition of the Psalms* (1872); *The Christian Life* (1877); *Counsel to the Confirmed* (1878); *Touchstones* (1884); *Short Comments on the Gospels* (1885). Consult his autobiography (London, 1891), and his posthumous *Plain Sermons* (ib., 1893), with memoir.

OX'ENFORD, John (1812-77). An English translator and dramatic writer, born at Camberwell, London, August 12, 1812. He was apprenticed for the law, but he gave it up for literature. Unaided by the schools, he mastered German, Italian, French, and Spanish. From these languages he made many translations which have been highly commended. Among them are Calderon's *Vida es sueño;* Molière's *Tartufe;* Boiardo's *Orlando innamorato* (incomplete); Goethe's *Dichtung und Wahrheit;* and Eckermann's *Gespräche mit Goethe.* In an essay entitled *Iconoclasm in Philosophy,* contributed to the *Westminster Review,* he first made Schopenhauer known to England. Oxenford's dramatic pieces probably number more than a hundred. Not only were they popular at home, but several of them were translated into French, German, and Dutch. Among them are *My Fellow Clerk, A Day Well Spent,* and *Twice Killed.* In 1850 or thereabouts, Oxenford joined the staff of the London *Times* as dramatic critic. In 1867 he visited the United States. He died at Southwark, February 21, 1877.

OXENHAM, ŏks'en-am, Henry Nutcombe (1829-88). An English theologian, eldest son of William Oxenham, an English clergyman and second master of Harrow School, born at Harrow, November 15, 1829. From Harrow he passed to Balliol College, where he graduated B.A. in 1850 and M.A. in 1854. Ordained in the English Church, he became curate of Worminghall, Buckinghamshire (1854), and at Saint Bartholomew's, Cripplegate, London (1856). From the first a high churchman, he went over to the Roman Catholic Church in 1857. He was subsequently appointed professor in Saint Edmund's College, Ware, and master of the Oratory School at Birmingham. He died at Kensington, March 23, 1888. Besides contributing to periodicals, he published extensively. Among his works are: *The Sentence of Kaires and Other Poems* (1854); *The Catholic Doctrine of Atonement* (1865); *Dr. Pusey's Eirenicon* (1866; 2d ed. 1871); *Catholic Eschatology and Universalism* (1876); *An Eirenicon of the Eighteenth Century* (1879); and *Short Studies in Ecclesiastical History and Biography* (1884-85). Oxenham studied for a time in Germany under Döllinger, several of whose works he translated into English.

OXENSTIERNA, or **OXENSTJERNA,** ŏk'sen-shär'nȧ (often called Oxenstiern by English writers), Axel, Count (1583-1654). A Swedish statesman, born at Fänö, in Upland, June 16, 1583. He studied at Rostock, Jena, and Wittenberg, his original interest being in theology, to which he devoted his attention. After leaving the university, he visited most of the German courts, but returned to Sweden in 1603, and soon afterwards entered the service of Charles IX., who, in 1606, dispatched him as Ambassador to the Court of Mecklenburg. He became a Senator in 1609. He conducted with marked discretion the settlement of certain disputes between the Livonian nobles and the town of Reval, and was appointed guardian of the royal family and head of the regency when Charles became incapacitated. On the accession of Gustavus II. Adolphus (q.v.) in 1611 Oxenstierna was made Chancellor. In 1613 he acted as plenipotentiary in the negotiations for peace between Sweden and Denmark, and he arranged the Peace of Stolbova with Russia in 1617. In 1621 he conducted the administration at home during the absence of the King, who was carrying on the war with Poland. Subsequently he was appointed Governor-General of the conquered district, and in 1629 concluded peace with the Poles on highly favorable conditions. For a while Oxenstierna strongly opposed the desire of Gustavus Adolphus to take part in the Thirty Years' War, but when he found that the King had determined on his course he set about collecting money and troops with energy and persistency. After Gustavus Adolphus had fairly entered on the sanguinary struggle, Oxenstierna joined him, and conducted most of the extensive and complicated diplomacy which the course of events entailed on Sweden. After the death of the King, at Lützen, November 16, 1632, he resolved to continue the contest with the Imperialists, in spite of the visible disaffection of many of the German Protestant princes. At the Congress of Heilbronn the States of Swabia, Franconia, and the Rhenish territories placed Oxenstierna at the head of the Evangelical League (1633). The will of the dead monarch was sent to Stockholm; according to its conditions the government—during the minority of his daughter Christina (q.v.)—was intrusted to five nobles, who empowered the Chancellor to prosecute the war. His difficulties were enormous, yet he managed partly to allay the rivalries of the Protestant leaders. After the severe defeat of the Swedes at Nördlingen in 1634 Oxenstierna transferred the leadership of the Protestant forces to Duke Bernhard of Weimar, and proceeded, in 1635, to France and Holland, to obtain aid against the Imperialists. Returning to Germany, he assisted in quelling a mutiny among the Swedish troops at Magdeburg; put Pomerania in a state of defense to resist the expected attack of the Elector of Brandenburg; renewed the treaty with Poland; and,

leaving Banér in command of the Swedes, returned to Stockholm in 1636. In 1645 he represented Sweden at the Peace of Brömsebro with Denmark. He continued to direct ably the policy of the Protestants in Germany, till the Peace of Westphalia, in 1648, put an end to the war. Oxenstierna's son was one of the Swedish envoys who signed the treaty, and it is in a letter to him that the famous sentence of the statesman occurs: *Nescis, mi fili, quantilla prudentia homines regantur* ("You do not know, my son, with how little wisdom men are governed"). Queen Christina did not show a proper respect for the advice of Oxenstierna and persisted in her resolve to abdicate in spite of all his protestations. Oxenstierna died August 28, 1654. Some treatises and historical fragments are attributed to him. Consult: Geijer, *Geschichte Schwedens* (3 vols., Hamburg, 1823-36). See references under GUSTAVUS II. ADOLPHUS.

OXENSTIERNA, JOHAN GABRIEL, Count (1750-1818). A Swedish poet and statesman. He studied under the poet and critic Olof Bergklint, served a year in the Chancellor's office, and then entered the diplomatic corps as secretary of legation in Vienna (1770). Returning to Sweden in 1774, he became King's chamberlain, enjoyed high favor at Court and held various high offices there, being Marshal of the Realm from 1792 to 1801. Oxenstierna was one of the first members of the Swedish Academy on its formation in 1786. He edited the papers of King Gustavus III. (1803-12), and translated Milton's *Paradise Lost* and a part of Tasso's *Gerusalemme liberata;* but he is better known for his own poetic works. *Skordarne* and *Dagens Stunder* are especially famed among his works for their beautiful descriptions of nature. In general his poetry is marked by a high order of imagination and a euphonious style, but it is not free from the pseudo-classicism of the period. His complete works were published at Stockholm (1805 to 1826). Selections from his diary were edited by Stiernström (Upsala, 1881). Consult Wirsén, *Minne af riksmarkalken grefve J. G. Oxenstierna* (in the *Transactions of the Swedish Academy*, Stockholm, 1885).

OX-EYE. (1) The dunlin (q.v.). (2) The semipalmated sandpiper (*Ereunetes pusillus*). (3) In Great Britain, the common larger titmouse (*Parus major*).

OXEYE. An ornamental plant. See CHRYSANTHEMUM; DAISY.

OX'FORD. The chief city and county-seat of Oxfordshire, England, and the cathedral town of the Diocese of Oxford. It is situated 52 miles (63 by rail) west-northwest of London, at the junction of the Isis (Thames) and Cherwell rivers (Map: England E 5). Its chief importance is due to its university. Oxford is a place of considerable antiquity, probably owing its origin to the shrine of Saint Frideswide, in whose honor a religious house was founded perhaps as early as the ninth century. The name is probably derived from Ousenford, or ford over the Ouse, a tributary of the Thames which comes in here, though the city arms, an ox crossing a ford, indicate a more popular etymology, Oxen-ford. Coins of King Alfred were struck here—a fact which testifies to the prominence of the place even in his day; but the first mention in written history is in the Chronicle under the year 912, when it was annexed or reannexed to the West Saxon Kingdom. It came to be a place of some importance as the key to the valley of the Upper Thames and in control of much of the trade of that region. It was a place of military significance and was possessed of fortifications, of which the great mound is still in existence. Its increasing prominence is shown in the more and more frequent mention in the Chronicles as a place of meetings and treaty-makings. At the Conquest it became part of the possessions of Robert D'Oyly, who built the castle, the keep of which still remains. It was fortified with a strong wall, and became a place of much importance, especially connected with royalty. Henry I. built a house or palace here. Queen Matilda was here besieged by Stephen; here both Richard I. and John were born, and here was held the Parliament of 1258, which enacted the Provisions of Oxford. The rise of the university attracted hither many religious Orders, and during the greater part of the period before the Reformation the chief interest of the place lies in the growth and struggles of the university (q.v.). In later times its chief historical significance lies in the part it played in the civil wars, when for a considerable time it was not merely the centre of Royalist operations, but the capital of Royalist England. It was besieged by the Parliamentarians, but fortunately not bombarded.

Despite its low-lying position amid the marshes of the many-branched Thames, surrounded by hills, Oxford is a very beautiful city, owing chiefly to the presence of the collegiate and university buildings. The centre of the city is Carfax (quatre voies), where the north and south ways (Cornmarket and Saint Aldate's) and the east and west ways (Queen Street and High Street) meet. High Street is the principal street of the place and is one of the most attractive thoroughfares in England. The chief architectural features of the place, in addition to the college and university buildings, are the very handsome new municipal buildings, begun in 1893, His Majesty's Prison, occupying the site of the old castle, and many interesting churches, including Saint Martin Carfax, the old city church, Saint Michael's, with an interesting Saxon tower, Saint Peter's in the East, with a Norman crypt, and many others. The city has much outgrown its former bounds, especially toward the north, in recent years, and is now surrounded by suburbs: North Oxford; Grandpont, on the south, reached by Folly Bridge over the Isis; Cowley, on the east, reached by Magdalen Bridge over the Cherwell; and Osney on the west. In 1901 Oxford had a population of 49,413. It is a Parliamentary and municipal borough, returning two members to the House of Commons besides the two from the university. It is governed by a mayor, ten aldermen, and thirty councilors, forming the corporation, a high steward, a sheriff, and a recorder. The jurisdiction of the civic government, however, does not extend over members of the university. It is a market town, has now some manufactures, and an increasing municipal importance. See OXFORD UNIVERSITY.

OXFORD. A city and the county-seat of Lafayette County, Miss., 73 miles southeast of Memphis, Tenn.; on the Illinois Central Railroad (Map: Mississippi, F 2). It is most important as an educational centre, having the State University (q.v.), and the Woman's College (Methodist Episcopal), opened in 1854. A Federal court's

building is located in Oxford. The leading industries are connected with cotton. Population, in 1890, 1546; in 1900, 1825.

OXFORD. A town and the county-seat of Granville County, N. C., 36 miles north of Raleigh; on the Seaboard Air Line and the Southern Railroad (Map: North Carolina, D 1). It has two private secondary schools, a Masonic orphan asylum, and an asylum for colored children. Oxford is in the fertile Piedmont section of North Carolina, the centre of extensive tobacco-growing interests. There are, besides several tobacco warehouses and stemmeries, cotton mills, a furniture factory, an iron foundry, a carriage factory, planing mill, etc. Population, in 1890, 2907; in 1900, 2059.

OXFORD. A village in Butler County, Ohio, 39 miles north by west of Cincinnati; on the Cincinnati, Hamilton and Dayton Railroad (Map: Ohio, A 7). It is a prominent educational centre, having Miami University (q.v.), and two colleges for women—Oxford College, opened in 1849, and Western College, opened in 1855. Population, in 1890, 1922; in 1900, 2009.

OXFORD, Provisions of. A set of regulations drawn up in 1258 for the government of England. In that year Henry III.'s difficulties with his barons had come to a head, and loud complaints were made when Parliament met at London on April 9th. Finally the King gave his consent to the formation of a committee of twenty-four, chosen half from the royal council and half by the barons, to propose reforms. On June 11, 1258, Parliament met at Oxford, and this Mad Parliament, as it was called, caused the adoption of a new scheme of government, now known as the Provisions of Oxford. A council of fifteen was selected in a complex manner, and this was to advise the King in all matters of government, and three times a year was to meet twelve representatives of the barons to discuss the whole state of affairs. This method of government lasted until 1263, with a short interruption in 1259. In 1263, however, war between Henry III. (q.v.) and his barons, led by Simon de Montfort (q.v.), began. Consult Stubbs, *Constitutional History of England*, vol. ii. (4th ed., Oxford, 1896).

OXFORD, Robert Harley, First Earl of. An English statesman. See Harley, Robert, Earl of Oxford.

OXFORD CLAY. An important formation of Middle Jurassic age found in England. It consists of dark-blue or blackish clay which sometimes reaches a thickness of 600 feet. The Oxford clay lies beneath the plain on which Oxford is built.

OXFORD MOVEMENT. The name commonly applied, from its place of origin, to the revival of the doctrines and practices of an earlier age which took place in the Church of England in the early years of the Victorian era. Though local in its inception, it achieved unexpected results and became world-wide in its influence. The movement proper, or the stage of it which is more strictly known as Tractarian, covered a period of twelve years. It began with Keble's famous sermon on national apostasy preached in Saint Mary's, Oxford, in July, 1833, and closed with Newman's defection in 1845. But under other leaders the work went on. Its field of operations was widened. It moved along new lines and gathered fresh strength, until it vivified and transformed the English Church.

It was distinctly a revival, but of a different type from those which had preceded it in the seventeenth and eighteenth centuries. That of the seventeenth century was anti-Calvinistic and based on the moral responsibility of man. That of the eighteenth was anti-latitudinarian and based on devotion to a personal Redeemer. The Oxford Movement was anti-individualistic and based on the incarnate life of Jesus Christ. The revival of spiritual life under the Wesleys and Whitefield was intensely subjective and therefore one-sided and imperfect. Its complement was furnished by the Oxford Movement with its deep religious fervor, but distinctly objective teaching. To attempt to gauge the movement simply by its restoration of obsolete external observances is to miss its meaning. It had a double trend, historical and doctrinal.

Historically it was part of a larger movement. The beginning of the nineteenth century marked an epoch in religious thought. The Deism of the preceding century, with its mechanical universe and absentee God, had induced an all-pervading deadness in spiritual things. Religion was little better than a cold morality. A reaction was inevitable. The search was for authority; the transcendental school found it in an 'inner light,' in reason or conscience or 'an imaginative faith;' the ecclesiastical school appealed to the authority of the Church and localized the divine in persons and places and acts. Transcendentalism saw God in man and nature, ecclesiasticism saw Him in sacraments and ordinances. In England at the beginning of the nineteenth century the Church had became so thoroughly Erastian that few looked beyond the State with its civil courts for any centre of ecclesiastical authority. The most definite form of ecclesiasticism, though one little known to the great majority of Englishmen, was the Latin communion with its persistent assertion of Papal claims; and over against this stood the Transcendental school with its equally persistent demand for the recognition of the individual reason. But with the birth of the Oxford Movement in England came the appeal to the authority of the historic Catholic Church, of which, it was contended, the national Church of the country was an integral part. According to Dean Church, it was not until Newman determined to force upon the public mind, in a way that could not be evaded, the great article of the creed, "I believe in one Catholic and Apostolic Church," that the movement really began. Underneath the restoration of certain external requirements lay this appeal to the authority of the primitive and undivided Church. The effort was to make the national Church of England more truly Catholic, not by the introduction of new features in her economy, but by the restoration of those elements of Catholicism which were already inherent, though latent, in her constitution. The movement sprang from the Catholic teaching of the Caroline divines. Its fathers were Andrewes and Laud and Cosin. It made episcopacy essential not merely to the *bene esse*, but to the *esse* of the Church. The Apostolic Succession became a prominent plank in the platform of the Catholic school.

The doctrinal teaching may be summed up in one word—the Incarnation. This, as witnessed

by Church and Scripture, was the sum and substance of the apologetic work of both the early and the later leaders of the movement. Underneath the contention as to holy orders and valid sacraments lay this basic truth of Christianity. It gave the world a living Christ, whose quickening and energizing humanity permeated the whole body of the faithful. He, it was held, inspired sermons, gave vitality to worship and efficacy to sacraments, and imparted energy both to individual lives and to corporate agencies for good. The sacraments were openly proclaimed as 'the extension of the Incarnation.'

The immediate cause of the movement was the suppression by the reform Government in 1833 of ten Irish bishoprics, coupled with the significant hint to the English prelates to 'set their house in order.' John Keble, professor of poetry at Oxford, had long chafed under the manifest Erastianism of the times; and what the poet had already sung, in the *Christian Year*, the preacher now proclaimed from the pulpit. But if Keble's sermon was the first word, the first step was taken at a meeting of a few friends at Hadleigh vicarage, in Suffolk, the home of Hugh James Rose, in July of the same eventful year. It was there decided to begin the publication of the *Tracts for the Times*, and the decision opened a new era in Christian polemics. The first three tracts appeared under date of September 9, 1833, and during that and the following year forty-six were printed and circulated among the parochial clergy. They were short but incisive statements, bearing upon the polity, doctrine, and worship of the Church. In 1834 an address signed by seven thousand clergymen of the English Church, expressing a general adherence to her apostolic doctrine and polity, was presented to Archbishop Howley, and this was followed by another of the same purport from the laity bearing the signatures of two hundred and thirty thousand heads of families. An 'association' was formed by William Palmer, and a short supplement to the Catechism was prepared and published by William Perceval. But the 'Oxford Tracts' were the motive power of the new movement and its leaders were soon known as 'Tractarians.'

Concurrent with the issue of the Tracts were Newman's four o'clock sermons at Saint Mary's. They were plain, but pointed and pungent. Men read the Tracts and listened to the sermons. An atmosphere was created and in it the urgent issues of the hour were discussed and weighed. Toward the close of 1834 Pusey joined the movement. As a professor and a canon of Christ Church, Oxford, he brought with him a name and a position. The Tracts grew into heavier and more exhaustive treatises. A translation of the early Fathers was begun. The Anglo-Catholic library was started. The movement met with unexpected success, and, under the leadership of Newman, Keble, and Pusey, gathered great strength in the effort to return, in doctrine and worship, to the Anglicanism of the seventeenth century.

But in 1839 a new school was formed within the movement which from that year until 1845 had a large, if not the chief, share in its guidance. It originated with William George Ward and other younger men who came into it, as Newman afterwards said, "at an angle and were sweeping the original party aside." It is said to have represented the ethical and philosophical side of the effort rather than the historical. The sympathies of its leading spirits were distinctly Roman. The vivid picture of Church authority and Catholic sanctity painted in Hurrell Froude's *Remains* fascinated many earnest and devout minds. The Protestant Reformation was represented as a deadly sin, and restoration to communion with Rome was the ideal. There was clearly a rift in the Tractarian forces. Ward's party were drifting toward the Roman Catholic Church. Pusey and Keble stood firm on the original foundation. Newman was unsettled. "The large and sweeping conception of a vast and ever-growing Imperial Church," we are told, "appealed strongly to his statesmanlike imagination." Flaws and imperfections were of no account in such greatness and could be overlooked. In 1839 his sympathies were strongly Roman Catholic. He had striven to present the Church of England as holding a central historic position between a bald Protestantism on the one hand and an infallible Roman Catholicism on the other. His appeal had been to the authority of the undivided Church. But his belief in the reality of the English Church was now being severely tested. While studying the Monophysite question in the summer of that year he says himself: "For the first time a doubt came across me of the tenableness of Anglicanism. I had seen the shadow of a hand on the wall. He who has seen a ghost cannot be as if he had never seen it. The heavens had opened and closed again. The thought for the moment had been, the Church of Rome will be found right after all. And then it had vanished. My old convictions remained as before."

Still the movement went on, with no outward signs of failure. But with the publication of Tract 90 there came a marked change. It was written by Newman, and interpreted the articles in what Ward called a 'non-natural' sense. It was an attempt to show, by an ingenious application of Article XXXV, on the Homilies, that the Articles were not necessarily anti-Roman. They were represented as condemning the popular exaggerations and misconceptions of Roman doctrine current at the time they were drawn up. This was enough in the temper of the times to let the storm loose. Dislike and suspicion had been seething, conspiracy and disloyalty had been darkly hinted; but with the appearance of the obnoxious Tract, the innate Protestantism of England flew to arms. The Tracts were stopped. Newman withdrew from Oxford to Littlemore. Saint Augustine's words about the Donatists, "Securus judicat orbis terrarum," kept ringing in his ears "like words out of the sky." The ghost came again, and this time it would not leave him. The attempt to establish a joint bishopric at Jerusalem, representing both the English Church and the Prussian Lutherans, pressed hard upon a sensitive and over-strained conscience. The Government and the Archbishop appeared guilty of the sacrifice of principle. Then came Pusey's suspension for his sermon on the Eucharist in 1843, followed by the condemnation of Ward's *Ideal of a Christian Church*, and the withdrawal of his degrees in the next year. By the summer of 1845 he and Faber and Oakeley had gone over to Rome, and in October the long impending blow fell. Newman transferred his allegiance from the Anglican to the Latin Obedience.

The catastrophe shattered the Tractarian

Party; it checked but did not stop the Oxford Movement. The influence of the revival had already reached far beyond the Church in England. The events connected with the Carey case in America are sufficient to show this. Arthur Carey was a graduate of the General Theological Seminary in New York, and a young man of unusual promise; but he had become imbued with the teaching of the Tractarians, and a protest was entered against his ordination on the ground that he was unsound in the faith. He was, however, after the case had caused considerable excitement, ordained when he had passed a special examination by a committee of clergymen appointed for the purpose. The movement became the subject of an able and earnest debate in the American General Convention of 1844. Resolutions were adopted to the effect that the faith was already sufficiently proclaimed in the formularies of the Church, and that the canons were amply adequate to govern any cases of supposed heterodoxy. Victory seemingly rested with the advanced or Catholic school.

Another blow fell in England when the Judicial Committee of the Privy Council gave its decision in the famous Gorham case. (See GORHAM CONTROVERSY.) The court merely decided that the language used by Mr. Gorham was not so clearly contrary to the formularies of the Church as to justify the action of the Bishop in refusing to institute him; but it was understood by many people to declare that the Church of England did not teach the doctrine of Baptismal Regeneration. It was looked upon by the High Anglicans as a further proof of the inherent and ineradicable Erastianism of the National Church. A number of clergymen sought refuge in the Roman Catholic Communion, the foremost of whom was Manning. But the movement widened and went on, its work becoming more practical and less argumentative. Signs of the revival of church life were everywhere manifest. New parishes were formed, new churches built. Interest in foreign mission was aroused. Men like Dr. Hook of Leeds, Bishop Wilberforce of Oxford, Mr. Gladstone, Judge Coleridge, and Sir Roundell Palmer (afterwards Lord Selborne) were found coöperating with the old and tried leaders. Doctrinal interest centred in the Holy Communion. The Real Presence and its corollary, the Eucharistic Sacrifice, were openly and widely taught and found expression in a revived and elaborate ritual. (See RITUALISM.) In 1856 proceedings were taken against Archdeacon Denison of Taunton, and in 1871 against Mr. Bennett of Frome, for teaching the Real Presence. But the result in both cases strengthened rather than weakened the position of the Catholic school. In the American Church Dr. De Koven fearlessly took his stand upon the English decision in support of the doctrine of the Real Presence as coming "within the limits of the truth held in the Church of England." It has since held a recognized place in Anglican theology, and the doctrine of the Sacrifice of the Eucharist was clearly defined and ably championed by the English archbishops in their reply to the Papal declaration against the validity of Anglican orders in 1897.

It is held by some that the real tendency of the Catholic movement was to Latinize the Church. The very principle of historic continuity for which the leaders fought and struggled has been designated as 'absurd and contradictory.' Its failure to 'trust the divine constitution of man' has been commented on, and we are told that it was too Augustinian in its theology. Froude maintained that the skepticism of England, in its leading principles, was introduced by Newman and that but for the Oxford Movement it would have remained 'a harmless speculation of a few philosophers.' It is also charged that the Mansell philosophy, with its unknown and unknowable God, was the culmination of its thought. It had its weak points, no doubt. But it had its strong features. It stood for great and forgotten truths. It rallied to it the learning and culture and intellect of England and other lands. It not impossibly anticipated, as some of its critics contend, the Higher Criticism and the agnosticism of the present day. It certainly begat the Neo-Oxford school whose views appeared in *Lux Mundi* in 1890, and who contend that the Church should assimilate the results of the ripest scholarship and the most searching scientific investigation.

Yet it is indisputable that the movement counts for much in the marvelous change which has taken place in religious life and work since the middle of the nineteenth century. Among its results may be placed the restoration of order and dignity to public worship; the more diligent ministration to the poor and distressed; the raising of the standard of clerical work; the foundation of religious communities for both men and women; the multiplication and maintenance of educational facilities; and the taking by the Church of England of a securer hold upon the affections of the people.

The bibliography of the Movement is very extensive, and includes some of the best biographical work in the language. Consult, especially: Church, *The Oxford Movement* (London, 1891); Oakeley, *Historical Notes on the Tractarian Movement* (ib., 1891-92); Newman, *Apologia pro Vita Sua* (ib., 1864); his *Letters and Correspondence During His Life in the English Church*, ed. by Anne Mozley (ib., 1891); Abbott, *The Anglican Career of Cardinal Newman* (ib., 1892); Liddon, *Life of Pusey* (4 vols., ib., 1893-97); Williams, *Autobiography*, ed. OX'FORDSHIRE. An inland county of England, bounded north by Warwick and Northampton, east by Buckingham, south by Berkshire, from which it is partly separated by the River Thames, and west by Gloucestershire (Map: England, E 5). Area, 750 square miles. The surface is varied, level toward the north and west; undulating and fertile along the Thames Valley and in the southeast, reaching an altitude of 820 feet in the Chiltern Hills. The principal rivers are the Thames, the Thame, the Cherwell, the Evenlode, and Windrush. The soil is fertile; agriculture is in an advanced state, a large proportion of the acreage being under crops or grass. Dairy farming is largely carried on. The manufactures are on a small scale, and include agricultural implements, Witney blankets, paper, and gloves. Capital, Oxford. Population of county, in 1891, 185,669; in 1901, 182,800.

OXFORD UNIVERSITY. One of the two principal universities of England. The legendary stories of its foundation by King Alfred may be neglected; but as early as 1117 there are notices of Continental scholars lecturing at Oxford, possibly attracted by the neighborhood of the palace of the scholar King, Henry I. The expulsion of foreigners from the University of Paris, as one of the results of the quarrel between Henry II. and Becket, seems to have caused a definite immigration to Oxford; and the account of a visit paid to it by Giraldus Cambrensis about 1185 shows that it was already a centre of learning, and possessed organized faculties with regular degrees. From this time on the university is a place of importance. In the reign of Richard I. scholars were maintained there by the royal bounty; and in 1209 the academic community suffered, as it had earlier grown, by migration. This grew out of one of the frequent conflicts between students and townspeople, and had as a result the transfer of a considerable number of students to Cambridge and the rise of the schools there to the dignity of a *Studium Generale*. In 1214 the liberties of the university were confirmed by decision of a Papal legate, which names for the first time a chancellor as a representative of the university, and requires the townsmen to surrender to him or to some other representative of the Bishop any 'clerks' whom they had seized. The distance from the see city of the diocese, Lincoln, which minimized direct episcopal control, and the prolonged struggles between town and gown, in which the university was generally successful, helped to differentiate it from the Continental universities. Yet in many ways the organization of Oxford was like that of Paris, a self-governing guild of masters, presided over by a chancellor of their election. As elsewhere, the earliest organization was for the purpose of limitation, not extension, of teaching; it was a trade guild, intended to supervise the qualifications of those who claimed admission to the teaching body. Like Paris and its imitators, Oxford had its 'nations,' though here there were but two—the North, including the Scotch, and the South, including the Welsh and Irish. From the beginning, the faculty of arts was of chief importance, those of law, medicine, and theology never rising to the dignity of separate deans. In the management of university affairs, the congregation or assembly of 'regents,' masters actually engaged in instruction, passed upon measures before they were submitted to the greater congregation or whole body of masters. It was a democratic society, and was found on the side of independence against Henry III., who threatened such radical measures as the hanging of the whole body of students. The reform movement of Wiclif, himself a fellow and perhaps a master of a college, also found here a considerable body of sympathizers. The mention of colleges brings us to an important step in the development of the university. At first, as elsewhere, the students had lived independently at their own expense in the town. By degrees voluntary associations of students sprang up, which elected their head, rented a house, obtained a license from the university, and acquired something like a corporate existence. By the middle of the thirteenth century, too, the mendicant Orders had begun to plant themselves in Oxford, as they were doing in other universities. The Dominicans came in 1221, the Franciscans in 1224, the Carmelites in 1256, and the Augustinians in 1268. They acquired property, built houses, and gained an influence among the students which soon brought them into conflict with the university authorities.

But about the same time another movement was set on foot which was destined to have more lasting consequences. This was the establishment of colleges by private benefaction for the support of students, combining the freedom of the halls with the means of support offered by the religious houses. The movement seems to have begun in Oxford and Paris almost simultaneously. In 1249 William of Durham left three hundred and ten marks for the support of ten masters in lodgings, which were purchased by the university in 1253; this endowment grew in 1280 by the granting of definite statutes unto the oldest of the colleges, University College. Sir John de Baliol, between 1261 and 1266, laid the foundation of Balliol College by a similar gift; but the real type, which was afterwards to prevail, was struck out by Walter de Merton, who founded and gave his name to the first real college in the modern sense at Oxford. It was not, like the colleges at Paris, an association of masters of arts electing their own head, but without control of the funds by which they were supported; it was governed by a warden and a number of senior fellows, who perpetuated their own body by cooptation, administered their own property, and oversaw the younger members of the college. Thus a fourth class of students came into being, besides the 'chamberdekyns,' who lived in independent lodgings in the town, those who were inmates of religious houses, and those who lived in hostels or halls. With the foundation of colleges, often by the absorption of these older halls, came a corresponding diminution in the number of the latter, and they are now almost extinct. The tendency was toward the inclusion of all students in colleges, where discipline as well as instruction would be easier.

The fourteenth century saw the foundation of a number of these. Exeter College (1314), Oriel (1324), Queen's (1340), and New College (1379), show the importance of the movement in this century. The exhaustion of England and its demoralized condition, growing out of the Hundred

Years' War and the Wars of the Roses, is revealed in the fact that only three colleges were founded in the fifteenth century—Lincoln (1427), All Souls (1437), and Magdalen (1458), in which last the system of teaching within college walls, begun by William of Wykeham at New College, was carried much further. The next century is much more prolific. Its foundations include Brasenose (1509), Corpus Christi (1516), Christ Church (planned by Wolsey as Cardinal College, but dating in its present form from Henry VIII.'s remodeling in 1546, and including the older Canterbury College), Trinity (1555), Saint John's (1555), and Jesus (1571). There are only two in the seventeenth century—Wadham (1612) and Pembroke (1624); then almost a century passes before the transformation of Gloucester Hall into Worcester College in 1714. Keble College (1870), and Hertford in its present condition (1874, though after a checkered career, lasting from 1282), date from the nineteenth. These, with the two remaining halls, Saint Mary and Saint Edmund, both doomed to extinction, like New Inn Hall, which has been absorbed into Balliol, a large body of non-collegiate students, and three small private halls, include all the resident members of the university. The foundation of the colleges had a profound influence on the history and polity of the university, and their existence here and at Cambridge marks the difference between these and other universities.

To return to the general history: The new learning of the Renaissance was at first warmly received at Oxford, and all the earliest Greek students in England were Oxford men. The more conservative members of the university, known as 'Trojans' from the opposition to the Grecians, resisted it for a time as likely to lead to heresy. The violent changes of the Reformation affected the prosperity of Oxford unfavorably. Elizabeth, however, did much to restore it, and Archbishop Laud, who was the ruling spirit there in the first half of the seventeenth century, still more. During the Civil War Oxford was more a court and a fortress than a home of study. The King resided at Christ Church, the Queen at Corpus Christi, and Parliament was held in the Divinity Schools. The university loyally contributed all its plate to the cause, and remained for long afterwards strongly reactionary in its politics. Yet the attempt of James II. to force a Roman Catholic head upon Magdalen was vigorously resisted, and was one of the causes which contributed to his overthrow. The eighteenth century was a period of stagnation; its only striking event was the rise of the Methodists from Oxford to influence the spiritual life of the nation, as the Tractarians (see OXFORD MOVEMENT) did half a century later. The history of the nineteenth century has been one of change. Two royal commissions have examined the whole subject of the university system; and legislation in 1850, 1876, and 1882 especially has resulted in freeing both university and colleges from the restrictions of the mediæval statutes, in restoring the university professoriate, in opening the fellowships to merit, and in relaxing the religious tests.

The constitution of the university may be most easily explained by drawing an analogy with that of the United States. It is strictly a federation, in which the colleges, with their own complete internal organization and laws, answer to the several States, while the university, with its separate officials and legislative bodies, represents the national Government. Its nominal head is the chancellor, who, however, 'reigns but does not govern.' He is usually some great nobleman or officer of State; thus the Marquis of Salisbury has held the office for many years. The actual administrative functions are discharged by the vice-chancellor, who is always the head of a college, elected for a period of four years in rotation. He is a dignified official, preceded in his public appearances by mace-bearers or beadles, and still invested with many far-reaching powers; in his court all cases are tried which affect members of the university. The disciplinary functions of the university are in the hands of the proctors —two masters of arts elected annually by the colleges in turn. Their powers are also extensive, a survival of mediæval days, and extend in some particulars even over those who are not members of the university, but whom they may, for cause, forbid to reside in the town. Their surveillance, while of course it is always directed to the prevention or punishment of serious breaches of morality or order, is exercised in such minor details as the infraction of the rule which forbids an undergraduate to appear in the streets after dinner without cap and gown.

Legislative proposals are first brought up in the Hebdomadal Council, a body mainly of practical educators, composed of the vice-chancellor, the retiring vice-chancellor, the proctors, and eighteen members elected by Congregation, of whom six must be heads of colleges, six professors, and six members of Convocation of five years' standing. This body, which, as its name implies, meets weekly, initiates legislation by framing statutes and presenting them to Congregation. The latter consists, besides certain ex-officio members, of all masters and doctors who reside in Oxford one hundred and forty days in each year—some four or five hundred in all. Statutes approved by Congregation are presented to Convocation, which may adopt or reject but cannot amend them. This larger body is composed of all masters and doctors who have kept their names on the books of their colleges, no matter where residing. The number amounts to some six or seven thousand; but no large proportion of these attend except on the occasion of some burning question of theological or academic import, when stirring scenes sometimes take place. Convocation, most of whose routine business is intrusted to certain committees called delegacies, also elects the two members of Parliament whom the university has returned since the reign of James I.

The examinations are conducted and the degrees granted by the university, not by the colleges. The examinations for the degree of B. A. are three in number. The first, responsions, colloquially 'smalls,' is now in practice usually taken at or before matriculation. The second, moderations ('mods'), occurs after one or two years, according to whether the candidate seeks honors in it or not; and two years later comes the final examination, or 'greats.' The degree of M. A. requires no further examination, but may be taken by any B. A. of twenty-seven terms standing (about seven years) from matriculation. In law, theology, science, music, letters, and medicine, there are various complicated requirements, including an examination or its equivalent, for

the bachelor's and doctor's degrees, except in the rare cases where they are honorary. Until recent years Oxford maintained rather strictly the traditional ideal of a classical education, contrasted with Cambridge, which has always excelled more in mathematical and scientific lines; but a strong tendency has been shown of late, and deeply deplored by the more conservative, to reduce the quantity of Latin and Greek required to a minimum. In moderations and finals, each 'school' or department is divided into a pass and an honor school, differing in the amount and quality of the work and the difficulty of the examinations. The degree attained is the same in each case; but in the honor schools lists of the men, divided into four classes (three in moderations), have been published since the establishment of this system in 1801.

The internal organization of each college consists of a head (variously called warden, provost, principal, president, or master), and of a number of fellows and tutors—the tutorial office being sometimes combined with a fellowship and sometimes separate from it. The officer charged with the internal discipline is known as the dean, except at Christ Church, where the dean is head both of the college and of the cathedral of the diocese of Oxford, which is combined with it. All these are known collectively and colloquially as 'the Dons.' To each undergraduate on his matriculation is assigned a particular tutor, who is supposed to take a close personal interest in him, in fact to stand *in loco parentis* during his residence; a man's own tutor, however, need not have anything directly to do with his studies, unless he happens to take up the branch in which the tutor gives instruction. Formal teaching is chiefly by means of lectures, which are supplied usually by the college or by combinations of colleges. The exception is the lectures of the professors, who are university functionaries and whose lectures are public. At these lectures, of which two, three, or four may be attended in a morning, the undergraduate is supposed to take full notes to which he may refer afterwards. Except an occasional request to construe a passage of a Latin or Greek author in a man's first year, there is scarcely any approach to what are known in America as recitations. The instruction given in the lectures is supplemented by individual instruction given by the tutors of the college, especially by means of essays, which the student writes on his subject and the tutor corrects. Beyond this, a man is supposed to 'read' for some hours each day, at his own discretion. This freedom is a characteristic feature of the Oxford and Cambridge system. It is tempered by a college examination known as 'collections' at the end of each term; this has no effect on the obtaining of a degree, but is intended simply to give the college authorities an idea of how a man's work is progressing.

The afternoon is devoted by most undergraduates to athletic exercise of one sort or another, interest in which forms a normal part of the life. Distinctions won in this way—the right to wear the 'blue,' the university color which denotes that the wearer has represented the university in cricket, football, rowing, etc.—are as eagerly coveted as a 'double first' in the schools. In the evening the whole college assembles in the hall for dinner, the dons sitting at the 'high table' on a sort of dais. Breakfast and lunch are taken in a man's own sitting-room. The evening is spent as he pleases, except that if he is residing in college he is absolutely required to be within the college gates before midnight. If he does not intend to 'read,' he will pass the evening in visiting or entertaining his friends, or in attending the meetings of the innumerable societies which exist, devoted to every conceivable interest, literary, scientific, musical, or purely social. Of these the most famous is the Union Society, which combines all the conveniences of a London club with the holding of regular debates in which many of the most famous public orators of England, from Mr. Gladstone and Lord Salisbury down, have received their first training. In fact, it may be considered one of the essential characteristics of English university life that there is no strict line of demarcation drawn between it and the after career of the student. The elasticity of the system adapts it to the requirements of very varied types of men; and the undergraduate who expects to enter political life or to become a mere country gentleman may profit by the discipline of life and the atmosphere of general culture, while a man who seeks for the attainment of advanced scholarship can easily get all the help he needs. The existence side by side of the pass and honor schools constitutes a distinct disavowal of the system of Procrustes.

The prevalent religious tone of the university is still one of attachment to the Church of England, in spite of the relaxation of the strict requirements of past days. The services in the college chapels are those of the Prayer-Book; attendance on them a certain number of times in each week is still usually compulsory, though in some colleges a roll-call at an early hour in the morning is allowed to take the place of the prayers. Since the throwing open of the university, Mansfield College for Congregationalists and Manchester College for Independents have been founded, as well as more recently a hall for Roman Catholic students. None of these, however, have any corporate connection with the university. Other institutions which have an influence upon the spiritual life of undergraduates are the Pusey House (see PUSEY) and Saint Stephen's House, the latter intended primarily as a training school for Church of England missionaries. Outside of the colleges proper there is also a considerable body of unattached students, who are members of the university without belonging to any college or hall. They are under the general supervision of an official known as the censor of unattached students. This class was admitted first in 1858. The total number of undergraduates is generally over three thousand. Since 1884 women have been allowed to share the instruction, though not to matriculate or take degrees. Two houses, Somerville and Lady Margaret Halls, have been founded for them.

BIBLIOGRAPHY. For detailed official information, consult the annual *University Calendar;* also the *Student's Handbook to the University of Oxford.* For historical and descriptive treatment, Brodrick, *History of Oxford University* (London, 1886); Wells, *Oxford and Its Colleges* (ib., 1899); Clark, *The Colleges of Oxford* (ib., 1891); Andrew Lang, *Oxford* (ib., 1879); Goldwin Smith, *Oxford and Her Colleges* (ib., 1895); Rashdall, *History of Universities in the Middle Ages* (Oxford, 1895). For fictitious description,

while Hughes's *Tom Brown at Oxford* (Cambridge, 1861) gives a pretty accurate picture of those days, the best modern presentation of the life and spirit of the place has been given by an American, L. P. Smith, in *The Youth of Parnassus* (London, 1895). See also OXFORD, and the articles on the separate colleges.

OX-GALL. The bile of the ox, greenish-yellow in color. It has several uses in the arts and manufactures. It is an excellent cleansing agent on account of the abundance of soda in its composition, which gives it a soapy quality, and is used for scouring wool and other purposes. It is reduced to the form of an extract for preservation, and is dissolved in alkaline water for use. Its chief employment is in mixing colors, especially in water-color painting, the effect being to give them tenacity and fluidity. It is also an ingredient in varnish and is a substitute for India ink, and is used in painting on ivory.

OX'IA'NA, LAKE OF. The ancient name of a lake in Asia. See ARAL.

OX'IDASE (from Gk. ὀξύς, *oxys*, sharp, quick, acid). The name of a group of inadequately known enzymes (q.v.), producing direct oxidation of various substances, particularly coloring matters and sugars. Oxidases appear to be widely distributed among plants, having been found in many fungi, in the latex (milky or colored sap) of certain plants, and in many kinds of leaves and fruits. Probably they will be found to play an important rôle both as agents in normal functions and as the cause of disease. The destruction of chlorophyll in certain areas of leaves, as, for example, in tobacco ('mosaic' disease), has been ascribed to the action of oxidizing enzymes upon the green pigment.

OXIDES (from Gk. ὀξύς, *oxys*, sharp, quick, acid). A term applied to a variety of compounds of oxygen, but more especially to those in which oxygen is combined only with a metal or a metalloid. The principal classes of oxides are the basic or metallic oxides, and the acid oxides or acid anhydrides. Lime, the oxide of calcium, is an example of oxides of the first class. Sulphur trioxide, or sulphuric anhydride (SO_3), is an example of oxides of the second class. An oxide of one class as a rule combines readily with an oxide of the second class to form a salt. Thus lime combines with sulphur trioxide to form calcium sulphate. Oxides are frequently prepared by the direct union of oxygen with other elements. Thus the oxides of all the elements, except bromine, chlorine, fluorine, iodine, gold, and platinum (not to mention the inert elements argon, helium, etc.), may be prepared. Many of the metallic oxides are formed by the action of heat on carbonates, nitrates, and other salts of volatilizable acids. Thus chalk (calcium carbonate) is transformed by heat into lime. The metallic oxides occurring in nature are among the most abundant and valuable ores. Thus hematite (sesquioxide of iron), pyrolusite (manganese dioxide), and cassiterite (tin dioxide) are important ores, respectively, of iron, manganese, and tin.

OX'LEY, JAMES MACDONALD (1855—). A Canadian author, born at Halifax, Nova Scotia, October 22, 1855. He graduated B.A. from Dalhousie University in 1874, and subsequently studied at Harvard. Called to the bar in 1878, he practiced in his native city for five years and then became legal adviser to the Department of Marine and Fisheries at Ottawa. During this period he edited *Nova Scotia Decisions* (1880-83) and Young's *Admiralty Decisions* (1882). He resigned his position in 1891, and in 1892 he became manager of the Sun Life Assurance Company at Montreal. Before leaving Ottawa, Oxley had begun his long series of books for boys, among which are *Bert Lloyd's Boyhood* (1887); *Up Among the Ice Floes* (1890); *The Chore Boy of Camp Kippewa* (1891); *Donald Grant's Development* (1892); *Diamond Rock* (1893); *Archie McKenzie, the Young Nor'wester* (1894); *In the Wilds of the West Coast* (1894); *On the World's Roof* (1896); *In the Swing of the Sea* (1897); *Fife and Drum at Louisbourg* (1899); and *Lhasa at Last*, a journey to the Forbidden City of Tibet (1900).

OXLEYA (Neo-Lat., named in honor of John *Oxley*, an Australian explorer in the nineteenth century), or FLINDERSIA. A genus of trees of the natural order Cedrelaceæ, of which one species, *Flindersia Oxleyana*, the yellow wood of Eastern Australia, often attains a height of 100 feet. Its timber is valued for boat-building, for cabinet-work, and for other purposes where an ornamental wood is desired. It is quite resistant to attacks of ants, an important consideration in tropical countries. A yellow dye is obtained from the tree. See FLINDERSIA.

OXLIP. An ornamental plant. See PRIMULA.

OXPECKER, or BUFFALO-BIRD. Any of several starlings, or starling-like birds, which gather about cattle and pick the parasites from their hides, or feed upon the insects which they disturb in the grass. The name more especially belongs to a South African species (*Buphaga Africana*), which seeks the company of the wild buffalo, and nowadays of tame cattle, and picks the ticks from their hides. Another species (*Buphaga erythrorhyncha*), distinguished by its red bill, performs the same service for the rhinoceros, and is commonly called 'rhinoceros-bird.' Similar birds with similar habits are known in the Orient as 'buffalo-birds,' and belong to the large genus Sturnopastor. Similar habits belong to the American cowbirds (q.v.). Compare BUFFALO-BIRD; and see Plate of LARKS AND STARLINGS.

OX'US. The ancient name of the Amu (q.v.).

OX-WARBLE. See BOT; WARBLE-FLY.

OXY-ACIDS. Those acids which contain oxygen, as distinguished from the acids which do not contain oxygen and were formerly designated as *hydracids*. The term oxy-acids is now seldom used in this sense. On the other hand, the term oxy-acids, or preferably *hydroxy-acids*, is applied by organic chemists to carbon compounds that are at once acids and alcohols, i.e. acids whose molecules contain one or more hydroxyl groups (OH) attached to a hydrocarbon radicle. (See ALCOHOLS.) Thus oxy-acetic acid, or hydroxy-acetic acid, known as 'glycollic acid,' has the constitutional formula $CH_2(OH).COOH$.

OX'YÆ'NA (Neo-Lat., from Gk. ὀξύς, *oxys*, sharp, quick, acid). A fossil creodont mammal

from the Wasatch Lower Eocene beds of the Western United States. See PATRIOFELIS.

OXYGEN (from Gk. ὀξύς, *oxys*, sharp, quick, acid + *-γενής*, *-genēs*, producing, from *γίγνεσθαι*, *gignesthai*, to become). A gaseous element isolated by Priestley in 1774. Priestley's classical researches in pneumatic chemistry led him to the discovery that when red mercuric oxide is heated by the sun's rays it decomposes into a colorless gas, which he called 'dephlogisticated air,' and metallic mercury. A year later Scheele, in Sweden, independently discovered oxygen, giving it the name of 'empyreal air.' Shortly afterwards Condorcet suggested the name of 'vital air.' Lavoisier, however, was the first definitely to establish the true character of oxygen, and it was he who first gave it its present name. See CHEMISTRY.

Oxygen exists uncombined in the atmosphere, to the extent of 21 per cent. by volume and more than 23 per cent. by weight. In combination, too, it is very abundant in nature, forming eight-ninths by weight of all water and a considerable percentage by weight of silica, alumina, and chalk, which are the three most abundant and widely distributed constituents of the earth's crust. It is further a normal component of nearly every rock and mineral, and of all animal and vegetable tissues and fluids. It is absorbed in large quantities from the atmosphere by animals and vegetables in the process of respiration, but plants also evolve it under the influence of sunlight. Oxygen may be readily prepared by heating red mercuric oxide, by heating manganese dioxide to a red heat, or by heating potassium chlorate to 370° C. Commercially it was long made by heating manganese dioxide, either alone or together with potassium chlorate. The alternate formation and decomposition of alkaline manganates was originally proposed in 1866 by Tessie du Motay, as a process of manufacturing oxygen for illuminating purposes. The process has been successfully employed in Europe and the United States. But more recently the alternate formation and decomposition of barium peroxide has been taken advantage of for the commercial production of oxygen. This method, which was chiefly developed by the brothers Brin, consists in heating barium oxide to a dull red heat in a current of air, whereby it is converted into barium peroxide, which at a still greater heat is decomposed again into barium oxide and free oxygen. This economic process is being worked on a large scale in various places. Pictet, in 1901, announced the invention of an economical method for obtaining oxygen from the air.

Oxygen (symbol, O; atomic weight, 16; see ATOMIC WEIGHTS) is a colorless, odorless, and tasteless gas which has been condensed to a pale steel-blue, transparent liquid, boiling at —181.4° C. and freezing to a white solid at —235° C. Compared with air as unity, oxygen has a specific gravity of 1.1504, and it is the least refractive of all gases. Oxygen is slightly magnetic, which property is diminished or temporarily suspended by elevation of temperature. When examined through thick layers, oxygen has a bluish tinge of color. It combines directly with most of the elements. (See OXIDES.) It is sparingly soluble in water, and nearly all natural waters contain oxygen in solution which can be completely removed by boiling in vacuo. This dissolved oxygen is the source from which fish obtain the oxygen necessary to sustain life. In the pure state it may be inhaled, for a time, with impunity, and it even acts as a tonic or exhilarant. Its long-continued respiration, however, is harmful. In pure oxygen bodies burn with much greater brilliancy than in common air. See COMBUSTION.

Oxygen has been used successfully to maintain air in a respirable condition, as in diving bells, submarine vessels, etc., and its use has been suggested for the revivifying of the atmosphere in public halls. It finds extensive application, in connection with hydrogen or illuminating gas, to produce the oxyhydrogen flame. (See OXYHYDROGEN BLOWPIPE and DRUMMOND LIGHT.) It is also used in the bleaching of paper pulp, in the oxidation and thickening of oils which are used in the manufacture of varnish and oilcloths, for the purpose of hastening the maturing of spirits, or liquors, and in the manufacture of vinegar. See also OZONE.

OXYGEN, IN MEDICINE. Oxygen is widely used, both in medical and surgical practice, in three ways: By the inhalation of the gas itself, by drinking oxygenated water, and by means of peroxide of hydrogen.

When employed as a gas, oxygen is liberated slowly from a cylinder containing it under strong pressure, and inhaled. In this form it is given in all conditions where there is interference with respiration. In the later stages of pneumonia, when there is danger to life from deficient aeration of the blood; in the chronic bronchitis of old people; and for the resuscitation of victims of coal-gas asphyxiation, oxygen gas is of very great value. It will allay the oppression and dyspnœa in phthisis and other wasting diseases. It acts as a direct stimulant to the respiratory mucous membrane, and has a beneficial effect on the heart and respiration. When prolonged anæsthesia is necessary, oxygen is often given in conjunction with the general anæsthetics, to relieve cyanosis, and as a safeguard against cardiac or respiratory failure. The use of oxygen in medicine is due to the valuable opinions and demonstrations of Dr. A. H. Smith, of New York.

OXYGENATED WATER is a solution of the gas in distilled water, made under pressure, and drawn off by means of a tap such as is used in siphons. It is taken internally, a glassful at a dose, and has a distinct value in chronic dyspepsia, persistent vomiting, constipation, and in headaches, whether neuralgic or digestive.

PEROXIDE OF HYDROGEN is a powerful local antiseptic, possessing the property of effervescing in the presence of pus, which it is useful in detecting in doubtful cases. It is widely used in diphtheria to loosen and destroy the false membrane. Application is made by means of a swab or spray. It is much used to cleanse ulcers and wash out abscess cavities. See HYDROGEN DIOXIDE.

OXYHYDROGEN BLOWPIPE, or COMPOUND BLOWPIPE. An apparatus by means of which hydrogen is burned in pure oxygen, the flame having an exceedingly high temperature. This apparatus, invented by Dr. Robert Hare, of Philadelphia, in 1801, and originally called a 'hydrostatic blowpipe,' may be used for fusing highly refractory substances. According to Bunsen, a temperature of 2844° C. (5151° F.) is obtained when a jet of oxygen gas is brought within the flame of hydrogen gas. A watch spring held

in such a flame, which is almost colorless, burns with brilliant scintillations, and platinum can be fused by means of the flame. The principal use of the oxyhydrogen flame has been for fusing metals, although recently similar results have been obtained by the electric furnace. See DRUMMOND LIGHT.

OX'YTO'CICS (from Gk. *ὀξυτόκιον*, *oxytokion*, medicine to facilitate quick delivery, from *ὀξύς*, *oxys*, sharp, quick, acid + *τόκος*, *tokos*, birth). Remedies which increase uterine contractions. The chief drugs of this class are ergot (q.v.) and quinine (q.v.). Ergot is the most widely known and used oxytocic, and was formerly employed to hasten labor, but it is now known that this practice is extremely dangerous, as it causes a tetanic instead of an intermittent contraction of the wall of the uterus and may lead to its rupture, an accident often fatal. It should never be given until the uterus has been emptied. In this way it is frequently given after labor, to cause contraction of the uterus and so prevent hemorrhage.

OX'YURIS (Neo-Lat., from Gk. *ὀξύς*, *oxys*, sharp, quick, acid + *ὀυρά*, *oura*, tail). A nematode worm belonging to the Ascaridæ, characterized by a fusiform shape and a rounded oval aperture. The variety *vermicularis* is the thread-worm or maw-worm found in the sigmoid flexure and in the rectum of human beings. In horses this worm is called the bot. The male is ¼ inch, the female nearly ½ inch in length. See ANTHELMINTIC.

OYER, ō'yėr (A.F., to hear). A term employed in common-law pleading to signify a demand by one party to an action, to hear read, or to have produced for inspection, a document to which the other party refers in his pleadings. Originally where a party based his claim or defense upon a deed, letters testamentary, or letters of administration, he was obliged to 'make profert' of the instrument, that is, allege that he produced it in court, whereupon the other party might 'crave oyer,' that is, demand to hear it read, in order that he might avail himself of its contents in his pleadings if he deemed it advisable. At a later date, instead of having it actually read in open court and spreading it upon the records, the party making profert was required to give the opposite party a true copy of the instrument.

In England and most of the United States the practice of requiring a pleader to make profert has been abolished, and with it the practice of demanding oyer, and instead a party referring to an instrument in a pleading is required to annex a true copy thereto. If it becomes necessary for a party to inspect a document in the hands of the other, he obtains an order to that effect from the court. See EVIDENCE.

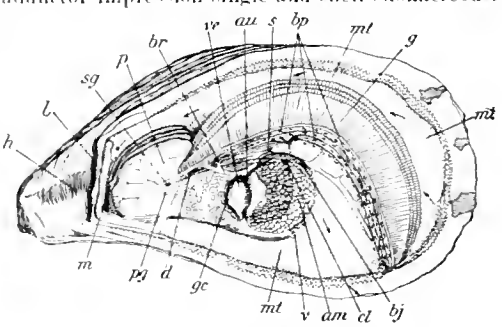
OYER AND TER'MINER (AF., to hear and to determine). In English law, a commission under the King's great seal appointing certain judges to hear and determine criminal causes in and for designated circuits. This commission was very ancient in its origin, it having first been employed some time after the reign of Edward III., the exact date not being certain. Before the Judicature Act (q.v.), the commissioners, as the judges so appointed were called, constituted the Court of Oyer and Terminer. The above act vested in the High Court of Justice all the powers formerly exercised by the Court of Oyer and Terminer, but its jurisdiction of criminal offenses is still dependent upon such a commission. A special commission is sometimes issued, authorizing the judges to try certain designated criminal cases out of the regular term.

The highest court of criminal jurisdiction in the State of New York was formerly known as the Court of Oyer and Terminer, but it derived its jurisdiction from the statutes creating it and not from a commission as was the case in England. It has been merged in the Supreme Court by the Constitution.

OYEZ, ō'yez (AF., OF., hear ye). An introductory word sometimes employed by court officers or criers in announcing the opening of court. It was introduced into England by the Normans, together with their other legal expressions and forms. The English translation 'hear ye' is still employed by most court criers in the United States.

OYO, ō'yō. The capital of the African State of Yoruba, now included in British Nigeria, situated about 90 miles northeast of Abeokuta (Map: Africa, E 4). It has an estimated population of 60,000, and its inhabitants are said to be intelligent and skillful in the crafts.

OYSTER (OF. *oistre*, *ouistre*, *huistre*, Fr. *huître*, from Lat. *ostrea*, *ostreum*, from Gk. *ὄστρεον*, oyster; connected with *ὀστέον*, *osteon*, Lat. *os*, bone). A sessile bivalve mollusk of the family Ostreidæ, especially any of the numerous species, extinct and extant, of the genus Ostrea. The shells are irregular and unequal; the fixed left valve generally spacious, strongly convex without and excavated within; right valve generally plane or concave externally, always less convex than its fellow; both shells beaked; ligamental area elongate or triangular; hinge toothless; adductor impression single and shell submacreous.



ANATOMY OF OSTREA VIRGINICA.

h, Hinge; *l*, ligament; *d*, *pg*, and *sq*, connective, and two ganglia of the nervous system; *p*, palps; *br*, blood-vessel from gills to auricle of heart; *au*, auricle; *ve*, ventricle; *s*, external opening of sexual and renal organs of right side; *bp*, pores from which the water issues into the branchial canals after passing through the gills; *mt*, mantle (the arrows showing the direction of currents produced by cilia); *g*, gills; *gc*, cavity between the two mantle folds; *cl*, cloaca; *am*, adductor muscle (cut across); *bj*, outline of organ of Bojanus, the so-called 'kidney.'

The oyster of the eastern coast of the United States is *Ostrea Virginica*, a valuable species of protean characters, formerly much subdivided by systematists and almost impossible to diagnose. The shells are lateral and hinged anteriorly, an elastic pad (ligament) causing them normally to gape. Closely applied to their inner faces and extensible beyond their margins are two thin folds (mantle) of the body-wall, which secrete the

shell in successive layers within and on the margins. The mantle encloses a chamber (mantle cavity) open ventrally and posteriorly, into which project on each side a pair of gills, commonly called the 'beard,' and in front of these a pair of smaller fleshy lobes (palps). Above the gills and palps lies the body, containing the digestive, reproductive, circulatory, excretory, and nervous systems, and the adductor muscle which closes the shells. The adductor (popularly, the 'eye' or 'heart') lies somewhat behind the middle of the body, the dark scars on the inside of empty shells marking its attachments. The funnel-shaped mouth lies between the two pairs of palps. A short gullet leads into a spacious stomach, and this into the tubular intestine which opens by an anus above the adductor. Surrounding the stomach is the liver, a large dark green digestive gland opening into the stomach by numerous ducts. In front of the adductor lies the pericardium, containing the two-chambered heart and in proximity to the excretory organ. The simple degenerate nervous system consists of two pairs of ganglia, one above the gullet and the other beneath the adductor, connected by a pair of nerve cords.

The sexes are separate, but without external distinction. The sexual glands when ripe are creamy white organs surrounding the digestive system and opening on each side beneath the adductor. In Long Island Sound spawning occurs from May to August, in Chesapeake Bay from April to October, in South Carolina as early as March, and in Florida as early as February. In oysters transplanted during the spawning season reproduction is often interfered with or arrested. An average oyster will produce 16,000,000 eggs and a very large one 60,000,000. When ripe the sexual products ooze from the genital openings and fertilization results from their accidental meeting in the water. Segmentation results in five or six hours in the production of a ciliated gastrula, a cup-shaped, free-swimming organism, often carried by the currents to found new and remote beds. An embryonic shell soon appears, and the little oyster sinks to the bottom, where, if favorably situated, it becomes attached by its left valve and gradually assumes the adult form. The recently attached spat is 1-80 to 1-90 of an inch in diameter, and its subsequent growth varies with its environment. Single oysters on firm bottom become round and deep, but those in clusters or on soft bottom grow irregular and elongate. On undisturbed natural beds they grow in clusters, and the beds repose, as a rule, on a muddy substratum upon which they have been built up from a comparatively small nucleus by the fixation, year after year, of the young upon the shells of their predecessors.

Oysters live from above low-water mark to a depth of 15 fathoms, where the density is between 1.002 and 1.025, the optimum being from 1.011 to 1.022, and in a range of temperature which in Chesapeake Bay extends from 32° F. to 90° F. The embryos and fry require more equable and stable conditions, the temperature required being between 68° F. and 80° F. The best and most productive beds are commonly in strong tidal currents, which disseminate the fry and food and keep the old shells clean enough to catch the spat. Diatoms constitute about 90 per cent. of the oyster's food, the rest consisting of other small plants and animals, and in the breeding season of its own eggs and fry. The latter are eaten by other mollusca also, and from its attachment until it reaches a large size the oyster is preyed upon by starfish, drills (Urosalpinx), drumfish, rays, and other aggressive enemies, while it wages a passive fight against starvation and suffocation with mussels, barnacles, sponges, worms, aquatic vegetation, and other prolific or luxuriant organisms growing on the beds.

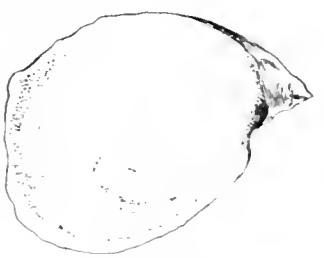
Ostrea Virginica occurs from the Gulf of Saint Lawrence to the tropics, but between Cape Breton and Cape Cod the Sheepscot River, Maine, is its only locality. It has also been introduced in San Francisco Bay, where it breeds to a limited extent. The yield of Eastern oysters at the beginning of the present century was as follows:

	Bushels	Value*
Gulf States	1,087,226	$687,539
South Atlantic States	1,612,181	884,934
Middle Atlantic States	19,749,077	10,286,556
New England States	2,649,072	1,910,684
Pacific States	360,000	792,000
Canada (estimated)	95,000	150,000
Totals	26,453,146	$14,211,713

* Value to oystermen and growers.

The greatest production is in Chesapeake Bay, where the principal yield is from the natural beds. Most of the oysters from New England and from New York and the outer coast of New Jersey are produced by planted beds; the entire yield of the Pacific Coast is similarly derived, and there has been recently a considerable increase in oyster culture in New Jersey, Virginia, and other States. The number of persons engaged in the industry is estimated at upward of 60,000, but as many of them are employed part of the year in other fisheries, farming, etc., definite statistics are not available. Baltimore is the most extensive market and New York has a considerable export trade with Europe.

The native oyster of the Pacific Coast is *Ostrea lurida*, a small thin-shelled species. It is hermaphroditic, and, like the European oyster, retains its young for a time in the mantle cavity. In 1901 159,340 bushels, valued at $251,192, were marketed, principally on the Pacific Coast.



PACIFIC COAST OYSTER

The European oyster (*Ostrea edulis*) is found from Italy to Norway. It is a round thin-shelled species, more shapely than the American species, and hermaphroditic, first female and afterwards male. It is less prolific than its American relative and the young undergo considerable development in the mantle chamber of the mother. It thrives in water of full, or almost full, organic density. The Portuguese oyster (*Ostrea angulata*) sexually and in its habits more closely resembles *Ostrea Virginica*.

The oysters of Japan are *Ostrea cucullata*, which occurs in shallow and moderately brackish or moderately salt water throughout the whole archipelago; and *Ostrea gigas*, a very large salt water species found in deep water. Many other species of Ostrea are found in temperate and tropical seas throughout the world.

Fossil Oysters. The oyster family appears to have had its origin in some imperfectly known forms, such as *Ostrea nobilissima* of the Carboniferous. The family is found also in the Permian. In the Triassic it is represented by a strongly plicated form, Aleetryonia, which form becomes more prominent in the Jurassic and Cretaceous. There are also the common arcuate shells of Gryphæa and Exogyra in the Jurassic and Cretaceous. Ostrea itself is known in the Mesozoic, but it attained its maximum of size and abundance in the Tertiary. The sandy marls of this period in the Southeastern United States often contain great numbers of very large specimens of oysters, especially of two species, *Ostrea Georgiana* and *Ostrea sellæformis*. Consult White, C. A., "A Review of the Fossil Ostreidæ of North America and a Comparison of the Fossil with the Living Forms," *Annual Report of the United States Geological Survey*, vol. iv. (Washington, 1883).

Oyster Culture. Owing to the exhaustion of the natural beds and their inability to supply the demand for oysters, it has been found necessary to resort to artificial methods of production, effecting (1) an increase in the number of eggs fertilized; (2) an increase in the surfaces available for fixation, and also of the number of spat attaching; (3) the saving of spat and young oysters which would naturally fall victims to enemies and adverse physical conditions; and (4) the utilization of barren bottoms and naturally unavailable food supplies. But a small part of the area under water suitable for oysters has been utilized by nature, mainly for lack of suitable bodies for the attachment of the young. In the United States such barren bottom is utilized by clearing it of all rubbish and either planting 'cultch' to collect the spat, or else young oysters (seed), that they may improve in size, shape, and quality under conditions safer and more favorable than in their original environment. In certain places either method may succeed, but commonly a locality is better adapted to one than the other.

The most suitable bottom for oyster culture consists of firm mud or of a firm substratum with a thin surface of soft mud, but stable sandy bottom is often used with success. Rocky bottom is usually deficient in food, loose sand drifts and covers the oysters, and very soft mud ingulfs and stifles them or produces inferior elongate stock. Mud naturally too soft may be utilized by distributing over it shells, sand, or other material, which, resting on or near the surface, furnishes a firm foundation upon which the growing oyster may repose in security. For spat-collecting it is frequently advantageous to use hard mud, gravel, or rocky bottom in shoal water, ill adapted to adult oysters from deficiency of food. The bottom being properly prepared and its boundaries marked with stakes or buoys, either system may be adopted to accord with circumstances. Generally seed-planting is more certain in its results and yields quicker returns to the grower. Seed-oysters vary from 'blisters' ½ inch in diameter to individuals almost ready for market, but ordinarily they are between 1 and 3 inches long. They are obtained from planters making a specialty of seed production or from natural beds, their cost varying from 10 cents to $1 per bushel, the larger culled stock, separate, well shaped, and free from rubbish, bringing higher prices and giving the best results. From 300 to 600 bushels of culled seed per acre are used, a larger quantity of 'rough' material being required, as much of it consists of old shells and débris. It is usually sowed broadcast with shovels from boats. Further attention, other than that required to keep the beds clean and free from enemies, is generally unnecessary, especially if culled seed has been used.

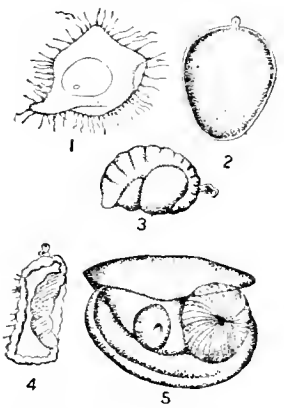
The system of spat-collecting is often extremely productive, though sometimes, for reasons not well understood, it results in complete failure. Spat will attach to almost any clean solid body, but certain materials, from their shape, structure, or cheapness, possess advantages which commend them. The most widely used and one of the best forms of cultch consists of the clean shells of the oyster itself. They are cheap, readily obtainable in all oyster regions, and, owing to their size and shape, can be used with success on bottom too soft for most other materials. The principal objection to them is that so many spat sometimes attach to a shell that they have no room for growth, and scallop (Pecten), jingle (Anomia), and other small fragile shells are sometimes preferable, as they catch the spat in smaller clusters and tend to break up as the oysters grow, but, owing to their lightness, they cannot be used in strong currents. The cost of oyster shells is from 2 to 5 cents per bushel, and sometimes they may be had for the hauling. Coarse gravel, pebbles, and crushed stone are used to a considerable extent in Long Island Sound and vicinity, but require a harder bottom than shells. The particles average about the size of a walnut or smaller, and as but few spat attach to each, the oysters are well shaped, less laborious to cull, and a larger proportion survive. This material costs from 5 to 8 cents per bushel and the cost of planting is about the same as of shells, ½ to 5 cents per bushel, according to local conditions.

Shells, stones, and gravel are distributed, like seed, from boats or scows. From 250 to 600 bushels per acre are used, soft bottom requiring more than hard. If there are extensive beds of adult oysters in the vicinity, and especially if the currents set from them to the spat-beds, they can be depended upon to supply the fry, but if not, adult oysters should be used in the proportion of 30 to 60 bushels per acre. The brood oysters should be planted several months before the spawning season, but the cultch should not be put down until spawning is about to begin, that it may be free from slime and sediment when the fry is ready to fix, even a thin coating of sediment being sufficient to suffocate the young oyster at that period.

Some planters allow the beds to remain unworked until the crop is ready to market, but to produce oysters of superior shape and quality, the clusters should be taken up and separated as soon as they can be culled without injury. It frequently happens that good localities for obtaining a set are not favorable to the production of marketable oysters, and in this case the culled young

may be transplanted with advantage and profit to beds possessed of an environment more favorable for the adults. Whether cultch or seed be planted, the beds should be closely watched to protect them from enemies which sometimes work havoc unsuspected until the time comes to market the crop.

The United States Fish Commission is experimenting with a system of fattening oysters artificially, by using fertilizers to stimulate the production of oyster food in ponds. Good results have been attained, but the commercial feasibility of the method has not yet been demonstrated. The alleged method of fattening oysters by feeding with corn meal is worthless. 'Plumping' them by placing in fresh or nearly fresh water is a bloating and not a fattening treatment, and is less resorted to than formerly. Oysters should not be planted or bedded in the vicinity of sewage contamination, as they may thereby become sources of disease infection, but there is no danger to be anticipated from the consumption of oysters from beds remote from sources of contamination. Green oysters are sometimes placed on the market. There are three types of greenness, two of which are perfectly harmless. The third type is evidently a pathogenic condition, correlated with the presence of copper; but, while the affected oysters are poor in quality, it is not demonstrated that they are dangerous.



OYSTER DEVELOPMENT.

1, Unfertilized egg shortly after mixture of spawn and milt; spermatozoa are adhering to the surface. 2, Same egg a few minutes after fertilization; polar body at broad end. 3, Optical section of egg 27 hours after impregnation, showing two large cells, covered by a layer of small ectodermal cells. 4, Optical section of an older egg, now become flattened from above downward. 5, An embryo with well-developed larval shells.

In England oyster culture is practically along the same lines as in the United States. Shells are used to collect the spat, and seed-oysters are planted in favorable places, notably on the bottoms controlled by the Whitstable Company, a coöperative corporation. On the Continent the methods are more elaborate, the low price of labor and the high price of oysters, as well as the restriction of the area upon which they can be grown, tending to encourage an intensive system of culture. Tiles and fascines are generally used as spat-collectors, and especially in Holland and France a system of ponds or 'claires' is used for growing and fattening. Japanese methods somewhat resemble those of France and Holland in the recognition of a distinction between the bottoms used for spat-collection and for growing, although ponds are not used. Bamboo branches in regular arrangement are used for spat-collectors and the oysters are usually twice transplanted, first to a place favorable for rapid growth, and finally to beds especially rich in food, where they fatten.

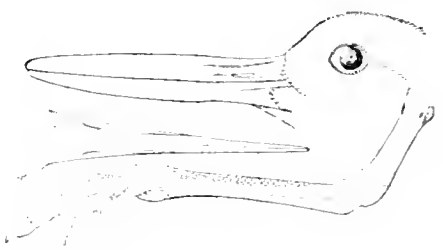
BIBLIOGRAPHY. OYSTER BAY. A town, popular both as a residence place and as a summer resort, in Nassau County, N. Y., 30 miles northeast of New York City, situated on the northern coast of Long Island, on a deep sheltered bay, opening into Long Island Sound (Map: New York, G 5). A line of steamboats and a branch of the Long Island Railroad connect Oyster Bay with New York. The town offers attractions of fine scenery, and facilities for boating, bathing, and fishing. It has many handsome residences and a public library. The principal industry is oyster cultivation. The government is administered by town meetings, held every two years. Population, in 1890, 13,870; in 1900, 16,334. Within the limits of Oyster Bay is the village of Sea Cliff. Population, in 1900, 1558. Oyster Bay is the home of President Roosevelt.

OYSTER-CATCHER, or MUSSEL-PICKER. A long-legged shore-bird of the stilt family, having a long, hard, wedge-pointed bill. One species inhabits the northern part of the Old World, and another North America, but the term is occasionally extended to other related forms. The common one in the United States (*Hæmatopus palliatus*) is from 18 to 20 inches long, smoky brown above, with head and neck black, and white beneath. It is found on both coasts of both American continents, but rarely occurs



BEAK AND FOOT OF THE AMERICAN OYSTER-CATCHER.

north of New Jersey. It feeds on oysters, clams, and other mollusks, and breeds freely on the coast of Virginia. On the Pacific coast occurs an oyster-catcher (*Hæmatopus Bachmani*) which has no white in its plumage. Both of these feed largely on worms, crustaceans, and the like, as well as on mollusks. The European species (*Hæmatopus ostralegus*) is similar in all respects, and is known in Great Britain (where

it breeds numerously on all sandy coasts) as 'sea-pie' on account of its handsomely variegated black and white plumage, resembling that of the magpie. Consult Newton, *Dictionary of Birds* (London and New York, 1893-96).

OYSTER-CRAB. A small brachyuran crab of the genus Pinnotheres, the females of various species of which are about the size and shape of a pea, and hence are called 'pea crabs' in Great Britain. These females live as commensals (see COMMENSALISM), within the shells and mantle-lobes of various bivalved mollusks. A familiar American species is *Pinnotheres ostreum*, found in oysters, and bright reddish-yellow when cooked. It is esteemed a great dainty, and large numbers are used for food in the Eastern United States. Another species is very common in the wing-shells (Pinna) of the Mediterranean, and was imagined by the ancients to render important services to its host in return for its lodging, keeping a lookout for approaching dangers, against which the 'blind pinna' itself could not guard.

OYSTER-FISH. See TAUTOG.

OYSTER PLANT. See SALSIFY.

OYSTERS, LAW AS TO. Oysters are classed with animals *feræ naturæ* (of a wild nature), and, therefore, in their wild state may be gathered by any one when they are located on land under navigable waters. In England the cultivation of oysters has been protected and encouraged by statutes since the reign of Richard II. Most of the oyster beds in the waters about the British Isles are now enjoyed by virtue of special grants from the Crown or by lease from royal commissioners, or by prescription, that is, long continued possession and user under the laws of England. No one can appropriate to his exclusive use land under public waters for the purpose of establishing an oyster bed, but, after gaining the right by grant or lease, a person has an absolute ownership in the oysters he plants or deposits in the space allotted to him, and appropriation of them by another in such a case is punishable as a misdemeanor.

In the United States generally, after wild oysters are gathered and 'planted,' that is, placed in another location for the purpose of propagation, they remain the property of the person who has thus reclaimed them, even though he plants them on ground under public waters. This rule prevails in most States, even in the absence of statutes, but there are generally statutory provisions regulating the industry, especially in regard to giving notice to the public where a person appropriates land under public waters for an oyster bed, and also establishing 'close' seasons. Therefore, in most States any one has a right to prœmpt an unoccupied area under public waters and establish thereon an oyster bed. When a bed is once established, as long as it is maintained, the law protects the owner, as the person planting the bed is called, in his property right in the oysters, and in his possession of the area which his bed covers. The owner of an oyster bed is not only entitled to the oysters which he plants, in order to allow them to mature, but also to all off-spring from those oysters, within the limits of his bed. The statutes usually require one who claims an oyster bed to stake it off by means of long poles embedded in the mud at the bottom and extending above the surface of the water. This is for the purpose of giving notice to the general public and avoiding an innocent invasion of the owner's rights. A person cannot acquire property right to a bed of oysters by planting young oysters in a natural bed already containing oysters in sufficient quantities to make it profitable for the public to gather them. If a person thus mingles his oysters with others which the public may gather he loses all separate property right in them, and can only gather them as a citizen of the State. Natural oyster beds are defined to be those that are not planted by man, but where oysters are to be found growing in sufficient quantities to be valuable to the public.

Where no definite period for the enjoyment of the privileges of oyster beds is fixed by statute, the right to use the public land under water for such purpose is construed to be a conditional or qualified license, which is personal in its nature and not inheritable or transferable, and the State in which the beds are situated may at any time revoke the license and demand back the possession of the submerged land, giving the owner of the oysters a reasonable time in which to remove them. This right of the State will not ordinarily be exercised, and as the owner of the oysters may dispose of them in any way he sees fit, and as they will go to his representatives at his death, it is often popularly supposed that the possession of the submerged land itself is a property right in the person who is said to 'own' the bed. The occupation of an oyster bed by an individual does not interfere with the rights of the public to fish in the waters above the bed. Statutes of a State prohibiting citizens of other States from taking oysters or locating beds on lands under its navigable waters have been held to be constitutional. A person taking oysters from a private oyster bed, without permission, is guilty of larceny. See FISHING LAWS; FERÆ NATURÆ. Consult the local laws and decisions for specific information of local rights.

OYSTER-SHELL BARK-LOUSE. A popular name for the most abundant and widespread of scale-insects (*Mytilaspis pomorum*), which occurs most abundantly upon the apple, but is found also in various parts of the world upon pear, quince, hawthorn, willow, maple, elm, and many other trees. It was introduced into the United States from Europe at the close of the eighteenth century, and spread gradually throughout the country until it is now present practically wherever the apple is cultivated. The insect hibernates in the egg state under the old female scales. The young hatch in spring, wander out upon the twigs, and settle at once both upon the young twigs and the fruit. It occurs very rarely upon the leaves and is not common upon fruit, but frequently clusters upon twigs and limbs so as completely to cover the bark. In the Southern United States there are two generations each year, but in the North only one. After settling, the female molts twice and begins the formation of the scale. The male is much smaller than the female, and is distinguished by the fact that it has but one cast skin at its anterior end, whereas the female has two. The scale of the adult is of almost the same shape as an oyster shell, whence the popular name. The insect is readily destroyed in the

spring, after the young have hatched, by the application of a dilute kerosene emulsion in the form of a spray. Consult Howard, *Year Book of the United States Department of Agriculture* (Washington, 1894). See SCALE INSECT.

OZANAM, ō'zä'nän', ANTOINE FRÉDÉRIC (1813-53). A French Roman Catholic writer. He was born at Milan, and began to study law at sixteen, besides picking up several languages and contributing to the periodical press. In 1832 he went to Paris to pursue his studies, and took his doctor's degree in law after four years; in literature, six years later. He soon came into close relations with Chateaubriand, Lacordaire, and Montalembert, and threw himself ardently into the cause of the Church. With seven other students he founded the Saint Vincent de Paul Society. (See SAINT VINCENT DE PAUL, SOCIETY OF.) In 1839-40 he was professor of commercial law at Lyons, and in 1844 became professor of foreign literature at the Sorbonne. His special study was the history of mediæval civilization, particularly with the view of showing the beneficent influence of the Church and her doctrines. His health proved unequal to his diligence as a teacher, and after a year's sojourn in the Pyrenees he died at Marseilles, September 8, 1853. His collected works appeared in eleven volumes (Paris, 1862-65). Important among them are: *Dante et la philosophie catholique au treizième siècle* (1836); *Etudes germaniques pour servir à l'histoire des Francs* (1847-49); *Documents inédits pour servir à l'histoire littéraire de l'Italie* (1850). In English translations have appeared: *History of Civilization in the Fifth Century* (London, 1868); *Protestantism and Liberty* (ib., 1874); and his letters, with sketch of his life (ib., 1886). There are biographies by O'Meara (Edinburgh, 1876); Legeay (Paris, 1854); and de Montrond (Lille, 1869).

OZANAM, JACQUES (1640-1717). A French mathematician, born at Bouligneux, of Jewish descent. He was trained for the Catholic priesthood, but after his father's death devoted himself to mathematics, and taught at Lyons and then in Paris, where, in 1701, he was admitted to the French Academy of Sciences. His works include: *Tables des sinus, tangentes et sécantes* (1670; 3d ed. 1710); *Dictionnaire mathématique* (1690); *Récréations mathématiques et physiques* (1694), which was frequently republished (in English by Hutton, 1803); and *La perspective théorique et pratique* (1711; 2d ed. 1720).

OZARK' MOUNTAINS. A low, dome-like plateau or uplift in the Mississippi Valley between the Missouri and the Arkansas rivers (Map: Missouri, C 5). It covers the greater parts of southern Missouri and northern Arkansas, and extends some distance into Kansas and Indian Territory. It consists of Paleozoic rocks, and in many respects resembles the Alleghany plateau, but is much less dissected. It rises gradually from the north, but is somewhat escarped and rugged in its southern portion in Arkansas, where it is also heavily timbered, this part of the country being in marked contrast with the surrounding plains. The plateau nowhere rises much above 2000 feet. The Ouachita Mountains, south of the Arkansas River, are an outlying portion of the main plateau.

OZE'NA (Lat. *ozæna*, from Gk. ὀζαινα, *ozaina,* fœtid polypus in the nose, from ὄζειν, *ozein*, to smell; connected with Lat. *odor, olor,* odor). A term applied generally to diseased conditions of the nose characterized by great fetor of the breath. It may be due to syphilitic necrosis of the intra-nasal structures, or to tubercular or malignant ulceration. When due to these causes there is an accompanying purulent discharge from the nostrils. The morbid secretions accumulate in the nasal passages and form dry crusts over the mucous membrane. These decompose and give rise to the peculiarly offensive odor from which the disease derives its name.

The disease is chronic and difficult of management. Much benefit, however, is secured from the removal of the fetid crusts and secretions by the frequent use of alkaline and antiseptic douches, followed by the application of stimulating substances to the affected mucous membrane. The general treatment in the specific form of the disease consists in toning up the general health. A change of climate is often beneficial. When the fetor is due to syphilitic or other trouble, the treatment must be directed to the disease which causes it.

OZEROFF, ō'zye-rôf, VLADISLAV ALEXANDROVITCH (1770-1816). A Russian 'pseudoclassical' dramatic writer. He graduated from the Cadet Corps, was adjutant to its director, served in the army and the Department of Forestry, and in 1808 retired, with the rank of major-general, to devote himself to literature. An admirer of the French 'Classicists,' he closely imitated Ducis's *Œdipe à Colonne* in his first success, *Œdipus at Athens* (1804). His fame grew with *Fingal* (1805), which was based on Ossian, and reached its zenith in *Dmitriy Donskoy* (1807). *Polyxena* (1809), though unsuccessful with the public, was his favorite tragedy. The fifth edition of his works appeared at Saint Petersburg in 1856.

OZOCERITE, OZOKERITE (from Gk. ὄζειν, *ozein*, to smell + κηρός, *kēros*, wax), or NATIVE PARAFFIN. A yellow, brown, and sometimes green, wax-like substance, originally found in Moldavia and Austrian Galicia, and more recently in Emery and Uinta counties, Utah, where it occurs in the form of small veins in Tertiary rocks. It consists chiefly of a mixture of hydrocarbons, is greasy to the touch, and melts between 56° and 63° C. (133° and 114° F.). It finds some use in the manufacture of candles, as an adulterant or substitute for beeswax, and in the manufacture of ointments and pomades. A residual product obtained in purifying ozocerite, having a hard waxy nature, is combined with india-rubber and used as an insulating material ('okonite') for electric cables.

OZONE (from Gk. ὄζειν, *ozein*, to smell), or ACTIVE OXYGEN, O_3. A colorless gaseous allotropic modification of oxygen. (See ALLOTROPY.) In 1785 Van Marum observed that oxygen gas through which an electric current had been passed, as well as the air or oxygen in the vicinity of an electric machine, possessed a peculiar odor somewhat resembling chlorine. He referred to it as the 'smell of electricity.' In 1801 Cruikshank observed a similar odor when water was decomposed by electrolysis. Schönbein, in 1840, investigated the matter and established the fact that the odor was due to the formation of new gas, which he named ozone. He showed that ozone was generated by the action of phospho-

rus on moist air, and that it was capable of liberating iodine from potassium iodide. Its constitution was a matter of doubt until Soret determined the fact that it was an allotropic form of oxygen produced by the condensation of three volumes of oxygen into two of ozone. It is found in minute quantities in the atmosphere, of which it is regarded as a normal constituent, and its presence is believed to be due to the electric discharges during thunder storms, silent discharges from thunder clouds, vibrations of water, especially of saline waters, as in sea foam, and the action of some vegetable products on the air. Ozone is also said to be formed by the action of sunlight on clouds and the blueness of the sky has been attributed to its presence. Ozone is formed when a series of electric sparks is passed through oxygen or air, and it is evolved at the positive pole in the electrolysis of acidulated water. The slow oxidation of phosphorus in air yields ozone, and it may also be obtained by the action of strong sulphuric acid on barium peroxide. Certain organic substances, such as turpentine, various essential oils, etc., generate ozone when exposed to the air.

Ozone is a gas with a strong penetrating odor resembling that of diluted chlorine. When condensed under a pressure of 125 atmospheres at —103° C., it forms a deep blue liquid. It is more strongly magnetic than common oxygen. It decomposes slowly even at ordinary temperatures. It is a very strong oxidizing agent, converting copper, mercury, silver, and iron into their oxides. It oxidizes most organic compounds, destroying rubber and vulcanite with great rapidity; also it bleaches many colored vegetable and animal products, such as indigo, litmus, blood, etc. Its powerful oxidizing properties are taken advantage of for commercial purposes and its artificial production for the purpose of purifying the air of sick-rooms has been recommended. It finds some application for bleaching, as in the case of discolored engravings, where the printed portion is rolled up and inserted in a glass vessel, on the bottom of which some water and pieces of phosphorus have been placed. It has also been used to oxidize alcohol to aldehyde and to vinegar, and for the rapid aging of liquors. Slightly ozonized air and oxygen are used medicinally, especially in pulmonary complaints, although if too strong it is said to produce harmful effects, causing headache and irritating the mucous membranes of the respiratory organs.

P

P The sixteenth letter in the English alphabet. It can be traced through the Latin and Greek alphabet to the Semitic *pē*, 'mouth,' probably so called from the originally elliptical shape of the letter. The form of the letter is now esentially Roman, which differed from the Greek in that the second stroke was bent round to meet the first.

Phœnician	Early Greek	Later Greek	Early Latin	Later Latin

PHONETIC CHARACTER. As a phonetic character, *p* is the breathed or surd labial stop consonant corresponding to the voiced *b*. In forming the sound the lips are closed for an instant, and the breath then escapes explosively. From the manner of its sound-formation it is termed an occlusive explosive. The sound *p* is often voiced to *b*, which may then become the closely related *f* or *v*, as Latin *episcopus*, 'bishop,' Spanish *obispo*, French *évêque*, English *bishop;* Avesta *xšapan*, 'night,' Persian *šab*, North Baluchi *šaf*, Kurdish *šav*. *P* in Sanskrit, Greek, and Latin becomes Germanic *f* by Grimm's law (q.v.), as Sanskrit *pād*, 'foot,' Greek *πόδ-αύ*, Latin *ped-em*, English *foot;* Sanskrit *napāt*, 'grandson,' Latin *nepos*, Anglo-Saxon *nefa*, English *nephew*. In English, *p* represents an original Indo-Germanic *b*, which was, however, of rare occurrence. No example of initial *p* from this original *b* exists in English. As examples of medial *p* from Indo-Germanic *b* may be cited Sanskrit *sabdr*, 'nectar,' English *sap;* Latin *lubricus*, slippery, English *slippery*. The digraph *ph* is pronounced *f*, as in *pharmacy, phonetic*, and is written *f* in Spanish and Italian, as *farmacia, fonético*. In English words beginning with *pn, ps*, and *pt*, as *pneumatic, pseudonym, pteropod, p* is silent. Such words are of Greek origin, as in pure Latin *p* combines initially only with the consonants *l* and *r*. A *p* in Latin is often euphonically inserted between *m* and *s*, and *m* and *t*. This *p* is retained in English derivatives of such words, as for example, *redemption, sumptuous*.

AS A SYMBOL. In Hebrew and Greek ⊃ and Π stood for 80; in mediæval numbers, P for 400, and P̄ for 400,000. In chemistry, P is the symbol for phosphorus. In music *p* is the abbreviation of piano (softly), and *pp* of pianissimo (very softly).

P is the abbreviation of Latin *post* in P.M. (*post meridiem*) and in P.S., postscript.

PAARL. The capital of a district of Cape Colony, South Africa, on the southern slope of the Drakenstein range, 36 miles by rail northeast of Cape Town (Map: Cape Colony, E 9). It is the centre of a fruit-growing region, which is the wine-producing district of the colony. It dates from an ancient Dutch settlement, and derives its name, signifying 'pearl,' from a neighboring granite rock of pearl-like appearance. Population of the town, in 1891, 7668; of the district, 21,363, of whom 13,137 were native blacks.

PAASCHE, pä'she, HERMANN (1851—). A German economist and authority on the sugar industry. He was born at Burg, near Magdeburg; studied at Halle; became professor at Rostock (1879), at Marburg (1884), and in the Berlin Polytechnic Institute (1897), and was elected to the Reichstag as a member of the National Liberal Party in 1881. Since 1893 he has also been a member of the Prussian Lower House. Paasche wrote: *Studien über die Natur der Geldentwertung und ihre praktische Bedeutung in den letzten Jahrzehnten* (1878); *Wandlungen in der modernen Volkswirtschaft* (1890); *Zuckerindustrie und Zuckerhandel der Welt* (1894), his most important work; and *Kultur- und Reiseskizzen aus Nord- und Mittelamerika* (1894).

PABIANICE, pä'bya-nyē'tse. A manufacturing town in the Government of Piotrkow, Russian Poland, situated about 10 miles southwest of Lodz (Map: Russia, A 4). It has textile mills, and manufactures paper and agricultural machines. Population, in 1897, 26,892.

PA'CA (Neo-Lat., from *pak, paq*, the native name in Brazil), or SPOTTED CAVY. One of the largest of the agoutis (*Cœlogenys paca*), found from Paraguay to Venezuela east of the Andes. It is about two feet long and dark brown in color, with four rows of white spots along the sides, and the throat and belly black. The form and gait are clumsy, yet the paca is quick and agile. It lives in moist ground, makes burrows, and feeds on plants, often damaging sugar plantations. The skull of this animal is remarkable for the great development in the breadth of the jugal arch, inclosing a large cheek cavity, which gives an extraordinary breadth and swollen appearance to the face. One or more other species (or varieties) inhabit the high Andes of Ecuador, and are much sought after as food by the aid of trained dogs. Consult Beddard, *Mammalia* (London, 1902).

PACA, WILLIAM (1740-99). An American political leader and jurist, one of the signers of the Declaration of Independence, born at Wye Hall, his father's estate on the eastern shore of Maryland. He studied at Philadelphia College, then went to England, where he was entered at the Middle Temple, London, and in 1764 was admitted to the bar. He began the practice of law at Annapolis, and in 1761 was elected to the Legislature. He served again from 1771 until 1774, when he was chosen a delegate to the Continental Congress, of which body he continued to be a member until 1779. Personally a strong advocate of the independence of the colonies, his hands were tied by the instructions of the State convention, which as late as the middle of May, 1776, declared against a policy of separation. Paca and his supporters labored to secure a reversal of these instructions, and on June 28th the convention gave its delegates power to vote on the question according to their own judgment. Paca was a member of the State Senate in 1777-79, and from 1778 to 1780 was Chief Justice of Maryland. He was then Chief Justice of the Court of Appeals in 1780-82, and was Governor of Maryland from 1782 to 1785. He was a delegate to the State convention which ratified the Federal Constitution in 1788, and in 1789 was appointed United States judge for the District of Maryland, an office which he held until his death.

PACAY, pä-kā′ (Quichua name). *Prosopis dulcis*, or *juliflora* according to some authorities. A tree of the natural order Leguminosæ, suborder Mimoseæ; a native of Peru, of rather large size, with a broad head; producing pods from 20 inches to 2 feet long, which contain black seeds imbedded in a white sweet flaky substance, used as an article of food. The ground pods are fed to stock.

PACCA, päk′kä, BARTOLOMMEO (1756-1844). An Italian diplomat and cardinal. He was born at Benevento, studied at Naples and Rome, and in 1785 became Chamberlain to Pius VI., who advanced him rapidly, made him Nuncio to Cologne in 1786, and sent him as special envoy to Louis XVI. in 1791. From 1795 to 1800 Pacca was Nuncio to Lisbon. One of the most prominent of the anti-French party, he was captured with the Pope in 1809 and imprisoned for two years. He urged Pius to break the agreement of Fontainebleau, and in consequence was banished by Napoleon (1814), but was rewarded after the fall of the Empire and received in 1830 the See of Ostia and Velletri. He remained a strong opponent of reform. Pacca wrote *Memorie istoriche* (1830), *Notizie sul Portogallo* (1835), and *Relazione del viaggio di papa Pio VII.* (1833).

PACCHIONIAN (päk′ki-ō′nī-an) **BODY**, or GLANDULA PACCHIONI. One of numerous small, whitish granular-looking bodies, collected together in clusters of varying size, found upon the human meninges, or cerebral membranes, principally in the following localities: Upon the *outer* surface of the dura mater, in the superior longitudinal sinus, being received into little depressions, called Pacchionian depressions, on the inner surface of the skull; upon the *inner* surface of the dura mater; in the superior longitudinal sinus (a large venous canal, or vein, attached to the inner surface of the skull, running from before backward); upon the pia mater, near the margin of the hemispheres. They are named after Antonio Pacchioni, an Italian anatomist (1665-1726). The Pacchionian bodies are not glandular in structure. They are produced by an increased growth of the villi of the arachnoid. They not infrequently contain small, hard, calcareous concretions called 'brain sand.' Their growth and consequent pressure produces absorption of the dura mater, through which they pass to the inner surface of the skull as well as into the superior longitudinal sinus. These bodies do not occur in infancy, and very seldom before the third year; usually after the seventh, increasing after this as age advances. Sometimes they are wanting. Their function is supposed to be that of lymph channels, for the outflow of lymph from the subdural and subarachnoid spaces into the sinuses of the dura mater. Consult Landois and Stirling, *Physiology* (Philadelphia, 1903).

PACCIOLI, pä-chō′lē, **PACIOLI**, or **PACIUOLO**, pä′chē-o͞o′lō, LUCA, or LUCAS, DE BORGO (c.1440-c.1515). An Italian mathematician, born at Borgo San Sepolcro, in Tuscany. He was a Franciscan monk, and in his younger days, had traveled extensively in the East. He taught mathematics at Florence, Rome, and Venice, and then took orders under the name Fra Luca Sancti Sepulchri. He afterwards taught in various Italian universities. His chief work was the *Summa de Aritmetica, Geometria, Proportioni et Proportionalita* (1494; 2d ed. 1523), a work which contained all that was then known of mathematics. This was the first important printed treatise on mathematics. Paccioli was a judicious compiler, and he exerted a powerful influence on the teaching of the sixteenth century.

PACE. See WEIGHTS AND MEASURES.

PACER (from *pace*, from OF., Fr. *pas*, step, from Lat. *passus*, step, pace, from *pandere*, to stretch; connected with *patere*, to lie open, Gk. πετανύναι, *petannynai*, to spread out). The ambling gait of the pacer, smooth, frictionless, and lateral, as distinguished from the diagonal gait of the trotter, has been appreciated from the earliest antiquity. In America the pacer long received slight encouragement in competition; yet against all odds, and mechanical contrivances to force the pacer to trot, his progeny continue to inherit his characteristics; and as it transpired that eventually pacers had greater speed than the trotter, he was first tolerated and then sought after. The time for a paced mile was gradually reduced from 2:28, until in 1897 "Star Pointer" made it in 1:59¼. The gaits of trotting and pacing are practically interchangeable, though it is still true that a fast trotter becomes a faster pacer. The *Narragansett pacer* is supposed to have been a descendant of the Spanish horse. Governor Robinson is said to have brought some Spanish horses from Andalusia to New England, and the breed was kept up to supply the demand for them in the Cuban trade, but with the falling off of the trade the industry was allowed to lapse, and the breed became extinct.

PACHACAMAC, pä′chä-kä′mäk, RUINS OF. The remains of a vast city of the Yuncas, the ancient coast Indians of Peru, situated about 20 miles southeast of Lima. It was their sacred city before the conquest of the Incas, and held the shrine of Pachacamac, the Creator or Maker of all things. The Incas, after they had subjugated

the Yuncas, erected here a great temple of the sun and a house of the Virgins of the Sun. The ruins cover four large hills which furnished abundant building material used in combination with bricks or adobes of sun-dried earth. The site is at present a waste of drifting sand, sometimes obscuring the buildings which in the rainless and frostless region are in a fair state of preservation. The city was well laid out, having broad streets and a surrounding wall with large gates for entering. The houses were great communal structures built in terraces like the New Mexican pueblos. There were capacious reservoirs and irrigation works; the hills were terraced and upon the level areas thus secured were located the temple and other buildings. The principal Yunca structure, the temple of Pachacamac, is located on a headland about 500 feet above the sea, which breaks at its feet.

The hill has been surrounded by four terraces, forming a semi-lunar pyramid, the summit several acres in area. The entrance is from the east and the ascent is by a series of ramps. The walls were at one time painted red and adorned with frescoes. The temple covers an area of 600×450 feet, and is an aggregation of rectangular buildings and sunken courts on the various terraces. The shrine is on the summit at the southern corner behind two projecting rocks. The Inca convent stands on low ground near a small lake. It is also built of adobe bricks and covers an area 350×200 feet. It consists of a square, terraced area covered with buildings, and from this extends a long wall having 18 cells on the inner face. At a right angle another wall extends to a square terrace backed also with a niched wall, in which a fine example of the round arch has been found.

Around the temple of Pachacamac is a vast cemetery in which the flexed bodies of the dead, wrapped in cloth and secured with a network of cord, were placed in vaults lined with adobe bricks and roofed with canes and rushes. Some of the tombs have three or more chambers. The objects buried with the dead consist of pottery, bronze, gold, or copper objects, textiles, weaving apparatus, pigments, food, and the like.

Pachacamac being a central shrine, first of the Yuncas and later of the Incas, was exceedingly rich; it is said that Pizarro secured here 1700 pounds of gold and 1600 pounds of silver at the sack of the temples. Consult: Squier, *Peru* (New York, 1853); Wiener, *Pérou et Bolivie* (Paris, 1880).

PACHECO, pä-chā'kō, Donna Maria. The wife of the Spanish patriot Juan de Padilla (q.v.).

PACHECO, Francisco (c.1571-1654). A Spanish painter and writer on art. He was born at Seville, and was a pupil of Luis Fernandez, an imitator of Raphael. Of small importance as a painter, he is remembered chiefly as the master and father-in-law of Velazquez, and deserves most lasting credit for his *Arte de la pintura* (Seville, 1639). The precepts of this work were for a long period considered of standard authority by Spanish artists, and it also contains many valuable historical notices.

PACHELBEL, Johann (1653-1706). An eminent German organist and composer, born at Nuremberg. First instructed there by Heinrich Schwemmer (1621-96), he next studied at Altdorf and Regensburg, and in 1674 went to Vienna, where he became assistant organist at Saint Stephen's. Called to Eisenach in 1678, he was successively organist there, at Erfurt (1678-90), Stuttgart, Gotha, and finally (from 1695) at Saint Sebaldus in Nuremberg. With Buxtehude, one of the immediate forerunners of Bach, he contributed much to the improvement of Church music, and was the first to introduce in Germany the overture form on the pianoforte. The few of his compositions that appeared in print include: *Musikalische Sterbens Gedanken* (1683); *Musikalische Ergetzung* (1691); *Acht Choräle zum Praeambuliren* (1693); *Hexachordum Apollinis* (1699). The manuscript of his important *Tabulaturbuch geistlicher Gesänge Markus Lutheri*, etc. (1704), is in the grand-ducal library at Weimar.

PACHMANN, päk'män, Vladimir de (1848—). A Russian pianist, born in Odessa. He first studied music under his father, a professor in the University of Odessa, an amateur violinist, and the friend of Beethoven, Weber, and other musicians. Subsequently he was sent to the Conservatory of Vienna, and, returning to Russia in 1869, made his first appearance as a pianist, and played also in Germany and France. In 1882 he went to London, and in 1890 traveled in the United States, making subsequent extended tours in 1892, 1899, and 1900. He became very popular in America and enjoyed a high reputation both there and in Europe, especially as a sympathetic exponent of the music of Chopin.

PACHO'MIUS, Saint. An Egyptian monk who is held to have been the first to substitute for the free asceticism of the solitary recluse a regular cenobitic system. He was born about the year 292, of heathen parents, served as a soldier, and was converted to Christianity by the kindness of certain Christians whom he encountered at Thebes. About 325 at Tabennæ, an island in the Nile, he founded the first monastic institution. The members agreed to follow certain rules of life and conduct drawn up by Pachomius, and to subject themselves to his control and visitation. His sister is said also to have embraced the cenobitic life, and to have established the first convent for nuns. The pair labored with so much diligence and zeal that, at their death, according to Palladius, not fewer than 7000 monks and nuns were under their inspection. Consult: Grützmacher, *Pachomius und das älteste Klosterleben* (Freiburg, 1896); Amélineau, *Etude historique sur Saint Pakhôme et le cénobitisme primitif dans la Haute Egypte* (Paris, 1887). See Monasticism.

PACHUCA, pä-chōō'kä, or Hidalgo. The capital of the State of Hidalgo, Mexico, situated 55 miles northeast of Mexico City (Map: Mexico, K 7). It is built in a mountain pass more than 8000 feet above sea-level, and its principal industries are derived from the rich silver mines of the district. These are among the most important in the country; they are said to have been worked before the Conquest, but still yield an annual output of 90,000 tons of rich argentiferous ore. It was here that in 1557 Bartolomé de Medina discovered the *patio* process of amalgamation, which is still considered the most economical process for reducing the peculiar ores of Mexico. Population, in 1895, 40,487.

PACHYDERMATA, pāk'i-dĕr'mā-tā (Neo-Lat. neut. pl., from Gk. παχύς, *pachys*, thick + δέρμα, *derma*, skin). The 'pachyderms,' an order of mammals in the system of Cuvier, including the rhinoceros, elephant, hippopotamus, tapir, hog, and other ungulate mammals regarded as 'thick-skinned.' The group was a thoroughly unnatural one and the name is no longer in scientific use, although it has been adopted into literary service as a synonym for insensitiveness. Several of these animals are illustrated on the Colored Plate of PACHYDERMS.

PACHYMERES, pāk'i-mē'rēz, GEORGIUS (1242-c.1310). A Byzantine historian. He was born in Nicæa, was educated there, and in 1261 went to Constantinople, his father's native city, where he entered the priesthood and held high office in both Church and State. He wrote a *Historia Byzantina*, covering the period 1255-1308, a valuable source for the reigns of Michael Palæologus and Andronicus II., which was edited by Bekker (Bonn, 1835).

PACIFIC OCEAN (from Lat. *pacificus*, peace-making, peaceful, from *pax*, peace + *facere*, to make). The portion of the water envelope of the earth which lies between America and Asia-Australia. The name Pacific was given to it by Magellan. On the north it connects with the Arctic by the Bering Strait, and southward it merges into the Southern Ocean, the parallel of latitude 40° S. being usually taken as the limit in this direction. Its waters communicate with the Indian Ocean on the west by numerous passages in the island chain extending from Southeastern Asia to Australia. The Pacific is the largest and deepest of the oceans. With the bordering seas—the Bering, Okhotsk, Japan, Yellow, Eastern, China, Celebes, Java, Molucca, Banda, and Arafura seas—which are regarded as its dependencies, it has an area of about 55,000,000 square miles, equal to the entire land surface of the globe. Its greatest length from north to south is about 7350 miles and the greatest breadth along the parallel of latitude 5° N., 10,300 miles.

THE PACIFIC BASIN. The configuration of the Pacific basin is quite irregular, although there are large areas where the bottom exhibits little relief. In general, the depth increases from southeast to northwest. A vast depression known as the Tuscarora deep extends from the Japan and Kurile islands eastward along the Aleutian chain toward the coast of North America. Within this area the depth exceeds 3000 fathoms and in places soundings of 4000 fathoms or more have been made. Another extensive deep lies south of the Tonga Islands, between the Chatham Islands and New Zealand on the west and the Maria Theresa Reef on the east. In the central part of the ocean are the Belknap, Miller, and Hilgard deeps. The deepest sounding—5269 fathoms—was made in 1900 off the island of Guam by the United States ship *Nero*. A sounding of 5155 fathoms and another of 5147 fathoms have been made north of New Zealand. These depths are much greater than have been found in any other ocean. The most extensive plateau in the Pacific lies southeast of New Guinea and includes the Solomon, Ellice, Fiji, and Tonga islands, while a southern arm extends from the last-named group to New Zealand. The bottom within this area rarely exceeds 2000 fathoms in depth and much of it is less than 1000 fathoms. Other plateaus are occupied by the Marshall and Gilbert groups, by the Caroline Islands, the Low Archipelago, and Hawaii. A broad continental shelf extends along the eastern coast of Asia, but the western shores of America slope abruptly to the ocean floor. The mean depth of the Pacific is estimated at 2300 fathoms.

The proportion of land drained into the Pacific is insignificant when compared with the drainage received by the Atlantic. Its basin includes the generally narrow strip of the American continent to the west of the Rocky Mountains and the Andes, Melanesia, the Indo-Chinese States, China, a small part of Siberia, and eastern Australia.

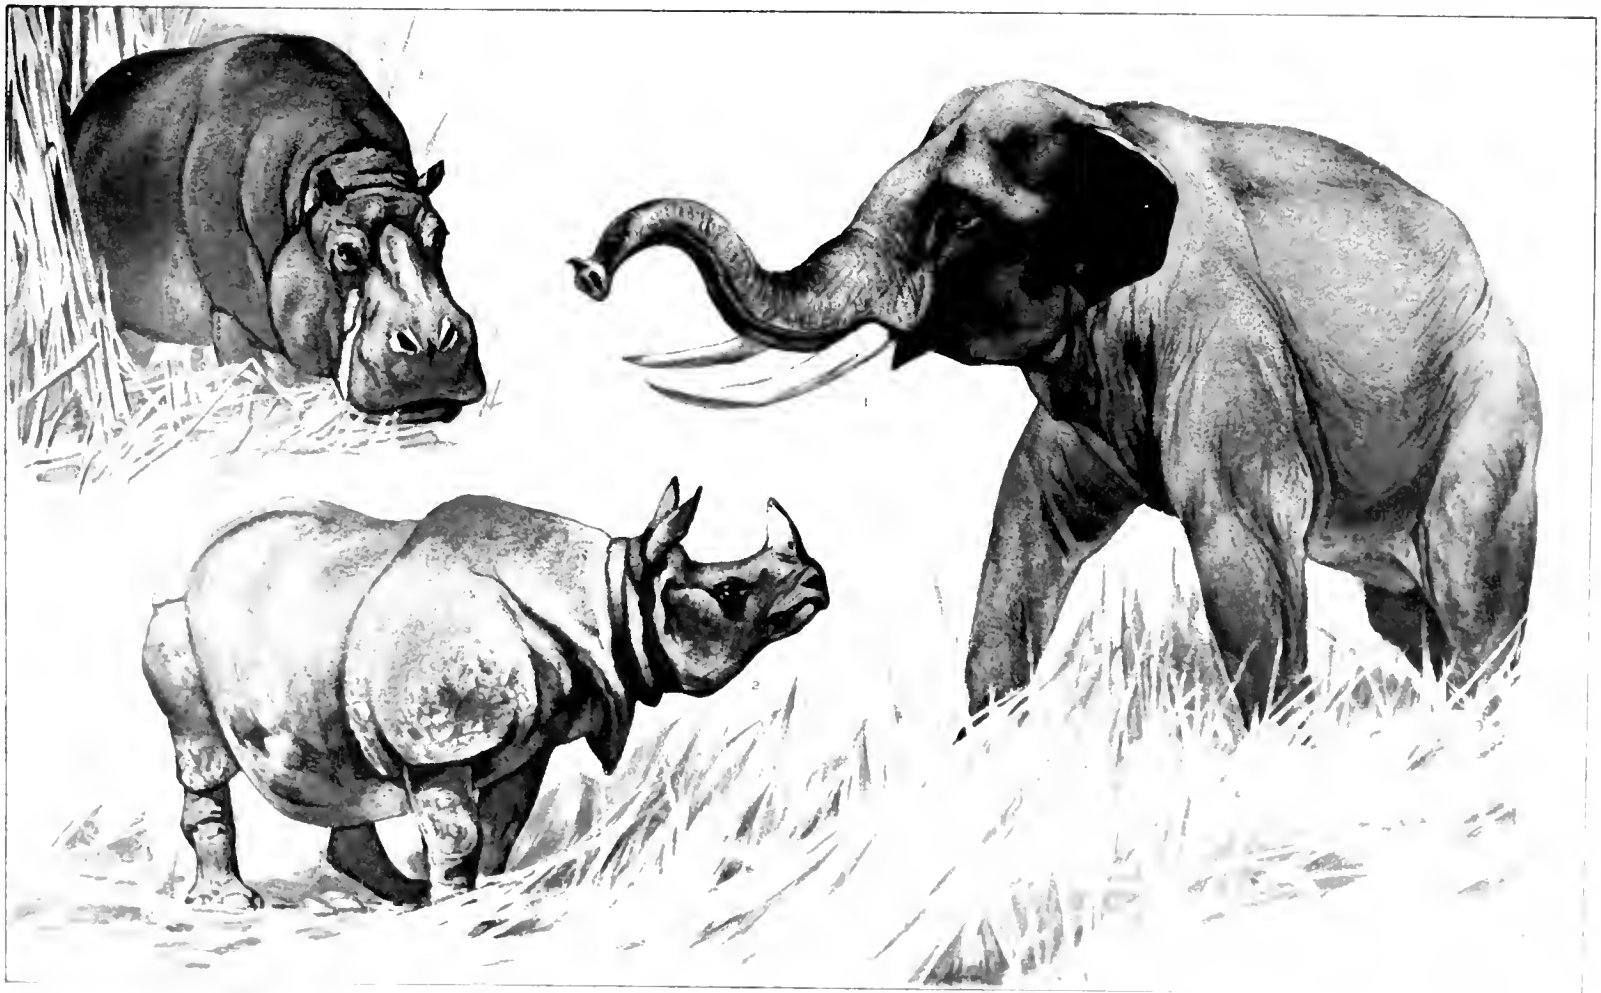
WINDS. In the trade wind belts of the Pacific the winds are generally quite uniform except when such belts approach the western coasts, where they are more or less modified by monsoon influences. In Polynesia hurricanes called typhoons are of frequent occurrence. North and south of the tropical zone the winds exhibit little regularity, being found to blow from all points of the compass during any given season of the year, though a westerly direction is most frequent. On the southern part of the coast of South America and the northern part of the coast of North America west winds prevail during the greater part of the year. In the Chinese seas the typhoon may occur at all seasons of the year.

CURRENTS. The currents of the Pacific Ocean are less marked in character than those of the Atlantic. In a general way the movement and direction of these currents follow the prevailing winds. In the northern trade wind belt a great equatorial current sweeps westward until at the western side it is largely deflected northward to the belt of westerly winds, where it flows northeastward as the Kuro Shiwo, or Japan Current, toward North America. A part of it subsequently turns southward along the American coast until it joins the equatorial current again; thus the surface drift of the northern Pacific Ocean constitutes a great eddy revolving slowly in the N.E.S.W. direction. In the southern Pacific a similar surface drift in the opposite direction, namely, north, west, south, east, is maintained, though not as well defined, because of the absence of the circumscribing continents. In the more quiet waters at the centres of these great eddies are the Sargasso or masses of floating seaweed, but these regions are very small compared with the large Sargasso Sea of the North Atlantic Ocean.

ISLANDS. The larger islands, with the exception of New Zealand, lie upon the continental shelf. The numerous small islands which rise out of great depths are one of the distinctive features of the Pacific. Most of these are of volcanic character, and in the equatorial region they are frequently surmounted by coral reefs. Consult Thomson and Murray, *Report of the Challenger Expedition* (London, 1880-95). See OCEAN.

PACIF'ICUS. The signature used in 1793 by Alexander Hamilton in a series of letters on neutrality. Madison replied to the letters in a number of essays signed *Helvidius*.

PACINI, pā-chē'nē, FILIPPO (1812-83). A prominent Italian anatomist. He was born in



Pistoia, studied medicine in Florence and Pisa, and became professor of anatomy at Florence. At twenty-three he made himself famous by discovering the peripheral nerve terminations which are called the 'corpuscles of Pacini' (or 'of Vater,' if the claim of the latter be considered). Pacini wrote much on anatomy, especially microscopic, and on pathology and therapeutics. His more important monographs include those on artificial respiration (1867, 1876, 1877, sqq.), which describe 'Pacini's method,' one of especial value in resuscitating asphyxiated new-born children.

PACINI, Giovanni (1796-1867). An Italian composer and teacher, born at Catania, and pupil of Marchesi and Furlanetto. His first opera, *Annetta e Lucindo*, was produced in 1813, and this was followed by forty-two operas during the subsequent twenty years. He was invariably successful, and was able to command the best theatres and artists in Italy. When one of his operas failed, he retired from the field of composition and devoted himself entirely to teaching, his school of music at Viareggio winning world-wide repute. His best work was done after 1840, the list of his compositions including about ninety operas, cantatas, masses, etc., besides numerous musical monographs and articles for musical periodicals. *Medea* (1843), *Saffo* (1840), and *Le regina di Cipro* (1846) are regarded as his best works. He died at Pescia.

PACINOTTI, pä'chē-nōt'tē, Antonio (1841—). An Italian physicist and electrician. He was born and educated at Pisa, taught there for two years, and at Bologna (1864-73), and, after nine years in the University of Cagliari, in 1882 became professor at Pisa. He is best known for his invention in 1860 of a dynamo in which the coils of the armature were wound on a ring. Subsequently the same device was independently discovered by Gramme, and was brought into extensive use in his machines.

PACK'ARD, Alpheus Spring (1798-1884). An American educator. He was a graduate of Bowdoin College, where he was tutor from 1819 to 1824, and professor of the Greek and Latin languages and literatures from 1824 to 1865. He became Collins professor of natural and revealed religion, and librarian in 1869, holding both offices until his death. During the last two years of his life he was acting president of the college. He edited and was joint author (with Nehemiah Cleaveland) of *The History of Bowdoin College, with Biographical Sketches of Its Graduates* (1882). He also edited: *Works of the Rev. Jesse Appleton, with a Memoir* (1836-37); *Xenophon's Memorabilia of Socrates, with English Notes* (1839; 3d ed. 1843); and contributed many articles to various periodicals.

PACKARD, Alpheus Spring (1839-1905). An American naturalist, born at Brunswick, Maine. He graduated at Bowdoin College in 1861 and at the Maine Medical School in 1864, and studied under Agassiz in the Lawrence Scientific School, Harvard University. In 1865-66 he was librarian and custodian of the Boston Society of Natural History; in 1867-78 curator and afterwards director of the Peabody Academy of Science, Salem; and in 1871-73 State entomologist of Massachusetts. From 1877 to 1882 he was a member of the United States Entomological Commission. In 1878 he was appointed professor of zoology and geology in Brown University. His chief work has been the classification and anatomy of arthropod animals, and contributions to economic entomology, zoögeography, and the phylogeny and metamorphoses of insects. In systematic zoology he proposed a new classification of the insects; a new grouping of the chief branches (phyla) of arthropods; a new order and several families of fossil merostomes, and the crustacean orders Phyllocarida and Syncarida. In comparative anatomy he discovered the brick-red renal glands of Limulus, the origin of the ovipositor, and that of the spiral thread of the trachea. His publications include: *Guide to the Study of Insects* (1869); *The Mammoth Cave and Its Inhabitants* (with F. W. Putnam, 1872); *Lyell's Story of Animals* (1876); *Insects Injurious to Forest and Shade Trees* (1890); *A Naturalist on the Labrador Coast* (1891); *A Text-book of Entomology* (1898); *Lamarck, the Founder of Evolution: His Life and Work* (1901).

PACKARD, John Hooker (1832—). An American surgeon, born in Philadelphia. He graduated at the University of Pennsylvania in 1850, and at the Medical School there in 1853. During the Civil War he was attached to the Christian Street and Satterlee army hospitals, with the rank of assistant surgeon, U.S.A. From 1863 until 1884 he was surgeon to the Episcopal Hospital, and from the latter date until 1896 he filled a similar position at the Pennsylvania Hospital. His publications include the translation of *Malgaigne on Fractures* (1859); *Manual of Minor Surgery* (1863); *Handbook of Operative Surgery* (1870); and *Sea Air and Sea-bathing* (1880).

PACKARD, Joseph (1812-1902). An American clergyman, of the Protestant Episcopal Church, born at Wiscasset, Me. He graduated at Bowdoin College in 1831, was a professor in Bristol College (Pa.) in 1834-36, and was ordained priest in 1837. From 1836 until his retirement as professor emeritus in 1890 he was professor of sacred literature in the Protestant Episcopal Theological Seminary of Virginia, near Alexandria. He was a member of the American committee for the revision of the Bible in 1872-85, contributed largely to Church periodicals, edited Malachi in the translation of J. P. Lange's Commentary (1874), and published *Questions on the Gospels* (1855).

PACKARD, Lewis Richard (1856-84). An American classical scholar born in Philadelphia, Pa. He graduated at Yale in 1856, studied further at Berlin University, in 1863 was appointed assistant professor of the Greek language and literature at Yale, and in 1866 full professor. In 1883 he was the second director of the American School of Classical Archæology at Athens. With J. W. White and T. D. Seymour he was editor of the "College Series of Greek Authors," of which one volume, the *Clouds of Aristophanes*, appeared in 1885. A collection of his lectures and essays was published in 1886 as *Studies in Greek Thought*.

PACKARD, William Alfred (1830—). An American classical scholar, born at Brunswick, Me. He graduated at Bowdoin in 1851, studied at Göttingen in 1857-58, and was appointed professor of the Latin language and literature in Princeton University. In addition to contribut-

ting to the *Presbyterian Review* and the *Princeton Review*, he revised the translation of Curtius's *Griechische Geschichte*, with translations from a later German edition.

PACK'ER, ASA (1806-79). An American capitalist, born at Groton, Conn. In 1822 he went to Pennsylvania, and eleven years later undertook the charge of one of the first boats on the Lehigh Canal. He became contractor for the building of locks and of boats for the transportation of coal from Pottsville to New York. He projected and completed (1855) the Lehigh Valley Railroad from Mauch Chunk to Easton. In 1844 he served in the Pennsylvania Legislature, and from 1853 to 1857 was a Democratic member of Congress. Having amassed great wealth, he gave liberally to charities, and founded and endowed Lehigh University (q.v.), Bethlehem, Pa., in 1866.

PACKER COLLEGIATE INSTITUTE. A school for girls in Brooklyn, N. Y., chartered in 1853, replacing the Brooklyn Female Academy, destroyed by fire in 1852. The new school was founded on a gift of $65,000 by Mrs. Harriet L. Packer. It has primary, preparatory, academic, and collegiate departments. The attendance in 1902 was 587, including 110 collegiate, 261 academic, 180 preparatory, and 36 primary students, and the faculty numbered 49. The institute has thoroughly equipped buildings, valued in 1902 at $222,047, the total valuation of its property being $277,860. The library contained 8479 volumes.

PACKING INDUSTRY. The slaughtering of cattle, sheep, and hogs, and the utilization of their carcasses is an important industry in many American cities, especially in the middle West. The choicer parts of the animals are shipped in refrigerator cars and vessels to the markets of this country and Europe for consumption as fresh meat, while other parts, especially in the case of the hog, are *cured*, by smoking or salting. The fatty portions are converted into lard and commercial grease by rendering processes. (See DIGESTER.) The bones are converted into glue or fertilizers, and the hoofs and horns (see HORN) are used or sold for other purposes. The term *packing industry*, which was originally applied to the curing and packing of the flesh of the hog, has been extended, with the development of the industry, to include all the multitudinous operations connected with the utilization and transformation into merchantable form of the different parts of animals slaughtered for food, in so far as these operations are conducted in a single plant.

The history of the packing industry begins in New England, in the seventeenth century, where large quantities of pork were packed in barrels for foreign trade. The first packing house in the West was established in Cincinnati in 1818. Cincinnati continued to lead in the industry for many years, but is now surpassed by Chicago, while in many other Western cities, including Milwaukee, Kansas City, Saint Louis, and Omaha, the industry has risen to great importance. Prior to 1872 most of the slaughtering was done during the winter months. About this time chilling processes began to be developed, which have since been brought to such a state of perfection that animals are killed and their products prepared for the market with equal success and in equal amounts in mid-winter and in 'dog-days.' Indeed, the development of the packing industry is largely due to the application of artificial means of refrigeration (q.v.), for at the foundation of all successful meat-curing is the thorough chilling of the carcass.

Before cold storage of meat was introduced, it was customary to ship the living animals to Eastern markets, and the long and tiresome journey was both cruel to the animals and harmful to the meat. Now the meat, after thorough chilling, is shipped in refrigerator cars to Eastern cities and placed in cold-storage warehouses owned by the packing company, from which it is delivered to local dealers, or if it is to be delivered in Europe, it is transferred directly from the refrigerator cars to specially constructed chill-rooms in the ocean steamers, to be delivered in London, Liverpool, or Glasgow.

Labor-saving devices have been adopted at every step in the packing industry. The animals are killed, "hooked by the nose to an endless chain, passed through scalding vats, and then through an automatically adjusted scraper which deprives them of hair and bristles in a few seconds. The animals are then hoisted, head down, upon an inclined rail and disemboweled, beheaded, washed, trimmed, and whirled to the chill-rooms at the rate of twenty a minute." In dressing hogs, about 20 per cent. is offal and the rest is used as meat, of which only about 10 per cent. is sold as fresh meat. The other parts are cured, usually by pickling in brine for seven or eight weeks, and then smoking for twenty-four hours. The most profitable part of the industry is the manufacture of sausage. The meat used is chiefly trimmings, which are obtained from all parts of the establishment, a large part of them being head and hoof trimmings. The meat is chopped, mixed with potato flour and water, in the proportion of 40 per cent. meat, 40 per cent. potato flour, and 20 per cent. water. Certain spices are also added, including sage, pepper, salt, ginger, and mustard. The intestines, which are used for sausage casings, are cleaned by machinery. They are filled with the sausage by means of a stuffing machine, which consists of two cylinders, the steam cylinder and the stuffing cylinder, and a piston rod directly connected with the piston rod of the steam cylinder. The sausage casings are slipped over a tube attached to the open bottom of the stuffing cylinder, and through this orifice the casings are filled at a rapid rate.

Another important part of the pork-packing industry is the manufacture of lard (q.v.). Two grades of lard are made—leaf lard and steam lard. In the leaf lard of commerce, not only the pure leaf, but all sorts of trimmings from the belly of the animal are used. Steam lard is made from scraps taken from all parts of the animal, particularly from the feet, or even the feet themselves and the head bones.

In dressing cattle, the parts intended to be sold as fresh beef are allowed to cool for forty-eight hours and then shipped. In the canning of fresh beef, inferior meat is used, either poorer grades of cattle or poorer cuts. Since 1891 the whole packing industry has been under vigilant Government inspection.

STATISTICS. According to the twelfth census of the United States, $189,194,264 were invested in the packing industry in 1900. The annual

value of the product was $785,562,433. Since 1850 the number of establishments had increased from 185 to 921; the number of laborers employed from 3276 to 68,534; and the average yearly wages per laborer from $376 to $488. The detailed figures published show that in Eastern cities, as Boston, New York, Newark, there has been a decided falling off in the business, while in certain cities of the Middle West, as Saint Joseph, Mo., there has been a more than correspondingly marked increase. This is due to the tendency to conduct the business nearer the centre of cattle-raising, which is, of course, the great corn belt of the Middle West and the pasture lands still nearer the Rockies. The accompanying table shows the exports of this industry in 1900.

MEAT PRODUCTS EXPORTED FROM THE UNITED STATES IN THE YEAR 1900

(Taken from the Statistical Abstract for 1900)

	Pounds	Dollars
Beef products—		
Canned beef	55,553,745	5,253,982
Fresh beef	329,078,639	29,643,850
Salted or pickled beef	47,306,513	2,697,340
Other cured beef	2,319,165	197,051
Tallow	89,030,943	4,398,204
Hog products—		
Bacon	512,153,729	38,975,915
Hams	196,414,412	20,416,367
Pork, canned	8,496,074	658,402
Fresh pork	25,946,905	1,925,772
Salted or pickled pork	133,199,683	8,243,797
Lard	661,813,663	41,939,164
Lard mixtures and substitutes (cottolene, lardine, etc.)	25,852,685	1,475,064
Casings for sausages		2,307,571
Mutton	773,760	64,313

NUMBER OF HOGS, CATTLE, AND SHEEP KILLED IN VARIOUS YEARS IN THE LOCALITIES NAMED

(From *One Hundred Years of American Commerce*)

HOGS PACKED IN THE WEST

YEAR	Summer	Winter	Total
1844-45			790,000
1849-50			1,652,000
1854-55			2,124,000
1859-60			2,351,000
1864-65			2,423,000
1869-70			2,635,000
1874-75	1,200,000	5,566,000	6,766,000
1879-80	4,051,000	6,950,000	11,001,000
1884-85	4,059,000	6,460,000	10,519,000
1889-90	6,881,000	6,664,000	13,545,000
1894-95	8,812,000	7,191,000	16,003,000

CATTLE KILLED IN FOUR WESTERN CITIES

YEAR	Chicago	St. Louis	Kansas City	Omaha
1871-75	190,000	104,000	37,000	
1876-80	411,000	165,000	60,000	
1881-85	864,000	182,000	82,000	10,000
1886-90	1,696,000	210,000	341,000	170,000
1890-94	2,223,000	303,000	756,000	460,000

SHEEP KILLED IN FOUR WESTERN CITIES

1871	261,000
1880	405,000
1890	1,621,000
1894	3,564,000

BIBLIOGRAPHY. The twelfth census contains many statistics, and also a good account of slaughtering and meat-packing methods in the United States. Consult, also, Philip Armour's description of the industry in Depew, *One Hundred Years of Commerce in the United States* (New York, 1895).

PACK-SADDLE. Contrivances for the transportation of materials, whether of merchandise or military stores, by means of pack animals. The pack-saddle in most general use consists of crossed sticks, fastened to saddle-bars of long bearing. In the United States Army pack-animals are usually supplied with the aparejo (q.v.). Ammunition mules are equipped with pack-saddles, specially adapted for the carrying of ammunition boxes, which are placed in such a way as to admit of easy access when the animal is employed in supplying troops in action. See illustration accompanying MOUNTAIN ARTILLERY.

PACTO'LUS (Lat., from Gk. Πακτωλός, *Paktōlos*). The ancient name of a small brook of Lydia, in Asia Minor (now called Sarabat), which rises on the northern slope of Mount Tmolus. It flows northwest past Sardis (Sart) and empties into the Gulf of Smyrna. It is nowhere more than ten feet broad and one foot deep. The sands or mud of Pactolus once contained a good deal of gold, and were regarded as the source of Cræsus's vast wealth; but as early even as the time of Strabo, Pactolus had ceased to yield any of the precious dust.

PACU'VIUS, MARCUS (c.220-c.132 B.C.). A Roman writer of tragedies. He was born at Brundisium, Italy. Repairing to Rome, he soon acquired fame by his skill in poetry and painting. One of his pictures was hung in the Temple of Hercules in the Forum Boarium at Rome. His finest works were his tragedies, which showed eloquence and refinement. Fragments of thirteen of these, as well as of a *prætexta*, or tragedy, with a typically Roman plot, have been preserved. These have been collected by Ribbeck, *Scenicæ Romanorum Poesis Fragmenta* (Leipzig, 1897).

PADANG, pä-däng'. The capital of the Dutch possessions on the west coast of Sumatra. It is situated amid picturesque mountain scenery near the centre of the west coast (Map: East Indies, B 5). Its Malay inhabitants live mostly in bamboo huts, but the Europeans and Chinese have well-built houses of stone and wood, and there are several churches, schools, a hospital, large warehouses, and Government workshops. The town is the terminus of a railroad line into the interior, and has a lively trade with Java and the other East Indian islands as well as with Europe, exporting coffee, nutmegs, copra, tobacco, gum, cane, and hides. It is the station of a United States consular agent. Population, in 1895, 32,038.

PADDLE. A wooden implement with a wide flat blade at one end or both, used by canoeists in place of oars. It is held in the hands, not rested in a rowlock, and is dipped into the water with a nearly vertical motion. The double-bladed paddle is frequently used in canoes, though many sportsmen prefer the single blade, which is worked over one side of the canoe, the steering being accomplished by giving a particular twist to the paddle at the end of each stroke. The fact that the paddler faces the bow of his boat is frequently an appreciable gain, especially in threading narrow streams. See CANOE.

PADDLE-FISH (so called from the form of the snout). A fish (*Polyodon spathula*) of the

Mississippi River and its tributaries, which has the general appearance of a rather slender catfish, but is a ganoid with a skeleton chiefly cartilaginous. It is about five feet long, has a smooth dark-green skin without scales, and a long bony snout containing fine teeth, with which it digs up the mud at the bottom of sluggish streams in search of the minute animals upon which it feeds. It has much the habits of a catfish, but inferior flesh, and is known as the 'duck-billed' or 'spoon-billed' cat, or 'spade-fish,' both names referring to the spatulate form of its snout. It represents the order Selachostomi of the subclass Teleostomi and the family Polyodontidæ, and is closely allied to the sturgeons. A similar species inhabits China. See Plate of Sturgeons, Paddle-Fish, and Bowfin.

PADDLE-WHEEL. An appliance in steam-vessels by which the power of the engine is made to act upon the water and produce locomotion. It consists of a skeleton wheel of iron, on the outer portion of whose spokes flat boards, called floats or paddles, are fixed, which beat upon the water, and produce, continuously, the same effect as is given, in an intermittent manner, by the blades of oars. The use of paddle-wheels in conjunction with steam as a motive power dates from about the commencement of the nineteenth century, but the employment of the paddle-wheel itself is as ancient as the time of the Egyptians. A specimen is also known to have been tried in Spain in the sixteenth century.

In the usual form of paddle-wheel, called the radial, the floats are fixed, and it will be seen that a certain loss of power is involved, as the full force of the engine on the water is experienced only when the float is vertical, since when the floats enter or leave the water the power is mainly employed in depressing or lifting the particles of water. This resistance has great force at the moment of starting, or when progress is very slow, as is illustrated by the small power a paddle-steamer evinces when trying to tug a stranded vessel off a sandbank; but when in full progress, the action is less impeded by this circumstance, the water in front of the wheel being depressed, and that abaft being thrown into the form of a wave. The extent of the immersion much influences the economy of power, as will be readily understood if the consequences of immersion up to the centre of the wheel be imagined. An immersion somewhat over the top of the lowest float is about the most advantageous, and, in order that the floats may be as nearly as possible vertical when they strike the water, it is advisable to give the wheel as large a diameter as possible, and to place the axis at the highest available point in the vessel.

To overcome the drawbacks to the radial wheel, there was devised early in the nineteenth century the *feathering paddle-wheel*, in which the floats are mounted on axes, and are connected by rods with a common centre, which revolves upon a pin placed eccentrically to the axis of the paddle-wheel. By this method the floats are kept, while immersed, at right angles to the surface of the water. So long as the water is smooth the gain is great, consequently feathered floats are much used in river-steamers. Paddle-wheels have been almost entirely superseded by screw propellers (see Screw Propeller) on all vessels except river and lake boats. See Steam Navigation.

PAD'EMEL'ON (Australian name). A small wallaby or kangaroo (*Halmaturus thetidis*) of New South Wales. It inhabits scrubby districts, and is hunted both for its flesh and its hide. Several other species in Australia, New Guinea, and Tasmania belong to this genus, which is characterized by the absence of hair on the muffle.

PADERBORN, pä'dĕr-bôrn. A town in the Province of Westphalia, Prussia, situated at the source of the Pader (hence the name of the town), about 15 miles southwest of Detmold (Map: Prussia, C 3). It has a modern aspect, a considerable part having been rebuilt since the conflagration of 1875. The cathedral, which was built above the source of the Pader mainly in the thirteenth century, and which contains parts of the original twelfth-century structure, was completely restored in 1891-93. It is Gothic in style and contains among other treasures the silver coffin of Saint Liborius, which was substituted for the original one coined into dollars by Duke Christian of Brunswick in 1622. The Busdorfkirche, of the fourteenth century, and the Rathaus, dating from the fifteenth century, and recently restored, are noteworthy buildings. The chief educational institutions are a gymnasium, an institute of theology and philosophy (taking the place of the university, which was closed in 1819), seminaries for priests and teachers, and a *Realschule*. The town has railway shops, manufactures of glass, soap, and tobacco, distilleries, flour mills, etc., and carries on some trade in fruit, cattle, and wool. In the vicinity are mineral springs of considerable reputation. Population, in 1890, 17,986; in 1900, 23,502, chiefly Roman Catholics. Paderborn first came into notice when Charlemagne held a diet there in 777, and eighteen years later nominated the first bishop. It was surrounded with walls in the eleventh century, and in the Middle Ages enjoyed considerable political independence as a member of the Hansa. For its early adoption of Reformation principles it was forcibly deprived of its privileges in 1604 by the Prince-Bishop Theodore of Fürstenburg. The bishopric, founded in 795 by Charlemagne, was secularized in 1802. Consult Richter, *Geschichte der Stadt Paderborn*, vols. i., ii. (Paderborn, 1899-1903).

PADEREWSKI, pä'dē-rĕf'skē, Ignace (1859—). A famous Polish pianist and composer. He was born in Podolia, Russia. When only three years of age he showed great fondness for music, and at seven was placed under a teacher, making such rapid progress as a pianist that in five years he gave public recitals. He studied under Raguski at the Warsaw Conservatory, in which he became himself a professor at the age of eighteen. In 1884 he accepted a similar position at Strassburg, and in 1887 made his formal début in Vienna, and was at once placed in the foremost rank of pianists. In 1890 he created a furor in London by his marvelous playing, and in 1892, 1893, 1895-96, and 1899 appeared in the United States. As a virtuoso pianist Paderewski must be placed among the very greatest performers that the world has yet seen. His pronounced individuality, his freedom from affectation, together with a vivid appreciation of tone gradations and values, a wonderful technique and mastery of the pedal, and a singularly intellec-

tual conception and interpretation of the great masterpieces of his repertoire, easily determine him as the greatest pianist of his day and generation. For his three months' season in the United States in 1895-96 he received the net sum of $200,000, and he gave to specially appointed trustees, for a fund to encourage American composers, $10,000. In 1902 he again visited the United States and personally conducted his opera, *Manru*, which met with an enthusiastic reception. His works, consisting largely of compositions for the piano, have become widely known; they include: *Prelude and Minuet*; *Elégie*, *op. 4*; *Danses polonaises*; chamber music; songs; and the grand opera *Manru* (1900).

PADIHAM, pād'i-hum. A town in Lancashire, England, on the Calder, 4 miles northeast of Accrington. Its industries comprise cotton mills, collieries, and stone quarries. Its parish church dates from the fourteenth century; it has an anciently endowed national school. Population, in 1891, 11,300; in 1901, 12,200.

PADILLA, pä-dē'lyä. The capital town of the Department of Chuquisaca, Bolivia, 90 miles northeast of Potosí (Map: Bolivia, E 7). It received its name in memory of the patriot guerrilla Manuel Ascensio Padilla, who met his death in the battle of Villar, September 14, 1816. Its population is about 4000.

PADILLA, JUAN DE (1484-1521). A popular hero of Spanish history. He came of a noble family of Toledo, was commandant of Saragossa in 1518, and administrator of his native city in 1520. While he was so employed, a formidable rebellion, caused by the excessive taxes which the Emperor imposed on the Spaniards to defray the cost of his various wars in Italy, Germany, and the Low Countries, broke out among the towns (*comunidades*) of Castile, and the rebels, who were known as *comuneros*, called upon Padilla to put himself at their head. Padilla for a short time was all-powerful, and formed a new junta to carry on the government. He was successful in a number of enterprises undertaken against the Royalist party, but on April 23, 1521, was completely beaten by the Royalists at Villalar. This conflict decided the fate of the rebellion, and of Padilla himself, who was taken prisoner, and on the following day beheaded.

His wife, MARIA PACHECO, rallied the wrecks of the rebel army, and for a long time held the castle of Toledo against the Royalist army, and after its fall in February, 1522, retired to Portugal, where she died in 1531. The deeds of Padilla and his wife have often been celebrated in Spanish song.

PADISHAH, pä'dē-shä' (Pers. *pādishāh*, king, from *pād*, Skt. *pati*, master, protector, from *pā*, to protect + *shāh*, OPers. *xšāyaθiya*, king, connected with Av. *xšī*, Skt. *kṣī*, to rule). One of the titles of the Sultan of the Ottoman Empire and of the Shah of Persia. Formerly this title was accorded only to the kings of France among European monarchs. It was subsequently allowed to the head of the House of Austria, and still later, by a special article in the treaty of Kutchuk-Kainarji (1774), to the Autocrat of All the Russias. Of late it has been accorded to the monarchs of all the great European nations, and even to those of secondary States.

PADOVANINO, pä'dō-vä-nē'nō, IL. The name commonly applied to the Venetian painter Alessandro Varotari (*q.v.*).

PAD'UA. The capital of the Province of Padua, Italy, situated 22 miles by rail west-southwest of Venice (Map: Italy, F 2). Several arms of the Bacchiglione, here canalized, flow through the city and are crossed by a number of old Roman bridges. The city lies in a compact shape in one of the richest gardened plains of Italy. The ancient, narrow, crooked streets are generally arcaded. The arcades, however, are being removed gradually to accommodate the increasing traffic. There are seven city gates.

The cathedral is of no particular interest, but its baptistery is a handsome brick conception of the twelfth century. The fine and immense San Antonio Church is identified with Saint Anthony, the patron saint of the city. It dates from the middle of the thirteenth century, and was restored about 500 years later. The saint is entombed here. The edifice has six domes, and is fashioned after the Byzantine Saint Mark's of Venice, with Gothic features added. The most valuable of its numerous contents are a monument by Al. Vittoria; a collection of goldsmith's work of the Renaissance period; a bronze candelabrum by A. Riccio, by whom are also valuable biblical reliefs in bronze; the high altar by Donatello; the exquisite white and gold decorations on the ceiling; the ambitious Renaissance Cappella del Santo; and a Madonna by A. Boselli. Before San Antonio stands Donatello's splendid equestrian bronze statue of the Venetian General Gattamelata.

Another fine church is the spacious Santa Giustina, begun by Riccio. Its façade is brick, with one of the many noble flights of stairs for which Padua is famous. Domes and cupolas add to the impressiveness of the edifice. In the interior are the fine "Martyrdom of Saint Justina" by Veronese, and handsome choir stalls. The adjoining cloister is used as barracks. In the northeastern part of the city are the Madonna dell' Arena and the Eremitani. The former is a fine chapel dating from the beginning of the fourteenth century. It is situated in an attractive garden, and is remarkable for its frescoes by Giotto, most of them in a good condition. The Augustinian Eremitani, dating from the thirteenth century and restored in 1880, contains scarcely less valuable and important mural paintings by Mantegna and other members of the school of Squarcione. The Mantegna pictures were painted between 1450 and 1460, the life of Saint James furnishing a part of the subjects. There are also found here, in the sacristy, a "Pietà" by Canova, and a "John the Baptist" by Guido Reni.

Among the notable palaces of Padua is the Palazzo della Ragione, belonging to the twelfth century, with a vast mediæval hall (Salone) 273 feet long, 90 feet wide, and 78 feet high. Donatello's celebrated wooden horse is here. The Loggia del Consiglio is a charming example of the early Renaissance. An arcade reached by majestic stairs. In the vicinity are found a statue of Victor Emmanuel II. and a column bearing a Lion of Saint Mark. Padua possesses also a monument to Petrarch, models of statues of Dante and Giotto, both by Vela, a [illegible] ment to Cavour, and a statue of [illegible]. The Scuola del Santo, occupied by the Brotherhood

of Saint Anthony, has three fine mural paintings by Titian. The chapel San Giorgio near by has numerous excellent frescoes by Altichieri and J. Avanzi. Among the objects of interest in the city is Dante's house, in front of which is an ancient tomb, containing, according to tradition, the ashes of Antenor, the legendary founder of Padua.

On the Via dei Servi, the main business street, stands the university (q.v.), far famed as a seat of learning in mediæval times. It occupies an edifice known as Il Bò, distinguished by a court with attractive colonnades. Padua has a celebrated café, the Pedrocchi, almost entirely of marble, with noble halls and columns, the scene of student uprisings against the Austrians. The municipal museum, in a building reconstructed in the latter part of the nineteenth century by Boito, has an attractive façade, and contains the city library (110,000 volumes), the picture gallery, archives, and an interesting monument of the Volumnii. The picture gallery is not important. Its best work is Romanino's Madonna —an altar piece. In the southern part of the city lies the spacious Piazza Vittorio Emanuele, beautified with trees and embellished with the statues of eighty-two celebrated persons who have been associated with the city. Some of the marbles are by Canova. The piazza is the lively scene of the annual fair which commences on Saint Anthony's festival, June 13th.

The Botanic Garden of Padua, which is connected with the university, is well known as the oldest in Europe, having been established by the Venetian Republic in the middle of the sixteenth century. It has some exotic trees which have long been celebrated, and are associated with certain of Goethe's scientific investigations here. Also connected with the university are an observatory and a large and valuable library. There are in the city an archiepiscopal seminary, a lyceum and other high schools, a technical industrial school, an agricultural school, an industrial art school, and a silk-worm breeding institution. The industries of Padua include foundries, farm machinery works, an automobile factory, chemical factories, distilleries, etc. The city is the centre for the trade of Venetia, cattle, wine, oil, and grain being chiefly dealt in. It is particularly famous for its fruit. Canals connect Padua with the Adige, the Brenta, and the Adriatic. The population in 1901 was 82,281.

Padua claims its origin from the time of Troy. In the height of Rome's glory it was the most important town in North Italy. It was sacked by the Goths and the Huns. Charlemagne wrested it from the Longobards. In the middle of the thirteenth century it was the capital of the cruel tyrant Ezzelino (IV.) da Romano. Later it was for a time a republic, then passed under the rule of the Carrara family, and became the object of conquest on the part of Venice, to which it fell in 1405, and whose fortunes it afterwards shared. Livy and Mantegna were born here. In art history Padua is prominent. Mantegna shed his glory upon the city, and the influence of the Squarcione school, with which he was associated, is traced all over Northern Italy. Giotto, Donatello, and Fra Filippo Lippi also did much work in Padua. Consult Cappelletti, *Storia di Padova* (Padua, 1875).

PADUA, University of. One of the oldest and most famous of European universities. It had its inception in the emigration from the University of Bologna in 1222 of a large number of students owing to difficulties with the town authorities. The School of Martinus for the study of jurisprudence at Padua, however, is mentioned as early as 1190. The restless students found Padua as unaccommodating as Bologna, and in 1228 entered into a contract to emigrate to Vercelli, that commune promising 500 houses for the accommodation of students and other privileges. This contract was only carried out in part, and the university at Padua was not wiped out entirely. At first jurisprudence constituted the principal study, but soon the liberal arts came into vogue. During the tyrannical reign of Ezzelino (IV.) da Romano (1237-59) the university lost its prestige and was almost ruined, but with his death the town endeavored to improve its condition. In 1260 a code of statutes, modelled after those of Bologna, was drawn up, two universities, the Ultramontani and the Citramontani, were established, and the grammatical, rhetorical, and medical studies instituted. In 1263 Pope Urban IV. speaks of the 'Universitas Magistrorum et Scolarium Padue' as a recognized institution, and in 1264 confirmed the power of the Bishop to confer the licentiate degree. The fame of the university soon rivaled that of Bologna. In 1282 the Paduans attempted to force new statutes, prepared by them, on the university. This was vigorously resisted by the university and Pope Nicolas IV. An attempt was even made to transfer the university to some other place, but the difficulty was settled in 1290. In 1363 Pope Urban V. instituted theology as a *studium generale*. In the same year the first college was founded, the number increasing gradually henceforth. After 1390 the university received many foundations for poor scholars, and in 1390 Francesco Carrara presented it with its first building. In the fifteenth century it far outranked Bologna in renown. Humanism obtained a strong foothold here, and besides the professional studies, mathematics, modern languages, fine arts, and knightly exercises were eagerly pursued. At Padua were established the first botanical garden and anatomical theatre. The university became a favorite place with the Germans, there being, in 1564, 200 of them under the faculty of law. During the seventeenth century the fame of the institution gradually declined. In 1613 the complaint was made that there were only 1400 students. Still there were about 100 annual promotions in jurisprudence. At that period the university was famous for the licentiousness of the students, which hastened the decay of the once flourishing institution. In the beginning of the eighteenth century Augustin Leyser laments its total ruin. Under the Austrian régime, and later under the Italian government, strenuous efforts were made to re-establish the former fame of the university, and its regeneration has proceeded gradually. During the troublous period of 1848-50 the university was closed. In 1902 the University of Padua consisted of the following schools and faculties: (1) law, (2) medical-surgical, (3) mathematical-natural science, (4) philosophy, (5) engineering, (6) pharmacy. The attendance was over 1400. The library contained 136,000 volumes, 64,900

PÆSTUM

RUINS OF THE TEMPLE OF NEPTUNE (RIGHT) AND THE SO-CALLED BASILICA

pamphlets, and 2326 manuscripts. The university also includes a number of clinics, an observatory, a botanical garden, and a number of museums. For bibliography, see UNIVERSITY.

PADUCAH, pā-dū'kā. A city and the county-seat of McCracken County, Ky., 48 miles east by north of Cairo, Ill., and 165 miles southeast of Saint Louis, Mo.; at the confluence of the Ohio and Tennessee rivers, and on the Illinois Central and the Nashville, Chattanooga and Saint Louis railroads (Map: Kentucky, C 3). It has a United States Government building, hospitals, and public parks. The city is in an agricultural, mineral, and timber region; is the terminus of several river packet lines; controls large lumber and tobacco interests, besides an important wholesale trade; and has extensive manufactures of lumber products, furniture, brick, potter's ware, tobacco, cotton rope, wagon material, flour, and foundry and machine shop products. The building of steamboats is carried on. The government, under a charter of 1893, is vested in a mayor, who holds office for four years, and a council. The school board is independently chosen by popular vote. The electric light plant is owned and operated by the municipality. Paducah was laid out in 1827, incorporated as a village in the following year, and received a city charter in 1856. In September, 1861, it was occupied and fortified by General Grant, and on March 25, 1864, then having a garrison of about 800 men under Hicks, it was unsuccessfully attacked by General Forrest with a force of 5000. Population, in 1890, 12,797; in 1900, 19,446.

PÆ'AN (Lat., from Gk. *παιάν, paian*, hymn in honor of Apollo, from Παιάν, *Paian*, Παιών, *Paiōn*, epithet of Apollo). An ancient Greek god of healing. Paean appears in Homer and later poets down to Æschylus as a personal god, a divine physician, invoked to cure disease and also to avert threatened destruction from other causes. From the middle of the fifth century B.C. we hear little of this god, and Pæan becomes a surname of Apollo, as the averter of disease and destruction. The hymn for deliverance, addressed probably originally to the god Pæan, with its refrain *ἰὴ* Παιάν, was also transferred to the worship of other gods, and became the name for a recognized division of the Greek choral lyric poetry. It was sung either in solemn procession or in a stately dance around the altar, especially of Apollo, though sometimes in connection with the worship of Dionysus, Asclepius, and others. We also find the word used to denote a prayer or hymn accompanying the libation at a sacrifice, or sung to the gods with the libation at the symposium or at the marriage feast. As a prayer for safety it was naturally chanted before the battle, and, indeed, before any undertaking where danger was anticipated. The refrain seems also to have become a shout of victory, as expressing thanksgiving for deliverance, and thus the Pæan is also the name for the hymn sung at the processions and the sacrifices in celebration of victory. Consult: Fairbanks, *A Study of the Greek Paean* (New York, 1900); Usener, *Götternamen* (Bonn, 1896).

PÆ'DOGEN'ESIS. See PARTHENOGENESIS.

PÆO'NIUS (Lat., from Gk. Παιώνιος, *Paiōnios*). A Greek sculptor of the latter part of the fifth century B.C. He was a native of Mende, probably the Thracian town, which was settled by Ionians, and is known by his statue of Nike (Victory), executed for the Messenians of Naupactus and erected as a trophy at Olympia, probably about B.C. 420. The statue stood on a triangular pedestal some thirty feet in height, and represented the goddess as in full flight toward the earth. The feet barely touch the pedestal, the support being afforded by the flowing drapery, which in its light folds suggests admirably the rush of the goddess through the air. Pausanias says that Pæonius also made the sculptures in the east pediment of the Temple of Zeus at Olympia, but this seems to be due to a misunderstanding of the inscription on the base of the Nike, in which the artist claims to have been the victor in making the figures on the extremities of the gables.

PAËR, pä-ār', FERDINANDO (1771-1839). An Italian composer, born in Parma. He was appointed chapel-master at Dresden in 1801; Imperial composer to Napoleon in 1807, and was director of the Italian opera at Paris in 1812-27. Besides a number of overtures and cantatas, he was composer of forty-three operas (the best is *Camilla*, 1799), which have long been forgotten. He is of interest more for the part he played in the musical life of his day, as shown by his appointments, and his rivalry with Rossini, his successful competitor for public favor, and for a time a joint conductor with him at the Théâtre Italien. He received the cross of the Legion of Honor in 1828; was elected to the Academy in 1831; and the year following became conductor of the Royal Chamber music. He died in Paris.

PÆS'TUM (Lat., from Gk. Παῖστον, *Paiston*, earlier Ποσειδωνία, *Poseidōnia*). An ancient Greek city of northwestern Lucania in Southern Italy, in the present Province of Salerno. It seems to have been founded under the name Posidonia, by Trœzenians expelled from Sybaris, probably not earlier than the latter part of the seventh century B.C. It does not appear prominently in the history of Magna Græcia, but its temples show it must have enjoyed considerable prosperity. About B.C. 400 it was captured by the advancing Lucanians, who, however, allowed the ancient inhabitants to remain, and even to mourn their lost glories at an annual festival. With the rest of the region it submitted to Rome, and in B.C. 273 was made the seat of a colony, but in the time of Strabo was reputed unhealthy, and gradually fell into neglect. In the ninth century the town was sacked by the Saracens, and after that the site seems to have been abandoned, and now is occupied only by a few houses and the fine ruins of three temples, commonly called the Temple of Poseidon, the Basilica, and the Temple of Ceres. They are all important monuments for the history of the Doric style, and are among the best preserved and most impressive examples of Greek temple architecture outside of Athens.

PAEZ, pä'ās. A mountain tribe of Colombia, occupying about twenty villages in the high Central Cordilleras, westward from Bogotá. They are believed to be the principal modern representatives of an ancient group of allied tribes, hostile to the more civilized Chibcha (q.v.), and constituting a distinct linguistic stock. They are hunters and go nearly naked in spite of the cold, but wear hats woven from reeds or bark. They also weave mats and cloth from maguey

fiers, and have some skill in hammering gold into ornaments. They burn the houses in which either a death or a birth occurs. They number about 2000.

PAEZ, José Antonio (1790-1873). A Venezuelan soldier and political leader, born at Araure in the old Province of Barinas. He was of aboriginal descent, and passed his early life as a herdsman on the llanos of the Apure. On the outbreak of the War for Independence he led a body of his half savage comrades to join the patriot ranks, and soon made his name a terror to the Spaniards. His most important victory was that of Carabobo in 1821, when he defeated the Spanish General Latorre and so assured the independence of Colombia. The next year he was given the chief military command in the Department of Venezuela, and in 1823 drove the Spaniards from Puerto Cabello, their last foothold in the Republic. In 1829 Venezuela, under his influence, seceded from Colombia, and in the following year he was elected its first President. At the end of his term in 1834 he was succeeded by Dr. José Vargas, during whose administration there were two attempts at revolution. Both were quickly suppressed by Paez, who in 1839 again became President and served until 1843. During the war between the Creoles and the colored people in 1846 he was made dictator, but at the conclusion of hostilities declined to become President, and resigned his powers to General Monagas. Scarcely a year later, however, he rebelled against the despotism of his successor, was defeated and captured, and was kept in prison until 1850, when he was allowed to leave the country. After the fall of Monagas, in 1858, he returned to Venezuela, and in 1860 was appointed Minister to the United States. The next year he was made commander of the army, and a few months later was proclaimed dictator. On account of age, he confided his duties to one of his ministers, who grossly usurped his power. The result was an insurrection which spread rapidly until, on June 15, 1863, Paez was forced to resign his office and again go into exile. In 1871 he went to New York, where he passed the last years of his life. In 1888 his remains were placed in the Pantheon at Caracas. Consult: *Autobiografia de General José Antonio Paez* (New York, 1867); Paez, *Public Life of J. A. Paez* (1864); Jones's translation of *The History of South America* (London, 1879), and Guzman Blanco's *Apotcosis de General Paez* (Paris, 1889).

PAGAN, pä-gän'. A town of the Myingyan District, Upper Burma, India, on the left bank of the Irrawaddy River, 92 miles southwest of Mandalay (Map: Burma, B 2). Population, estimated, 7500, chiefly Buddhists. Pagan was the capital of Burma from its foundation in A.D. 847 until 1284, when, to resist the advance of an avenging Chinese army, the Burmese ruler demolished a great part of the city to build fortifications, but finally abandoned the project and fled. The ruins of Buddhist temples and pagodas in every stage of dilapidation occupy an area along the river about 8 miles long by 2 miles broad. The best preserved and most important archæologically of the temples are the eleventh-century cruciform Ananda, occupying a square of 280 feet and rising to a height of 183 feet; the Thapinyu, 201 feet high, built in 1100; the Gaudapalin, 180 feet high, built in 1160; and the low quadrangular Bodhi, dating from 1200.

PAGANI, pä-gä'nē. A town in the Province of Salerno, Italy, on the Naples-Taranto Railroad, 21 miles southeast of Naples (Map: Italy, J 7). In the Church of San Michele is the tomb of Alfonso de Liguori, founder of the Order of the Redemptorists. There are manufactures of silk and cotton goods and matches. Population (commune), in 1881, 12,780; in 1901, 14,607.

PAGANINI, pä'gä-nē'nē, Niccolò (1782-1840). A famous violinist, born in Genoa, the son of a poor shopkeeper. Under his father's encouragement the child was early imbued with the ambition to become a great violinist, and formed the habit, which he maintained throughout his career, of incessant practice. He studied at first under Servetto, the leader of the Genoa Theatre, and two years later under Costa, the principal violinist and conductor in the Cathedral at Genoa, with whom he made his greatest progress. Other teachers were Gnecco, Alessandro Rolla, and Ghiretti. He produced his first sonata before he was nine years of age, and was also desired by his teacher to perform every Sunday in church a violin concerto, a practice to which Paganini attached great importance, in that it forced him to the constant study of new music. His first appearance in public was in 1793 at Genoa. In 1795 he went to Parma to become a pupil of Rolla, but there is some doubt whether the arrangement was carried out. About this time he evolved a style of fingering and a method of bowing peculiar to himself. Upon his return to Genoa he composed his first studies, which were of such unheard-of difficulty that he frequently was known to have spent ten or twelve hours practicing a single passage. So far, he had been wholly under the control of his father, whose only thought apparently was as to how far he could turn his son's talent to his own financial advantage; but in 1798, after a very successful concert at Lucca, he threw off parental control and made a tour of Pisa and other places. He was everywhere received with the utmost enthusiasm, and although but a youth, he unfortunately became intoxicated with the license of his life and plunged into all kinds of dissipation, especially that of gambling. Alternate periods of gambling and study, both pursued with equal zeal, reacted dangerously on his naturally weak constitution, with the result that illness frequently prevented his fulfilling engagements. On one occasion he was announced for a concert at Leghorn, but having gambled away his money and pawned his violin, he was compelled to appeal for the loan of an instrument to keep his engagement. In this emergency M. Livorn, a French merchant of Leghorn, lent him his Guarnerius, said to be one of the finest violins in the world. After the concert, when Paganini desired to return the instrument, its owner exclaimed, "Never will I profane the strings which your fingers have touched. That instrument is yours." Paganini used this instrument at all his concerts, and at his death bequeathed it to his native town of Genoa, where it is still preserved in the museum. From 1801 to 1803 he lived in comparative retirement at his home, dividing his attention between composition and the guitar, on which instrument he was very proficient. He took up

his concert tours in 1805, meeting, if possible, with greater enthusiasm than before. He was appointed Court solo violinist at Lucca, at which place he remained until 1808, and then for twenty years made concert tours in Italy. In 1828 he began his tours of other countries, commencing with Austria. His opening concert in Vienna was a complete triumph. The gold medal of Saint Salvator was conferred upon him by the city authorities; from the Emperor he received the title of Court virtuoso, and on all sides he was hailed as the popular hero. A similar success greeted him in Germany (1829) and in France (1831). His first appearance in London was on June 3, 1831, and in the year which followed he appeared in the principal cities of England, accumulating a considerable fortune. He then returned to Paris, but revisited England the following season. The winter of 1833-34 was spent in Paris, during which period he maintained a close intimacy with Berlioz, whom he invited to write a concerto for his Stradivarius viola, a request which resulted in the composition of "Harold en Italie." Four years later Berlioz received from Paganini a present of 20,000 francs as a mark of his admiration. In 1834 he returned to Parma and purchased several properties, in one of which, the Villa Bagona, he made his residence for two years. About this time his health gave signs of a complete breakdown. In 1836 he was persuaded to join some Parisian speculators in the establishment of a casino for music and gambling in the fashionable quarter of Paris. It was opened under the name of the Casino Paganini, but the Government refused to sanction gambling, and the venture proved a failure, with great financial loss to Paganini. The end of his career was rapidly approaching. He journeyed to Marseilles, and from there to Genoa, and shortly afterwards to Nice, in which city he died. His technic in double-stops, left-hand pizzicato, harmonics, and staccato approached the miraculous, while his power and control of tone and the intense passion of his style brought his audiences into instant subjection, so that he swayed them at will. He had many personal eccentricities and numberless tricks of virtuosity. His compositions were comparatively few, and included the following: twenty-four capricci for single violin; six sonatas for violin and guitar; three grand quartets for violin, viola, guitar, and violoncello (opus 4, 5); concerto in E_2 (solo part written in D, for a violin tuned a semitone higher; opus 6). Consult: L'Héritier, *Notice sur le célèbre violiniste Niccolò Paganini* (Paris, 1830; Eng. trans., London, 1830); Schottky, *Paganinis Leben und Charakter* (Hamburg, 1830); Fétis, *Biographical Notice of Niccolò Paganini* (trans. from the French, London, 1871).

PAGE, Mr. In Shakspeare's *Merry Wives of Windsor*, a gentleman to whom, under the name of Brook, Falstaff boasts of his conquest of Mrs. Page and in consequence becomes a laughing-stock. Page's daughter, Anne, is in love with Fenton.

PAGE, David (1814-79). An English geologist, born at Lochgelly, Fifeshire, and educated at Saint Andrews. His parents had devoted him to the ministry, but he preferred natural science, and worked on a Fifeshire newspaper, besides doing other journalistic work, until 1843, when the Chambers Publishing Company of Edinburgh first employed him as scientific editor. He was appointed professor of geology in Durham University in 1871. Page's especial claim to fame was his ability as a popular writer on geology; he wrote many excellent text-books, such as: *Rudiments of Geology* (1844); *The Earth's Crust* (1864 and after); *Physical Geography* (1864); and elementary and advanced text-books of geology. It is probable that he contributed to *Vestiges of the Natural History of Creation*.

PAGE, David Perkins (1810-48). An American educator, born at Epping, N. H. He was educated at the Hampton Academy, and was afterwards principal of a department in Newburyport High School. In 1845 he was appointed first principal of the Albany State Normal School, a post he held until his death. His work, *Theory and Practice of Teaching, or the Motives of Good School Keeping* (1847), remains a valuable work on the subject. The edition of 1886 contains a biography by W. H. Payne.

PAGE, John (1744-1808). An American patriot, born in Rosewell, Va. He graduated at William and Mary College in 1763, sat in the Virginia House of Burgesses, and became a member of the Colonial Council. He was a member of the convention which, in 1776, framed the Constitution of Virginia; at one time was colonel of a militia regiment; was appointed one of the first councilors; was a member of the Committee of Public Safety; and was Lieutenant Governor of the State. In the course of the war he contributed a large part of his very considerable private fortune to aid the Patriot Party. He was a member of Congress from 1789 to 1797, and in 1802-05 he was Governor of Virginia. Subsequently, until his death, he was commissioner of loans for this State.

PAGE, Thomas Jefferson (1808-99). An American naval officer, born in Gloucester County, Va. He was appointed a midshipman in 1827, and became lieutenant in 1839, and commanded the *Dolphin* against the Chinese pirates. From 1853 to 1860 he was engaged in making surveys of South American rivers. In 1855 he had reached the rank of commodore, but upon the secession of Virginia, resigned from the United States service. He declined the rank of admiral in the Italian Navy, and commanded the Confederate batteries at Gloucester Point, York River, Virginia. He was made commodore in 1862, and was sent to England to superintend the building of two powerful rams on the Mersey, but these were seized by the British Government on the protest of Charles Francis Adams, the United States Minister. In January, 1865, a small ironclad, built for the Confederacy, was commissioned at Copenhagen and called the *Stonewall*. In this he cruised for some time after the collapse of the Confederacy, but turned her over to the Governor General of Cuba in return for $16,000 to pay the crew. Afterwards he engaged in cattle and sheep raising in the Argentine Republic and superintended the building of four gunboats for the navy of that country. The last twenty years of his life were spent in Florence, Italy. He published *La Plata: the Argentine Confederation and Paraguay* (1859).

PAGE, Thomas Nelson (1853—). An American novelist. He was born of old Virginian stock in Oakland, Hanover County, Va. He graduated

Washington and Lee University and studied at the University of Virginia. He practiced for some years in Richmond, Va., then after a second marriage moved to Washington, D. C., where he continued to live. Aside from some dialect poetry, his first noteworthy literary venture was the tale *Marse Chan*, published in the *Century Magazine* in 1884, and incorporated, with *Meh Lady* and other stories, in the volume entitled *In Ole Virginia* (1887). This was followed by *Two Little Confederates* (1888); *Befo' de War*, a collection of his early poems together with poems by A. C. Gordon (1888); *On Newfound River* (1891); *Elsket* (1891); *The Old South*, a volume of essays (1892); *Pastime Stories* (1894); *Red Rock* (1898), a novel of the Reconstruction period; and *Gordon Keith* (1903). These stories, with very few exceptions, deal with Virginia, present negro character, and are noted for the faithfulness and sympathy with which they depict the courtesy, courtliness, and high spirit of the aristocracy of that State just before, during, and after the Civil War.

PAGE, William (1811-85). An American portrait and historical painter. He was born at Albany, N. Y., and in 1819 moved with his parents to New York City. He first studied with S. F. B. Morse, through whom he entered the Academy of Design. From 1828 to 1830 he studied theology at Andover and Amherst, but, returning to art, he took up portrait painting at Albany, and later at New York, where, in 1836, he was made National Academician. His works of this period include portraits of Governor Marcy for the New York City Hall, and John Quincy Adams for Faneuil Hall, Boston; "The Holy Family," Boston Athenæum; "The Infancy of Henry IV.;" and others. In 1849 he went abroad, residing at Rome and Florence, where he made many fine copies of Titian and painted his celebrated "Venus," the "Flight Into Egypt," the "Infant Bacchus," besides portraits of Robert and Elizabeth Browning and others. In 1860 he returned to New York, and in 1871-73 was president of the Academy of Design. He afterwards painted portraits of Henry Ward Beecher, Wendell Phillips, Charles P. Daly, James Russell Lowell, and General Grant. He published a *New Geometrical Method of Measuring the Human Figure* (New York, 1860).

PAGÈS, pä'zhĕs'. See Garnier-Pagès.

PAGET, pāj'ĭt, Sir George Edward (1809-92). An English physician and reformer of medical education, born at Great Yarmouth, Norfolk. He studied at Charterhouse School and at Gonville and Caius College, Cambridge, and got his medical education at Saint Bartholomew's Hospital and in Paris. He practiced in Cambridge, and in 1842 his suggestion of bedside examinations for medical students was adopted by the university. Paget represented Cambridge in the General Council of Medical Education (1863 sqq.) and served as its president (1869 and 1874). For the last score of years of his life he was regius professor of physic in Cambridge. Paget wrote little besides papers for the *Lancet*, the *British Medical Journal*, and the *Edinburgh Medical Journal*.

PAGET, Henry William. See Anglesey, First Marquis of.

PAGET, Sir James (1814-99). An English surgeon and pathologist, born at Yarmouth. He became apprenticed there to Charles Costerton, a practitioner, from whom he gained the rudiments of medical knowledge. Having finished his apprenticeship, Paget, in 1834, entered Saint Bartholomew's Hospital, London, where he distinguished himself in his first year by discovering the *Trichina spiralis*. At the end of his second year he carried off all the honors. He was soon made curator of Saint Bartholomew's Hospital Museum, and in 1839 demonstrator in the hospital. In 1842 he undertook an immense task which resulted in the publication of the *Descriptive Catalogue of the Pathological Specimens Contained in the Museum of the Royal College of Surgeons* (London, 1846-49). He prepared a similar catalogue for Saint Bartholomew's Hospital Museum. From 1847 to 1852 he was professor of anatomy at the College of Surgeons, and during this period delivered the famous lectures on surgical pathology which gave him a wide reputation. He became surgeon to Saint Bartholomew's Hospital in 1861; he was also made sergeant-surgeon to the Queen, surgeon to the Prince of Wales, and in 1871 was made a baronet. His chief works, besides the *Descriptive Catalogue*, were his *Lectures on Surgical Pathology* (London, 1863), which were for many years the standard text-book in England and the United States.

PAGET, Violet (pen-name Vernon Lee) (1856—). An English author, who in 1871 settled in Italy. From her we have several novels and many brilliant essays on art and literature. Among her publications are: *Studies of the Eighteenth Century in Italy* (1880); *Belcaro*, a volume of essays (1881); *The Prince of the Hundred Soups*, a fairy tale (1883); *Ottilie, an Eighteenth Century Idyll* (1883); *Euphorion*, a collection of essays (1884); *Miss Brown*, a novel (1884); *Baldwin*, philosophical dialogues (1886); *A Puppet Show* (1889); *Hauntings* (1890); *Vanitas* (1892); *Althea* (1893); *Renaissance Fancies* (1895); *Limbo*, a volume of essays (1897); *Genius Loci* (1899).

PAGGI, pä'jē, Giovanni Battista (1554-1627). An Italian painter, born in Genoa. He was a pupil of Luca Cambiaso, and lived in Florence twenty years, painting for the Medici. His best works in Florence are "Saint Catharine of Siena," in Santa Maria Novella, and the "Transfiguration," in San Marco. In 1600 he returned to Genoa and there became one of the most noted of the Genoese school. His two pictures in San Bartolommeo, and his "Massacre of the Innocents" in the Palazzo Doria, are good examples of his graceful treatment of sacred subjects. He is less successful as a colorist.

PAGO'DA (Sp. *pagoda*, from Pers. *butkadah*, idol temple, pagoda, from *but*, idol + *kadah*, temple; Chinese, *peh-kuh-t'a*, *poh-kuh-t'a*, white bone tower, *pao-t'a*, precious tower, *t'a*, tower, pile). A temple of Eastern Asia, or part of a temple, and generally a tower-like mass of many stories. As the term is European and applied to a non-European building, and as it is in careless popular use without exact significance, it can be said only that the idea generally conveyed by it is that of an Eastern religious tower. Thus an accurate writer describing Buddhist temples in Japan will speak of the hondo or temple proper, the gateway building, and the pagoda; but the

word 'pagoda' is not Japanese. These buildings in Japan are always of wood.

In the magnificent stone-built Buddhist temples of India the pagoda is generally a pyramidal structure raised above a gateway, or above the inner sanctuary; just as in a Christian church there may be a tower at the west end, or one over the crossing, or both. These Indian pagodas are among the most splendid buildings of pure monumental design in the world. The term is also applied to the tope or stupa; but this is clearly unnecessary and should be avoided. See TOPE.

In China a pagoda is often a memorial building and not connected with a temple or a monastery. The most common form is an octagonal tower of many stories, with curved roof, and a piece of roof like that of a veranda surrounding each story. Most Chinese pagodas are built of brick, with no very great architectural pretension, but they are effective in outlines, and their great number in certain parts of the Empire adds a peculiar charm to the landscape. But little archæological and critical study has been given to them (see CHINESE ART), and the books of recent travelers illustrated with specially taken photographs have added very greatly to our understanding of the great number and variety of them which exist in many of the provinces. Consult the authorities mentioned under CHINESE ART.

PAGO-PAGO, päng'ō-päng'ō, or **PANGO-PANGO.** A splendid natural harbor on the south coast of Tutuila (q.v.), the chief of the Samoan Islands (Map: Australasia, L 4). It was ceded to the United States in 1872 for a naval and coaling station, and during the imbroglio over the local kingship in 1898 was occupied by a United States naval contingent. By the Anglo-German agreement of 1899, it came under the protection of the United States with part of the Samoan group in 1900.

PAHANG, pä-häng'. The largest of the Federated Malay States (q.v.), situated on the eastern coast of the Malay Peninsula and bounded by the independent native States of Kelantan and Trengganu on the north, the China Sea on the east, the States of Negri Sembilan and Johor on the south, and the protected States of Perak and Selangor on the west (Map: Burma, D 6). Its area is officially estimated at 14,000 square miles. It is a thickly wooded and partly mountainous region traversed by the shallow Pahang River, which is formed by the confluence of the Jelai and the Tembeling. The coast is mostly sandy and indented at the mouths of the rivers, which are accessible only during high tide. The climate is cooler than on the western coast and the soil well adapted for agriculture. The State is noted for its gold deposits, which are successfully worked by European mining companies, electricity being used as the motive power. Tin lodes are extensively worked along the Pahang River. The Malays are chiefly engaged in agriculture, while for mining Chinese are mostly employed. The financial condition of the State is unsatisfactory, but the revenue is gradually increasing. While Pahang is the largest of the Federated Malay States in area, it is the least populated. The census of 1901 gives the population as 84,113, including 134 Europeans, Americans, and Australians, 73,462 Malays and other natives (including 7340 aborigines), 8695 Chinese, and 1227 Tamils and other natives of India. A British resident was first appointed to the Sultan of Pahang in 1888, and the State joined the Federation in 1895. The seat of administration is Kuala Lipis.

PAHARIA, pä-hä'rē-ä. An alternative name for the Mâler, of the Rajmahal Hills in Bengal, one of the northern Dravidian peoples. Farther south in the same region dwell the Mal-Paharias, whose affinities are not very clear. One of the sections of the population of Nepal, speaking a neo-Aryan dialect, is also called Paharia. Some account of the Dravidian Paharia will be found in Dalton, *Descriptive Ethnology of Bengal* (Calcutta, 1872), and the works of a general character relating to the Dravidian peoples. See DRAVIDIANS.

PAHLANPUR, pä'lân-pōōr'. A native State of India. See PALANPUR.

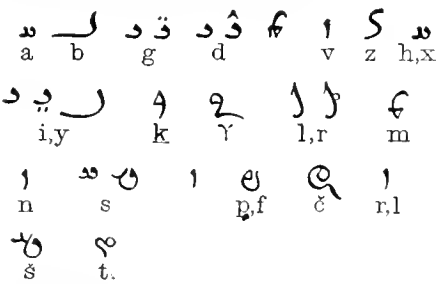
PAHLAVI (pä'lä-vē) **LANGUAGE AND LITERATURE** (from Pers. *Pahlav*, hero, name of a district about Ispahan, from OPers. *Parθava*, Parthia; cf. Skt. *Pahlava*, Persian). The language and literature of the middle Persian period, extending from the third to the ninth or tenth century A.D. The language is closely akin to Old Persian (q.v.) and Modern Persian (see PERSIAN LANGUAGE), although it stands far nearer to the latter than to the former. In its phonology Pahlavi in the main agrees with modern Persian. The principal divergencies are as follows: Original initial *a*, lost in Persian, is still found in Pahlavi, as Pahlavi *anumīd*, Persian *umīd*, 'hopeless,' Pahlavi *anāk*, Persian *nāk*, 'evil;' the diphthongs *ē* and *ō* (Indo-Iranian *ai*, *au*, Sanskrit *e*, *o*, Avesta *aē*, *aō*) are retained unchanged in Pahlavi, except that in the later period before *m* and *n* they become *ī*, *ū*, while in Persian they are changed to *ī* and *ū* throughout, as Avesta *daēva*, Pahlavi *dēv* (cf. the Armenian loan-word *dew*), 'demon;' Avesta *yaōsh*, Pahlavi *rōz* (cf. the Armenian loan-word *rocik*, 'daily bread'), Persian *rūz*, 'day;' but Avesta *daēna*, Pahlavi *dēn* (cf. the Armenian loan-word *den*), *dīn*, Persian *dīn*, 'creed;' Avesta *haoma*, Pahlavi, Persian *hūm*, 'sacred plant;' original intervocalic *k* and *p* are retained in Pahlavi, but become *g*, *d*, and *b* or *v* in Persian, as Old Persian *bandaka*, 'slave,' Pahlavi *bandakān*, Persian *bandagān*, 'slaves;' Old Persian *api*, Pahlavi *āp*, Persian *āb*, 'water;' Old Persian *niyapišam*, 'I wrote,' Pahlavi *nipištan*, Persian *nivištan*, 'to write;' initial *v* remains unchanged in Pahlavi, but in Persian becomes *b* or *g*, as Old Persian *vasiy*, Pahlavi *vas*, Persian *bas*, 'much;' Avesta *vazra*, Pahlavi *vas*, Persian *bas*, 'much;' Iranian *s* is retained in Pahlavi, but becomes *h* in Persian, as Avesta *kasu*, Pahlavi *kas*, Persian *kah*, 'small.'

Like modern Persian, Pahlavi has lost all the nominal inflections excepting the plural ending, as *rūbān*, 'soul,' plural *rūbānān*, and the *ī* or *izāfat* which serves to express the genitival and adjectival relations, as *granāk-ī ātaš*, 'heat of the fire;' *zan-ī pagāhar*, 'nobly born wife.' The other case relations are expressed by prepositions, as *ō ōy gōft*, 'he said to him;' *mahīst pa tanō*, 'greatest in body;' *frafām mēn marahān*, 'first of men.' Plural adjectives in Pahlavi receive no termination unless they are employed as substantives, and then, as a rule, only if there is no accompanying word to show the plural, as *darvandān*, 'wicked (men),' but *hamāk ān ī*

buland kōf, 'all the high mountains,' while the attributive adjective is invariable, as *niāk būdand*, 'they are good.' The comparative and superlative degrees are formed by *-tar*, and *-tām* or *-ist* respectively, as *hūp*, 'good,' *hūptar*, 'better;' *tag*, 'brave,' *tagatūm*, 'bravest;' *kam*, 'few,' *kamist*, 'least.' The pronouns and numerals do not differ essentially from those found in modern Persian. The conjugation is very simple. The active voice alone remains, the passive being periphrastic in its formation. The moods are indicative, imperative, subjunctive (corresponding to the modern Persian precative), and potential (corresponding to the Old Iranian optative), besides a present, a past, and a future participle, and an active infinitive. The old tenses are the present and preterite; the other tenses, perfect, pluperfect, future perfect, present and perfect conditional, and perfect subjunctive, are periphrastic. The inflection of the verb is almost the same both in Pahlavi and in modern Persian, as may be seen from the following comparative table of the present Pahlavi *darīdanō*, and Persian *darīdan*, 'to tear:'

	Pahlavi.	Persian.
Singular	*darēm*	*daram*
	darē	*darī*
	darēd	*darad*
Plural	*darēm*	*darīm*
	darēd	*darīd*
	darēnd	*darand*

From the grammatical sketch just given one might reasonably infer that Pahlavi was one of the easiest of languages. On the contrary, it presents two problems of great difficulty. These are the alphabet and the Semitic forms which abound in the literature, which, though simple if the script were adequate, are often rendered extremely doubtful on account of the meagre alphabetical system. The Pahlavi alphabet, which is read from right to left, is based on an Aramaic script, and is closely related to that of the Avesta (q.v.). There are two varieties, the Chaldæan Pahlavi, used only in two of the oldest inscriptions in the language, and the Sassanian Pahlavi, which became with some modifications the literary script, the so-called Book-Pahlavi. This latter alphabet is as follows:



The ambiguity of these single characters is complicated by the ligatures, as  , *am*, *ām*, *hm*, *xm*,  , *madamam*,  , *ahū*, *axū*, *āān*, *āhū*, *ahn*, *āxū*, *hār*, *hān*, *xān*, *zdān*, *čšra*, *išn*, *dahišn*, *īyār*, *īyān*, *īkūn* or *īgān*, *sān*, *yčhō*, etc., of which there are a little more than a hundred, many of which admit of several different readings. The fact must be emphasized, however, that the ambiguity is not so great as it seems at first sight. Since the alphabet is Semitic, the vowels are not written, for initial *a* is a consonant in Semitic grammar, although *ī* and *ū* may be denoted, as in the Aramaic alphabet, by *y* and *r*. The Semitic words give a peculiar aspect to Pahlavi. They are not loan-words, as is the case with the Arabic element in Persian, but seem to have been logograms, i.e. Semitic words were written, but Iranian words were pronounced. This may not only be inferred from the statement of Ammianus Marcellinus that Shapur II. (c.309-c.379) was called *Saunsaan* (i.e. *Shāhān-Shāh*, Old Persian *xšāyaθiya xšāyaθiyānām*, 'king of kings'), although his coins bear the Aramaic equivalent, *malkān malkā*, but it is stated positively by Ibn Mukaffa, who flourished about the middle of the tenth century. He says that in their spelling, called *Zarārišn*, one wrote for 'meat' the Aramaic *bisrā*, but read for this logogram the Iranian equivalent *gōšt*, and in like manner for 'bread,' one wrote the Aramaic *lahma*, but read for it the Iranian *nān*. The Pahlavi which contains both Iranian words and Aramaic logograms is called Huzvaresch (Pahlavi *Āūzvarišn*, Persian *Zvārīš*, *Uzvārīš*, *Uzvārišn*). The meaning of this term is uncertain, but of the many explanations which have been advanced, that which connects the word with the Avesta *zbar*, 'to be distorted,' from which the Arabic verb *zavvara*, 'to conceal, distort, falsify, deceive, trick, mislead,' has been borrowed, seems quite probable. If this etymology is correct, the term seems to have been employed on account of the disguise of the Iranian words by the Aramaic logograms. Another plausible etymology connects the name with the obsolete Persian *zuvārīdan*, 'to be old or worn out,' in allusion to the archaic Persian found in Pahlavi as compared with the modern language. There is a native lexicon, known as the *Sassanian Frahāng* or *Frahāng-i Pahlavīy*, which gives a list of about 1300 Semitic logograms with their Iranian equivalents. The difficulties of Huzvaresch led at a later period to a transcription from the Pahlavi characters. The Semitic logograms were then omitted, and in their stead their Iranian equivalents were written. The term applied to this Iranized Pahlavi is Pazend or Parsi, although usage differs somewhat, as some authorities call the texts Pazend and the language Parsi, while the more common and better distinction defines the transcription in Avesta letters as Pazend, while that in Persian and Gujarati script is called Parsi.

The correct forms of Pahlavi words are often problematical on account of the inadequate alphabet, and the traditional readings of many of them are certainly incorrect. The common means of determination by comparison with Avesta and Persian cognates, with the Aramaic equivalents of the logograms, and with the numerous Armenian loan-words from Middle Persian, often renders a fairly accurate restoration of the original form of the Pahlavi words possible.

Pahlavi literature is of considerable extent, although its literary value is slight. It may be divided into three classes—Pahlavi translations, intermingled with commentary, of the Avesta, texts on religion, and treatises on miscellaneous

subjects. Of the first class the most important published texts are the *Pahlavi Vendidād*, *Yasna*, and *Vispered*, the *Hāṭōxt Nask*, the *Aogemadaēčā*, the latter two dealing mainly with eschatological subjects and with death, and the *Frahang-ī Oīm-aēvak*, a dictionary of (Iranian) Pahlavi words, with their Avesta equivalents. Of the Pahlavi texts on religion, the principal are the *Dīnkart*, a large work of which six books have been preserved, treating of Zoroastrian customs, doctrines, and literature; the *Būndahisn*, which gives the Iranian cosmogny; the *Dātistān-ī-Dīnīk*, a series of replies to ninety-two inquiries on religious questions; the *Šikand-gūmānīg Vijār* (of which only the Pazend text and a Sanskrit translation are thus far known), a most important source for a knowledge of Zoroastrian philosophy, and of interest also for its criticisms of Christianity, Manichæism, and Mohammedanism; the *Šāyast-lā-šāyast*, on the duties of Zoroastrians and the dangers which beset them; the *Dīnā-ī-Maīnōg-ī Xrat*, being the answers of the 'Spirit of Wisdom' to seventy-two inquiries concerning the faith; the eschatological treatises of the *Artā-ī-Vīrāf Nāmak* and the *Bahman Yast*; and the *Mātīgān-ī Yōšt-ī Fryānō*, containing Yosht's replies to thirty-three riddles propounded to him by the wizard Akht, whom he answers and destroys. The third division has as its most important texts the *Yātkār-ī Zarīrān*, a history of the war resulting from Zoroaster's conversion of Vishtaspa (see ZOROASTER), the historical romance of the *Kārnāmak-ī Artaxšīr-ī Pāpakān*, and a geographical treatise, the *Satrōīhā-ī-Aīrān*, which describes about a hundred cities in Iran.

Gosht-i Fryano, and Hadokht Nask* (Bombay, 1872; this contains also a valuable table of Pahlavi ligatures and an outline of the grammar by West); Jamasp Asa, *Arda Viraf Nameh* (Bombay, 1902); Barthélemy, *Gujastak Abâlis, relation d'une conférence théologique* (Paris, 1887); Peshotan, *Ganje shayagân, Andarze Atrepât Mârâspandân, Mâdigâne Chatrang, and Andarze Khusroe Kavâtan* (Bombay, 1885); Sheriarjee Dadabhoy, *Pandnâmeh-i Aderbad Mârasfand* (ib., 1869); Noldeke, "Geschichte des Artachsîr-i Pâpakân, aus dem Pehlewi übersetzt," in Bezzenberger, *Beiträge zur Kunde der indogermanischen Sprachen*, vol. iv. (Göttingen, 1878); Modi, *Aiyadgâr-i-Zarîrân, Shatrôihâ-i Airân, and Afdiya va Sahigiya-i Sistan* (Bombay, 1899); id., *Mâdigân-i Hazar Dâdistân* (ib., 1901).

PAHLEN, pä'len, PETER LUDWIG (1745-1826). A Russian general best known as one of the murderers of the Emperor Paul I. (q.v.). Entering the military service at an early age, he fought in the wars against the Turks and participated in the storming of Otchakov in 1788. In 1790 he became lieutenant-general, three years later was made Governor of Livonia, and in 1795 of Courland. He was raised to the rank of count in 1799 and in the following year became head of the ministerial council. After taking a leading part in the conspiracy which brought about the death of Paul I. (March 23, 1801) he continued for some time in the service of Alexander I., but retired in 1804.

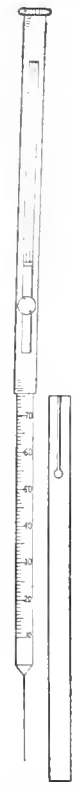
PAILA, pī'lā. A Hindu sage, who, according to the Puranas (q.v.), was a pupil of Vyasa (q.v.). When Vyasa had composed the Vedas (q.v.), he divided them into four parts, giving one to each of his four favorite pupils. In this way Paila became the teacher of the Rig-Veda, Vaiśampayana of the Yajur-Veda, Jaimini of the Sama-Veda, and Sumantu of the Atharva-Veda, while the Itihasas and Puranas, also composed by Vyasa according to Indian tradition, were intrusted to Romaharshana. Consult Muir, *Original Sanskrit Texts*, vol. iii. (London, 1868).

PAILLERON, pä'ye-rôN', ÉDOUARD JULES HENRI (1834-99). A French dramatist and satirist, born in Paris. He began life as a notary's clerk, but at twenty-six gained notoriety by satiric verses, *Les parasites* (1860), and a comedy, *Le parasite* (1860). With *Le monde où l'on s'ennuie* (1881) popularity became fame. This is one of the wittiest satires on fashionable literary coteries ever written and is supposed to count among its *dramatis personæ* several contemporary Parisian celebrities, notably Professor Caro. In 1882 Pailleron was elected to the Academy. He wrote a few other plays, but he never equaled the success of *Le monde où l'on s'ennuie*. *La souris* (1887) is his only other noteworthy play. Consult his *Pièces et morceaux* (1897).

PAIN (OF., Fr. *peine*, from ML. *pena*, Lat. *poena*, pain, punishment, from Gk. ποινή, *poinē*, penalty; connected with Gk. τίνειν, *tinein*, to pay, Skt. *ci*, to avenge). A term employed by psychologists of the English associationist school (see ASSOCIATION OF IDEAS) for what

termed unpleasantness (see AFFECTION), pleasure and pain being the two fundamental qualities of the affective life. But the concrete pains of everyday experience are, as even a superficial introspection shows, partly matters of sensation. "Pain (*Schmerz*) is always at once a sensation and a violent feeling of unpleasantness (*Unlustgefühl*)" (Wundt). It is therefore impossible to restrict the term to the sphere of affection.

Under the heading CUTANEOUS SENSATIONS, it is noted that pain is, as a matter of fact, a distinct and specific cutaneous quality, having as its terminal organs the free nerve-endings in the epidermis. The pain-spots are constant in position, and pain-maps can be drawn which furnish as permanent and valid records of the pain sensitivity as do the pressure and temperature maps of their cutaneous qualities. We have here, then, merely to discuss pain as an organic sensation (q.v.).



HAIR ÆSTHESIOMETER FOR PAIN AND PRESSURE SPOTS.

It was formerly supposed that pain was a common sensation, excitable by excessive stimulation of any and every sensory nerve, optic, acoustic, etc. This theory still lingers in the belief, e.g. that there are special temperature pains producible and only producible by excessive thermal stimulation of the cutaneous surface. But it found its chief support in the great variety of organic pains. There seems to be no internal organ, however insensitive during healthy function, that cannot mediate pain when the function is deranged. And the pains vary in character, according to their place or mode of origin. They may be throbbing, as in toothache; dull and gnawing, as in extreme hunger or in inflammation of the bowels; dull and throbbing, as in lesion of the rectum; acute and shooting, as in neuralgia; acute and intermittent, as in colic; acute and constant, as in peritonitis; dull and nauseating, as in certain diseases of the ovaries and testicles; pressing, boring, constricting, cutting, piercing, as in headaches; burning or smarting, as in certain skin wounds; dragging, as in certain forms of rheumatism. It is very natural — indeed, it seems at first sight necessary — to explain these differences as differences of quality; to assume the existence of many different kinds of pain. If we look at the facts more closely, however, we see that certain of the descriptive adjectives point unmistakably to simple differences of time and of intensity. A throbbing pain is an interrupted pain; a shooting pain is one that shows, besides intermittence, a quick rise of intensity as it runs its course; a piercing pain is intensive, a dull pain weaker. Moreover, all the concrete pains are intermixed with the specific sensations (pressure, various organic qualities) peculiar to the organs which mediate them: a sickening pain contains the sensation of nausea, a dragging pain contains a mass of muscular sensations. These concomitant sensations, again, are variously localized: an acute pain seems to occupy a small area, a dull pain is massive, wide-spread. When we take these facts into account, and remember the specific differences to which variations of time and intensity may give rise in conscious complexes other than pains, we shall hardly resist the conclusion (suggested also by introspection) that the pain quality is one and the same throughout. There is one pain; there are many pains. The many pains differ temporally, intensively, and in their associations; not qualitatively. The organ of this organic pain quality must then be looked for in the muscle substance; but whether it consists of a free nerve-ending, like the pain-ending of the epidermis, we do not know. Consult: Titchener, *Experimental Psychology* (New York, 1901); Wundt, *Physiologische Psychologie* (Leipzig, 1893).

MACDONALD'S TEMPORAL ALGOMETER.

PAIN, BARRY (?—). An English author. He was educated at Cambridge, was an army tutor at Guildford, and in 1890 removed to London. He succeeded Jerome K. Jerome as editor of *To-Day*, in 1897. Pain is at his best as a parodist and fantastic humorist. He wrote: *In a Canadian Canoe* (1891); *Playthings and Parodies* (1892); *Stories and Interludes* (1892); *Graeme and Cyril*, a juvenile (1893); *Wildmay, and Other Stories of Women* (1898); *Eliza* (1900); and *Another English Woman's Love Letters* (1901).

PAINE, CHARLES JACKSON (1833—). An American soldier and sportsman, born in Boston. He graduated at Harvard in 1853, and made a considerable fortune in railroad enterprises. In 1861 he entered the Federal service as a captain in the Twenty-second Massachusetts. The next year he was sent to Ship Island, Miss., and in October was commissioned colonel of the Second Louisiana Volunteers, a negro regiment. During the siege of Port Hudson (May 24-July 8, 1863), he commanded a division. On March 4, 1864, he resigned, but the following July again entered the service as a brigadier-general, and on September 29th led a division of negro troops at Newmarket, Va. On January 15, 1866, he was brevetted major-general of volunteers. During his later years he took a great interest in yachting and built, or helped to build, the *Puritan*, the *Mayflower*, and the *Volunteer*, each of which successfully defended the *America's* Cup against a British challenger.

PAINE, JOHN ALSOP (1840—). An American archæologist, born in Newark, N. J., and educated at Hamilton College and at Andover Theological Seminary. He left the ministry to take up botanical work for the Board of Regents of New York State (1862), was two years professor of natural science at Robert College, Constantinople (1867-69), and acted as archæologist to the first expedition in the country east of the Jordan, sent out by the Palestine Exploration Society in 1872. He became curator of the

Metropolitan Museum of Art, New York City, in 1889.

PAINE, JOHN KNOWLES (1839—). An American composer, born in Portland, Me. His most important home teacher was Kotzschmar at Portland, after which he went to Berlin, where he studied organ and counterpoint under Haupt, singing under Fischer, and instrumentation under Wieprecht. Returning to Boston in 1861, he settled there as an organist, and gave organ concerts in various cities. In 1862 he taught music at Harvard, and in 1876 was raised to full professor, and the first chair of music in an American university was created. His early compositions belong to the strictly classical school, of which he was for years an unyielding adherent, but his later works lean toward the romantic school. His works include: mass in D (1867); *Saint Peter*, oratorio (1873); *Centennial Hymn* (1876); music to *Œdipus Tyrannus*, of Sophocles, for male voices and orchestra (1881), considered by many to be his masterpiece; *The Realm of Fancy*, cantata for soprano solo, chorus, and orchestra (1882); *Phœbus, Arise*, cantata for tenor solo, male chorus, and orchestra (1882); *The Nativity*, cantata (1883); *Song of Promise*, cantata (1881); symphony in C minor (1876); *Spring*, symphony (1880), in which the first indications appeared of his conversion to the romantic school; overture to *As You Like It* (1878); overture to *The Tempest* (1877); duo concertante for violin and violoncello (1878); *An Island Fantasy*, symphonic poem (1888); chamber and pianoforte music, songs and part songs, and compositions for the organ.

PAINE, MARTYN (1794-1877). An American physician. He was born in Williamstown, Vt., and in 1813 graduated at Harvard. He was one of the founders of the University Medical College (1841) (now the medical department of New York University), where he was a professor from 1841 to 1867. Among his works the best known are: *Cholera Asphyxia at New York* (1832); *Medical and Physiological Commentaries* (1840-44); *Institutes of Medicine* (1847); and a *Review of Theoretical Geology* (1856).

PAINE, ROBERT TREAT (1731-1814). An American lawyer and patriot, one of the signers of the Declaration of Independence. He was born in Boston, Mass., graduated at Harvard in 1749, and then taught school and studied for the ministry, acting as chaplain of the Northern troops in 1755. He subsequently studied law, and in 1759 was admitted to the bar. In 1768 he was a delegate to a convention called by prominent citizens after Governor Bernard had dissolved the Legislature for refusing to rescind its circular letter to the other colonies, and in 1770 he managed, in the absence of the Attorney-General, the prosecution of Captain Preston and his men for firing upon the citizens on March 5th. (See BOSTON MASSACRE.) In 1773-74 he was a member of the Massachusetts Assembly; was one of the representatives of Massachusetts in the Continental Congress from 1774 to 1778; and was a signer of the Declaration of Independence. He was Speaker of the Massachusetts House of Representatives in 1777; helped draft the new State Constitution in 1779; was Attorney-General of the State from 1780 to 1790; and was an associate justice of the Massachusetts Supreme Court from 1790 to 1804, when he resigned on account of deafness. Besides being an able lawyer, he was well known for his scholarly attainments, and in 1805 received the degree of LL.D. from Harvard. He was one of the founders (1780) of the American Academy of Arts and Sciences.

PAINE, ROBERT TREAT (1773-1811). An American poet, son of the preceding, born at Taunton, Mass. His name was originally Thomas, which was changed in 1801 to that of his father. He was graduated from Harvard College in 1792. In 1794 he started a fortnightly literary paper called the *Federal Orrery*. For this he wrote the *Lyars* and the *Jacobiniad*, satirical poems full of personalities; these made him bitter enemies, and several times caused him to be assaulted. He then became interested in the theatre, and in 1795 he married Miss Baker, an actress. The same year, upon taking the degree of A.M., he read a poem upon *The Invention of Letters*, which brought him temporary reputation, as did also *The Ruling Passion* and *Adams and Liberty* (1798). He then took to the law, studying in Newburyport under Theophilus Parsons and practicing in Boston in 1802. The last years of his life were passed in destitution. His work is without lasting qualities.

PAINE, THOMAS (1737-1809). An Anglo-American political and philosophical writer and agitator. He was born at Thetford, Norfolk, England, January 29, 1737, the son of a Quaker. His schooling was over by the time he was thirteen, and he was then put to his father's trade of staymaking. In 1759 he established himself as a staymaker at Sandwich, Kent, and in 1762 he became an excise man. In 1765 he was discharged because he had testified to having performed certain duties which he had really neglected, and went back to his trade. In 1766 his petition for restoration was granted, but he did not take up the work again till 1768, supporting himself in the interval by teaching in London, where he also preached as a Methodist. In 1771 he kept a tobacco shop at Lewes, Sussex. In 1772 he was chosen by the excisemen to plead for an increase in their salaries, but was not successful. In 1774 he was again discharged from the excise service, this time on the ground, as officially stated, "of having quitted his business without obtaining the board's leave for so doing, and being gone off on account of the debts which he had contracted." In October, 1774, he emigrated to America with a letter from Benjamin Franklin to Richard Bache of Philadelphia, who introduced him to Robert Aitkin. He found employment as an editor for eighteen months of Aitkin' *Pennsylvania Magazine, or American Monthly Museum*. Paine entered heartily into the spirit of the times, allying himself from the first with the Patriot or Whig Party. On January 9, 1776, he published his famous pamphlet, entitled *Common Sense*, in which he argued that "government, even in its best estate, is a necessary evil," that there is no warrant or reason for "the distinction of men into kings and subjects," and that the American colonies, owing no real allegiance to the British Crown, from which they had suffered innumerable grievances, "should forthwith become independent." The pamphlet expressed with great force the views of the more radical Whig element and

a remarkable influence throughout America, and did much to win over the timid and the wavering to the side of those who advocated separation from the mother country.

In the fall of 1776 Paine enlisted in the Continental Army, and for a time was a volunteer aide-de-camp on the staff of General Greene. His military experience was brief. It prompted the first issues of *The Crisis*, a series of sixteen pamphlets, which was written by him over the signature 'Common Sense' between December, 1776, and December, 1783, and which, like his earlier pamphlet, were much read and had a powerful influence over the people. In January, 1777, Paine was appointed secretary to the commission sent by Congress to treat with the Indians at Easton, Pa., and in April he was elected secretary to the Congressional Committee of Foreign Affairs. He was virtually compelled to resign, January 8, 1779, because he had used in print information which had come to him in his official capacity. He became a law clerk, and was clerk of the Pennsylvania Assembly for a year. In 1781 he went as secretary to John Laurens, who had been sent to France on a Government mission to raise money. The two were cordially received by the King, and returned "with 2,500,000 livres in silver, and in convoy a ship laden with clothing and military stores." In February, 1782, at the suggestion of Washington, Congress granted $800 to Paine on condition that he should use his pen in support of the country. In 1784 the State of New York presented him with 277 acres of land at New Rochelle, and Pennsylvania with £500; and in 1785 Congress gave him $3000. He was thus relieved from poverty, and employed his leisure in experimentation, especially in perfecting his iron bridge, an invention of merit.

In 1787 Paine went to France, where he exhibited his bridge to the Academy of Sciences in Paris. He also visited England, and was lionized in London by the party of Burke and Fox. He set up the model of his bridge on Paddington Green, and huge crowds went to see it. But he brought himself into odium by writing in 1791 and 1792 his pamphlet *The Rights of Man*, in reply to Burke's *Reflections Upon the Revolution in France*. Notwithstanding Burke's kind treatment of him and their former friendly relations, he accused Burke of ignorance, prejudice, and blind partisanship. The English Government brought a suit against him for his attack upon the English Constitution in the second part of the *Rights of Man*, and in his absence passed a sentence of outlawry (December, 1792). Paine had already gone to France. There he was enthusiastically received. The National Assembly gave him the title of citizen (August 26, 1792), along with Washington, Hamilton, and Madison, and several departments elected him as their deputy to the French Convention. Paine accepted the election of Pas-de-Calais, and attended the sessions of the Convention. He could not speak French, and had translations of speeches read for him while he stood upon the tribune. The most important business then in hand was the deposition of the King, and Paine was courageous enough to speak and vote against his execution. He even offered him a temporary asylum in the United States. When the Girondists, with whom he acted, fell from power, he was ejected from the Convention on the ground of being a foreigner, and on December 28, 1793, was committed to the Luxembourg Prison, where he was kept for ten months. Just before his arrest he had finished the first part of his *Age of Reason*, the famous exposition of Deism, and had committed it to his friend Joel Barlow. While in prison he worked upon the second part. His release (November 4, 1794) was mainly due to the change in the government. He was unanimously restored to his seat in the Convention, and sat there until its adjournment (October 26, 1795). In the same year he attracted considerable attention by making a bitter attack upon Washington, whom he charged, among other things, with inefficiency and treachery.

Paine returned to America in 1802, and landed at Baltimore, October 30th. He found that his services in the cause of the colonies were in some quarters gratefully remembered, but that his *Age of Reason* had cost him the esteem of the religious part of the community. He suffered also from ill health, and became careless in manners and morals. He lived successively at Bordentown, N. J., at New Rochelle, N. Y., and in New York City. He died in New York, June 8, 1809, and was buried in New Rochelle, where a monument was erected to him in 1839, although his body had been exhumed and carried to England by direction of William Cobbett in 1819. As a writer Paine was forceful and original. His versatility is shown by the variety of the topics which engaged his attention. His attack upon the Bible was unscholarly and ignorant, and his defiant assertion of Deism brought him into great ill repute in his time. The best edition of his works is by Moncure D. Conway (4 vols., New York, 1894-96), who has also written his biography (ib., 1892; condensed ed. 1902). Consult, also, Tyler, *Literary History of the American Revolution* (New York, 1896).

PAINE, William H. (1828-90). An American engineer, born in Chester, N. H. He did much to improve roads and engineering methods in California in 1849, surveyed a line for a railroad from Sacramento to Utah (1853), and in 1861 volunteered in the Union Army. He served throughout the war, attained the grade of colonel, and made valuable maps. He worked under Roebling as consulting engineer on the Brooklyn (N. Y.) Bridge, and for a time superintended the entire work. The cable system on the bridge was planned by Paine; and he built and engineered cable roads in New York City, Omaha, Denver, Kansas City, and Cleveland.

PAINESVILLE, pānz'vĭl. A city and the county-seat of Lake County, Ohio, 29 miles east by north of Cleveland; on the Grand River, and on the New York, Chicago and Saint Louis, the Lake Shore and Michigan Southern, and the Pittsburg and Western railroads (Map: Ohio, il 2). It is the seat of Lake Erie College, opened in 1859, and has a public library with more than 5500 volumes. A massive stone viaduct spans the river at this point. Painesville is of considerable commercial importance, being situated but three miles from Fairport, on Lake Erie, where there is a fine natural harbor with extensive ore docks. Its industrial establishments include a grain elevator and flouring mills, foundries and machine shops, and large veneer machine and brick machine works. The waterworks and electric light plant are owned by

the municipality. Population, in 1890, 4755; in 1900, 5024.

PAINT, Luminous. See Luminous Paint.

PAINTED QUAIL. (1) The mountain quail (*Orcortyx pictus*). See Quail. (2) A small quail-like partridge of China (*Excalfactoria Sinensis*) found from India to Ceylon and Formosa. It has a plumage of varied colors, in which chestnut is conspicuous, and is much hunted. A darker race inhabits the Philippines, Malayan islands, and Australia; and similar species occur in New Britain and neighboring islands, and in Central and Southern Africa. The Australian form is called 'least swamp-quail.'

PAINTED TURTLE, or Painted Terrapin. The commonest pond turtle (*Chrysemys picta*) of the Eastern United States. It is greenish above with yellow and red markings, and yellow and brown below.

PAINT'ER, William (1540?-94). An English translator, educated at Saint John's College, Oxford. In 1560 he became clerk of the ordnance in the Tower of London. Notwithstanding his denials, he seems to have pilfered the Queen's funds. He is known for *The Palace of Pleasure* (vol. i., 1566; vol. ii., 1567), a collection of one hundred tales, translated from Latin, Greek, French, and Italian. Painter may be said to have made Bandello, Boccaccio, Cinthio, and various other Italians familiar to English readers. The collection was immensely popular and led to many similar compilations. From it the English dramatists drew freely for their plots. Consult the reprint, ed. by Jacobs (London, 1890).

PAINTER-ENGRAVER. An artist who engraves his own designs—that is, an original engraver, one occupied in expressing his artistic thoughts by means of some process of engraving, as distinguished from one who engraves the designs of others. The term is adopted from the French, *peintre-graveur*. Albrecht Dürer was very eminent as a painter-engraver with the burin; Rembrandt in etching; T. M. W. Turner in mezzotint. So, among men of our own time, there may be named Gaillard, in live work, and Whistler as an etcher.

PAINTERS' COLORS. The number of colors used by painters in their art has greatly varied. Until the time of Apelles but four were known—white, yellow, red, and black. Green, purple, and blue were discovered later. The discoveries of modern chemistry have greatly increased the number available, which are derived from the mineral, vegetable, and animal worlds. But although the painter of the present day has a long list to choose from, a dozen is quite sufficient for the richest palette. They are prepared for use by calcining and washing; oil paints are ground in poppy or linseed oil, and preserved in tin tubes. In general, colors are either opaque or transparent, the former being used for the lights, the latter for the shadows and dark portions of the picture. For the sources and character of painters' colors, consult the subdivision *Pigments* of the article Paints, and the articles on the special colors, such as Blue; Carmine; Purple Colors; Ultramarine, etc. For the quality of color in a painting, see Color.

PAINTING. In the fine arts, the representation by means of color and line upon a flat surface, of objects of nature and of the imagination. According to the flat surface used, painting may be mural, panel, easel, etc. (See Mural Decoration.) As regards the materials used the principal varieties of painting are encaustic, fresco, pastel, tempera, water color (q.v.), oil, and stereochrome. (See also Stereochromy.) According to the subjects represented, the principal varieties are figure, genre (q.v.), history, portraiture (q.v.), landscape (q.v.), animal, and still life painting. For the implements used by the painters, see Canvas; Easel; Ground. The following historical sketch is concerned chiefly with expressive rather than decorative painting, and will trace the evolution of painting in the Western world. The purely decorative arts of China, Japan, and other Oriental countries are treated under Chinese Art, etc. See also Decorative Art. Special articles will also be found on every painter of importance mentioned in the historical sketch.

ANCIENT PAINTING.

Egypt. The ancient Egyptians made large use of color in their art. All sculpture in wood, clay, or ordinary stone was painted, and even hard stones, such as granite and basalt, did not often escape coloring. On flat surfaces the Egyptian artist preferred to color a very low relief, or a slightly sunk design; and even where no sculpture was employed, the drawing and conventions were the same. There was no knowledge of the laws of perspective, and apparently no attempt to attain any real effect of depth. Objects on the same level may be drawn one above the other, or so that they overlap. Allowing for such conventions, however, the Egyptian artist shows skill in drawing, and great vivacity and naturalness in the treatment of his subject, especially in the depiction of animals or in the numerous scenes from daily life which decorate the tombs. In dealing with religious scenes, his freedom was fettered by strict conventions. Any play of light and shade was, of course, unthought of, but the Egyptian palette was well supplied with colors. The colors were prepared in fine powders and mixed with water and gum for use.

The remains of painting in Babylonia and Assyria are very scanty. The favorite method of decoration was by enameled brick, bearing figures in relief, which can scarcely be called painting in any strict sense. See Assyrian Art and Babylonian Art.

Greece. It was in Greece that ancient painting, like other forms of art, reached its highest development, in the fifth and fourth centuries B.C. Not that skillful fresco painting had not been common earlier. The fragments from Tiryns, and still more the splendid decorations from Cnossus in Crete, show that the Mycenæan Age (about 1500-1200 B.C.) possessed much of the technical skill of the Egyptian artist and far greater freedom and originality. With the fall, however, of Ægean civilization, we lose all examples of painting properly so called, though the vases (see Vase) enable us to trace the progress of drawing, and the statues and remains of buildings show how extensively color was employed as an auxiliary to the sister arts of sculpture and architecture. Indeed, this use continued throughout the classical period. See

GREEK ART.) There are traditions of Corinthian and Sicyonian painters, who drew outlines on walls or whitened tablets of clay by the aid of shadows, and indicated details by a few lines, but used only one color. There are also records of paintings which would carry back the art into the eighth century. Eumares of Athens is said to have distinguished the sexes, probably by the use of different colors, in distinction from the early monochrome artists, and Cimon of Cleonæ to have introduced correct drawing in profile, probably of the eye, and variety in the direction of the glance. These artists, who have some claim to be considered real persons, must have lived about the middle or end of the sixth century.

In the great outburst of Greek genius which followed the Persian wars, and which centred in Athens, painting rose to an equality with sculpture. This advance is directly connected with Polygnotus (q.v.) of Thasos, whom Theophrastus describes as the discoverer of the art. His works were large scenes covering the walls of public buildings, such as the "Painted Portico" at Athens and the "Lesche" of the Cnidians at Delphi. In general his subjects were mythological, but his contemporaries and fellow-workers Micon and Panænus, brother of Phidias, seem to have treated also events in recent history. At this time painting, like sculpture, is found in the service of the State for the decoration of public buildings and temples. As to the style of these artists, it is safe to say that true perspective was wanting, nor were light and shade indicated. The figures were on different levels, and there was some indication of broken ground. Polygnotus's palette, we are told, contained only black, white, yellow, and red, with which he succeeded, however, in producing a variety of shades. In spite of the flat color, Polygnotus was famed for his fine composition, dignity, and perfection of characterization, and severe, yet expressive, drawing.

The most important advance was made shortly after by the scene-painter Agatharchus of Samos, who discovered some of the applications of perspective and shading. His book on his new discoveries led the philosophers Anaxagoras and Democritus to serious investigation of the laws of perspective. The new methods were transferred from the large surfaces to panels by Apollodorus of Athens, and thus within a century the way was fairly cleared for a growth of the art beyond all that the Egyptians had achieved in three thousand years. The school which now arose, about the end of the fifth century, is commonly called the Asiatic or Ionic school, and is best represented by the two great rivals Zeuxis (q.v.) of Heraclea and Parrhasius (q.v.) of Ephesus. The former was famed for his truthful and even deceptive reproduction of nature, and the latter for his delicate drawing, but both must have been masters of chiaroscuro, if any reliance can be placed in the comments that have survived. To this school also belonged Timanthes of Cythnos, famous for the variety and depth of facial expression.

In the early fourth century B.C. the centre of painting seems to have been at Sicyon, where Timanthes lived late in life. Its founder was Eupompus, who was succeeded by Pamphilus (q.v.) and Melanthius, who laid great stress on systematic instruction, especially in drawing, which was introduced into the schools of the city. A pupil of the school, Pausias, perfected the encaustic painting (q.v.), which, however, did not drive out the old tempera (q.v.) process. How far the school had advanced in handling of light and shade may be judged from the praise given the black ox of Pausias. In the second quarter of the fourth century a school of Theban and Attic artists arose who seem to have given especial attention to pathos, and whose favorite subjects were battle pieces. The tendency away from the severe and lofty, which is found in sculpture, also manifested itself in painting, and many of these artists are also credited with genre scenes, flower pieces, and trifling subjects. In contrast to this tendency Nicias of Athens, who seems to have survived Alexander, insisted on the importance of great subjects. It seems very probable that the release of Io by Hermes, in the "House of Livia" on the Palatine Hill in Rome, is a copy of one of his works. The highest technical skill and artistic merit were claimed by the ancients for the two great masters of the younger Ionian school, Apelles of Ephesus and Protogenes of Caunus; the former famed for his grace, the latter for his painstaking, which in the opinion of some led him to weaken the spontaneity of his pictures. The paintings in the Etruscan tombs, though undoubtedly influenced by Greek models, are far too rude to serve as standards of reconstruction, and most of them are not later than the middle of the fourth century. Of more value is a sarcophagus from Corneto, now in Florence, on which is painted in tempera a wonderfully vigorous battle of the Greeks and Amazons, probably the work of an Etruscan artist of the early third century B.C., but evidently a close copy of a Greek model, which must have ranked in beauty and power little below the works of the best period.

The Hellenistic age shows in painting, as in sculpture, two tendencies. One was toward the rendering of mythical scenes, which afforded opportunity for pathetic or tragic expression, as in the famous picture of Timomachus of Byzantium, representing Medea meditating the slaughter of her children, of which some reminiscences seem preserved in Pompeian paintings. On the other hand, many painters seem to have preferred lighter themes. They also rendered the landscape with pleasure, and even experimented with effects of artificial light, as in a painting of a boy blowing a fire. Often the choice is low, and triviality, not to say sensuality, is a prominent characteristic. The walls of Pompeii furnish abundant examples of these tendencies. It is only from this late period of Hellenistic art that many works have come down to us. In Rome are the Aldobrandini marriage, a series of landscapes illustrating the *Odyssey*, and a rather poor series of panels representing victims of unnatural love, while the baths, palaces, and tombs have from time to time yielded others, many of which have now perished. Among these the first place must be given to those from the Farnesina Gardens, some of which recall the best Athenian lecythi of the fourth century. The largest number are, however, from the buried cities of Pompeii and Herculaneum, and of especial value are the portraits of the second century A.D., discovered in the Fayum, Egypt, where they were used to cover the faces of mummies.

ROMAN PAINTING. A mere appendix to the

Greek, Roman painting developed little originality, and, being decorative in character, will be found treated under ROMAN ART.

MEDIEVAL PERIOD.

The painting of the Middle Ages is, in the main, decorative and dependent upon architecture. (See CHRISTIAN, BYZANTINE, ROMANESQUE, and GOTHIC ART.) It exercised little influence upon the general development of painting except during the Gothic period in Italy.

ITALY. In the free cities of Italy, especially in those of Tuscany, Gothic painting reached its highest development. Here Gothic architecture was purely decorative in character, and left large wall surfaces which afforded ample opportunity for paintings. The technique used was fresco (q.v.). About the middle of the thirteenth century a number of painters in different parts of Italy began to modify, though at first slightly, the Byzantine manner. The most important of these painters was Cimabue at Florence (died after 1302), who displayed a leaning toward the Gothic, which took the form of a slight naturalism. He painted the draperies less rigid, and put more expression in the faces and life in the movements of the figures.

By far the greatest progress before the Renaissance was made by Giotto (1266-1337) at Florence. It is generally accepted that he was a pupil of Cimabue, although late authorities maintain that his art is related to that of Pietro Cavallini. The faces are still typical, rather than individual, but they are strong and the figures are dramatic in action and very characteristic. The drapery is no longer stiff, but falls in broad masses, showing the movement of the body beneath. The accessories, such as animals, landscape, and architecture, are symbolic, and conceived in a decorative sense, as is indeed the entire composition. The scale of color was limited and determined by decorative harmonies, the method being to fill in the outlines with color. What most impressed contemporaries was his great step toward naturalism. By none of his immediate followers was real progress made. By far the most important was Andrea Orcagna (d. 1368), who, in his startling frescoes and altar-pieces in the Strozzi Chapel, Santa Maria Novella, Florence, surpassed Giotto in depicting the human figure, and in the treatment of light and shadow, and even had an elementary knowledge of perspective, anticipating the discoveries of the Renaissance.

Contemporary with the Florentine, there flourished at Siena a school which retained more of the Byzantine character. (For its chief characteristics, see SIENESE SCHOOL OF PAINTING.) Duccio, its real founder, was, on the whole, a more finished painter than his contemporary, Cimabue. He perfected the hands and feet, and gave a sweet, tender expression to the long Byzantine face. Among his successors the greatest progress was made by Simone Martini (d. 1344), who strengthened the type by rounding it and adding emphasis of expression. The most important Sienese artists of the following generation were the brothers Lorenzetti (middle of fourteenth century), whose works show a strong intellectual grasp and forceful methods.

At Rome, during the Gothic period, some good mosaics were produced, but no painting. (See MOSAIC.) Elsewhere in Italy the manner of Giotto prevailed throughout the fourteenth century, even in Naples and the South, but none of these local schools were important except those of Verona and Padua, where schools, inspired by the work of Giotto in the Arena Chapel, arose. The most important master of this region was Altichiero da Zevio of Verona, who worked conjointly with Jacopo Avanzi. Their works have all the seriousness and depth of Giotto's, but without his pathos; they are not so vehement in action, but softer and more tender in emotion.

As *Transition Painters* we may classify other Italian painters of the fifteenth century, who are nevertheless Gothic in sentiment and technique. The art of Fra Angelico (1387-1455) is distinguished for devout religious sentiment, in which last respect it has never been excelled. His younger contemporary, Gentile da Fabriano, who belonged rather to the Sienese school, produced an art rich in color and detail, and he seems to have been the first to show the effect of sunlight upon landscape.

THE RENAISSANCE (1400-1600).

Renaissance art was not altogether a revival of the antique, although this was one of its essential features, especially in Italy. It was equally a revival of natural truth, especially in painting. As no antique paintings survived, the painter was compelled to go directly to nature for inspiration, unlike the sculptor, whose models were the statues of antiquity. In Northern Europe not even statues survived, and nature was the only guide. Here the Renaissance took its earliest and simplest form, spreading to Germany, France, and Spain, during the fifteenth century. Almost contemporaneously a more important development had taken place in Italy, which during the latter fifteenth century began to make itself felt in France and Spain, and during the sixteenth, replacing the Flemish influence, became dominant in Europe. Our method of treatment is suggested by the development just outlined. The period naturally falls in three divisions—the Early Renaissance, corresponding, roughly speaking, with the fifteenth century; the High Renaissance (c.1500-50); and the Decline (c.1550-1600), during which period Italian art predominated throughout Europe.

EARLY RENAISSANCE. Under the patronage of the Court of Burgundy, and of the rich burghers of the Netherlands, a school of painting arose during the latter fourteenth century, which appears highly developed in Flanders in the art of Huybrecht and Jan van Eyck (d. 1440). In their works, the most important of which is the Ghent altarpiece, we find already solved some of the chief problems of painting—a fine color, bright, but in a low key; an aërial perspective, with true rendering of atmosphere, and of light and shade. For the first time the landscape is used as a background to give sentiment to the picture, and to promote its unity, which is somewhat interfered with by the highly detailed finish. More startling still is the uncompromising naturalism of the figures, and the remarkable technique of oil painting which they invented, and which was universally adopted in modern art. (See EYCK.) Among the followers of Jan van Eyck in the school of Bruges, which he founded, was Petrus Cristus, while at Ghent flourished Hugo van der Goes and Justus van Ghent. The chief follower or rival of Jan van Eyck was Rogier van der Weyden

who established the school of Brabant, at Brussels, and added dramatic power and vehemence of expression.

Of the work of the early Dutch school few pictures survive. Haarlem was its centre, and Aelbert van Ouwater, celebrated for his landscape backgrounds, was the reputed founder. The work of his pupil, Gerrit van Haarlem, resembles contemporary Flemish painting, as does also the later work of Dierik Bouts (d. 1475), of Haarlem, founder of a school at Louvain. He excelled in luminous treatment and improved the landscape, contributing depth and variety of character to the school. The greatest master of the next generation is Hans Memling (d. 1495), who surpassed other Flemish masters in delicate brushwork and refined sentiment. Among his followers was Gheeradt David (d. 1523), who introduced breadth of treatment, especially in landscapes, though real freedom of style only came with the influence of Italy.

During the fifteenth century a Renaissance had also begun in *Germany*, differing from the Flemish in that, although showing a strong impulse toward realism, it retained the gold backgrounds, with an innocent fervor and a graceful sentimentalism derived from the Gothic. The chief seat of this art was Cologne, and its principal master was Stephan Lochener (d. 1451). About 1450 the Flemish influence made itself felt in Germany, and during the same period important local schools flourished in Southern Germany, commonly grouped together under the name of the Swabian school. At Kolmar the chief master was Martin Schongauer (d. 1488). The chief seat of the school of Franconia is Nuremberg, and its principal master is Michael Wolgemut (1434-1519). Nuremberg also dominated the art of Bohemia, Silesia, and Poland (Cracow). On the whole, German art in the fifteenth century was unprogressive in character, and not until the sixteenth century, under Italian influence, did it pass this primitive stage.

In *France*, *Spain*, and *Portugal* the Flemish influence predominated for the most part during the fifteenth century, though finally yielding to the Italian. In France pictorial art found more expression in miniatures (see MANUSCRIPTS, ILLUMINATION OF) than in panel painting. The art resembled the Flemish, except that the advance to realism was slower and less marked. The chief master was Jean Fouquet of Tours, a portrait painter and illuminator, who practiced a detailed and exact art, like the Flemish, but with softer color, individual French characteristics, and some Italian influence.

In Spain paintings were imported during the fourteenth century from the Netherlands and from Italy. Jan van Eyck himself visited Spain, and some of the best works of Petrus Cristus and Roger van der Weyden went there. In Aragon Florentine influence was predominant, but in Castile, where artistic production was greater, there was more Flemish, while Seville shows an amalgamation of both. The most famous artist of the fifteenth century was Antonio del Rincon (1446-1500), Court painter to Ferdinand and Isabella, who is said to have abandoned Flemish art for Florentine, as did also Alejo Fernandez at Seville. Another important name is Juan de Borgoña (1495-1533), who labored chiefly at Avila and Toledo. Notwithstanding foreign influence, the Spanish painters of the early Renaissance display a distinct national tendency, chiefly evident in a general brownish tone and in the landscapes. In Portugal Flemish influence prevailed until late in the sixteenth century, when it was replaced by the Italian.

EARLY RENAISSANCE—ITALY. Italian painting had the great advantage of flourishing contemporaneously with a very high intellectual and a general artistic development. What the Northerner knew but imperfectly, as a result of his own observation, the Italian based on scientific knowledge of natural laws. The laws of linear perspective (q.v.) were discovered and applied by Brunelleschi and Alberti; anatomy was scientifically studied, even the skeleton being drawn before the flesh and the draperies. Renaissance architecture afforded large wall spaces for decoration and the resulting frescoes gave a monumental character to painting. The study of the antique tended to idealize art and afforded decorative motives; but the Italians only saw in it a means of approaching nature. Finally, a natural tact prompted them to subordinate detail, while not neglecting it, to higher poetic truth, thus giving their art the charming naturalism which is its chief characteristic during the fifteenth century.

During the fifteenth century *Florence* retained its primacy of Italy, both as to the number of artists and the character of work produced. Florentine work was especially good in intellectual qualities, excelling in all respects except in color. (See FLORENTINE SCHOOL OF PAINTING.) The first painter who can be distinctly classed as belonging to the Renaissance is Masolino (1383-1447), whose works show advance in perspective, composition, and anatomy. All of these qualities were achieved to a greater extent by Masaccio (1401-28), the most prominent figure in Italian painting between Giotto and High Renaissance. His figures are powerful and dramatic, and show complete mastery of perspective. Every detail has its purpose, and in his composition every figure is a necessity. His frescoes in the Brancacci Chapel were the models of the century, and their influence may even be seen in the works of Michelangelo and Raphael.

None of Masaccio's followers or contemporaries equaled him. A group of Naturalists, the head of which was Paolo Uccello (1397-1475), made valuable experiments in perspective and were good in drawing, but lacked composition and pictorial feeling. Other members of this school were Andrea del Castagno, Domenico Veneziano, and Alesso Baldovinetti. Masaccio's real successor was Filippo Lippi (1406-69), a painter of great imagination and charm, who excelled in the essentially pictorial qualities of color, light, and shade, and was the first to portray individual faces in the sacred pictures. (See MADONNA.) The school of Filippo Lippi contains important names. Sandro Botticelli's (c.1447-c.1510) paintings are full of poetic sentiment and deep spirituality. His art is the most subtle of the century, though highly individualized, both in his dreamy Madonnas and in his large mythological pictures. Filippino Lippi's (1457-1504) painting, modeled upon that of his father and Masaccio and influenced by Botticelli, is also full of grace and sentiment.

Among other Florentine painters of the period were Benozzo Gozzoli, a pupil of Fra Angelico, who painted attractive frescoes with portrait heads, and Piero di Cosimo, known by his mythological pictures on a small scale. Another distinct group was composed of painters who were at the same time goldsmiths. Their habit of metal work is seen in the treatment of flesh, which is bronze-like in color, in the rigid draperies, and the high relief in which the figures are modeled. Chief among this group are the Pollaiuolo brothers, who flourished in the latter half of the century, and especially Andrea Verrocchio (1435-88). Among Verrocchio's pupils were Leonardo da Vinci (see below) and Lorenzo di Credi, whose work is less strong than graceful. Finally, Domenico Ghirlandajo (1449-94) combined in his art the various tendencies of the century, being an able technician in most respects, and a pleasing artist, but one who lacked the genius to produce a new style.

During the fifteenth century the Sienese school lagged behind the Florentine, the true heir of its sentiment and color being the *Umbrian school* (q.v.), which developed an ecstatic and sentimental type, although throughout its life the school was influenced by the Florentine. The first painter in whom we find this distinctly Umbrian sentiment is Niccolo da Foligno (d. 1502), a pupil of Benozzo Gozzoli. At Perugia some progress was made by Benedetto di Buonfiglio (d. c.1496), although he never mastered drawing, and by Fiorenzo di Lorenzo (d. 1521). The first to accept the Florentine Renaissance was Piero degli Franceschi (d. 1492), a learned painter who wrote a treatise on perspective. His pupil, Melozzo da Forli (1438-94), achieved admirable results in foreshortening, but the pupil of Franceschi and Da Forli, Giovanni Santi (d. 1494), the father of Raphael, was an artist of little originality. The most distinguished pupil of Piero degli Franceschi was Luca Signorelli (1441?-1523), who was rather Florentine than Umbrian in spirit. A master of anatomy, he relied only upon the human figure to express emotion, foreshadowing in this regard and in his exaggerated action the genius of Michelangelo. More distinctly Umbrian was Pietro Perugino (1446-1523), the master of Raphael, who clothed Umbrian sentiment in a Florentine garb. His strong points were grace in composition and a richness of color, due to his successful use of oil painting. The art of Pinturicchio (1454-1513) resembled that of Perugino in type and sentiment, save that it was decorative in character. At Rome the popes were munificent patrons, but there was no native school, the talent being imported from other parts of Italy. Nor was there a noteworthy native school in Naples or in Sicily, where the taste rather inclined to the art of the Netherlands.

There is no connection between *Paduan* painting of the fourteenth century and the school established by Francesco Squarcione (1394-1474) in the latter half of the fifteenth. Its chief characteristics were the statuesque character of the figures, which are usually coarse and heavy, and the wealth of classic ornamentation employed. (See SQUARCIONE.) Andrea Mantegna (1431-1506), the chief master of the school, understood the antique more thoroughly than any other painter of the Early Renaissance, combining with this knowledge a trenchant realism, and achieved the greatest results of the century in foreshortening. The influence of the school of Padua extended throughout Northern Italy, where it occupied a position analogous to that of the Florentine in Middle Italy.

At *Venice* Byzantine art dominated longer than anywhere else in Europe, and even in the early fifteenth century the painters were craftsmen rather than artists. A great influence, however, was exercised by Gentile da Fabriano, especially upon the school of the outlying island Murano, the chief representatives of which belonged to the Vivarini family, whose work also shows Paduan influence. Carlo Crivelli (d. 1493?) in his repulsive figures and decorative motifs was essentially Paduan, only revealing his Venetian origin in a superior color. The eldest member of the Bellini family, Jacopo (d. 1470), followed Gentile da Fabriano to Florence, but also worked in Padua, where Mantegna became his son-in-law. His son, Gentile (d. 1507), treated Venetian subjects with open-air effects and knowledge of light and atmosphere. A second son, Giovanni (d. 1516), was the true founder of those qualities of color which distinguished the Venetian school. At first under Paduan influence, he adopted the oil technique recently introduced into Venice, securing transparent and harmonious effects. Of the pupils of the Bellini, Vittore Carpaccio (d. c.1522) developed legendary subjects, while Cima da Conegliano (d. after 1508) excelled in modeling and in light and shade. Marco Basaiti (d. 1521), although he brought oil technique to high perfection, possessed little originality, as is also true of Vincenzo Catena (d. 1531), the portraitist. Of very great importance for Venetian and Italian art was the Sicilian portrait painter Antonello da Messina (d. 1493), by whom oil painting was introduced from Flanders into Italy.

At *Ferrara* a school arose, chiefly under Paduan influence, but more charming in color. (See FERRARESE SCHOOL OF PAINTING.) The founder was Cosimo Tura (d. 1498?), and its chief artists were his followers, Francesco Cossa and Lorenzo Costa (1460-1535). They afterwards removed to Bologna, where Costa's rugged and manly style was softened by Umbrian sentiment. He was probably the master of the Bolognese Francia (1450-1518), in whom Umbrian sentiment preponderated, and who was in later life somewhat influenced by Raphael. The work of Francia's pupil Timoteo Viti (1469-1523) is pervaded by delightful sentiment and a deep poetic feeling, which he probably imparted to Raphael.

In the cities of *Lombardy* were schools of some importance, though none of them, during the fourteenth century, achieved the eminence of the Paduan or Venetian schools. The school of Verona, founded by Vittore Pisano (d. 1456), was influenced by Padua as regards the modeling of the figure, but was independent in its color scheme, which, notwithstanding the use of several bright tints, tended to be gray or brown. The founder of the early Milanese school was Vincenzo Foppa (d. 1492), and its greatest representatives were Borgognone (d. 1523) and Bartolommeo Suardi (d. 1529-36), called Bramantino.

HIGH RENAISSANCE (1500-50)—ITALY. The highest development of Italian painting falls,

roughly speaking, in the first half of the sixteenth century, though works belonging properly to the High Renaissance were produced in the last decade of the fifteenth, and the Venetian school maintained its excellence almost to the end of the century. A deeper study of the antique, though not to the neglect of nature, brought artists nearer the ideal type. Certain mighty geniuses arose, uniting in themselves, each in a different fashion, the best elements in the rich art of the fifteenth century, and produced the highest development of figure painting the world has ever seen.

Most of the leaders of the movement were either born or trained at *Florence*. Leonardo da Vinci (1452-1519) was the pioneer. The greatest all-round scientist of the day, besides being a musician and a sculptor, he was also the greatest theorist on art, which especially qualified him for teaching. He achieved the greatest mastery hitherto attained over atmosphere, light, and modeling. Nevertheless, his paintings charm more by the sweet and majestic presence of his figures, and by mysterious sentiment, which pervades them, than by their technical qualities. Though Michelangelo Buonarroti (1475-1564) was primarily a sculptor, no artist of the Renaissance had a greater influence upon painting. He made no progress over his contemporaries in the essentially pictorial qualities, but in his great fresco cycle in the Sistine Chapel he obtained the highest possible perfection in drawing of the human figure and in decorative effect. The quality of his purely subjective art which most impressed itself on his contemporaries was his tendency toward the gigantic in form and the violent in action. Directly the opposite was Raphael (1483-1520), the most objective of painters, whose art was a composite of the best elements in Middle Italian art. Himself an Umbrian, he acquired poetic sentiment from Timoteo Viti and tenderness from Perugino; at Florence he learned composition from Fra Bartolommeo, modeling and subtle charm from Leonardo, and from Michelangelo drawing and force. But all these qualities were duly assimilated, and his art was pervaded by an individuality, which especially revealed itself in a wonderful harmony.

Even after this great trinity had left Florence, important artists remained. The works of Fra Bartolommeo (1475-1517), a pupil of Roselli, are pervaded by deep religious feeling, and reveal high technical qualities, especially in color. His co-worker Albertinelli (1474-1515) has an art resembling his, though it is less religious. Of greater importance than either was Andrea del Sarto, the best colorist of the Florentine school, in fresco as in oils. He attained the highest technical qualities that had hitherto been attained in brushwork, warmth of color, and atmospheric effects. His chief pupils were Franciabigio, who excelled in portrait painting, Jacopo Pontormo, and Il Rosso.

At *Milan*, from about 1485 till 1499, Leonardo da Vinci was at the head of the academy founded by Lodovico Sforza, exercising a predominant influence upon painting there. The most important of his pupils and followers were Andrea Solari (born c.1460), who attained many of his master's high qualities; Bernardino Luini (d. 1533?), the most important of the group, in whose art Leonardo's vigor is replaced by graceful, pathetic sweetness; and Gaudenzio Ferrari (d. 1546), who was grander in style and more brilliant in color, though often excessively sentimental. Among the less important though still good painters of the school were Beltraffio (1467-1516), Marco d'Oggiono (d. 1530), and Cesare da Sesto.

Properly speaking, there was no distinctly *Roman* school of painting, the term being applied to the pupils of Michelangelo and Raphael, and the Mannerists who labored there after them. Of Michelangelo's pupils, the principal was Sebastiano del Piombo (d. 1547), a Venetian, who had studied under Bellini and Giorgione, and attempted to unite Venetian color with Michelangelo's line; others were Marcello Venusti (b. 1515) and Daniele da Volterra (1509-66). Of Raphael's pupils, Giulio Pippi (Romano) (1492-1546) was the chief, but even in his work Michelangelo's influence is predominant. Though excellent as a draughtsman, his violent compositions tended toward the Baroque. Others among Raphael's pupils were Francesco Penni (died 1528), Giovanni da Udine, Perino della Vaga (1500-47), and Polidoro da Caravaggio, the last three being mainly decorators. Andrea Sabbatino (died c.1545) transmitted Raphael's art to the south of Italy, where it prevailed for the remainder of the century.

At *Siena*, art, which had lain dormant during the fifteenth century, was resuscitated in the sixteenth by Antonio Bazzi (1477-1549), generally known as Sodoma, a pupil of Leonardo, who treated the human figure with much grace and expression. The most important of his numerous pupils was Baldassare Peruzzi (1481-1536), an architect and a fine decorative painter. Girolamo della Pacchia (born 1477) was rather a rival than a pupil of Sodoma.

The painters of *Ferrara* and *Bologna* are often classed as followers of Raphael, though wrongly so, since they maintained a distinct local character. Their chief characteristics were a cool though pure scheme of color, a less conventional composition than the Romans, and an original use of landscapes as background. The most important representatives were Dosso Dossi (c.1479-1542), a pupil of Costa, who was also influenced by the Venetians; Garofalo (1481-1559), best known from pictures on a small scale from Bible history, who was influenced by Raphael. Other prominent contemporary artists of the school were Mazzolino, Bagnacavallo, and Innocenzo da Imola. The High Renaissance of Northern Italy (outside of Venice) found its greatest master in Correggio (1494-1534). The pupil of various obscure masters, but active chiefly in Parma, he was the principal exponent of the nature worship of the Renaissance—of the material beauty of things, and of poetic sensuality. His technical advances were in the treatment of light and shade, and in perspective.

The *Venetian* school of painting (q.v.) differed from others principally in this respect, that it sought only pictorial effects. Its painters developed color as it had been developed nowhere else in the world, treating light and shade in such a manner as to bring out all local tints, and were the first to practice a broad and facile brushwork. The chief painters of the High Renaissance in Venice were directly or indirectly pupils of Bellini. The pioneer was Giorgione da Castelfranco (c.1478-1511), in whose

hand the new oil medium was used with subtle skill to portray the effects of light and color in landscape, which he created on a new and unprecedented scale, as well as upon the human figure. Palma Vecchio's (d. 1528) color was gaudier than Giorgione's, and he painted everything in a bright golden light. He is chiefly known by female portraits of highly developed charms. Lorenzo Lotto's (d. 1556) art was more subtle, being charming, even coquettish, in style.

As a painter pure and simple, Titian (1477-1576) was the greatest of the Italian school. He was the first to handle a brush with absolute freedom and facility, and in his art the sensual beauty, harmony, repose, and gorgeous glow of color of the Venetian school found its culmination. He has shown us, perhaps, as no other has done, the ideal, free and happy, unfettered by the real. Among the large number of his assistants and pupils was Paris Bordone (1500-71), whose art resembles Titian's, though it is more realistic, and found its best expression in portraits. The works of the three Bonifazi are idyllic in feeling, brilliant, and rich in color. Likewise under Palma's influence stood Rocco Marconi (born c.1505), who learned the elements of his art from Bellini.

The Renaissance lasted longer in Venice than elsewhere, and almost to the end of the century painters of the highest rank appear. Among these, Tintoretto (1518-92) sought to combine with the color of Titian the line of Michelangelo in his violent and impetuous style. Paolo Veronese (1528-88) continued the original tendencies of the Venetian school, both as to color and subject, developing *Existenz-Malerei* (painting expressions of the joy of living) to its highest extent. It was mostly decorative. He was par excellence the great painter of banquet scenes.

The artistic influence of Venice also extended to its subject territories on the mainland. At Udine Pellegrino (d. 1547) and Pordenone (1483-1539), a decorative painter of high dramatic power, were active. Though under Venetian influence, the Brescian school had very distinct characteristics, chief among which was a silvery tone. Its chief master was Moretto (1498-1555), a very individual artist, able in composition, fine in line, and delicate in color. His pupil Moroni (d. 1578) excelled in his portraits, which are essentially modern and realistic in spirit.

High Renaissance—Germany. In the early sixteenth century German painting reached its highest development. Gradually emancipating itself from the detailed execution incidental to its connection with engraving, it paid more regard to the ensemble, and while holding fast to the realism peculiar to German art, it aimed at a loftier and more ideal treatment. Although this change was in part due to Italian influence, German art continued to maintain a distinctly national character.

It was reserved for *Nuremberg* to produce the most original and imaginative German artist of all times. The pupil of Wolgemut, Albrecht Dürer (1471-1528), inherited the angularity of line and detail of the German school. The Italian influence (Barbari and Bellini), to which he was subjected, tended to soften and idealize his art, but without loss of individuality. Perhaps greatest as an engraver, he was, nevertheless, strong and effective as a painter, admirable in line and often excellent in color. His pupils Schautelin and Hans von Kulmbach combined his style, the latter inclining more to Italian methods. Followers of Dürer also were the 'Little Masters,' rather engravers than painters, and so called because of the size of their plates. They included such artists as Georg Penez (d. 1550) and the Beams.

In the sixteenth century the centre of the *Suabian school* shifted to Augsburg, where the Renaissance developed a more self-sufficient composition, better use of color, and more sense of the ensemble than anywhere else in Germany. The founder of the school was Hans Burgkmair (1473-1531), a pupil of Schongauer, and about 1508 Hans Holbein the elder adopted the Renaissance, bequeathing to his son his realistic style and conception. Hans Holbein the younger (1497-1543), the greatest painter Germany ever produced, excelled in all the essentially pictorial qualities, and knew how to combine fine detail with a good ensemble. Although influenced by Mantegna, he was self-sufficient and individual in his forceful realism. The other centres of the Suabian school are less important. The Renaissance came into Ulm through Martin Schaffner (mentioned c.1500-1535), remarkable for his graceful and fine composition; prominent as a portraitist was Bernard Strigel (d. 1528). At Kolmar (Alsace) flourished Matthias Grünewald, the 'Correggio of Germany,' unique among German painters in his attention to color, light, and atmosphere, rather than detail. The chief painter at Strassburg was Hans Baldung Grün (c.1476-1545), whose works show the influence of Schongauer and Dürer. The so-called Saxon school was founded by Lucas Cranach (1472-1553), a Franconian master, whose work, though typical and interesting, is angular and strained, without shadows or aërial perspective.

The Decline. As early as 1530 the decline of the Renaissance in Italy began. In the forms of Raphael and Michelangelo the *Manneristi* (q.v.) executed great crowded compositions, of exaggerated action and striking effects of light and shade, and only in portraiture were they tolerable. At Florence Bronzino (d. 1572) and Vasari (1511-74) were among the chief masters; at Parma Parmegiano (1504-40); at Urbino Barocci (1528-1612), who followed Correggio; at Rome the brothers Zuccari and many lesser masters. The Sienese school alone remained true to nature, as did Luca Cambiaso (1527-85) at Genoa. At Venice the Manneristi came later, and maintained still something of the glory of Venetian color, as is evident in the dashing technique of Palma Giovane (1544-1628) and the fine color of Padovanino (1590-1650).

In the *Netherlands* the influence of Italian art did not at first destroy the native development. The principal Flemish painter of the early sixteenth century, Quentin Massys (d. 1530), introduced genre painting, life size figures and Renaissance background, the last under Italian influence, to which he became subjected late in life. Socalled Lucas van Leyden (1494-1533) the most important painter of the early Dutch school, whose works are original in composition and style, and brilliant in color. Massys founded the school of Antwerp, which henceforth becomes the centre of Flemish painting. Its painters sought to graft Italian art upon the Flemish stock, as did also the less numerous contemporary Dutchmen. Among the principal repre-

tatives are Jan Mabuse (d. 1541), Barend van Orley (d. 1542), Lambert Lombard (1505-66), Frans Floris (d. 1570), and others; the portraitists Jan van Scorel and Antonis Mor; the landscapists Joachim Patinir (d. 1524), Hendrik Bles (Civetta), Paul Bril, and the Breughels.

In *France* during the sixteenth century Flemish art, as well as Italian, found patronage at the Court of Francis I. Jehan Clouet (d. 1541?) and his son François (d. 1572), Court painters to Francis I., were thorough Flemings. But the King's chief importations were Italians, and the extensive decorations of Il Rosso, Primaticcio, and others at Fontainebleau, gave the tone to French art of the century. The principal native artist was Jean Cousin (d. 1589), a man of great talent and versatility, whose surviving works show Italian influence.

In *Spain* the Netherlandish influence disappeared, except in portraiture, both Alonzo Sanchez Coello (died 1590) and his pupil Pantoja de la Cruz (d. 1609) preserving the manner of Antonis Mor. All native originality was engulfed in a mannered Italian style, as exemplified in Berruguete (d. 1561), Becerra (d. 1570), and Morales (d. 1586), of the Castilian school; and in Vergas (d. 1568) and Vicente Joanes (d. 1579), founders respectively of the schools of Andalusia and Valencia. Toward the end of the century the influence of the Venetian colorists, combined with some originality, appears in the works of Navarete (d. 1579), called 'El Mudo,' and of Theotocopuli 'El Greco' (d. 1625), at Toledo, whose chief pupil was Tristan (1586-1640). The same tendency may be seen in the works of Roelas (d. 1625), the chief master of the early Andalusian school, in whose works the national Spanish characteristics first appear. Pacheco (d. 1654), the master of Velazquez, was a mere teacher. At Valencia Francisco de Ribalta (d. 1628) was a pupil of the Carracci, and was influenced by Sebastiano del Piombo. The Valencian school, however, became absorbed in the Andalusian, with a centre at Seville, chiefly under Church patronage, while the chief seat of the Castilian school became Madrid, under Court patronage. The difference between the Spanish schools is rather geographical than artistic.

THE SEVENTEENTH AND EIGHTEENTH CENTURIES.

From a technical standpoint the seventeenth century is the golden age of painting. Technical perfection had been achieved by a few great masters during the Renaissance; but it was not prevalent to the same general extent, and the seventeenth century certainly made advances in the treatment of atmosphere and of light and shade. It saw a broadening of the sphere far beyond the bounds of the old monumental figure painting—an unprecedented development of landscape, genre, and portrait painting. Although it saw the rise of Eclectics as well as Naturalists, it was a realistic rather than an idealistic period. It developed easel painting rather than great decorative pieces. Italy was no longer the seat of the highest artistic development, the sceptre passing to France, and especially to Spain and the Netherlands, where great naturalistic schools developed.

ITALY. Toward the end of the sixteenth century the reaction against Mannerism became manifest in two widely different schools: the Eclectic and the Naturalistic. While not neglecting the study of the antique and of nature, the *Eclectics* sought to combine the excellence of all schools: Michelangelo's line, Titian's color, Correggio's light and shade, Raphael's grace. The pioneers of the movement were the three Carracci brothers, who about 1580 founded the first art academy, in the modern sense, at Bologna. (See BOLOGNESE SCHOOL OF PAINTING: CARRACCI.) They produced an art admirable in technical qualities, but lacking in originality and genius. Of their pupils Domeniehino (1581-1641) was the strongest and most conscientious; Guido Reni (1575-1642) the most gifted, but inclined to sentimentality. There were less important schools at Milan, Cremona, Ferrara, and at Rome, where flourished Carlo Maratti (1625-1713), an inferior kind of Guido Reni. The Florentine school maintained a semi-independent position, deriving inspiration from Andrea del Sarto.

Contemporary with the Eclectics there flourished in Italy the *Naturalists*, who went more directly to nature than they. Their version of nature was an extravagant one, delighting in scenes of passion and bloodshed. Their chief technical characteristics are the use of dark shadow masses, whence the name the 'Darklings' (Tenebrosi), and strong light effects; their line was coarse and strong, and their brushwork harsh. The chief seat of the school was Naples, where it maintained its position as much by the use of poison and the dagger as by artistic production. Caravaggio (1569-1609), the founder of the school, painted figures of the street as saints and angels and genre pictures with much dramatic power. His chief pupil, the Spaniard Ribera (1588-1656), a painter of great strength and fine color instincts, delighted in the gloomy subjects favored by his race. Salvator Rosa (1615-73), likewise of Naples, was a remarkably versatile painter of historical genre and landscape subjects.

FRANCE. Throughout the seventeenth century the Italian influence prevailed in France. The Realists, like the three brothers Le Nain, and Valentin, a follower of Caravaggio, were in the minority. Men like Fréminet (d. 1619) and Vouet (d. 1649) were Mannerists after Italian models. The most important French painter of the century is Nicolas Poussin (1593-1665), the founder of the classic element in French art, whose works represent a purer classical sentiment than Mannerism. He was practically the founder of the so-called heroic landscape (q.v.), which was further developed by Gaspard Poussin (1613-75), and to its highest extent by Claude Lorrain (1600-82). Beautiful and rich in color, and pervaded by a golden or silver haze, his landscapes are full of profound poetic feeling. The establishment of the French Academy at Rome strengthened the connection of French and Italian art. Charles Lebrun (1619-90), who dominated the art of the reign of Louis XIV., painted enormous canvases of classical subjects glorifying the King—works of some decorative merit and original in composition, but poor in other respects. Of about the same merit were the religious paintings of Lesueur (1616-55), an imitator of Raphael. Sébastien Bourbon (1616-71) was more of a colorist, as was also Pierre Mignard (d. 1695), who succeeded Lebrun. The portraitists of the epoch, of whom the chief representative is Philippe de Champagne (1602-74), are far more pleasing.

Spain. The seventeenth century was the golden age of Spanish painting. An art distinctly national in character arose, with a trenchant realism, combined with Catholic devotion, emphasis of light and shade, and a broad execution as its chief characteristics. In the works of Herrera the Elder (1576-1656), at Seville, first appears the striking realism developed so consistently by his pupil Velazquez (1599-1660), who was not only the chief master of the Spanish school, but who, perhaps, achieved the highest technical perfection ever attained. He paints his figures in full atmosphere without artifice in light and shade. They are frankly naturalistic, but individual and characteristic. The color values and the relation of light and shade are perfectly rendered, the brushwork is sure and without effort. His pupils, Mazo (d. 1667), Carreño de Miranda (d. 1685), and others, continned his manner, and the last important painter of the Castilian school was Claudio Coello (d. 1693), whose style was founded upon Titian and Rubens. At Seville Zurbaran (1598-1662), a pupil of Roelas, painted ecstatic religious subjects with Venetian breadth of treatment and heavy shadows, reminiscent of Caravaggio, while Cano's (1601-67) paintings were statuesque in character. The chief master of the Andalusian school was Murillo (1618-82), in whose works the Spanish characteristics, realism and religious ecstasy, are gracefully blended, with charming color effects.

Flanders. Under the leadership of Rubens (1577-1640), the Antwerp school developed an art which, though essentially Flemish as regards its characteristic realism, was much influenced by Italy. His figures lack beauty of face and tenderness of feeling, but they are strong and robust, full of life and spirit. No painter ever produced pictures more brilliant in line and color. His chief pupil was Van Dyck (1599-1641), celebrated for refined aristocratic portraits. Jordaens (1593-1678), coarser and more Flemish than Rubens himself, was rather his follower. Other followers were the portrait painter Cornelius de Vos, and Snyders (d. 1657) and Fyt (d. 1661), painters of game, still life, fruits, and flowers. At the same time there flourished a school of genre painting more distinctly Flemish in character, and resembling the contemporary masters in that line in Holland. The chief representatives are Teniers the Younger (1610-90), who pictured scenes from ordinary life, and Gonzales Coques (1618-84), whose subjects were more refined.

Holland. Dutch painting differed from that of other countries in that it was bourgeois instead of aristocratic. Its prime object was the decoration of the home, and it consequently produced chiefly the small panel pictures. Beginning with portraits, Dutch painting developed in every direction, genre, landscape, cattle, still life, all within a single century—the seventeenth. Among the earliest portraitists were Mierevelt (1567-1641), Ravesteyn (d. 1657), and Keyser (d. 1667), but the chief master of the Haarlem school was Frans Hals (c.1584-1666), one of the greatest portraitists of all times. An astonishing realist of delightful humor, he painted his pictures in full light, and excelled in all pictorial qualities, his strength being only equaled by his facility. The greatest painter in Dutch art was Rembrandt (1606-69), of the Amsterdam school, the master of light and shade. In the emphasis achieved by the use of high lights, in luminosity and transparency of shadows, and in harmony of warm, rich color, he has never been surpassed. A master of realism and characterization in portraiture, he nevertheless grasped universal truths, and in landscape and genre he showed the same breadth of view. His chief pupils were Bol, Flinck, and Eeckhout. Of quite a different character was Van der Helst (d. 1670), whose well modeled heads were more precise and detailed. Among Dutch genre painters, one class devoted itself to peasant scenes, especially in the tavern, coarse in subject, but highly picturesque in character and fine in color; the chief representatives were Adriaen van Ostade, Brouwer, and Jan Steen. Another class, including Gerard Dou, Metsu, Frans van Mieris the elder, Netscher, Jan van der Meer of Delft, and Eglon van der Neer, devoted itself to society of a higher social scale, usually interiors, painted with the greatest detail; the best of this group are the refined Terborg and Pieter de Hooghe.

The Dutch landscape differs from the classic in its realism (see LANDSCAPE), and in the substitution of beauty of tone for that of color, which is subordinated to a prevailing brown scheme. It shows a thorough knowledge of the forms of natural objects and of aërial perspective. Following earlier landscapists like Van Goyen (d. 1656) and Salomon van Ruysdael (d. 1670), the school culminated in Jacob van Ruysdael (c.1625-82) and Hobbema (c.1638-1709). The former's talent was of a gloomy and tragic character; the latter's a sunnier and more friendly. Both confined themselves chiefly to Dutch scenes, while others of the Dutch landscapists made extensive travels. Allart van Everdingen (d. 1675) visited Norway, while Berchem, Dujardin, and Pynacker produced classic Italian pieces. Among cattle painters with whom, however, the landscape is of equal importance, were Paul Potter (1625-54), a harsh realist, Adriaen van de Velde (d. 1672), and Albert Cuyp (1620-91). Of marine painters the most important were Backhuysen (d. 1709), who portrayed the tempest, and Willem van de Velde the younger (d. 1707), who preferred the smooth haven, with ships riding at anchor. The work of the numerous still-life painters is characterized by emphasis of detail. Among these the principal painters of flowers were Jan de Heem, Van Huysum, and Rachel Ruysch; of dead game, Weenix and Van Aelst; of poultry, Hondecoeter; of pots, pans, dishes, and vegetables, Kalf.

Eighteenth Century. The eighteenth century is the transition from the aristocratic art of the seventeenth to the more democratic art of the nineteenth. On the one hand it witnessed, especially in France, an after-development and the decline of the art of the seventeenth; on the other, it saw in England the rise of what may be called an art of the middle classes, which came to prevail universally in the nineteenth century.

With the Regency and the reign of Louis XV., painting in France assumed the frivolous character of the changed Court life, producing admirable decorative pieces for boudoir and hall, charming in color and light in touch. The most important master of the period was Watteau (1684-1721), who depicted delicate and skilful genre pieces of fashionable life. His best pupils

were Lancret and Pater, who continued his style with success, but with Van Loo and Boucher it degenerated into extravagances. Fragonard (1732-1806) was a superior painter, especially in color effects. The principal landscape painter of the day was Joseph Vernet, the chief portraitist Hyacinthe Rigaud. Contemporary with the Court painters were others who painted genre scenes from the life of the middle classes, like Chardin, a good colorist and an able realist, and Greuze, well known through his heads of young girls.

In Italy a style prevailed, originated by Pietro da Cortona (1596-1669), and developed by Luca Giordano (1632-1705), the principal characteristic of which was rapidity of execution. Only in Venice was there real artistic activity. The genre painters Piazetta and Longhi were followed by Tiepolo (1697-1770), the last great Venetian. With an art based upon Veronese, though lighter in color, he painted in a dashing style, but with a strong, picturesque realism. Canaletto and Guardi painted Venetian scenes with fine color effect. In Spain the dearth of talent was broken by Goya (1746-1828), an intense realist of grotesque imagination, who handled his brush with almost the ease of Velazquez, and treated light and shade in a peculiarly individual manner.

England. A prelude to modern painting took place in England during the eighteenth century, which, however important, stands apart from the general development. Up to this time the demand for artists had been supplied by importations, chief among whom were Holbein, Van Dyck, Lely, and Kneller. Consequently there was no tradition to break, and English artists were the first to turn directly to nature. The first native painter of note was William Hogarth (1697-1764), a coarse realist of original technique, who used art as a vehicle for inculcating moral ideas. He was, however, less influential than Sir Joshua Reynolds (1723-92), the founder of the academic element in English painting. His art was eclectic, but his portraits are dignified realistic presentations. Far more original was Gainsborough (1727-88), who went directly to nature for inspiration, and whose highly poetic temperament is as evident in his portraiture as in his landscapes, in which he is an innovator. The art of Romney (1734-1802), another portraitist, was midway between that of Reynolds and Gainsborough. In landscape Richard Wilson (1713-82) continued the classic manner of Claude, while in Morland (1763-1804) England produced a most able painter of genre and animal subjects. At the same time a school of water-colorists, founded by Cozens (1752-99) and Girtin (1775-1802), introduced brightness of tone and *plein air* methods, preparing the way for the modern landscape. This medium, further developed by Thomas Stothard (1755-1834) and Turner, has always been one of the strong points of the English school.

MODERN PAINTING.

France. Owing to the intelligent patronage of the State, as well as to the artistic character of the people, the hegemony in the fine arts in the nineteenth century, especially in painting, belonged to France. Here the epoch making movements in its development have originated, and the chief representatives have appeared.

The first great factor in modern painting was the *classical reaction* upon the Rococo art of the *ancien régime* corresponding with the French Revolution in politics. Neglecting the essentially pictorial attributes, it sought the chief beauty of art in form, as shown in ancient sculpture, and preferred to depict strictly classic subjects. The leader was David (1748-1825), dictator of art under the Republic and the first Empire, where his teachings prevailed for half a century. His dignified and statuesque style was continued by many pupils, among whom were Girodet, Guérin, Regnault, Vincent, Prud'hon (1758-1823), a good colorist, who stood rather apart from the rest, while Gros (1771-1835), in his Napoleonic battle-pieces, led the way toward Romanticism. Ingres (1780-1867) modified Classicism by the study of Raphael and the great Italians, greatly improving its modeling. To his influence the fine draughtsmanship of the modern French school is perhaps chiefly due.

Corresponding with the romantic revolt in literature was one against the prevailing classic traditions in painting, which began about 1830. *Romanticism* saw in the expression of the painter's emotional nature the highest beauty of art. Disregarding classical restraint in line and composition, it placed the chief emphasis upon color and natural truth. Géricault (1791-1824) made the beginning, but upon his early death the leadership passed to Delacroix (1799-1863). In warm prismatic colors and with regard for the general effect only, he depicted tragic subjects in a highly dramatic manner. His disciples include the realist Gigoux, the younger Isabey, and others who painted historical subjects, like Devéria, Cogniet, Roqueplan, Robert Fleury. The Orientalists were Romanticists, who, following Delacroix's example, went to the Orient for subjects. Among the best known are Decamps (1803-60), Marilhat (1811-47), and Fromentin (1820-76). To the same group belong later the painters Théodore Frère and Ziem, the latter famous for Venetian scenes, and Regnault (1843-71), also a fine portraitist.

The *Barbison* painters represented the emotional impulse of Romanticism as applied to landscape. Influenced by the *plein air* work of Constable and Bonington, they went directly to nature, portraying it with fine feeling for light, atmosphere, and color. Their pictures were never photographic, but expressions of poetic moods. Corot (1796-1875) was the lyric talent of the group, the painter of the silvery tones of morning and evening; Rousseau (1812-67), the epic, treating the majestic phases of nature; Jules Dupré, the dramatic; Diaz, the fantastic. To the same group belong Daubigny (1817-78), Chintreuil, and Français, and later painters like Cazin and Harpignies, the latter being rather realistic. The most prominent animal painters were Troyon (1810-65), who renders the character of cattle in truthful fashion; Jaques, the sheep painter, and Van Marcke, pupil of Troyon. More realistic and far less artistic in feeling are the animal painters Auguste and Rosa Bonheur. At Barbison also lived Jean François Millet (1814-75), who has depicted the dignity of life and labor of the French peasant with great force and simplicity and high artistic feeling. Jules Breton (1827—) is more academic and less of a thinker.

Meanwhile painters had begun to unite the excellencies of the contending factions. Under

Louis Philippe, Delaroche (1797-1856), a popular but weak painter of historical scenes, united romantic subjects and color with classic line, as did Horace Vernet, the battle painter, and Ary Scheffer. More classic in character were Flandrin, 'the religious painter of France,' Gleyre, and the Neo-Greeks, like Hamon, Aubert, and Gérôme, in the earlier part of his career. The term Semi-Classicists is applied to a group of painters under the Second Empire, who combine academic training, romantic color, and realistic treatment, like Cabanel, Bouguereau, Gérôme, Lefèbre, and perhaps Henner. Among the chief portrait painters are Bonnat, the realist, and Carolus-Duran, while Laurens (1838—), Benjamin Constant, and Rochegrosse treat historical subjects. Baudry (1828-86), the decorator of the New Opera, is rather a follower of the Italians of the sixteenth century. In a class by himself stands the idealistic Puvis de Chavannes (1824-98), the great French decorative painter, whose art reminds rather of the early Florentines.

The third great factor in French art is *Realism*, as established in the forties by Gustave Courbet (1819-77). He advocated the abolition of academic law and of sentiment, and the portrayal of nature just as it is, and he practiced these theories in his strong materialistic painting. He had no direct pupils, but his influence has permeated French painting. The painters of military subjects and genre show realistic influence, like Meissonier (1815-91), whose art, however, is based upon seventeenth-century Dutch. Among his followers in fashionable genre Vibert is the best known; among the military painters are De Neuville and Detaille. The genre scenes of Ribot and Roybet are of a different kind and more artistic, while among still-life painters Vollon (1833—) has never been surpassed.

The fourth great factor in the art of the present day is so-called *Impressionism*, the advocates of which organized in 1874. Their progress consists in the abolition of the traditions of color and modeling, which the realists retained, and by rendering the impression they attained a better portrayal of life and motion. (See Impressionist School of Painting.) Manet (1833-83) was the founder of the school; the present head is Claude Monet, the painter of pure daylight, and among its chief representatives are Pissaro, the founder of *pointillisme* (dotting with pure tints), and the figure painters Degas and Renoir. Akin to their art is the work of Monticelli (d. 1886). Their doctrine soon spread among other artists, winning such men as Besnard, Carrière, and Raffaelli, who have portrayed the picturesqueness of the lower classes. The art of Bastien-Lepage (d. 1884) is a compromise between realism and the new high light painting, as is that of his many followers, like Renouf, Dagnan-Bouveret, and Fantin-Latour. In late years an imaginative reaction against the materialistic side of impressionism, a new idealism, found expression especially in the Exhibition of 1900, in such men as Henri Martin, Aman-Jean, Fournier. The greatest of this group is Gustave Moreau (1826-98), whose numerous pupils have applied his maxims to every phase of modern life.

Germany. A great influence upon German art was exercised by the writings of the archæologist Winckelmann (d. 1768). Raphael Mengs (1728-79) put his theories into practice, and Carstens (1754-98) followed them to their logical consequence, utterly neglecting color and inaugurating the cartoon style, which so long dominated German art.

The reaction against Classicism took the form of an imitation both in form and religious spirit of Italian masters of the fifteenth century, inaugurated at Rome about 1815 by German painters generally known as the 'Nazarenes' under the leadership of Overbeck (1789-1869). (See Pre-Raphaelites.) Of these painters Cornelius (1783-1867) became head of the Munich school, and, to meet the great demand for mural decoration, he practiced the cartoon style of painting, which was good in drawing and composition, but in which pictorial qualities were neglected. His chief follower was Kaulbach (1805-74), who used cartoon painting to express philosophic ideas. At Düsseldorf, on the other hand, under the teaching of Schadow, a school of painting arose, which paid attention to color, and represented the romantic tendencies of German art. (See Düsseldorf School of Painting.) The greatest German mural painter of the nineteenth century, Alfred Rethel (1816-59), was from the school of Düsseldorf, while the principal romantic painter, Moritz von Schwind (1804-71), came from Munich. Romantic landscape found its highest development in Karl Friedrich Lessing and his pupils, like the brothers Achenbach, while Friedrich Preller and Rottmann, by a revival of the heroic landscape, represented the classical tendencies.

A great change was effected in German painting by the French and Belgian colorists, and to the generation of the fifties Paris was the high school of art. The earliest of these French trained artists was Anselm Feuerbach, who refined the French influence by contact with the Italian. At Munich Piloty (1826-86) engrafted French color on the cartoonist style. Among his numerous pupils were the Austrians Makart (1840-84), who was a still greater colorist, and Gabriel Max. Meanwhile the genre pictures began to bring art back to real life; especially well known in this line are Knaus, Vautier, Ramberg, Defregger, and Grützner.

The greatest change over German art, however, came after 1870, when historical painting definitely gave place to that of life—to realism. Most prominent among German realists is Menzel (1815—) of the Berlin school, likewise a great colorist. Neither he nor Pettenkofen (1822-89), a figure painter on realistic lines at Vienna, had influential following. In Munich there was a period of fruitful study of the old masters, the greatest product of which was the portraitist Lenbach (1836—), a brilliant colorist and delineator of character. Leibl occupied at Munich the same position as Courbet in Paris.

With the Munich exhibition of 1879, French Impressionist painting became known in Germany. The chief representatives of the new art are Liebermann at Berlin, a genre painter; Uhde, who paints Scriptural subjects in contemporary life and costumes; and Max Klinger, the most brilliant of the younger painters. In a class for himself stands the Swiss Arnold Böcklin (d. 1901), brilliant in color, weird in imagination. At Vienna Klint, leader of the Secessionists, represents Impressionist views. Munkácsy (d.

1900), the best known Hungarian painter, was rather Parisian in technique.

GREAT BRITAIN. Until late years English art was little affected by that of the Continent. Among portrait painters were the dignified and impressive Scotchman Raeburn (d. 1823), the vivacious and clever Laurence (d. 1830). The tendency was toward the historical picture of an academic order, in which two Americans, Copley (d. 1815) and Benjamin West (d. 1820), had high repute, as had Etty (d. 1849), Haydon (d. 1846), and Eastlake (d. 1865)—all mediocre as painters. The greatest of all, though without color sense or technical training, was the imaginative genius William Blake (1757-1827). England is the home of genre painting executed with high detail, like that of the Scotchman Wilkie (d. 1841), Mulready, Collins, Newton, and Frith. In landscape the English have been peculiarly original. Turner (1775-1851) is the great representative of the heroic landscape, which he developed with modern methods and dazzling color effects. Here also the *paysage intime* (see LANDSCAPE) originated, chiefly through John Constable (1776-1837), who was the first to eliminate the brown tone in favor of nature's blues and greens. Cox was his chief pupil, and Bonington the intermediary between his art and French.

The reaction against English academic tendencies came in 1848 through the Pre-Raphaelites (q.v.), among whom Rossetti was the best colorist, Holman Hunt the most detailed and laborious, Burne-Jones (d. 1898) the most decorative. Millais (d. 1896) soon became more of a realist, but Madox-Brown, Walter Crane, and Watts lean toward the Pre-Raphaelites in sentiment. Leighton (d. 1896) is more classical and academic. Among the best known contemporary painters are Holl, Herkomer, and Shannon; among landscapists Cecil Lawson, Stanhope Forbes, Alfred Parsons, Luke Fildes, and Henry Moore for marines. At Glasgow is a school which has more affinity with Paris than with England, and which has been influenced by Whistler.

OTHER EUROPEAN COUNTRIES. Spanish painting after Goya followed the French, though adding some national touches. The greatest influence of the century was wielded by Fortuny (1839-74), a sparkling genre painter—a follower of Meissonier. Other important names are Madrazo, a facile portraitist, Zamacois, Zuloaga, a high light painter, and Rico, a painter of Venetian scenes. Italy has fluctuated between German and French influence, of late years the latter. The chief painter of the century is Segantini (d. 1903), the Italian Millet, whose grand Alpine peasant scenes are of a strikingly original style. Genre painting, in imitation of Fortuny, is much practiced by such well-known artists as Michetti, De Nittis, Boldini, and others, the last named being a portraitist Parisian in technique.

In Scandinavian countries the influence was at first German, but in late years, under Parisian teaching, important schools of high-light painters have arisen. The Danish (Johansen) is homelike and quiet in color, the Swedish more cosmopolitan and Parisian (Zorn), the Norwegian primitive (Thanlow). In Russia the early influences were Byzantine; but of late years a modern school has arisen, chiefly under French influence, but with some strong national traits. Among the best known are Vereshtchagin (d. 1904), the military painter, Repin, for historical, and Maliavine for figure subjects. In Poland there is a school extremely national in subjects, though not especially in technique, the chief representatives of which are Matejko and Siemiradzki. For the Belgian and Dutch schools, see NETHERLANDS SCHOOLS OF PAINTING.

UNITED STATES. In the Colonial period British portraitists were active in America, but none of these possessed essentially American qualities. The Americans Copley, West, Lesley, and Newton were British painters, who passed most of their lives in England. Even after the Revolution American painting remained under British influence, although there was an inclination to follow the Italians in larger subjects. The principal historical painter of this early period was Trumbull (1756-1843), who depicted Revolutionary subjects. Gilbert Stuart (1755-1828), famous for his portraits of Washington, was the chief portraitist, and for the period an excellent colorist. Among other portraitists were Vanderlyn, Allston, the two Peales, Jarvis, and Sully—none of them, except Sully, ever rising above mediocrity.

About 1825 an indigenous art began to appear. It manifested itself principally in the landscape painters of the Hudson River school (q.v.), founded by Thomas Cole. The earliest painters of this school were self-taught, but its work improved with men like Durand, Kensett, and F. E. Church. Connected with this school, at least in sentiment, was the work of Hubbard, Bierstadt, Moran, and others, who painted extensive panoramas of the Rocky Mountains and similar grand scenery, and the work of Sanford, McEntee, Whittredge, Bradford, and Richards, who painted smaller but much better canvases. The portrait painters of the period were Harding, Elliott, Inman, Huntington, and Healey.

Meanwhile the influence of foreign schools, which was to some extent evident in the work of these men, began to make itself felt with greater force. That of the Düsseldorf school was represented by Lentze (1816-68), the painter of Revolutionary subjects. More important was the French influence, introduced by Hicks (1823-90), a pupil of Couture, and especially by W. M. Hunt (1824-79), who was a disciple of the Barbison school, the methods of which he introduced into this country. Important contemporary figure painters were George Fuller, Eastman Johnson, and Vedder, and especially John La Farge and Winslow Homer, both men of high technical accomplishments and great originality. In landscape there were Wyant, Inness (d. 1897), the most original and able American landscape painter, and Homer Martin (d. 1897).

The latest development may be said to have begun with the Centennial Exhibition of 1876, which revealed to American artists the achievements of foreign schools. Since that time it has been the general custom to study abroad, to some extent at Munich, but principally at Paris. Indeed, French methods have become quite generally adopted, although American art has remained national in its choice of subjects and in its conceptions. The principal centre of art is New York, and the new development is especially represented by the Society of American Artists (q.v.), founded in 1878, in opposition to the more

conservative National Academy (q.v.). Among the more important contemporary artists residing in America are W. M. Chase, an excellent technician in all respects, and in all subjects, Blum, Dewing, Thayer, and Kenyon Cox. Figure and genre painting are further represented by men like Simmons, Hassam, Wiles, Blashfield, and Turner; portraiture by Lockwood, Tarbell, and Vinton; landscape by Weir, Twachtman, Theodore Robinson (d. 1896), Horatio Walker and Maynard.

There is nothing essentially national about the American painters who practice abroad. Probably the most important artist of American birth was Whistler (1834-1903), the essence of whose work is refinement, both in conception and color. The work of the other Americans residing at Paris and elsewhere, like Alexander Harrison, Melchers, and Walter Gay, is rather French than anything else. Among the Americans at London E. A. Abbey (1852—) is a good colorist, and Sargent (1856—) is in many respects the greatest portrait painter of the present day.

BIBLIOGRAPHY. The most scholarly history of painting is by Woltmann and Woermann (Leipzig, 1878-88; Eng. trans., New York, 1901). Kugler's *Handbuch der Geschichte der Malerei* (Berlin, 1867) is best known in the English translations, *Italian Schools of Painting*, edited by Layard (London, 1891); and *German, Flemish, and Dutch Schools of Painting*, edited *by Crowe* (ib., 1898). Van Dyke's *History of Painting* (New York, 1901) is a good brief text-book, especially strong in the technical characterization of the artists. An admirable brief German history is that of Muther, *Geschichte der Malerei* (Leipzig, 1899-1900). The standard French works are by Blanc (Paris, 1876) and Viardot (London, 1877). Ruskin's *Modern Painters* (London, 1843-60) is a suggestive and stimulating work.

The best account of Greek painters is still that in Brunn's *Geschichte der griechischen Künstler*, vol. ii. (Stuttgart, 1859; 2d unaltered ed. 1889). Consult also Girard, *La peinture antique* (Paris, 1892). An excellent series of biographies is that edited by Dohme, *Kunst und Künstler des Mittelalters und der Neuzeit* (Leipzig, 1877-86). The best general histories of modern painting are those of Rosenberg (Leipzig, 1894) and Muther (Eng. trans., London, 1895-96). Consult also the *Dictionary of Painters*, by Bryan (new ed. by Williamson, New York, 1903 et seq.). For authorities upon the special schools, consult the articles on the FLORENTINE, NETHERLANDS, and other schools, and upon the special artists.

PAINTS. A paint is composed of a pigment, which is a solid substance ground to a fine powder, mixed with a liquid of such a nature that when spread in a thin film and exposed to the air it will turn into an adhesive and more or less tough solid substance, thus cementing the particles of pigment to each other and to the coated surface. The pigments used in paint-making are of various origins and compositions, but all are of such a nature as to have little or no chemical action on the liquid component. This liquid may be watery, like the solution of glue used in kalsomine, or an oil, like linseed oil; or it may be any kind of varnish. In all cases this liquid part of the paint is, while liquid, called the *vehicle*, and when dry the *binder*. To the mixture of pigment and vehicle there is usually added a *drier* and a *solvent* or *thinner*. Special paints, like 'fire proof' paints and ships' bottom paints, are considered separately in succeeding sections.

PIGMENTS. The only *white pigments* are white lead and white zinc, the former being a mixture of carbonate and hydrate of lead, and the latter an oxide of zinc. The *black pigments* are lampblack, boneblack, and graphite. Lampblack is mainly carbon, and results from the imperfect combustion of oil or gas, the latter being also known as gas black and carbon black. Lampblack is the finest in texture of all pigments, but different lots differ greatly in this respect. The finer grades are the more valuable. It contains some peculiar oily matter, and retards the drying of oil more than any other pigment, but it is, on the other hand, the most durable. The black pigment most commonly used (except in the special class of anticorrosive paints) is boneblack, known also as drop black, and in the finer grades as ivory black. This contains about 10 or 12 per cent. of true carbon, to which it owes its color, the remainder being the mineral matter of the bone, 3 or 4 per cent. of carbonate, and most of the rest phosphate of lime. Graphite, or mineral crystallized carbon, is extensively used in anti-rust paints; it is flaky in structure and brownish-black in color; like all carbon pigments, it is extremely opaque; it is difficult to grind it to a fine powder. The most brilliant *red pigments* are vermilion and carmine. True vermilion, or English vermilion, is a sulphide of mercury. It is a pigment of great opacity and beautiful color, and tolerably permanent in ordinary use. Carmine is the most brilliant red known, and is an organic compound of alumina, such as is technically called a lake. It is rather transparent and is used as a finishing color. Some of the coal-tar dyes also make red lakes of great permanence and beauty. These reds are the only pigments of importance derived from coal-tar colors. Various iron oxides form the ordinary *brownish red and brown pigments*; some of these are of a purple shade; all are deep in color and have great opacity. The hydrated oxides are brighter in color than the anhydrous. Many of these oxide pigments are made from ores containing clays, which make them brown, or, in the case of ochres, yellow. Sienna, which, when roasted, is exactly the color of old mahogany, and is used to stain light woods, is one of these earthy oxides. The most common *yellow pigment* is chromate of lead, which is an orange-yellow substance; the paler shades are made by the addition of sulphate of lead at the time of making the chromate. The pure orange chromate of lead is made by the addition of a solution of bichromate of soda to a solution of nitrate or acetate of lead; by adding sulphate of soda to the bichromate solution, and then mixing this with the lead solution, a mixed precipitate of chromate and sulphate of lead is produced; the sulphate is, therefore, a proper ingredient in medium and light chrome yellows. By precipitating Prussian blue in a similar manner with chromate of lead, chrome greens are made. Cadmium yellow is a brilliant and valuable pigment, a sulphide of cadmium; the chromate of strontium is known as perfect yellow. Oxide of zinc makes a dull and impure kind of yellow. (To

green is the principal green; it fades badly. Paris green is an arsenical compound of copper, very brilliant, but not a very opaque pigment. Chrome oxide makes an olive green of a subdued but handsome color. It is probably the only permanent green. *Prussian blue* is a ferrocyanide of iron, dark blue, somewhat resembling indigo; but the most common blue is ultramarine, an artificial substance whose somewhat variable composition is known accurately only to its makers. It is only moderately permanent. The high price of cobalt blue prevents its extensive use; it is more permanent than other blues. The foregoing are the principal opaque body colors. Besides these there is a large class known as *lakes*, which are made by precipitating the color ingredients of various dyestuffs with suitable chemicals, usually compounds of alumina, barium, or lead. These lakes are commonly used to impart a desired tone to the more opaque pigments. Madder lakes are prepared from madder, and may vary in shade from pink through red and yellow to purple and brown. See MADDER.

VEHICLES. The principal oil used as a vehicle is linseed. This is made by expression from flaxseed; the crude oil is purified by settling, letting it stand two or three months in tanks at a temperature not lower than 70° F.; it is finally filtered. Linseed oil when spread in a thin film absorbs and combines with oxygen from the air, and is converted into a somewhat elastic leathery substance, commonly known as linoxyn. A few other oils have this power in a less degree, but only one equals linseed oil; this is known as tong oil or Chinese wood oil, and appears to exceed linseed oil in this respect. It is, however, higher in price than linseed, and darker in color, so that it is not likely to be used.

DRIERS. Driers act by taking up oxygen from the air and giving it up to the oil. These driers are compounds of lead and manganese, in solution in the oil; these metals have the power of forming two sets of oxygenated compounds, the peroxidized ones having twice as much oxygen as the others. When in linseed oil they give up half their oxygen to the oil, then, being exposed to the air, they absorb a fresh equivalent of oxygen, which again the oil takes from them; in this way they act as carriers of oxygen from the air to the oil, acting, of course, only when the oil is spread out in a film and exposed to the air. Since the oil is thus converted into a solid dry substance, these agents are called driers.

SOLVENTS. Most oil paints contain some turpentine or other volatile solvent. It is generally agreed that turpentine is the best of these; it is slow to evaporate, and any residue which does not evaporate readily oxidizes into a durable resinous substance, highly elastic, while benzine, which is often used as a substitute, is more rapidly volatile. The turpentine mixture retains its complete fluidity some little time after brushing out into a film, and so the brush-marks flow out and disappear, and the whole surface becomes smooth and uniform; but benzine evaporates immediately, and the paint becomes comparatively stiff and shows brush-marks and all imperfections of surface. This is, of course, more marked still in varnishes. Benzine has also a tendency, in some cases, to cause a separation. Kerosene is also used as a substitute for turpentine, but no good paint can be made with kerosene as an ingredient. Artificial turpentines are usually made of high boiling-point benzine or low boiling-point kerosene, scented with eucalyptus and other essential oils. They are not to be used.

FIRE-PROOF PAINTS. The best fire-proof paints are made by grinding into each gallon of paint about a pound of boric acid. Some manufacturers use instead a very soft and easily fusible glass which is powdered and used in the same way. The idea is that when exposed to heat the boric acid or the glass will melt and form an air-proof glaze over the wood; the boric acid also, being slowly volatile, penetrates the surface with a gas which neither burns nor supports combustion. None of these paints are at all fire-proof when fresh, as the oil is so combustible as to overcome the restraining influence of the flux; but when the oil has become oxidized, it no longer burns readily, and, of course, the pigment is in almost all cases incombustible, and the protective action of such paint is then very considerable. The fire-proofing quality of such a paint diminishes with age and exposure, as the boric acid dissolves out and is washed away by the rain.

SHIPS' BOTTOM PAINTS. In general, the subject of painting the bottoms of iron ships may be divided into the preservation of the metal from corrosion and the prevention of fouling. The former is secured by applying any good anti-corrosive paint, and the problem, so far, is like the preservation of metallic structures in general. Some of the paint manufacturers attempt to do this by a special paint; others aim to make their anti-fouling compounds keep the water from the metal plates and serve both uses. The anti-fouling paints work by poisoning the organisms which attach themselves to the ship, and are chiefly of three kinds. One of these has for its active agent the oxides of copper; these were, in the first instance, ground and mixed with Stockholm tar. The copper was supposed to dissolve slowly and to kill the adhering organisms. Its use was suggested by the successful use of copper sheathing on wooden ships, but the generally accepted theory of the action of copper sheathing is that it acts, not by poisoning, but by a process of exfoliation or scaling off; that animals attach themselves to it, but that an outer layer of the copper peels off and leaves a fresh surface. (See SHEATHING.) Another sort of copper paint is a copper soap, made by precipitating a solution of common soap with a solution of some salt of copper, thus making an oleate or some similar salt of copper. This is a soapy or greasy substance, insoluble in water, and is applied hot, making a thick coating. This is not a good foundation for animals or plants to attach themselves to, and it is continually wearing away. The third, and at present the most numerous class of paints, are the varnish paints, already partly described, made from a spirit varnish. The pigment in these may be almost anything; commonly it is oxide of iron, sometimes with some white lead or white zinc; sometimes the coloring matter is Paris green, or some green pigment suggesting copper. The poisonous matter may be some arsenical compound, but in some of the most successful ones it is a mercury compound. The arsenical compounds are very cheap and are undoubtedly poisonous, but the mercury compounds are more

intensely poisonous; that is, they poison with a less amount, but they are very expensive, costing for the most part about a dollar per pound of contained mercury. It may be doubted whether there is much choice among the mercury compounds, as the sea water will convert any of them into corrosive sublimate. The essential thing seems to be to get a varnish which will last as long as possible, regard being had to the absolute necessity of having one which will dry almost immediately, then to put in enough mercury or other poison to last as long as the varnish does, in quantity sufficient to kill everything with which it comes in contact.

MANUFACTURE. Paint being a composite substance consisting of a pigment, a vehicle, a drier, and often a solvent, it is evident that paint manufacture includes first the manufacture of the separate constituents, and second the mingling of these constituents. In large paint works all the ingredients as well as the mixed paint are made in one plant, but in many paint works one or more of the ingredients are purchased, the mixing only being done at the works. Generally described, the process of paint manufacture is to grind the pigment, vehicle, and drier together in special grinding mills, the liquid coming from the mill being the finished paint, which has then only to be sealed in cans or kegs to be ready for sale. The method of manufacturing the various pigments defined in the preceding paragraph differs in each case. Different vehicles, driers, and thinners are also made in different ways.

See MINERAL COLORS; OILS; TURPENTINE.

PAIRING. In parliamentary practice, an arrangement by which two members of a legislature who intend to cast opposite votes on a question agree that both will absent themselves for a limited time, thus leaving the relative strength of their parties unchanged. It has long been a recognized custom in the House of Commons. The first known instance in the United States Congress occurred in 1840. It was severely rebuked by John Quincy Adams, who prepared a resolution declaring that it involved the violation of the Constitution, of an express rule of the House, and of the duties of both parties. The resolution was never voted upon, and the practice, recommended by its obvious convenience, has since become common.

PAISIELLO, pā'sē-zyĕl'lō, or **PÆSIELLO,** GIOVANNI (1741-1816). An Italian musician, son of a veterinary surgeon at Taranto. He received his musical education in the conservatory of Saint Onofrio at Naples. Of his earlier operas produced at Naples the most celebrated was *Dal finto al vero*, composed in 1777. Some of his best works, particularly *Il barbiere di Seviglia*, were written during an eight years' residence at Saint Petersburg. At Vienna he composed twelve symphonies for large orchestra, and the opera buffa *Il re Teodoro*. Between 1785 and 1799 he produced a number of operas for the Neapolitan Theatre, and was appointed by Ferdinand IV. his *maestro di capella*. In consequence of having accepted under the Revolutionary Government the office of national director of music, he was suspended from his functions for two years after the restoration of royalty, but was eventually restored to them. In 1802 he went to Paris to direct the music of the consular chapel; but the indifferent reception shortly after given to his opera *Proserpine* led him to return to Naples, where he died. His compositions are characterized by sweetness and gracefulness of melody, and a simplicity of structure remarkable for the period and conditions in which he lived. Besides no fewer than ninety operas, Paisiello composed masses, requiems, cantatas, an oratorio, instrumental quartets, harpsichord sonatas, and concertos.

PAISLEY, pāz'lĭ. A manufacturing town, municipal and Parliamentary burgh of Renfrewshire, Scotland, on the White Cart, three miles above its junction with the Clyde, and seven miles west-southwest of Glasgow (Map: Scotland, D 4). The town comprises the old portion on the west bank of the river, with long regular streets of warehouses and factories, and the new portion to the east built on level ground. It has fine municipal and ecclesiastical buildings, and the restored remains of the abbey founded in 1164 are the best specimens of their kind in Scotland. The town has several parks and recreation grounds, including Dunn Square, the Fountain Gardens, the Brodie Park, and Saint James Park, with a race course on which since 1608 horse-races, originated by act of the burgh bailies, have been held annually on Saint James's day. The town owns much real estate, and gas, water, and electric lighting works, controls the charities, manages the hospitals, and maintains public libraries and museums, baths, slaughter houses, cemetery, and artisans' dwellings. Paisley may be considered the seat of the thread manufacture for the home and American markets. Tartan cloths, handkerchiefs, carpets, etc., soap, starch, and corn flour are largely manufactured; and dyeing establishments on an extensive scale, power-loom factories, print works, machine shops, bleach-fields, shipbuilding yards, etc., are in operation in the town and vicinity. The manufacture, now almost extinct, of the famous shawls originated at the beginning of the nineteenth century. Commonly recognized as the Roman Vandmara, the town is mentioned in 1157 as Passeleth, a possession of Walter Fitzalan, who six years later founded the priory. Population, in 1891, 66,400; in 1901, 79,350. Consult: Lees, *Abbey of Paisley* (Paisley, 1878); Brown, *History of Paisley* (2 vols., Paisley, 1886).

PAIXHANS, pāk-sēns', HENRI JOSEPH (1783-1854). A French artillery officer, author, and inventor. He was born in France, graduated from the Ecole Polytechnique, and was assigned to the artillery, in which service he became a general officer. The gun called by his name was adopted in France about 1824, and shortly afterwards in England. Paixhans was also distinguished for his other improvements in heavy ordnance, gun carriages, projectiles, and methods of working guns. He strongly recommended the use of cylindro-conical projectiles as going more directly and striking more powerfully than round balls, and as being less exposed to air resistance. He

original Paixhans gun was 9 feet 4 inches long, with a bore of $8\frac{2}{3}$ inches, and a weight of about 7400 pounds; the charge consisted of between $10\frac{1}{2}$ and 18 pounds of powder. It would bear hollow shot of 60 pounds, or solid shot of 86 to 88 pounds. He was the author of several works on naval gunnery. See articles GUNS, NAVAL; ORDNANCE.

PAJARITO. A fish. See HALFBEAK.

PAJOU, pä'zhōō', AUGUSTIN (1730-1809). A French sculptor. He was born in Paris, was a pupil of Lemoine, and obtained the Prix de Rome for sculpture in 1748. On his return after twelve years of study at Rome, he was elected a member of the Academy on the merit of his work, "Pluto Holding Cerberus in Chains" (Louvre), and in 1767 he became professor. Louis XVI. employed him to adorn with sculptures the façade of the Palais Royal, and to execute statues of Pascal, Turenne, Bossuet, Buffon, and Descartes. He executed also the sculptures of the Salle de l'Opéra at Versailles, the ornaments of the Palais Bourbon, and of the Cathedral of Orleans. The Louvre contains a number of his works, among which are the aristocratic bust of Madame de Pompadour, and the charming ideal statue of "Psyche." His art is characterized by exquisite grace, and resembles that of his contemporary, the painter Boucher. He received a handsome fortune from his works, but lost it by the Revolution. Consult his biography by Lebreton (Paris, 1810).

PAK'ENHAM, Sir EDWARD MICHAEL (1778-1815). An English soldier. He was born in County Westmeath, Ireland; entered the army at an early age, and by rapid promotion came to be major-general in 1812. He served under Wellington in the Peninsula, particularly distinguishing himself at Salamanca, where he commanded the division which broke the enemy's centre and brought success to Wellington. In 1814 he was selected to direct the expedition against New Orleans, and was killed in the unsuccessful attack of January 8, 1815. See NEW ORLEANS, BATTLE OF.

PAKHOI, päk-hoi'. A treaty port of Southern China, in the Province of Kwang-tung, situated on the Gulf of Tongking, 280 miles southwest of Canton (Map: China, C 7). The Chinese town is built at the foot of a bluff on the top of which lies the European section. The city serves as the port of Lien-chow. In 1901 its volume of trade amounted to $2,875,000, the chief exports being hides, anise-oil, indigo, and fish, and the imports cotton and woolen goods, petroleum, and opium. Population, about 20,000. Pakhoi was opened to foreign trade in 1876.

PAK-KWA, pä'kwä' (Chin., eight diagrams). Eight figures or symbols said to have been elaborated by the mythical Chinese Emperor Fuh-hi (q.v.). Each consists of a group of three parallel horizontal lines, some of them whole, and some broken in two, the broken lines symbolizing the *yin*, female or negative principle in the cosmogonic theory held by the Chinese, and the unbroken lines the *yang*, male or positive principle. By doubling these groups and ringing the changes on the different possible combinations, a new series of 64 hexagrams was produced, and these form the basis of the oldest of the Chinese classics, the *Yi-King* or "Book of Changes."

PAKS, pōksh. A market-town of Hungary, in the County of Tolna, situated in a marshy region on the Danube, 60 miles south by west of Budapest (Map: Hungary, F 3). The town has a trade in wine and poultry. Population, in 1890, 11,800; in 1900, 12,034, mostly Magyars.

PALACE. Originally a building for the residence of the sovereign, the term being derived from the buildings on the Palatine Hill at Rome, where the successive emperors built their residences and halls of state. In English, the word has strictly no other sense than this; but there are many recent adaptations from foreign languages which are in use among travelers, students of art, and the like. Thus, the Italian *palazzo*, which means a stately private dwelling; and, in some cities, one having a carriage driveway (porte-cochère) admitting to a court, is translated carelessly by 'palace.' Also as 'palazzo' is extended to cover municipal buildings, such as those at Siena, Perugia, Gubbio, and the like, some writers translate Palazzo Communale, Palazzo Municipale, Palazzo Vecchio, by a compound term, of which 'palace' forms a part. More rarely, the French word *Palais*, as in Palais de Justice, Palais de Commerce, is rendered into English as 'palace.' The use of the word for a very costly dwelling-house is a mere exaggerated expression not received into the language, as having a separate signification.

PALACIO VALDÉS, pä-lä'thē-ō väl-dās', ARMANDO (1853—). A Spanish novelist, born at Entrealgo, in Asturias. He passed much of his youth at Avilés, on the coast. After a preliminary training at Oviedo, he went to Madrid to devote himself to the study of jurisprudence and political economy. He became a prominent member of the Ateneo, and was made editor of the periodical *La Revista Europea* when but twenty-two years old. After directing it for three years, he withdrew to give himself up to the composition of novels. The first of them, *El señorito Octavio* (1881), illustrates his fondness for simplicity of plot, and marks him from the start as one who excels in the psychological analysis of the inner man as in the description of the aspects of outer nature. His second novel, *Marta y María* (1883), is by many deemed to be his masterpiece. It deals with the contrast between a life of active, human love and one of virginal and mystic contemplation. In his later novels Valdés inclines toward naturalism. The more recent works—all of great interest and most of them, like the *Marta y María*, now translated into English—are: *El idilio de un enfermo; José*, a charming seaside idyll; *Aguas fuertes*, a collection of tales; *Riverita*, and its sequel, *Maximina*, the latter containing many autobiographical elements; *El cuarto poder; La hermana San Sulpicio; La espuma; La fe; El maestrante; El origen del pensamiento; Los majos de Cádiz; La alegría del capitán Ribot*. The author's ideas with regard to the art of fiction are expressed in essays prefixed to the editions of the *Hermana San Sulpicio* and the *Majos de Cádiz*. Other works of a critical nature are: *Los oradores del Ateneo; Los novelistas españoles; Nuevo viaje al Parnaso;* and, produced in collaboration with Alas, *La literatura en 1881*. Consult: Blanco-García, *La literatura española en el siglo XIX.*, second

part (Madrid, 1891); Howells, in *Harper's Magazine* (New York, April, 1886, and November, 1886); Baxter, "A Great Modern Spaniard," in *The Atlantic Monthly* (Boston, April, 1900); Davidson, in the introduction to his edition of the *José* (Boston, 1900).

PALACKY, pä-läts'kē, Frantisek (1798–1876). A Bohemian historian and political leader. He was born at Hodoslavitz in Moravia, and studied at Pressburg and Vienna. He became archivist at Prague in 1823, and national historiographer in 1839. In 1848 he was a prominent member of the Slavic Congress at Prague, and shortly after acted as representative in the Austrian Diet at Kremsier. A leader of the Czech national party in the provincial Diet of Bohemia, he became a prominent figure in the political life of the Empire, allying himself (although a Protestant) with the Ultramontanes in his opposition to the *Ausgleich* with Hungary. He took part in the Panslavic Congress at Moscow in 1867. Palacky's reputation as historian rests on his *Geschichte von Böhmen* (1836-67), begun in German and continued in Czech, a work based on vast original research into original sources. Other writings are: *Die ältesten Denkmäler der böhmischen Sprache* (1840); *Geschichte des Hussitentums* (1868); *Geschichte des Hussitenkriegs* (1872-74).

PALADILHE, pä'lä'dēl', Emile (1844—). A French composer, born near Montpellier. He studied at the Paris Conservatory under Benoist, Marmontel, and Halévy, and in 1860 won the Grand Prix de Rome with the cantata *Le czar Ivan IV.* During his stay in Rome he wrote an opera buffa and considerable instrumental music, but upon his return to Paris he became more widely known for his songs, which include: "Mandolinata," "Premières peuïnes," and Mélodies écossaises." His first opera, *Le passant*, was produced in 1872, and was followed by *L'amour africain* (1875); *Suzanne* (1878); *Diana* (1885); and *Les Saintes Maries de la mer*, a lyric drama (1892). His most successful opera, *Patrie*, produced in 1886, has been given in Germany and Italy. His compositions also include considerable sacred music.

PALADIN (OF. *paladin*, from It. *paladino*, from ML. *palatinus*, warrior, one connected with the palace, from Lat. *palatium*, palace). A term originally derived from the Counts Palatine, or of the palace (see Palatine), who were the highest dignitaries in the Byzantine Court, and hence used generally for a lord or chieftain, and by the Italian romantic poets for a knight-errant.

PALÆARCTIC REGION. See Palearctic Region.

PALÆASTER (Neo-Lat., from Gk. παλαιός, *palaios*, ancient + ἀστήρ, *astēr*, star, starfish). An extinct genus of starfishes, found in rocks of Ordovician to Carboniferous age in North America and Europe. See Starfish.

PALÆMON, Quintus Remmius. A Roman grammarian of the first century. He was born at Vicentia, the son of a female slave. Unlike the earlier scholars, who had made the older literature the centre of their linguistic studies, Palæmon devoted himself chiefly to Vergil, and is to be remembered for having first introduced the latter's works as a text-book into the Roman schools. His grammar, *Ars*, is said to have been much consulted by later grammarians, but is now lost. The grammar that bears his name is wrongly ascribed to him. He is mentioned by Suetonius (*De Illustribus Grammaticis*, 23), and by Juvenal (vi., 451; vii., 215-219), who says that Palæmon was the master of Quintilian. Consult: Nettleship, in the *English Journal of Philology* (xv., 192); and Marschall, *De Remmii Palæmonis Libris Grammaticis* (Leipzig, 1887).

PALÆOBOTANY, etc. See Paleobotany, etc.

PALÆOCREU'SIA (Neo-Lat. nom. pl., from Gk. παλαιός, *palaios*, ancient, + Neo-Lat. *Creusia*, from Gk. Κρέουσα, *Kreousa*, a character of Greek mythology). A Lower Devonian barnacle that lived as a commensal in cavities of the coral Favosites. See Barnacle.

PALÆOHATTE'RIA (Neo-Lat. nom. pl., from Gk. παλαιός, *palaios*, ancient + Neo-Lat. *Hatteria*, of uncertain origin). A fossil lizard-like reptile of the order Rhynchocephalia, found in the Permian formations of Europe. See Rhynchocephalia.

PALÆOL'OGUS (Lat., from Gk. Παλαιόλογος, *Palaiologos*). The name of an illustrious Byzantine family, which first appears in history in the eleventh century, and attained the Imperial dignity in the person of Michael VIII. (q.v.), who became Emperor of Nicæa in 1259, and mounted the throne of Constantinople in 1261. His successor on the throne was his son Andronicus II., in whose reign, which extended from 1282 to 1328, the Turks commenced a series of assaults on the Byzantine dominions. He associated his son, Michael IX., with himself, but was dethroned by his grandson, Andronicus III., who reigned from 1328 to 1341. The latter was an able warrior and ruler, who repeatedly defeated the Bulgarians, the Tatars of the Golden Horde, and the Servians, but was unsuccessful against the Catalans in Greece, while the Turks during his reign ravaged the coasts of Thrace as far as the Balkans. He was greatly esteemed by his subjects, and well merited the title of 'father of his country.' Andronicus III. was succeeded by his son, John V., who ruled, with some interruptions, from 1341 to 1391. During his minority his mother, Anna, and John Cantacuzenus were regents. The latter in self-protection had himself proclaimed co-Emperor as John VI. in 1341. (See Cantacuzenus.) During John V.'s reign the Turks made great progress, and the Emperor was compelled in 1370 to agree to pay them an annual tribute. In 1376 John was overthrown by his son, Andronicus IV., but regained the crown in 1379. In 1390 the son of Andronicus IV., John VII., dethroned him and ruled for a few months, but John V. ultimately regained the crown, and retained it until his death, February 16, 1391. John VII. sought Turkish aid, and compelled the son and successor of John V., Manuel II. (q.v.), to make him co-Emperor in 1398, but in 1402 he was sent to the Island of Lemnos, and in 1407 some land was given to him in Thessaly and Macedonia which the Turks soon conquered. He died about 1408. The successor of Manuel II. was his son, John VIII., who ruled from 1425 to 1448. On being pressed by the Turks he held out to the Popes the old bait of the union of the Greek and Western churches under his sway, and even presented himself at the Council of Florence, where, in July, 1439, the union of the churches was brought about.

But on his return to Constantinople the opposition of the Greek ecclesiastics to the union, supported by the people, rendered the agreement of Florence a dead letter. The Pope, however, stirred up Ladislas of Hungary and Poland to attack the Turks, but they could not be driven back. John was succeeded by his brother Constantine XI., who ruled from 1448 to 1453, and with him the Byzantine Empire ended. (See CONSTANTINE XI.) A branch of the Palæologi ruled Montferrat, in Italy, from 1306, but became extinct in the sixteenth century. The Palæologi were connected by marriage with the ruling families of Hungary and Servia, and the niece of the last Byzantine Emperor married Ivan III., Czar of Russia—a fact which the Czars of Russia were wont to bring forward as an argument in favor of their claims to European Turkey.

PA'LÆONIS'CUS (Neo-Lat., from Gk. *παλαιός*, *palaios*, ancient + *ὄνισκος*, *oniskos*, fish of the cod kind, diminutive of *ὄνος*, *onos*, ass). A genus of fossil actinopterygian fishes found in the Permian rocks of Europe. The body was long and slender, covered with regular ganoid scales, and was provided with small triangular dorsal, pectoral, pelvic, and anal fins. It is especially common in the shales of England and in the copper-bearing shales of Thuringia, in Germany.

PA'LÆOSPON'DYLUS (Neo-Lat., from Gk. *παλαιός*, *palaios*, ancient + *σπόνδυλος*, *spondylos*, *σφόνδυλος*, *sphondylos*, vertebra). A very interesting fish-like fossil found in the flagstones of the Old Red Sandstone at Achanarras, near Thurso, Scotland. The entire fossil is scarcely two inches long, and it consists of an anterior broader cephalic portion and a long posterior slender vertebral column, terminated by a delicate feather-like fin. The structure of the head resembles that of the recent lamprey, and on this account Palæospondylus is supposed to be an ancestral lamprey, in which all the cartilages were calcified. Consult: Dean, "The Devonian Lamprey, Palæospondylus gunni Traquir, with Notes on the Systematic Arrangement of the Fish-like Vertebrata," in *New York Academy of Sciences, Memoirs*, vol. ii., part i. (New York, 1899). See CYCLOSTOMI.

PA'LÆOTHE'RIUM (Neo-Lat., from Gk. *παλαιός*, *palaios*, ancient + *θηρίον*, *thērion*, diminutive of *θήρ*, *thēr*, wild beast). An extinct perissodactylate hoofed mammal of the size of a rhinoceros found in abundance in some Eocene deposits of Europe. It was described and named by Cuvier in 1804 from specimens exhumed at the gypsum quarries at Montmartre, near Paris. By some authors it has been looked upon as a three-toed ancestor of the horse, but it is more properly considered to represent a lateral offshoot from the main line of evolution of the horse. See HORSE, FOSSIL.

PALÆ'PHATUS (Lat., from Gk. *Παλαίφατος*, *Palaiphatos*). A Greek mythographer, of an uncertain period, who is said to have written in several books an historical and allegorical explanation of Greek myths. Of this work there is extant only a short abstract, *On Incredible Tales* (*Περὶ ἀπίστων*), which was formerly a favorite school book. In it Palæphatus gives a brief account of about fifty of the most celebrated Greek legends, and explains them according to the method of Euhemerus. The treatise has been edited by Westermann, in his *Μυθογράφοι* (Brunswick, 1843). Consult Wipprecht, *Questiones Palæphateæ* (1892).

PALAFOX Y MELZI, pä'lä-fōks' ē mâl'thē, JOSÉ DE, Duke of Saragossa (1780-1847). A Spanish patriot and soldier. He entered the army in 1792, and was lieutenant in 1808. Upon the invasion of the French he carried on a fierce guerrilla warfare against them; was made Captain-General of Aragon; unsuccessfully attempted to hold the line of the Ebro, and distinguished himself by his heroic defense of Saragossa, July 27-August 14, 1808, and December 20, 1808-February 21, 1809. He was taken a prisoner to France and kept at Vincennes until the restoration of Ferdinand VII. in 1814, when he was made Captain-General of Aragon. He commanded the National Guard from 1820 to 1823, and afterwards lived in disgrace till 1836, when he became Duke of Saragossa and grandee of the first class.

PALAIHNIHAN, pä-lī'nē-ăn (Klamath *p'laikni*, mountaineers). A small linguistic family of North American Indians, living in northeastern California, in the basin of the Pit River, whence they are called also Pit River Indians. Seven tribal divisions have been recognized among them. In their social life and morals, no less than in their vigor, the Palaihnihan tribes are among the lowest aboriginal peoples.

PALAIS BOURBON, pä'lä' bōōr'bōN'. See CHAMBRE DES DÉPUTÉS.

PALAIS DE JUSTICE, pä'lä' de zhụs'tēs'. A group of buildings on the Ile de la Cité in Paris, occupying the site of the old royal palace, and devoted to the law courts. Of the ancient palace, which was presented to the Parlement by Charles VII. in 1431, the only portions spared by the fires of 1618 and 1776 are the Tour de l'Horloge, containing the oldest public clock in France, dating from 1370, the famous Sainte-Chapelle (q.v.), the Conciergerie (q.v.), the so-called Kitchens of Saint Louis, and three towers. During the war of the Commune in 1871 a large part of the structure was destroyed, but has been restored. A number of the courts open into the Salle des Pas-Perdus, one of the largest halls in existence, 240 feet long, 90 feet wide, and 33 feet high. The hall was formerly the great hall of the royal palace, and consists of two galleries separated by arcades. It contains several monuments and statues. The chief entrance of the Palais de Justice is formed by the handsome Court of Honor, adorned with allegorical statues.

PALAIS ROYAL, pä'lä' rwä'yäl' (Fr., royal palace). The name now borne by a heterogeneous mass of buildings on the eastern side of the Rue Richelieu in Paris, composed of a palace, theatres, public gardens, bazaars, shops, cafés, and restaurants. The old palace was built between 1619 and 1636 on the site of the Hôtel Rambouillet by Cardinal Richelieu, who at his death bequeathed it to Louis XIII. It subsequently became the residence of the Orleans branch of the Bourbons, and during the minority of Louis XV. acquired a scandalous notoriety as the scene of the wild orgies in which the Regent, Orleans, and his dissolute companions were wont to indulge. In the time of his great-grandson, Philippe Egalité, it became the focus of revolutionary intrigue. This prince, partly to repair

his impoverished fortune and partly to prove the sincerity of his professed sympathy with the people of Paris, converted part of the gardens of the Palais Royal into a place of public resort, and the pavilions of the great court into bazaars, which were divided into shops and stalls. On the downfall of Egalité the building was taken possession of by the Republican Government. On the restoration of the Bourbons it was occupied by Louis Philippe till his elevation to the throne of France in 1830, when it was incorporated in the general domains of the State. The palace was sacked by the mob during the Revolution of 1848, when many of its works of art were destroyed. It was thoroughly repaired and magnificently furnished in 1855, and given by Napoleon III. to his uncle, Jerome Bonaparte, whose son, Prince Napoleon, resided there until 1871. The Communists set fire to the palace in 1871, and all the apartments occupied by the Prince were destroyed, but the flames were checked before they spread to the galleries and shops, and the injured portions were restored in the autumn of 1873. The garden, with its avenues and parterres, fountains, and grass plots, still constitutes one of the liveliest and most frequented spots in the whole city; and its cafés still maintain, in great measure, their former reputation. The north side of the grand court is occupied by the Théâtre du Palais Royal, devoted to high comedy and farce.

PALAME'DES (Lat., from Gk. Παλαμήδης). In Greek mythology, a hero, son of Nauplius and Clymene. In Homer he is not mentioned, but in the later literature on the Trojan War he plays a prominent part, being especially noted for his quick understanding and resource. His wit detected the simulated madness of Odysseus, by placing the infant Telemachus in front of his father's plow. To him also was ascribed the invention of letters, numbers, weights and measures, money, dice, and draughts. This last, we are told, was to divert the army in a time of scarcity. His death was attributed to the jealousy of Odysseus and Diomedes, or the revenge of Odysseus, but the stories as to the plot and its execution varied widely. The name Palamidi, which is now borne by the rocky height above the modern Nauplia, is commonly believed to point to a cult of the hero in the neighborhood. Consult Jahn, *Palamedes* (Hamburg, 1836).

PALAMEDESZ, pä'lä-mä'dĕs, ANTONIS (*c.*1601-73), surnamed STEVAERTS. A Dutch painter, born probably at Delft, or, according to Houbraken, in London, where his father, a gem-setter and painter, was in the service of James I. He entered the guild of Delft in 1621, and was its president in 1673. He painted the figures in Van Delen's architectural pictures, and probably through him met Dirk Hals, whose influence is noticeable in his works. His subjects are portraits or military scenes, treated with vivacity and glowing color. Among his authentic works are: "Portrait of a Young Man," in the Berlin Museum; "Spanish Soldiers and Girls in a Peasant's Cottage" (1632); "A Soldier Bargaining for a Hare;" and a "Soldier Making Love," all in the Museum at Hanover; and a guard-room scene, in the Liechtenstein Gallery in Vienna. With Van Delen, he painted "The Meeting of the States-General" (1651), in The Hague Museum. His brother, PALAMEDES PALAMEDESZ (1607-38), was his pupil, and painted much the same subjects in the same manner, but with less skill. There is a spirited "charge of Cavalry" in the Berlin Museum signed with his name.

PALAMON' AND ARCITE, ăr'sīt. Two Theban princes, imprisoned by Theseus, who both loved Emilia, sister to Hippolyta. Their story is told by Chaucer, in the "Knight's Tale," which was taken from Boccaccio's "Teseide." A French poem, "Palamon and Arcite," by Anne de Graville, appeared in 1487. The same story is used in Fletcher's tragedy *Two Noble Kinsmen*, printed in 1634, but probably written in 1606 and said to have been revised by Shakespeare. The tale is also used in Edwardes's play *Palamon and Arcite*, now lost, produced for Queen Elizabeth, at Oxford, 1566. Another lost play of this title is mentioned in Henslowe's *Diary* as played in 1594. Dryden introduced a version of the story in his "Fables" in 1700.

PALANPUR, or **PAHLANPUR**, pälän-pōōr'. A native State of Gujarat, India, Bombay (Map: India, B 4). Area, 3177 square miles. Population, in 1891, 274,804; in 1901, 222,027, the decrease being due to the effect of the plague and famine of 1899-1900. The capital, Palanpur, is a station of the Rajputana-Malwa line, and had a population of 17,599 in 1901.

PALAPRAT, pä'lä'prä', JEAN, Sieur de Bizet (1650-1721). A French dramatist, born at Toulouse. He became secretary to the Grand Prior of Vendôme (Louis of Cleves). With David Augustin de Brueys he wrote a number of plays once esteemed for their wit. He himself was the sole author of a few, including *Les Quiproquos* and *Hercule et Omphale*. All were collected in five volumes in 1735-55.

PALATE (OF. *palat*, from Lat. *palātum*, *palatus*, palate, roof of the mouth). The palate forms the roof of the mouth, and consists of two portions, the hard palate in front and the soft palate behind. The framework of the *hard palate* is formed by the palatal process of the superior maxillary bone, and by the horizontal process of the palate bone, and is bounded in front and at the sides by the alveolar arches and gums, and posteriorly it is continuous with the soft palate. It is covered by a dense structure formed by the periosteum and mucous membrane of the mouth, which are closely adherent. Along the middle line is a linear ridge or raphe, on either side of which the mucous membrane is thick, pale and corrugated, while behind it is thin, of a darker tint, and smooth. This membrane is covered with scaly epithelium, and is furnished with numerous follicles (the palatal glands). The *soft palate* is a movable fold of mucous membrane inclosing muscular fibres, and suspended from the posterior border of the hard palate so as to form an incomplete septum between the mouth and the pharynx; its sides being blended with the pharynx, while its lower border is free. When occupying its usual position (that is to say, when the muscular fibres contained in it are relaxed), its anterior surface is concave, and when its muscles are called into action, as in swallowing a morsel of food, it is raised and made tense, and the food is thereby prevented from passing into the posterior nares, and is at the same time directed obliquely backward and downward into the pharynx. Hanging from

the middle of the soft palate's lower border is a small conical pendulous process, the *uvula*; and passing outward from the uvula on each side are two curved folds of mucous membrane containing muscular fibres, and called the *arches* or *pillars of the soft palate*. The *anterior pillar* is continued downward to the side of the base of the tongue, and is formed by the projection of the palato-glossus muscle. The *posterior pillar* is larger than the anterior, and runs downward and backward to the side of the pharynx. The anterior and posterior pillars are closely united above, but are separated below by an angular interval, in which the *tonsil* of either side is lodged. The tonsils (*amygdalæ*) are glandular organs of a rounded form, which vary considerably in size in different individuals. They are composed of an assemblage of mucous follicles intermingled with diffuse adenoid tissue and covered by a mucous membrane. The follicles secrete a thick, grayish matter, and open on the surface of the gland by numerous (12 to 15) orifices.

The space left between the arches of the palate on the two sides is called the *isthmus of the fauces*. It is bounded above by the free margin of the palate, below by the tongue, and on each side by the pillars of the soft palate and tonsils.

As the upper lip may be fissured through imperfect development (in which case it presents the condition known as the hare-lip), so also may there be more or less decided fissure of the palate. In the slightest form of this affection the uvula merely is fissured, while in extreme cases the cleft extends through both the soft and hard palate as far forward as the lips, and is then often combined with hare-lip. When the fissure is considerable, it materially interferes with the acts of sucking and swallowing, and the infant runs a great risk of being starved; and if the child grows up, its articulation is painfully indistinct. When the fissure is confined to the soft palate, repeated cauterization of the angle of the fissure has sometimes been found sufficient to effect a cure by means of the contraction that follows each burn. As a general rule, however, the child is allowed to reach the age of five or six years without intervention, when the operation of *staphylorrhaphy* (suture of the soft parts) is performed. If the fissure involves the hard palate as well as the soft palate, that structure is also repaired at the same time, the operation being known as uranoplasty. Acute inflammation of the tonsils is treated of in the article QUINSY.

Chronic enlargement of the tonsils is very frequent in children and the adolescent, and is not infrequently met with in adults. Its usual symptoms in children are muffled speech, obstruction in breathing, and a disposition to acute attacks of tonsillitis. Deafness occasionally is present both in children and adults from pressure of the enlarged tonsils upon the openings of the Eustachian tubes. The condition of chronic tonsillitis is to be met by general measures designed to improve the tone and nutrition of the individual, such as an open-air life and the use of such tonics as iron and cod-liver oil. When the symptoms of enlarged tonsils are especially noticeable and the general health is suffering, the organs should be removed by surgical measures.

The *uvula* is subject to relaxation or elongation. When this occurs the appendage is found to be more or less œdematous and protruding downward toward the larynx, where, by its irritation, it often gives rise to a constant tickling cough. The condition is usually relieved by astringent applications and gargles. Where these fail to relieve the condition, the excess must be cut away by the surgeon.

PALATINATE (F. *palatinat*, from ML. *palatinus*, palatine, from Lat. *palatinus*, relating to a palace, or to the Palatine Hill, from *palatium*, palace, Palatine Hill). A feudal district whose ruler exercised nearly all the prerogatives of sovereignty. Under the Frankish Merovingian kings, a *comes palatinus*, or count of the palace, was a high judicial officer residing at Court. After the time of Charlemagne, the office became localized and territorial, and the *comes palatinus* ruled in almost complete independence over his own district, often near the frontier. As early as the eleventh century the Count Palatine (Pfalzgraf) of the Rhine appears among the hereditary princes of the German Empire. In the thirteenth century the term palatinate or county palatine was introduced into England from the Continent to designate a jurisdiction whose beginnings can in some instances be traced back to Anglo-Saxon times. There were three principal counties palatine in England—Chester, Durham, and Lancaster—whose origin and development were no doubt influenced by their proximity to the frontier. The counts or earls palatine ruled over entire counties, so that all the landowners held feudally of them; they received the whole profits of the courts and exercised all the regalia or royal rights, nominated the sheriffs, held their own councils, and acted as independent princes, except in the owing of homage and fealty to the King. The Duchy of Lancaster was a creation of the year 1351, but has since 1399 been united with the Crown in such manner that the King ruled within its borders not as King, but as Duke Palatine of Lancaster. Its legal jurisdiction has since 1873 been transferred to the High Court of Justice, but its revenues are still independent of Parliamentary control. Chester was united with the Crown in 1301, and has since, together with the Principality of Wales, been vested in the eldest son of the sovereign. Durham ceased to be a separate jurisdiction under the Bishop of Durham in 1836. Other counties palatine were formerly Kent, Shropshire, Pembrokeshire, the Isle of Ely, and Hexamshire, though the varying extent of their immunities makes it difficult in some cases to determine whether they were true palatinates. In very early times there were similar jurisdictions in Scotland, the most important of which was that of Strathearn. The Province of Maryland, in America, was granted to the Baltimores, on the model of the Palatinate of Durham. Consult: Stubbs, *Constitutional History of England*, vol. i. (6th ed., Oxford, 1897); Lapsley, *The County Palatine of Durham* (New York, 1900).

PALATINATE, THE (Ger. *Pfalz*, palace). The name of two little countries in the old German Empire, the Upper Palatinate and the Lower or Rhenish Palatinate, which were politically connected till 1620. The Upper Palatinate is at present included within the Bavarian district of the Upper Palatinate (Oberpfalz) and Regensburg. The capital was Amberg. The Lower Palatinate (Unterpfalz) was composed of an ir-

regular and disjointed territory on both sides of the Rhine, included roughly within the space marked off by the cities of Mainz, Worms, Heilbronn, Landau, and Zweibrücken. It included the Electoral Palatinate (with Heidelberg, and for a time Mannheim, as its capital), the Principality of Simmern, the Duchy of Zweibrücken (Deux Ponts), the principalities of Veldenz and Lautern, etc. Within its borders were embraced also the episcopal sees of Worms and Speyer, the free cities of Worms and Speyer, the county of Leiningen, etc. The Counts Palatine of the Rhine (see PALATINATE), whose original seat was Aix-la-Chapelle, appear in the eleventh century as holding a leading position among the hereditary German princes. In 1214 the Rhenish Palatinate was acquired by the House of Wittelsbach in the person of Louis I., Duke of Bavaria, and thereafter for four hundred years its history is the usual story of partition and reunion, varied with occasional increase of territory through purchase. Early in the fourteenth century a part of Bavaria between the Danube and the Fichtelgebirge was made over by the Emperor Louis the Bavarian to his kinsmen ruling in the Rhenish Palatinate; this was the origin of the Upper Palatinate. In 1356 the Golden Bull of the Emperor Charles IV. designated the Count Palatine of the Rhine as one of the seven Imperial Electors. Rupert I. of the Palatinate founded the University of Heidelberg in 1386. Rupert III. occupied the Imperial throne of Germany from 1400 to 1410. The Reformation made rapid progress in the Palatinate, and, influenced by the teachings of Melanchthon, the Elector Frederick II. (1544-56) embraced the reformed faith. Under Frederick III. (1559-76), who inaugurated the Simmern line in the Electoral Palatinate, Calvinism was made the established religion, and the Heidelberg Catechism was drawn up (1563). Frederick III. also aided the French Huguenots and extended his protection to Protestant refugees from France. Frederick IV. (1583-1610) became head of the Evangelical Union formed in 1608 by the Protestant States for the protection of their interests. His son, Frederick V. (1610-32), the son of James I. of England, was elected King in 1619 by the Bohemian Protestants, whose revolt against the House of Hapsburg had inaugurated the struggle which was to be the Thirty Years' War. Frederick was defeated at the battle of the White Hill in 1620 and was deprived of his lands. The electoral dignity was conferred on Maximilian I., Duke of Bavaria, in 1623, and in 1628 this prince was formally invested with the Upper Palatinate. By the Treaty of Westphalia the son of Frederick V. was restored in the Lower Palatinate, and an eighth seat in the Electoral College was created for him, the Upper Palatinate remaining in the possession of Bavaria. During the wars of Louis XIV. the Palatinate, one of the richest and most fertile lands in Germany, was mercilessly devastated by the French armies in 1674 and in 1689. In 1685 the Simmern line died out and was succeeded by the collateral line of Neuburg, whose members were of the Catholic faith. This led to the emigration, in 1709-10, of a large number of Protestant inhabitants (estimated at 13,000) to England. Thence a large body crossed over to Ireland, while others came to North Carolina, Pennsylvania, and Virginia. In 1710 between 3000 and 4000 'Palatines,' as they were called, settled in Columbia and Ulster counties, N. Y., whence many removed to Montgomery and Herkimer counties and to Pennsylvania. In 1742 the line of Neuburg in the Electoral Palatinate was succeeded by that of Sulzbach. In 1777 Bavaria was united with the Palatinate. By the Treaty of Lunéville (1801), the portion of the Palatinate lying on the left side of the Rhine was ceded to France, while the territories on the right bank were partitioned among Baden, Hesse-Darmstadt, Leiningen, and Nassau. The part beyond the Rhine was given up by France in 1814-15 and was divided among Bavaria, Hesse-Darmstadt, and Prussia. The Rhenish Palatinate (Bavaria) was the scene of a revolutionary uprising in 1849, which was suppressed by Prussian arms. The Bavarian Government districts of the Palatinate (Rhenish Palatinate) and Upper Palatinate (Upper Palatinate and Regensburg) have an area respectively of 2289 and 3729 square miles. The population of the former in 1900 was 831,533 and of the latter 553,857. The surface of the Palatinate (which is bounded on the east by the Rhine) is diversified with smiling plains, swelling hills, and wooded mountains. The western portion is traversed by the low range of the Hardt. The region yields bountiful crops of cereals, potatoes, tobacco, hemp, flax, etc., and is noted for its wine. The capital is Speyer. The Upper Palatinate is traversed by the offshoots of the Fichtelgebirge, the Bohemian Forest, and the Bavarian Forest, and is bordered on the west by the Franconian Jura. The Danube flows along the southern border. The capital is Regensburg. Consult: Häusser, *Geschichte der rheinischen Pfalz* (Heidelberg, 1845); Nebenius, *Geschichte der Pfalz* (Heidelberg, 1874).

PALATINE. A name frequently applied in the later days of the Roman Empire to persons in the imperial service whose duties connected them with the court. Under Constantine the Great the Palatini were the troops stationed at the capital in contradistinction to those charged with the defence of the border. In the Byzantine Empire the term was applied to the officials connected with the administration of the finances and the imperial domains. It was bestowed as an epithet of honor on persons in the entourage of the early German kings, and under the Carolingian rulers the Count Palatine was the highest judicial officer of the realm. Though, in the course of time, a number of counts palatine were created and charged with the execution of the imperial will in various parts of the Empire, the title ultimately became restricted to the ruler of Rhenish Franconia whose territory came to be known specifically as the Palatinate (q.v.). In England, after the Conquest, the see of Durham, the earldom of Chester, and the duchy of Lancaster were ruled by counts palatine who were possessed of regal powers within their jurisdiction. They had courts of their own which were exempt from the authority of the king, exercised the right of coining money, and stood at the head of the feudal system of land tenure in their counties.

PALATINE ANTHOLOGY. A collection of Greek poems made by Constantine Cephalas in the tenth century, lost, and rediscovered in 1606 by Salmasius in the Heidelberg Library. It was not, however, published until 1776, when

it appeared in Brunck's *Analecta*. Consult Thackeray, *Anthologia Graeca* (London, 1877).

PALATINE HILL (Lat. *Mons Palatinus*). The central hill of the famous seven hills of Rome, and the seat of the earliest Roman settlements. In point of historic interest it ranks next to the Capitol and the Forum. Its summit is about 140 feet above the Tiber level. The form of the hill is irregularly quadrangular. Its northwestern slope, toward the Capitoline Hill and the Tiber, was called *Germalus* or *Cermalus*. The origin of the name is uncertain, although several derivations are given connecting it with legendary stories. Romulus is said to have founded the city upon this hill, and on Germalus grew the sacred fig-tree (near the Lupercal) under which he and his brother, Remus, were found sucking the she-wolf. Upon the Palatine were the temple of Jupiter Stator, the temple of Cybele, the sacred square inclosure called *Roma quadrata*, and other sacred places and edifices, and, during the Republic, many of the finest private houses in Rome. Under the Empire it became especially the site of the Imperial residence. Augustus and Tiberius resided here, and at last Nero included it entirely within the precincts of his *aurea domus*, which Vespasian subsequently restricted to the hill. From the time of Alexander Severus it ceased to be the residence of the emperors, except occasionally. Recent excavations have brought to light numerous remains of the structures with which the Palatine Hill was once covered. A considerable portion of the hill remains yet to be excavated.

PALAT'KA. A city and the county-seat of Putnam County, Fla., 60 miles south of Jacksonville; on the Saint John's River, and on the Georgia Southern and Florida, the Jacksonville, Tampa and Key West, the Florida East Coast, and other railroads (Map: Florida, G 2). It enjoys considerable popularity as a winter resort, and is the commercial centre of a productive fruit-growing and market-gardening section, its trade interests being of considerable importance. Population, in 1890, 3039; in 1900, 3301.

PALAUAN, pä-lä'wän, or PALOWAN. A general designation of the Tagbanua tribes from whom the island of Palawan took its name. See PHILIPPINE ISLANDS.

PALAU (pä-lou') **ISLANDS**. A group of islands in the Pacific Ocean. See PELEW ISLANDS.

PALAWAN, pä-lä'wän, or **PARAGUA**, pä-rä'gwä. One of the Philippine Islands, the extreme southwestern of the larger islands of the archipelago (Map: Philippine Islands, C 10). With its numerous dependent islands it forms a continuous chain extending from Mindoro southwestward to the northern extremity of Borneo. The chain runs parallel with the Sulu Archipelago and separates the Sulu Sea on the southeast from the China Sea on the northwest. The island of Palawan itself is of very elongated shape, being 278 miles long from northeast to southwest, with an average width of 20 to 25 miles, narrowed into an isthmus 4½ miles wide a little north of the centre. It ranks sixth in size among the Philippine Islands. Its area is 4368 square miles, with its 98 politically dependent islands 4726, and with the 135 islands forming the group or territorial division 5037 square miles. The island itself is accordingly a little smaller and the group a little larger than the State of Connecticut. The principal dependent islands are the Calamianes (q.v.), lying between Palawan and Mindoro, Dumarán (128 square miles), off the extreme eastern point of Palawan, and Balábac (168 square miles), between Palawan and Borneo. To Balábac belong a number of small outlying islands scattered over the Sulu Sea.

The coasts of Palawan are indented with numerous small bays and sounds, some of which form excellent harbors, especially that of Malampaya (q.v.). The surface consists of an elevated tableland falling rapidly toward the coasts on either side, and the latter are in some places bold and rugged with limestone cliffs. From the plateau an irregular series of summits and ridges, running generally obliquely across the island, rise to an average height of 2500 feet. The highest point is Mount Mantalingajan, in the southern part, with an altitude of 6843 feet. Owing to shape and contour of the island, the streams are all very short. The climate is regulated by the winds to which the island is exposed, the dry northeast trade winds during summer, and the moist southwest monsoons in winter. These moderate the temperature, but malarial fevers are common along the coasts. The flora of the island is rich and varied, with many peculiar species, notably among the pitcher plants, the ferns, and the orchids. The mountains are covered to their summits with immense forests of valuable cabinet, building, and dye woods, including ebony, sandalwood, logwood, and many species unknown to the rest of the archipelago. There are many trees, producing resins, such as dammar, gum mastic, and copal. Among the animals the birds, monkeys, and reptiles are especially abundant, the pythons reaching an enormous size.

Owing to the sparseness of the population, economic activities are in a very primitive state. Agricultural products are raised only for home consumption, and there are no industries beyond the primitive weaving and other manufactures carried on by each family for home use. There are no regular roads, the mountain trails and the rivers being the only means of access to the interior. The island is, however, favorably located for future development, lying along the route from India to China and Manila. Many sailing vessels on that route pass along the eastern coast of the island to avoid the violent monsoons in the China Sea. The inhabitants have never been enumerated, but their number is estimated at 50,000. Aboriginal Negritos inhabit the mountains of the interior; along the coast of the northern half of the island are Malays and mixtures of Malays and Negritos, known as Tagbánuas and Tandulanos. The coasts of the southern half are occupied by Mohammedan Moros. By the Provincial Government Act of June 23, 1902, the northern half of the island, lying north of parallel of latitude 10°, together with the Calamianes and other adjacent islands, was constituted as the Province of Paragua, with the seat of government at Cuyo, on the island of that name in the Sulu Sea. The portion of Palawan lying south of parallel 10°, known as Moro Palawan, was left without civil government, while the island of Balábac, with its dependent islands in the Sulu Sea, forms a distinct political division, the local government of which was es-

tablished by the treaty with the Sultan of Sulu of August 20, 1899. The chief towns of the mainland are Taytay (q.v.), in Paragua Province, and Puerto Princesa (q.v.), in Moro Palawan.

Palawan was a part of the Sultanate of Borneo until the beginning of the eighteenth century, when the Spanish began to found military stations on the island to protect their northern possessions from the Moro pirates. Two attempts by the Spanish authorities to colonize the island, first by importing free immigrants from Luzon, and second by founding convict settlements, were unsuccessful. Palawan was occupied by United States troops during one of the early campaigns in the southern islands. On the establishment of civil government in Paragua there were no military stations in that province. Consult Marche, *Luçon et Paloauan* (Paris, 1887).

PALAZZOLO ACREIDE, pä-lät'sō-lō ä-krā'ē-dā. A town in the Province of Syracuse, Sicily, 22 miles west of Syracuse (Map: Italy, J 10). Near by are the ruins of the ancient Acræ, founded by a colony from Syracuse in B.C. 664. Curious remains are still to be seen, including a small but almost perfect theatre, an aqueduct, a temple, and various tombs and vases. Population (commune), in 1881, 11,154; in 1901, 14,840.

PALAZZO VECCHIO, vĕk'kyō (It., old palace). A commanding structure rising from the Piazza della Signoria in Florence, and dating from 1298. It was originally the seat of the Signoria, the republican Government, and later became the residence of Cosmo I. It now serves as the town hall. The most impressive portion of the building, and one of the most conspicuous objects in Florence, is the massive square tower, rising to a height of 308 feet. The court, dating from 1454, contains the statue of a boy with a fish, which serves as a fountain. It has elaborately decorated columns. The Great Hall was constructed for the Council in 1495. It contains a colossal statue of Savonarola, who in 1498 was burned at the stake at the corner of the palace, on the site now occupied by the great fountain.

PALE. See ENGLISH PALE.

PALE (OF., Fr. *pal*, from Lat. *palus*, stake, pale, from *pangere*, Skt. *paś*, to fix, to fasten). In heraldry (q.v.), one of the figures known as ordinaries.

PALEA (Lat., chaff). A chaff-like bract in certain plants, especially grasses, in which the term is applied to the glume in most intimate relation to the flower. It is also sometimes applied to the 'chaff' which in the heads of many Compositæ subtends the flowers. See GRAMINEÆ.

PALEARCTIC REGION (from Gk. παλαιός, *palaios*, ancient + ἀρκτικός, *arktikos*, northern). A primary division in zoögeography embracing the northern part of the Old World, or Paleogæa. It includes all of Europe, the whole Mediterranean basin, as far south as the Atlas Mountains, lower Egypt, Northern Arabia, Syria, and Asia Minor, the whole of Asia north of the Himalayas, and Japan. It is divisible, according to the scheme of Sclater and Wallace, into four sub-regions, which, however, are not very clearly defined: (1) Europe north of the line of mountains running from the Pyrenees to the Caucasus; (2) the Mediterranean basin, and eastward through Turkey and Persia to the Indies; (3) Northern and Northwestern Asia; (4) Manchuria, Northern China, and Japan. It is contended by many students of the subject that this area is not entitled to rank as a grand 'region' distinct from North America (Nearctic Region, q.v.), but that the two should be joined as one called the Holarctic Region or Arctogæa, and the weight of modern opinion tends toward this view. Some would include Africa in this grand division. Consult maps and authorities cited under DISTRIBUTION OF ANIMALS.

PALEARIO, pä-lā-ä'rē-ō, AONIO, or ANTONIO (c.1500-70). An Italian humanist and reformer, born at Veroli, near Rome. He is also called Della Paglia and Degli Pagliaricci. He was educated in Rome, and remained there until 1529, except for the interval of the siege in 1527. Afterwards he went to Perosa, Siena, where he principally lived, and Padua, where he wrote *De Immortalitate Animorum* (1536), his most important work—a long didactic poem in Latin hexameters. In 1542 he wrote *Della pienezza, sufficienza e satisfazione della passione di Cristo.* The Inquisition pronounced it heretical, but Paleario defended himself against the charge with much eloquence, and successfully. The tract was followed by *Actio in Pontifices Romanos et Eorum Asseclas*, which was not printed until after his death (1606). He was professor at Lucca from 1546 to 1555, and then taught at the University of Milan. The election of Pius V. was the signal for a fresh attack from his enemies. He was formally accused of heresy in 1567, and after a year's imprisonment at Rome, was burned at the stake, in July, 1570. Paleario especially protested against the Roman Catholic doctrine of Purgatory. His other works include three volumes of *Epistolæ*. An edition of his works was published at Amsterdam in 1696, and at Genoa in 1728. The tract *Beneficio di Cristo*, attributed to him, more probably is by Benedetto of Mantua.

PALEMBANG, pä'lĕm-bäng'. A residency of the Dutch East Indies, embracing the region of the Musi River in the southeastern part of the island of Sumatra (Map: East Indies, B 5). It is bordered on the north by the Djambi territory, on the east by the Java Sea, on the south by the Lampongs District, and on the west by the Barisan range. Area, 53,497 square miles. Population, in 1897, 692,317. Palembang is a low and exceedingly fertile region, subject to overflows by the rivers. It has deposits of petroleum. The inhabitants are nearly all Malays and Mohammedans. In the dense forests live the Orang-Kubu, a curious race exhibiting the lowest grade of civilization. Capital, Palembang.

PALEMBANG. The capital of a residency in Sumatra, on the Musi River, about 45 miles from its mouth (Map: East Indies, B 5). It extends four or five miles along the river banks, and lies in a swampy district, which is subject to overflows. The houses are of bamboo, and many stand on rafts in the stream. The town has a fine mosque dating from the middle of the eighteenth century, the palace and tombs of the Sultans, and a fort. There is a considerable commerce, coffee and pepper being the leading shipments. The chief industries are silk weaving, wood and ivory carving, and the manufacture of weapons and gold articles. Population, about 60,000, chiefly Malays and Chinese.

Palembang was conquered by the English in 1812, and by the Dutch in 1821.

PALENCIA, pä-län'thē-ä. The capital of the Province of Palencia in Old Castile, Northern Spain (Map: Spain, C 1). It is situated on the left bank of the Carrión, 24 miles north of Valladolid, and is an old town with narrow streets and few modern improvements. It has a beautiful episcopal palace and a notable Church of San Miguel with a massive square tower. The most prominent building, however, is the Gothic cathedral, which, though it is ill situated and has an uninteresting exterior, is beautifully ornamented within, and contains a rich collection of old Flemish tapestries. The town has a hospital, a bull ring seating 8000 spectators, a provincial institute, a seminary, a normal school, and a municipal academy of arts. The chief manufactures are shawls and blankets, agricultural machinery, fire-works, chocolate, and bricks. Population, in 1887, 15,028; in 1900, 15,610. The ancient *Pallantia* was the capital of the Vaccæi. It was taken by the Romans after an obstinate resistance, and remained an important city through the Middle Ages, being in the twelfth century the seat of the Castilian kings and Cortes.

PALENCIA, Diego Fernandez. See Fernandez de Palencia.

PALENQUE, pä-län'kä. An ancient city of vast extent lying near the village of Santo Domingo del Palenque, in the State of Chiapas, Southern Mexico, and bordering on Guatemala. It is located on the steep slopes of the Tumbala foothills amid the most beautiful tropical surroundings. Almost impenetrable vegetation covers the country, so that up to the present only six existing ancient structures have been described, though it is believed many more exist in the forest. By a series of walled terraces level areas on the slopes have been prepared for the buildings. These were set on steep pyramids, the sides of which were faced with stone or covered with steps. Twelve of these pyramids remain in the Palenque group, the greatest height being about 80 feet. The largest building is called the Palace; the others are named Temple of the Inscriptions, of the Sun, of the Cross, of the Cerro, and of the Bean Relief. The plan of the temple is simple, showing an oblong, rectangular area, divided into two vaulted chambers, the front wall pierced with from one to five door-openings, the middle wall pierced with as many doorways as there are compartments in the back chamber. The two vaulted chambers are the unit of construction, the complicated plan of the palace being made up of a series of such units. The vaults are corbeled and have the form of the so-called Mayan arch, a variety of the triangular. In the rear chamber were set on the back wall finely carved slabs of sacred character, which the building was intended to inclose as a sanctuary. The exteriors of the buildings present several remarkable architectural features; above the vertical walls the roof slopes away at the slant of the arch within, resembling a mansard; the top of the roof slopes gently to the ridge, which is crowned with a high, narrow, perforate comb in the form of an arch, the walls having openings crossed with slabs resembling a grille. The exterior of the buildings was surfaced with plaster and decorated with relief models tinted with color. The mansard slope had complicated relief work in stucco representing masks and figures of gods. The latticework roof comb also bore stucco figures in high relief. The chief feature of the palace is a unique square tower 40 feet high, of which at present four stories and a blind story remain. The builders of Palenque decorated their edifices with sculpture and modeling exclusively in bas-relief, while those of Yucatan sculptured in the round. The most remarkable of the Palenque reliefs are the tablets from the sanctuaries adorned with figures and hieroglyphics. Two of them bear figures in the form of a square cross between standing figures which have attracted world-wide notice. They are in low relief and are worked out with a delicacy of form and refinement of finish superior to that of any other work of stone in this hemisphere. In stucco work also the Palenque artists were the greatest modelers in America. Colors were lavishly used and included black, white, blue, two reds, yellow, and green. While some dressed stone was used, the finish of the walls was almost invariably in plaster. Two important pieces of engineering are found at Palenque, one an arched bridge of masonry 30 feet wide and 40 feet long across the Otolum, and the other a subterranean arched waterway 500 to 600 feet long, 10 feet high, and 7 wide, massively built and inclosing the same stream. New artifacts have come to light at Palenque; some tombs in the pyramids have been excavated and terra-cotta figures showing the characteristic head profile and costume, beads of jadeite, spindle whorls, lance-heads, obsidian knives, etc., have been found. As to the age of the structures it does not seem possible to arrive at any determination. Comparative archæology, however, shows that the builders were of the Mayan stock, which is responsible for the wonderful architectural remains of Chiapas and Yucatan.

PALEOBOTANY. The branch of paleontology which deals with fossil plants. The terms vegetable paleontology, fossil botany, phyto-paleontology, and paleo-phytology are used synonymously, and within the scope of the subject is included the consideration of all dead vegetable matter which is, or which was at any time, buried in the earth; or which has left its traces there in the form of casts or impressions either in solid rock or in incoherent deposits; or which may have become preserved in whole or in part by incrustation, by petrifaction, or by carbonization.

History. Paleobotany, as a science, is practically a product of the nineteenth century, although a number of writers on natural history, Agricola, Albertus Magnus, Matthiolus, Gesner, and others, had long previously described petri-

fied wood in common with other fossils and minerals. Leaf impressions, however, do not appear to have been described previous to the publication of Johann Daniel Magor's *Lithologia Curiosa, sive de Animalibus et Plantis in Lapides Versis*, at Jena, in 1664, and after that not again until Eduard Lhwyd published at London, in 1699, his *Lythophylacii Britannici Iconographia*. Probably the next succeeding work of importance in which fossil plants are mentioned is Johann Jacob Scheuchzer's *Herbarium Diluvianum*, the first edition of which was published at Zurich in 1709. After this, until the end of the eighteenth century, many writers in natural history incidentally described or mentioned fossil plant remains, but generally with exceedingly crude conceptions in regard to their nature, origin, or antiquity.

In 1801 Ernst Friedrich, Baron von Schlotheim, issued his *Abhandlung über die Kräuter-Abdrücke in Schieferthon und Sandstein der Steinkohlen-Formation*, in *Hoffs Magazine*, at Leipzig, and in 1804, at Gotha, his *Beschreibung merkwürdiger Kräuter-Abdrücke und Pflanzen-Versteinerungen, ein Beitrag zur Flora der Vorwelt*. With the advent of this latter work paleobotany, as a science, may be said to have had its birth, and from that time on it has made steady progress. During the years from 1820 to 1838, Kaspar Maria, Count von Sternberg, issued in a series of fascicles at Regensburg, Leipzig, and Prague successively, his *Versuch einer geognostisch-botanischen Darstellung der Flora der Vorwelt*, and in 1828 Adolphe Theodore Brongniart published at Paris, his *Prodrome d'une histoire des végétaux fossiles, etc.* These two works are generally regarded as having placed the science upon a firm foundation, and its subsequent progress was rapid.

During the half century from 1830 to 1880 the science was developed under Goeppert, Unger, Ettingshausen, Saporta, and others, and the fossil floras of the Old World became comparatively well known. J. W. Dawson had been at work on the coal floras of British America as early as 1845; J. S. Newberry about 1850 on those of Ohio; and a few years later Leo Lesquereux began his researches, which ultimately embraced the Carboniferous floras of Pennsylvania, Illinois, Arkansas, and other States, and also the floras of the more recent formations of the Western States and Territories. About the year 1856 paleobotany began to receive a constantly increasing degree of attention as a result of collections of fossil plants made by Government exploring parties and by the Northwestern Boundary Commission. Reports upon these collections were contributed by Newberry, and subsequently both Lesquereux and Newberry undertook the study of the material collected by the United States Geological and Geographical Surveys. The results of their researches appeared from time to time in the reports issued by the surveys and in the transactions of learned societies. With the death of these two pioneers in the subject, in 1889 and 1892, respectively, the historical period of paleobotany in America may properly be said to have terminated. The subsequent labors of Ward, Knowlton, White, Hollick, Penhallow, and others belong to the period of present active work.

GENERAL FACTS AND PRINCIPLES. The extinct flora of the earth, as evidenced by its fossil remains, was gradually evolved from simple forms low in the scale of life into forms successively more and more complex and higher in the scale. Each subkingdom, class, order, or other subdivision of the vegetable kingdom had its own particular time of origin, and all experienced subsequent phases of evolution during which some reached a maximum and then either declined and became extinct or else continued down to the present time, diminished in numbers, and often degenerated in size; while others maintained an upward development which has continued to the present day. It is thus possible to divide geologic time as a whole into a series of plant ages, and to designate each age by the name of the particular subdivision of the vegetable kingdom which was predominant during that age. Such a time division, based upon certain great types of vegetation, would be as follows: (1) Age of Cryptophytes—Eozoic and Paleozoic time. (a) Age of Thallophytes—Archæan, to and including the Upper Silurian period. (b) Age of Pteridophytes—Devonian and Carboniferous periods. (2) Age of Spermatophytes—Mesozoic and Cenozoic time. (a) Age of Gymnosperms—Triassic and Jurassic periods. (b) Age of Angiosperms—Cretaceous, Tertiary, and Modern periods.

Such a presentation of the facts is not, however, entirely satisfactory, for the reason that only the periods of maximum development of each designated type are indicated. A method which presents more accurately the several phases of development of each type and at the same time the development of the vegetable kingdom as a whole is by means of a diagram, in which the successively higher types are represented by a series of successively higher waves, each one having its origin later in geologic time than the preceding one, and subsequently overlapping and rising above it, the crests representing the periods

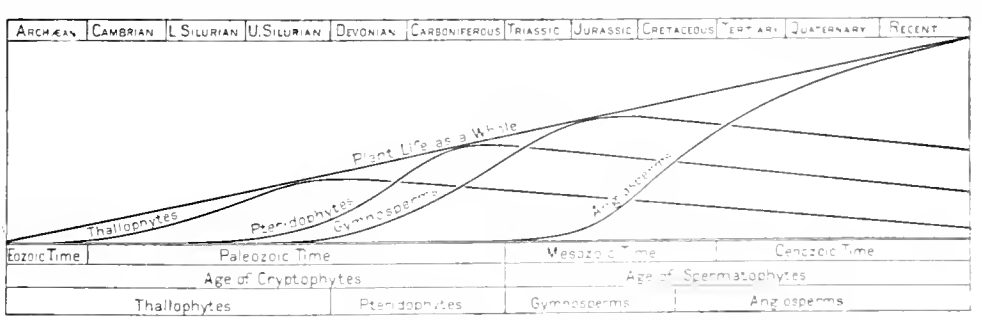

DIAGRAM SHOWING THE DEVELOPMENT OF PLANT LIFE.

of maximum development and a line tangent to the crests the development of plant life as a whole.

The general botanical character, or expression, of any fossil flora is sufficient to determine the era to which it belongs; the identification of a few of its principal genera will determine the period, and the identification of certain typical genera or species may be relied upon for the determination of the exact or approximate age of the particular strata or beds in which they may occur. Recognition of the above facts has led to the acceptance of the broad principle, expressed by Ward, that "Great types of vegetation are characteristic of great epochs in geology, and it is impossible for the types of one epoch to occur in another." This principle is subject to modification, however, when fossil floras of widely separated localities and smaller geological subdivisions are compared. The order of sequence of types has been found to be the same everywhere, but evolution has at times been less rapid in one locality than in others, and hence the same types may occur, in different parts of the world, in strata which are not quite contemporaneous. To this identity of sequence, apart from contemporaneity, the term 'homotaxis' was applied by Huxley.

Relation to Geology. In connection with geology, a knowledge of fossil plants is as essential as a knowledge of fossil animals, whenever paleontological facts are of interest or value. Fossil plants may serve as corroborative evidence in the determination of the geologic age or the stratigraphic relations of strata; in some instances they may present the only available evidence, or, as has frequently happened, they may prove that conclusions deduced from other data are erroneous.

Relation to Botany. The facts relative to the phylogeny, or ancestral development, of the vegetable kingdom supplied by paleobotany have materially aided in placing modern vegetable taxonomy upon a firm and philosophical basis. Many of the now recognized early errors in taxonomy might have been avoided if the path indicated by phylogeny had been followed. Nearly every change which systematic botanists have made in the sequence or grouping of living plants, in their efforts to bring supposed allied forms together, has resulted in producing a taxonomic arrangement more closely approximating the phylogenetic sequence in the evolution of the fossil ancestors. The recognition of the fact that our living flora consists merely of the remnants of that which preceded it enables us to understand the meaning of many otherwise puzzling phenomena, such as that of monotypic genera, like Gingko, Liriodendron, Sassafras, etc., each of which is represented by a single species more or less widely separated biologically from its nearest living allies. Any apparent isolation of this kind in systematic botany was not capable of explanation by means of any known facts in connection with the existing flora.

Paleobotany has been of material assistance in solving many of the problems connected with the geographical distribution of living plants. The genus Sequoia, represented by the redwoods (*Sequoia sempervirens*) and the giant trees (*Sequoia gigantea*) of California, is restricted in its range to a narrow belt on the west coast of the United States, but its fossil remains demonstrate that the genus had in the past a large number of species and a distribution which embraced practically the whole of North America, Europe, and Asia. Geological changes resulted in its extermination throughout the latter region and in all except the one limited area in the former. The genus Nelumbo is represented by two living species, one of which is restricted in distribution to Asia, the other to Eastern North America. When the fossil representatives of the genus were discovered they showed that the genus once extended over the whole of North America and Europe, and it is now recognized that changes in environment almost caused its extinction and left only one representative species in each continent. The problems of abnormal growths or of apparently useless organs in living plants have frequently been explained satisfactorily on the theory of atavism or reversion to ancestral characteristics when their fossil representatives have been examined.

Plants have always been regarded as excellent climatic indices. The fact that certain species or genera or families can exist only within certain extremes of temperature is well known, and hence if a relationship between a fossil flora and living plants of restricted climatic range can be established, it may be accepted as good evidence that the fossil flora was associated with a climate comparable with that of the region in which the similar living flora is now found. Fossil remains of cycads and palms found in the Cretaceous and Tertiary strata in the Arctic zones prove conclusively that tropical or subtropical conditions formerly prevailed there.

Evolution of the Principal Types of Vegetation. Theoretically plant life must have preceded animal life. It is assumed that the primordial vegetation was of an exceedingly low type, biologically, both on theoretical grounds and by reason of its known subsequent development from lower to higher forms. The earth and its waters are supposed to have been for a long period of time in a highly heated condition, and the first vegetation capable of existence under such conditions was probably represented by the lower thallophytes, some of which live in water at a temperature that is fatal to other forms of life. Exactly what the earliest vegetation was like cannot be determined, for the reason that its remains have been either entirely obliterated or else so altered that its original character cannot be recognized. The existence of plant life of some kind at a time when the earliest sediments were laid down is strongly indicated by the presence of carbon in the form of graphite in these rocks.

Thallophytes. By reason of their cellular structure the thallophytes were poor subjects for preservation, while from their microscopic size they would be exceedingly difficult to detect even when preserved. Their comparative rarity as fossils is then to be expected, and such of their traces as are known are for the most part nothing more than casts or markings. The schizophytes, representing the agencies of disintegration and decay, were undoubtedly present at the very dawn of life, but their early existence is predicated upon theoretical grounds.

The fungi are also of comparatively little importance in fossil botany. They are represented by thallus and mycelium fragments, or by the effects produced presumably by these growths in

the tissues of higher plants, notably in those of the Carboniferous period, and there is every reason to believe that they were among the earliest floral elements of the earth. A complete enumeration of all the known fossils which have been classed as fungi has been made by Alloysius Meschinelli, in his *Fungorum Fossilium Omnium*, published at Venice in 1898, in which are listed and described about 400 species, included in about 70 genera. The lichens are almost unknown as fossils. Those found are apparently referable to living genera; they consist mostly of flakes on fragments of lignite or are inclosed in amber, and none is known from horizons below the Tertiary. The algæ are represented by the earliest known definite traces of vegetable organisms, even if all the problematic casts and tracings which have been referred to these plants are eliminated. Many of these latter to which generic names have been given may be considered as mere mechanical markings, such as are made by ripples, sun or frost cracks, etc., or by the tracks or burrows of marine animals. In the former class may be included the genera Eophyton, Vexillum, Goniophycus, etc., and in the latter, Scolithus, Phytopsis, Bilobites, etc. Nevertheless, if all these uncertain forms are disregarded, a large number of fossil species are known, which are apparently referable to the larger marine algæ, and are included in the genera Buthotrephis, Lierophycus, Nematophycus, Lithothamnion, Chondrites, etc., which occur in rocks of all ages from the Cambrian upward.

The diatoms are the most abundant as well as the most perfectly preserved of all the thallophytes, their siliceous tests generally retaining perfectly their original characters. They occur in abundance from the Cretaceous period upward, often forming extensive beds of 'tripoli' or diatomaceous earth, such as those of Bilin in Bohemia and Richmond in Virginia. (See DIATOMACEÆ.) With very few exceptions, the genera of fossil diatoms are identical with those now living, and the same is true of a large number of species. The Characeæ are represented in the fossil state mostly by minute spheroidal bodies which are supposed to be the fruit cases or oögonia of species of Chara. They have been found in rocks of Devonian age in North America and are quite common in those of the Jurassic and Tertiary periods, where they are occasionally accompanied by fragments of stems.

THE BRYOPHYTES. Our knowledge concerning fossil bryophytes is practically confined to a small number of remains found in the Tertiary and more recent deposits, all of them either identical with or closely allied to living species. The Hepaticæ are represented by about twenty fossil species. Several in the genus Marchantia have been described from the Tertiary rocks of Europe, and one from the Eocene rocks of Montana. The mosses occur sparingly as fossils, and have been satisfactorily identified only in Tertiary deposits.

THE PTERIDOPHYTES. The rise and decline of this sub-kingdom of plants comprises one of the most remarkable chapters in the life history of the earth. Pteridophytes probably originated in the Lower Silurian period, although their earliest well-defined remains are from the Devonian. During the Carboniferous period they attained a position which, in respect of actual and relative numbers and high degree of development as a type, has no parallel in the vegetable kingdom; but since that period the sub-kingdom as a whole has steadily declined numerically, and it has also undergone profound biologic degeneration. The ferns are probably the best known of the fossil pteridophytes. They were important elements in the Devonian flora, and reached a maximum of development in the Carboniferous period, at which time they apparently formed about 50 per cent. of the entire flora; they declined to about 30 per cent. in Mesozoic time, and in Cenozoic time to less than 6 per cent. All the Paleozoic genera (Neuropteris, Pecopteris, Sphenopteris, etc.) are extinct, and so probably are most of those of Mesozoic time, although a number of the latter are considered to be identical with living ones. Tertiary forms are generally regarded as generically and in many cases specifically, the same as existing forms.

Rhizocarps, inconspicuous both in size and in numbers at the present time, are but poorly represented as fossils, even if all doubtful forms are included. They probably made their first appearance during Devonian time. A number of undoubted species of Salvinia are known from Cretaceous and Tertiary deposits of North America and Europe. The Equisetum type had its beginning in the Devonian, and perhaps earlier. The remains consist of trunks or stems, leafy branches or fructifications, which are known under the generic names Calamites, Calamodendron, Asterophyllites, Calamostachys, etc. They attained their maximum of evolution during the Carboniferous period, at which time they formed probably 10 per cent. of the flora. These genera became extinct at the close of Paleozoic time and were succeeded by the Mesozoic genera Schizoneuron, Phyllotheca, etc., and Equisetum, which latter has continued, through forms which steadily decreased in numbers and size, down to the present time.

Lycopods were represented very early in geologic time, probably in the Upper Silurian period or even earlier, but reached their highest development during the Carboniferous, contributing about 15 per cent. to the flora of that period. Their remains are represented mostly by trunks and limbs, under the generic names of Lepidodendron, Lepidophloios, Knorria, etc.; by the fruiting spikes, under Lepidostrobus; by foliar organs, under Lepidophyllum, etc. These genera became extinct at the same time with the other pteridophyte genera of Paleozoic time, and were succeeded by degenerate descendants which are either identical with or closely related to the living genera Lycopodium and Selaginella.

PLANTS OF DOUBTFUL RELATIONSHIP. In this connection it is necessary to mention several important types of vegetation whose exact botanical affinities are not definitely known. It is probable that some of these may represent synthetic types which combine characters belonging to both the pteridophytes and the gymnosperms, and they may, therefore, be properly considered between the discussion of these two groups. The Cycadofilices are plants which, in the present state of our knowledge, may belong either with the cycads or with the ferns, such as those included in the genera Hoeggerathia, Thinnfeldtia, etc. The important Paleozoic genus Sigillaria, with its rhizomes known as stigmaria, has been thought possibly to represent a type intermediate between

the lycopods and the gymnosperms, while the genus Sphenophyllum is one which has never been satisfactorily classified botanically.

The Spermatophytes. The earliest definite remains of plants of this sub-kingdom thus far recorded in America belong to the Devonian period, but in Europe they probably date as far back as the Upper Silurian. They developed slowly until Mesozoic time, when, as gymnosperms, they became the dominant type of vegetation, and from then onward, as angiosperms, they continued their upward development to the present time.

The gymnosperms were the earliest representatives, of which the extinct genera Cordaites, Gingkophyllum, etc., may be considered as original types. As a class they were of relatively little importance numerically until the close of the Carboniferous period, when both cycads and conifers began to develop rapidly, and in early Mesozoic time these plants formed together more than 60 per cent. of the entire flora. This was the period of maximum development of the cycads in particular, after which they declined, and are now a rare and unimportant element in the living flora. The conifers apparently originated before the cycads; their development was more uniform and they continued to be important factors in the vegetation of both Mesozoic and Cenozoic time, as they are yet in the living flora. Genera such as Baiera, Araucarites, etc., closely allied to our Ginkgo and Norfolk Island pine, were in existence in the Jurassic and early Cretaceous periods, and these were followed by undoubted living genera, such as Sequoia, to which the giant trees of California belong; Pinus, which includes our common pines, etc. As a whole, the conifers have continued to decline in relative importance ever since the early part of the Cretaceous period.

The angiosperms may have had their origin in the Carboniferous period, but the few supposed Paleozoic forms described are very doubtful. Toward the close of the Jurassic period this class of plants was abundantly represented, and in the Cretaceous it rapidly developed into the dominant type, which position it has maintained ever since. In regard to the monocotyledons we know but little. The time of their first appearance is not definitely established, and it was not until the palms made their appearance in the Upper Cretaceous that they assumed any prominence. Grasses and sedges probably preceded the palms, but their remains have mostly been found in rocks of Tertiary age, during which period the class, as a whole, may have contributed about 10 per cent. of the entire flora.

It is probably in connection with the dicotyledons that the greatest interest centres. Their origin is traced to certain archaic forms in the Jurassic and Lower Cretaceous deposits of North America and Europe, to which Saporta has given the name of proangiosperms. Some of these from the Potomac formation of Virginia suggest, superficially, a blending of the monocotyledons and dicotyledons, as seen in the genera Acaciæphyllum and Proteæphyllum. Others, like Protorrhipis, Braseniopsis, etc., have certain characters suggestive of relationship to those few dicotyledons which, in common with the monocotyledons, possess an endogenous structure, and of which Nymphæa, Nelumbo, etc., are examples. Apparently the dicotyledons attained their high degree of development, both biologically and numerically, more rapidly than did any one of the types of vegetation which preceded them. In the Middle Cretaceous they had become the dominant type, and they have continued so to the present time. Among the earliest identifiable genera are many whose relationship with living genera is more or less clearly defined, as indicated in the names Populophyllum, Quercophyllum, Saliciphyllum, etc., while these were followed by others like Sassafras, Platanus, Liriodendron, Magnolia, etc., which it has been found impossible to separate generically from those now in existence. Living species have been recognized as far back as the Eocene and the Tertiary, and in the Quaternary period it is probable that all were identical.

Bibliography. The following may be cited as general compends, text-books, and works of popular interest on the subject. Dawson, *The Geological History of Plants* (New York, 1888); Knowlton, "Fossil Plants as an Aid to Geology," in *Journal of Geology*, vol. ii. (Chicago, 1894); Potonie, *Lehrbuch der Pflanzenpaläontologie* (Berlin, 1899); Saporta, *Le monde des plantes avant l'apparition de l'homme* (Paris, 1879); Saporta and Marion, *Origine paléontologique des arbres*, etc. (ib., 1888); Schenk, *Die fossilen Pflanzenreste* (Breslau, 1888); Schimper, *Traité de paléontologie végétale* (Paris, 1869-74); Schimper and Schenk, *Paléophytologie*, being part ii. of Zittel's *Handbuch der Paläontologie* (Munich and Leipzig, 1890); French translations of same by Barrois (Paris, Munich, and Leipzig, 1891); Scott, *Studies in Fossil Botany* (London, 1900); Seward, *Fossil Plants as Tests of Climate* (ib., 1892); Seward, *Fossil Plants for Students of Botany and Geology* (Cambridge, Eng., 1898); Von Solms-Laubach, *Einleitung in die Paläophytologie*, etc. (Leipzig, 1887); Von Solms-Laubach, Garnsey, and Balfour, *Fossil Botany, Being an Introduction to Palæophytology from the Standpoint of the Botanist* (Oxford, 1891); Unger, *Synopsis Plantarum Fossilium* (Leipzig, 1845); Unger, *Genera et Species Plantarum Fossilium* (Vienna, 1850); Ward, "Sketch of Paleobotany," in *Annual Report of the United States Geological Survey*, vol. v. (Washington, 1885); Ward, "Principles and Methods of Geologic Correlation by Means of Fossil Plants," in *American Geologist*, vol. ix. (Minneapolis, 1892); Ward, "The Geographical Distribution of Fossil Plants," in *Annual Report of the United States Geological Survey*, vol. viii. (Washington, 1889); Zeiller, *Eléments de paléobotanique* (Paris, 1900).

PALEOGRAPHY (from Gk. παλαιός, *palaios*, ancient + -γραφία, *graphia*, writing, from γράφειν, *graphein*, to write). In its widest signification the science which treats of the writing of the ancients and that of the Middle Ages. It includes within its scope the study of all marks or characters which may be designated as writing, whether on materials regarded as indestructible or as destructible. The term is commonly used, however, in a more restricted sense, and denotes the science which treats of writing on destructible material. Hence we may define Greek and Latin paleography as that branch of the general science of paleography which is concerned with the writing of those languages, found on such material as wax, papyrus, parchment, and paper, and dating from the earliest times. Historically, the

science of Latin paleography owes its origin to the demands of diplomatics, or the study and criticism of ancient legal documents. Gradually paleography assumed an importance of its own, and finally became a distinct science when the importance of diplomatics diminished after the French Revolution. The interest aroused by Latin documents led to the study of Greek paleography, through the investigation of the writings of the Greek Church Fathers. The field of Greek paleography is limited in comparison with Latin paleography, as the Greek letters were used for only one language, but the Latin alphabet served for the whole of Western Europe.

Letters and Their Forms. Letters may be classed in a general way as majuscules and minuscules. The former are either capitals or uncials. Capitals are either square, such as are found in the most carefully made inscriptions, or rustic, which are drawn with greater freedom with cross strokes oblique and short. Uncials are modified capitals arising from the favoring of curves and avoiding of angles inasmuch as they are the production of the pen on papyrus. Minuscules are the result of the rapid and inartistic writing of majuscules, which have been changed in form and size. The forms of letters were also influenced by the material upon which they were written. Those made on soft substances show curved lines, while letters on stone or metal are angular.

Materials. The materials used by mankind for purposes of writing have varied much. Leaves and bark were employed in a primitive state of society. Linen was used by the Egyptians and by the Romans for their religious books. Clay was inscribed or stamped by the people of Babylonia, Assyria, and Egypt, and by the Greeks and Romans. Bronze was used by the Romans for legal documents, such as the *diplomata*, giving privileges of citizenship and legal marriage to the soldiers, and lead served also for documents and dedicatory inscriptions. Stone inscriptions belong to the science of epigraphy. Wax tablets were used by the Greeks and Romans for writing purposes, a use which continued through the Middle Ages and down to modern times, as in the fish markets at Rouen. These were made of wood or ivory in a rectangular form and had a smooth surface slightly sunk and bordered by a rim. The surface was covered with black wax in which the writing was drawn by means of a stylus, a sharp-pointed instrument of bone, ivory, or metal. These tablets might be used singly, or two or three could be bound together. Many wax tablets have been found, as in the mines of Dacia, which date from A.D. 131 to 167, and at Pompeii dating from A.D. 15 to 62. Papyrus (q.v.) was very commonly used as a writing material in Egypt, Greece, and Italy. Papyrus rolls found at Herculaneum, which was destroyed A.D. 79, preserve the earliest Latin writing on this material. Next in date are the deeds of Ravenna, running from the fifth to the tenth century A.D. Of the fifth century are the fragments which contain rescripts written in a Roman cursive and addressed to Egyptian officials. The use of papyrus continued through the Middle Ages to some extent for literary works and regularly for Papal documents down to the eleventh century. Parchment (q.v.) was first employed by the Greeks and Romans simply as a cover for the rolls of papyrus, and its use for books dates from the latter part of the first century A.D. The term used in modern times for any kind of skin book is vellum, which properly designates calfskin. Vellum was employed until the fourteenth century, when paper made from rags generally took its place. Paper made from cotton had been used for Greek manuscripts in the thirteenth century. As suggested above, papyrus assumed the roll form, or *volumen* proper. Parchment, on the other hand, was made up into book form in imitation of the wax tablets.

Greek Paleography. The science of paleography as applied to the study of Greek writing on papyrus is of modern date. Greek papyri were discovered at Herculaneum in 1752, and in 1778 forty or fifty rolls were found in Egypt, which with one exception were afterwards destroyed. In 1820 a large number belonging to the second century B.C. were found at the Serapeum in Memphis. During the next thirty years there were discovered at intervals important literary papyri, as in 1821 the Bankes *Iliad* (the last books), in 1847 orations of Hyperides, and in 1849-50 the Harris Homer (parts of *Iliad* xviii., and in book form, books ii.-iv.). Far more important discoveries were to follow. In 1877 many fragmentary papyri of a more literary character belonging to the Byzantine period were unearthed at Arsinoë in the Fayum district. In 1892, at Socnopaei Nesus, in the same district, another group was found containing documents ranging from the beginning of the first century A.D. to the middle of the third. In 1889-90 Flinders Petrie found that the cartonnages of mummy coffins at Gurob were made of papyri, written in the third century B.C., which proved to be fragments of documents and of literary works, among them part of the lost *Antiope* of Euripides. Fortunately, some papyri were also deposited with the dead, and were thus preserved in fairly good condition. Among these were the *Constitution of Athens* of Aristotle, the Mimes of Herondas, the oration of Hyperides against Athenogenes, and portions of the odes of Bacchylides. In 1896-97 Grenfell and Hunt, acting for the Egyptian Exploration Fund, discovered at Behnesa, the ancient Oxyrhynchus, thousands of papyri, fragments of literary works, and complete rolls of non-literary character. Among these were the famous Logia or sayings of Christ, parts of the Gospel of Matthew, and pieces from classical writers. They range in date from the first to the seventh century A.D. Previous to these discoveries it was customary to classify Greek papyri according to the style of writing as the literary or book hand or, again, the cursive. Although these differ in their general style, there is no set form for each. Writing on vellum may be classed as uncial and minuscule, and this distinction can be sharply drawn in the Middle Ages, when the literary hands were settled. This is not true, however, of the papyrus period, for it is impossible to distinguish uncials and minuscules, both of which may be written cursively. The uncial of the medieval period is a lineal descendant of the literary style in the papyri, but the mediæval minuscule is a new letter, based on the cursive, but molded into an exact form and becoming finally the regular hand of the literary style. Three periods in the history of Greek writing on papyrus may be recognized. These correspond to political changes

The Ptolemaic, B.C. 323-30, marked by freedom and breadth of style; the Roman, from Augustus to Diocletian, marked by roundness and curved, flowing strokes; and the Byzantine, from A.D. 360 to the Arab conquest of Egypt in 640, marked by a large, handsome style.

It is possible that the earliest extant example of writing on vellum is an Egyptian fragment of two leaves containing part of Demosthenes's speech, *De Falsa Legatione*, in a hand like that of the Herondas papyrus, written perhaps in the early part of the second century A.D. This is a rare example, and we do not find a rapid increase in the use of vellum until the fourth century, when literary works on papyrus are almost entirely lacking and its place was taken by vellum. The oldest vellum manuscripts, excepting the fragment of Demosthenes, are the great uncial codices of the Bible, the Codex Vaticanus and the Codex Sinaiticus. Manuscripts written in Greek minuscules are numerous. They are classified as the *retustissimi*, from the ninth to the middle of the tenth century; the *retusti*, from the middle of the tenth to the middle of the thirteenth century; the *recentiores*, from the middle of the thirteenth to the middle of the fifteenth century; and the *novelli*, all of later date. These show a varying style of minuscule, the earliest being the most simple and exact.

Latin Paleography. In studying the history of Latin paleography, we begin with majuscule writing as found in the earliest Latin manuscripts extant, such as the Vergil of the fourth century. Uncials described above may be recognized in Latin paleography by the letters € and Φ, and also by rounded forms of D and H. As a literary hand the uncial writing runs from the fifth to the eighth century. The cursive hand generally used influenced the more limited literary majuscule hand, so that a style designated the half-uncial finally became the book hand. The earliest examples of the cursive style are the wall inscriptions and wax tablets of Pompeii, written before A.D. 79. The style of writing differed very slightly in the first three centuries of the Christian Era. From the cursive hand came the so-called national hands, which assumed an individuality according to the locality in which they held sway. The Lombardic is the writing of Southern Italy as practiced in the monasteries of Monte Cassino and La Cava, and lasted from the ninth to the thirteenth century. The Visigothic was employed for books and documents in Spain from the eighth to the twelfth century. The Merovingian appears as a book hand on manuscripts of the seventh and eighth centuries. It never reached the calligraphic form, which marked the highest development of the other national hands, for it was supplanted by the round minuscules of the Carolingian reform. The Irish and Anglo-Saxon writing must be mentioned apart from the national hands, for it was not derived from the cursive style, but from the half-uncial which was brought to Ireland by the missionaries in the sixth century. One important peculiarity of the Irish hand is the tendency to calligraphic forms and ornamentation of the manuscripts, as in the famous Book of Kells of the latter part of the seventh century. The Irish hand found its way into the northern part of Britain, so that the English hand may thus be traced to the Roman half-uncial.

The reform of writing which marked the reign of Charlemagne was initiated by a decree of 789 for the revision of Church books. It had its origin in the monasteries of France, particularly at Tours, where, in the Abbey of Saint Martin, under the direction of Alcuin of York, much attention was given to writing. A new hand was the result, which is known as the round Caroline minuscules. These are small uncials of the true Latin form modified by cursive influences, and they became the literary hand of the Frankish Empire. In the tenth century these minuscules began to spread, and in the eleventh century they began to assume their individual form in various nations of Europe. This was the starting point of the history of modern hands, which are traced to the Roman alphabet. In the twelfth century the so-called Gothic writing appeared, which is simply the Caroline minuscule with angles replacing the curves. The writing of the fourteenth century shows a gradual decline and the letters become less distinct and are less carefully made. Nevertheless, a renaissance in Italy in the fourteenth century gave a very regular and beautiful style—the humanistic hands of the fifteenth century, which had great influence on the type forms. These minuscule letters were the ancestors of the lower-case letters of the Roman alphabet, and the Gothic form of the same gave the German lower-case letters.

Bibliography. The most convenient handbooks are: Thompson, *Handbook of Greek and Latin Palæography* (London, 1893); Reusen, *Eléments de palæographie* (Paris, 1897); Prou, *Manuel de palæographie latine et française* (ib., 1892); and Paoli, *Programma scholastica di palæografia latina e di diplomatica* (Florence, 1884-94). For facsimiles, the large series of facsimiles of the Palæographical Society (London, 1873 et seq.) are of great value; also Vitelli and Paoli, *Collezione fiorentina di facsimili palæografici greci e latini* (Florence, 1884-96).

For Greek Paleography: Gardthausen, *Griechische Palæographie* (Leipzig, 1879); Wilcken, *Tafeln zur ältern griechischen Paläographie* (Berlin, 1891); Altenbach, *Anleitung zur griechischen Palæographie* (3d ed., Leipzig, 1895); and as an introduction to the subject of Greek papyrus paleography, Kenyon, *The Palæography of Greek Papyri* (London, 1899). Facsimiles for general study of Greek paleography are: Omont, *Facsimiles des plus anciens manuscrits grecs en onciale et en minuscule de la Bibliothèque Nationale du IVème au XIIème siècle* (Paris, 1892); id., *Facsimiles des manuscrits datés de la Bibliothèque Nationale du IXème au XIVème siècle* (ib., 1890); id., *Facsimiles des manuscrits grecs des XIème et XIIème siècles* (ib., 1887); Wattenbach and von Velsen, *Exempla Codicum Græcorum Litteris Minusculis Scriptorum* (Heidelberg, 1828); id., *Scripturæ Græcæ Specimina* (Berlin, 1883).

For Latin Paleography: Delisle, *Album palæographique* (Paris, 1887); Wessely, *Schrifttafeln zur ältern lateinischen Paläographie* (Leipzig, 1898); Monaci and Paoli, *Archivio paleografico italiano* (Rome, 1882-1890). Old and standard works are: Silvestre, *Palæographie universelle* (London, 1850); Champollion-Figeac, *Chartes latines sur papyrus* (Paris, 1835-40). For facsimiles, Arndt, *Schrifttafeln zur Erlernung der lateinischen Palæographie*, 3d ed., by Tangl (Berlin, 1897-98); Zangemeister and Wattenbach, *Exempla Codicum Latinorum Litteris Minusculis*

Scriptorum (Heidelberg, 1876-79); Chatelain, *Paléographie des classiques latins* (Paris, 1884-96); id., *Uncialis Scriptura Codicum Latinorum Novis Exemplis Illustrata* (ib., 1901).

For abbreviations: Walther, *Lexicon Diplomaticum* (Ulm, 1756), is still the standard work. Chassant, *Dictionnaire des abbréviations* (2d ed., Paris, 1884), is a convenient handbook. Consult also: Allen, *Notes on Abbreviations in Greek Manuscripts* (London, 1889); Cappelli, *Dizionario di abbreviature latine ed italiane* (Rome, 1899); and for English documents, Martin, *The Record Interpreter* (London, 1892).

PALEONTOLOGY (from Gk. *παλαιός, palaios*, ancient + *ὄντα, onta*, pl. of *ὤν, ὄν*, being + *-λογία -logia*, from *λέγειν, legein*, to speak). The science which deals with the ancient life that has inhabited the earth during the past periods of geological time. It is based upon the study of fossils, and has close affiliations with geology, physiography, and biology. It embraces, under a broad conception of its scope, not alone the description and classification of fossils, but also all questions relating to the nature, morphology, and physiology, biomony and ecology, geologic and geographic distribution, and to the ontogeny, evolution, and phylogeny of all forms of plant and animal life that have lived upon the earth and that are now found, in more or less well-preserved condition of fossilization, imbedded in the rocks that form the earth's crust. Paleontology is the history of the organic life of the earth from its inception in remote geologic time to its culmination in the vegetable and animal life of the present era. This science was founded on an independent basis by Lamarck, Cuvier, Schlotheim, Sowerby, Parkinson, D'Orbigny, and Goldfuss about the beginning of the nineteenth century, and most of the early paleontological literature dealt with mere descriptions and classifications of fossils. After the publication of Darwin's *Origin of Species* in 1859, and the subsequent elaboration of the doctrine of evolution, it became evident that proof of this doctrine must be furnished largely by the paleontologists, and the study of fossil organisms received a new impetus along those lines of research which bear upon the broader philosophical questions of the origin, evolution, and phylogeny of the various species and races of fossil animals and plants. Quite coördinate with this development of the biological phase of paleontology has been the elaboration of that phase of the science which is more closely allied to geology; namely the more refined methods in the use of fossils as markers of geologic horizons, the investigation of the succession, migration, and evolution of fossil faunas and floras, and the determination of the physiographic changes and other causes of such phenomena.

Two lines of paleontological research may then be recognized. Certain investigators confine their attention almost entirely to the elucidation of the morphology, embryology, ontogeny or development, and phylogeny or genealogy, and to the description and classification of organic remains, noting the names only of the geological formations whence the species have been derived. Such studies fall within the scope of paleobotany and paleozoölogy, which are essentially branches of biology. The other phases of the science of paleontology, and perhaps the more comprehensive of the two, may be designated as paleontologic geology, stratigraphic paleontology, geological biology, and deals with the relations existing between the fossils and the rocks in which they are found. It is practically that part of historical geology which is based upon the study of fossils. Under this head are embraced the following lines of investigation, and also others not mentioned that are of more special interest: (1) The use of index fossils as markers of geological formations and horizons; (2) the assemblage, within individual formations, of species and genera of fossil plants and animals to constitute paleofloras and paleofaunas; and the study of the succession, migration, and evolution of these ancient floras and faunas, and their relations to the grander divisions of geologic time; (3) the development of facies, and the influence of the facies on the conditions of existence of the life of ancient times; (4) the study of paleogeography, comprising the determination of the physiographic and climatic conditions existent during the successive periods of the earth's history. All these latter lines of investigation, however closely related in their final results to the physical side of geology, nevertheless depend for their successful pursuit upon intimate knowledge of the purely biological aspects of paleontology, for they are based primarily upon keen discrimination between allied species and upon recognition of the phylogenetic relationships of the species involved.

Fossils. The nature of fossils and the modes of fossilization are described in the article Fossil. Not all animals and plants of past time have been preserved to us as fossils. A large number of them were of such organization that they were hardly likely to leave traces of their existence in the rocks. It is also known that many formations which originally contained fossils have suffered so great metamorphism that their organic contents have been wholly or partially destroyed. Other formations have been upheaved above the level of the ocean to form part of the land and have been subjected to erosion, with the result that their materials have been carried down to lower levels or into the sea, there to build up deposits of later age. Yet, in spite of the many gaps which will probably never be filled, the history of organisms is being rapidly compiled with an increasing degree of continuity in the series of life epochs, the lines of descent of many races of animals and plants have been established, and the sequence of those events in geological history that bear upon the conditions of existence of extinct faunas has been worked out for several portions of the earth's surface, and with a surprising degree of detail.

Through observation of the true order of superposition, the rocks of the earth's crust have been arranged by geologists into a series of systems, stages, and formations, the lowermost being the oldest and the uppermost the youngest, and the relative succession of the individual members of this series has been determined to be the same in all parts of the world. The fossils of the different members of the series have been studied and described, and it has been ascertained that the assemblage of fossils found in one formation always differs more or less from the assemblage of fossils found in the overlying and underlying beds, and furthermore that the difference is accentuated as the distance between the formations is increased. For table of geological formations, see GEOLOGY.

Faunas. The fossils contained in a rock formation are in general indicative of the animal and vegetable life that lived during the period of time in which that rock was deposited. Successive faunas and floras of variable expression have succeeded each other on the earth and have left their remains in the rocks that were forming during the periods of their existence. The large divisions of time are distinguished by the predominant types of life, as the Paleozoic era by invertebrates, the Mesozoic era by reptiles, etc., and the smaller periods of time, represented by the stages and substages, are characterized by particular genera and species. Thus the Helderbergian series is identifiable by the brachiopod genus Gypidula, and a division of that series, the Coeymans limestone, is recognizable by the presence of *Gypidula galeata* a well-marked species that serves for the identification of that horizon in many parts of America. Such a characteristic genus or species, which can be relied upon for the recognition of geological horizons or zones, is called an index fossil, and its use is the result primarily of careful observation in the field. This empirical usage of index fossils is that adopted by geologists who have not been trained in the methods of paleontological research. There is a second and more important usage of index fossils based upon a knowledge of the phylogeny of races of animals and plants. By recognition of the phyletic position of a fossil the expert paleontologist can determine within close limits the relative age of the rock from which the fossil was obtained.

Indigene and Exotic Faunas. In a single basin it is sometimes found that a series of similar faunas, evidently evolved each from its predecessor in this basin, is eventually succeeded at a higher horizon by a new fauna totally different from those below. The lower faunas are the indigene faunas, developed or evolved in this province through a long period of time and consisting of members nicely adapted to their environment and to each other. The new fauna, generally associated with a change of sedimentation, is called an alien or exotic fauna, and it has invaded this region in consequence of physiographic or climatic changes. It may find itself in congenial surroundings, and its species will then multiply and evolve, and if left undisturbed it will in turn become the indigene fauna of the region. But if its new environment happens to become uncongenial it may suffer partial extinction of its members or suppression of development of its individuals, and it will remain in the region for a short time only, to be succeeded by another alien fauna or by a returning party of the original indigene fauna. The migrations of faunas are largely due to changes in the 'facies' consequent upon physiographic and climatic changes.

Facies Development and Bionomy. Facies is the combination of physical and biological characteristics exhibited by a geological formation at a particular point. These are determined at the present time by climate, depth, tides, nature of medium, distance from shore, etc. (see Distribution of Animals; Ecology; Fauna; Flora), and just as different types of facies are being developed in the ocean and on the land at the present time, so they have been developed during all past periods of geological history. It follows then that the deposits formed during any one period may be represented in different regions by littoral, sublittoral, abyssal, corallic, estuarine, lacustrine, or terrestrial facies, and each of these facies will have its own distinctive fauna. Study of the life habits of modern organisms enables us to restore the habits of extinct forms of life, and we are able to portray with a considerable degree of correctness the conditions under which the ancient faunas lived, and consequently also to picture the physiography of past times. The large majority of fossiliferous rocks are of marine origin, and hence a study of modern marine organisms is essential to a proper understanding of the bionomic conditions of the past. Freshwater and terrestrial deposits are also claiming more attention than they formerly received; they with their peculiar faunas and floras occur chiefly in the Mesozoic and Cenozoic formations.

Bionomy. Marine organisms are broadly divided into pelagic, or those that inhabit the open sea, and littoral, those that live in the vicinity of the coasts. According to their modes of life they are divided into plankton, nekton, benthos.

Plankton includes the majority of pelagic organisms that are more or less passively drifted about by the waves and currents of the ocean. Many organisms are planktonic only during their larval stages and when adult become attached and adopt a benthonic life (meroplankton). Such are sponges, medusæ, annelids, echinoderms, brachiopods, bryozoans, most mollusks, and Crustacea. Others are planktonic throughout their lives, as Foraminifera, Radiolaria, Siphonophora, Ctenophora, Chætognatha, Pteropoda, Heteropoda, and some crustaceans. Planktonic organisms are generally widely distributed and their fossil remains occur principally in the sublittoral and abyssal facies, though they may be found in the littoral facies.

Nekton includes the organisms that are active swimmers independent of storms, currents, and tides. Here are included fishes, most malacostracan crustaceans, the dibranchiate cephalopods, and also the marine reptiles, including the extinct ichthyosaurs, plesiosaurs, Pythonomorpha, and the cetaceans.

Benthos includes all forms which live at the bottom, and of which there are recognized two sub-groups: the sessile and the vagile benthos. The benthos includes by far the larger proportion of marine organisms that are found in a fossil state. Among them are the marine algæ, some foraminifers, sponges, hydroids, corals, echinoderms, worms, brachiopods, bryozoans, gastropods, lamellibranchs, cirripedes, tunicates, and many cephalopods, such as the orthoceratites and belemnites. Radial symmetry is most highly developed in the sessile benthos (corals and echinoderms).

Littoral Facies includes deposits formed on the beach and in the shallow sea in the vicinity of the coast. They consist mostly of terrigenous materials ranging in size from fine mud, through sand to coarse conglomerate, and some kinds of organic deposits. The coarse beds contain few fossils, but those of finer grain abound in them. Fossils of the littoral facies comprise remains of the organisms that inhabited the shallow water and the region between tides; also those of the beach, and others that have drifted in to shore from the open sea. The majority of the fauna is made up of benthonic forms and all the animals and many of the plants have strong cal-

careous skeletons. Certain types of mollusks are characteristic of the littoral zone; oysters, mussels, the heavy clams, limpets, chitons, Littorina-like shells, the boring lamellibranchs, and here belong also the coarse marine algæ, crabs, and anomurans. The littoral facies is the most important of all, for most of the fossiliferous rocks have been formed in the shallow water near the shore and on the continental shelf, and also because preëminently, in its peculiar development of corallic facies, it contains the largest fauna.

Sublittoral Facies includes those deposits formed in the deeper water at a distance from the coast. It merges on the one side into the littoral and on the other into the abyssal facies. It contains the remains of pelagic (plankton and nekton) organisms which after death have sunk to the bottom, and also of those benthonic organisms of the deeper waters. Here are included fish, ammonoids, pteropods, graptolites, many foraminifers, radiolarians, and many echinoderms, mollusks, and brachiopods of more delicate build than those found in the littoral facies. Many of the pelagic organisms enjoyed very wide distribution, as the graptolites, and hence afford excellent index fossils for correlative purposes. Examples of sublittoral facies are the graptolite shales of the Ordovician, goniatite, and ammonite limestones and shales of the Upper Paleozoic and Mesozoic, and many pteropod limestones, like the Styliolina limestone of the Devonian.

Abyssal Facies. Here are included the deposits of the deep sea, consisting of very fine grain sediments of various types. (See Ooze.) The existence of abyssal sediments among the rocks of the earth's crust has been strongly denied by some writers. It is, however, difficult to assign certain geological formations to any other category. Such are the chalk deposits of the Cretaceous, the Upper Paleozoic radiolarian cherts of New South Wales, and those of Jurassic age in the Alps, and the Aptychus shales of the Alps, all of which are very similar to the abyssal deposits of the present day.

Corallic Facies. This is really a phase of the littoral facies, but as its characteristics are so distinct, and as its development depends upon the absence of many of those features associated with the normal littoral facies, it deserves special consideration. The conditions under which corals form reefs at the present time are a warm temperature, shallow water not more than 125 feet deep, and pure sea-water entirely free from mud and from inflowing fresh water. The other organisms living about the coral reef require the same conditions. These conditions existed also during the formation of the Paleozoic and Mesozoic and Tertiary coral reefs, for the rocks of these fossil reefs are free from traces of mud and clay.

Estuarine Facies embraces the deposits and faunas of lagoons and estuaries. The sediments are usually irregularly bedded muddy sands and clays. Here is found a commingling of brackish water types with marine organisms, fresh water and terrestrial types. A fine example of such an estuarine facies is afforded by the Lower Carboniferous nodule-bearing shales of Mazon Creek, near Morris, Ill., described by Meek and Worthen, Scudder, and others. The nodules have furnished a very large congeries of plants and animals. There are represented here ferns, amphibians, fish insects, spiders, scorpions, myriapods, eurypterids, crustaceans, aquatic worms, lamellibranchs of marine and fresh water types, gastropods of freshwater, marine, and terrestrial types. No strictly marine types, like crinoids and brachiopods, occur here, those present being species which could live in brackish water. Other examples of estuarine facies are found in the Carboniferous, Mesozoic, and Tertiary formations of Europe. In all probability many of the coal-measure swamps were of estuarine nature, for sections through the beds show alternations of marine and fresh or brackish water faunas.

Fresh-Water Facies appears first in the Carboniferous in the form of swamp deposits, now turned into coal. In these deposits are abundant fossil plants of various types, and remains of fresh water mollusks, insects, etc., and also of amphibians and fish. In the Mesozoic, and in more pronounced degree in the Tertiary, lacustrine deposits are largely developed. They may be recognized by their contained fresh-water shells; Paludina, Goniobasis, Planorbis, Limnæa, Unio, and Anodonta. They have afforded also the far more important and more interesting vertebrate remains, such as the dinosaurs, birds, and mammals. *Terrestrial facies*, represented by deposits of flood plain, desert, and prairie, do not as a rule afford many fossil remains. The loess, a recent accumulation of dust and river mud, contains land and fresh-water shells; and the White River Miocene clays of Colorado, containing finely preserved vertebrates, are thought to have been accumulated largely as dust upon a Tertiary prairie.

Composite Facies. The fossil elements of a fauna may be distinguished as autochthonous, or those which naturally belong in the deposits where found and which have been buried where they lived or where they fell to the bottom; and heterochthonous, or those which owe their entombment to the agencies of currents or other means of transportation, and have been buried far from their natural habitats. The autochthonous fossils are the more reliable for zonal correlation, while the heterochthonous fossils indicate the nature of preëxistent faunas and the proximity of neighboring faunas of different facies.

Ancient Climate and Paleogeography. Climatic zones are thought to have existed as early as Cambrian time and to have continued through the Silurian and Devonian periods. The European and North American faunas of these periods can be separated into northern and southern types which are quite distinct, the various genera having representative species in each zone. The courses of oceanic currents have been indicated for the early and late Ordovician by Matthew and Ruedemann. Other evidence regarding the climate of the Paleozoic is derived from study of the distribution of the fossil coral reefs of the Silurian, and of the plants of the Carboniferous. The Silurian coral reefs are found in high latitudes and indicate rather warm temperatures for those regions, and the structure of the Carboniferous tree-trunks points to a remarkable uniformity of the seasons during that period. Neumayr has tried to demonstrate that the Jurassic and Cretaceous faunas show the influence of well marked climatic zones which extended in belts around the globe independent of the continental barriers, but his results have not been confirmed

by subsequent investigations. During the Tertiary, however, climatic zones certainly existed, as is indicated by the fossil floras and faunas, but a lowering of the temperature began during Eocene time in North America and during Miocene time in Europe, and culminated in the ice age of the Pleistocene. Various interesting attempts have been made by Neumayr, Suess, Chamberlin, and others to correlate the evolution of animals and plants with the changes of climate in past times.

It will be seen from what has been said regarding facies development that the study of the distribution and migration of fossil faunas leads to conclusions regarding the physical geography, paleogeography, of ancient times; these conclusions must of course be tested in the light of the evidence derived from the study of the tectonic features. Much has been accomplished in this field of research by Heer, Neumayr, Suess, De Lapparent, Canu, Smith, Chamberlin, Weller, Ortmann, Schuchert, Ulrich, and Clarke.

The Species and Genus in Paleontology. The early conceptions of species held by the botanists and zoölogists of the non-transformist school were held also by paleontologists. Each fossil species was considered to represent a distinct entity separate from its allies and specially created. At that time transitional forms between species were grouped as varieties under one or the other specific head, or were even in many cases thrown away and destroyed, as they interfered with the hard and fast delimitations sought after in the early classifications. Subsequently, as the evolution doctrine became better understood, these transitional individuals were recognized as affording examples of the variability of species, and they are now considered to be of equal importance with the norm of the species itself, as affording evidence upon the origin of new varieties. A fossil species differs from a living species in one important respect. The living species of the present day is distinguished by certain particular characters which differentiate it from its allies, certain physiological tests determine its individuality, and it has a more or less limited area of geographical distribution. The species of the paleontologist is a far different conception. In addition to its geographical distribution, it has geologic range; for it lived during the period of deposition of perhaps several successive formations, and it is represented in these formations by a series of fossil forms of more or less unmistakable continuity until it disappears at some higher horizon. The physiological tests are impossible, and hence the paleontologist must rely upon likeness of form and upon continuity of occurrence, and he groups under a single specific denomination those individuals which resemble each other in essential characters and which differ only in secondary characters. Some species were evidently very short-lived, others enjoyed long lives and underwent little if any change of form, while still others varied considerably during their periods of existence, and in their later stages present such wide departure from the original form that, were the intermediate transitory phases absent, they would be considered to constitute distinct species or perhaps event distinct genera. Examples of such series of variable species are furnished by the Planorbis of the Upper Miocene at Steinheim, Württemberg, described by Hyatt and Hilgendorff; the Paludinaus of the Lower Pliocene of Slavonia, described by Neumayr; the Ammonites of the *Oppelia subradiatus* type of the Jurassic limestones, studied by Waagen.

The existence of such series of transitional forms, the members of which occur in successive horizons and all of which have apparently been derived from an original common ancestor, forces recognition of the fact that the term species in paleontology is a very arbitrary one, and that the limitation of a species is determined not by any strictly definable form, but rather by the absence of transitional forms that would serve to link it through scarcely distinguishable grades of variation to its nearest ally. Two species found in formations of different ages, and now considered distinct, may through future discovery of intermediate transitional stages prove to be but the earliest and latest stages of a single race. The same principles are true with respect of genera, families, etc. (see Horse, Fossil), our conceptions of which change as intermediate forms are discovered, and as the gaps in the classification are filled up. The inevitable conclusion drawn is that species and genera and even the larger groups are mere stages in the life history of organisms, that they have no real existence in nature, and that they are arbitrary concepts of the stages of evolution attained by a race of organisms at a particular moment or during a more extended period of its history.

Persistent and Aberrant Types. Persistent or conservative types are common among fossils, and they include those types that have escaped all changes of environment, and also those members of an original stock which have not responded to the influences of changed environments, and which have perpetuated the characters of their more primitive ancestral type through several geological formations or epochs. Examples are found among the Foraminifera, Globigerina and Orbulina (Cambrian to recent); Nautilus among cephalopods (Ordovician to recent); Lingula, Crania, and Rhynchonella among brachiopods; and Cidaris among echinoderms.

Aberrant types, or forms in which organs have been developed to an extent not found in the other normal members of the group, are common among fossils. Eucalyptocrinus among crinoids, the Rudistæ, Pholadidæ, and Teredinidæ among pelecypods, Ampyx among trilobites, Triceratops and Naosaurus among reptiles, and the titanotheres among mammals, serve as examples. The most aberrant forms are usually found at the ends of short lines of descent, and they seem to mark approaching extinction of these side lines. They seem to indicate extreme adaptation of the organism to special modes of life and appear to have lost their powers of adaptation in other directions.

Generalized and Synthetic Types. In the early history of a subkingdom there is often found to be a group of fossil organisms which combine in more or less marked degree the characters that distinguish a number of distinct classes or orders of later date. Such a generalized type or synthetic group is considered to resemble closely if not actually to represent the ancestral type of the entire subkingdom. An excellent example is afforded by the Cystoidea of Cambrian and Ordovician origin, which combine the characters of the Crinoidea, Blastoidea, Asteroidea, and Echinoidea of later origin. (See

CYSTOIDEA; CRINOIDEA.) At a date after the Cystoidea and Blastoidea had become extinct, and after the Echinoidea had passed through a considerable amount of evolution, there appeared in the Triassic the isolated genus Tiarechinus, which resembles both the Blastoidea and the Echinoidea, and which thus constitutes a synthetic type between these two classes. The Phyllocarida form a generalized group connecting the Entomostraca and Malacostraca; the Merostomata, containing the Eurypteridæ and Limulidæ, connect the Crustacea and Arachnida (especially the scorpions); the suborder Condylarthra of Lower Eocene time contains the ancestors of all the later suborders of the Ungulata, and also presents characters resembling those of the Carnivora; and the Gnetaceæ are synthetic between the angiosperms and gymnosperms. Nearly all races of fossil animals that can be traced back through ancestral forms are found to have their origin in such groups of generalized types.

PALEONTOLOGY AND EVOLUTION. The causes of variability among species, the meaning and processes of evolution and natural selection, and the relations between evolution and classification are considered in other articles under those particular titles. The bearing of paleontologic research upon these subjects and some of the results attained deserve brief notice here, and for further information regarding these lines of research the reader is referred to the papers cited in the bibliography at the end of this article. The following lines of research have been distinguished: Auxology or Bathmology, the study of growth of organisms; Genesiology, the study of heredity; Ctetology, relating to the origin of acquired characteristics; and Bioplastology, dealing with the correlation of the ontogeny and phylogeny, or the stages of development with those of evolution.

EMBRYOGENY OF FOSSIL ORGANISMS. Embryonic shells of mollusks, brachiopods, and crustaceans are sometimes found as minute objects in highly fossiliferous shales and limestone. Some adult shells retain at their apices the form of the embryonic shell, and others, like the ammonites, have the young shell which hatched from the egg inclosed within the centre of their coiled disks. By examining large numbers of brachiopod shells of all sizes, Beecher and Clarke, and later Schuchert, were able to arrange the individuals of certain species in series according to size, and to show that they all were derived from an embryonic stage, called the protegulum, of very simple form, resembling the Cambrian genus Paterina. They have shown that members of all the families of brachiopods began their existence as paterina-like shells, and that the distinctive adult shapes have been attained through modifications in the mode of growth of the shell during the stages subsequent to the protegulum stage. Beecher has shown that members of the principal families of trilobites began their existence as embryonic forms, called the 'protaspis,' which is comparable with the protonauplius stage of the more primitive living crustacea. Among the corals, several fossil genera, as Favosites, Syringopora, etc. (fide Beecher and Girty), pass through an embryonic stage that resembles another fossil coral Aulopora. The nautiloid and ammonoid cephalopods present the most favorable conditions for the preservation of the embryonic stages of growth, because their shells hold within their centres all the successive stages through which they have passed in their ontogenetic development. By breaking open such a shell the developmental stages can be studied from the earliest "protoconch" hatched from the egg and found at the centre of the coil, to the senile or old age stage represented by the last chamber in which the animal lived. See CEPHALOPODA.

AGASSIZ'S LAW OF RECAPITULATION, subsequently termed by Haeckel the law of palingenesis, according to which the stages of development or ontogeny of the individual can be correlated with the stages of evolution or phylogeny of the race to which the particular individual belongs, has received abundant confirmative evidence from paleontology, and the literature on this and allied branches of research is quite formidable, especially in its technicality of expression. The following scheme of terms adapted from Hyatt has been devised to distinguish the corresponding stages:

Ontogeny, or Development		Phylogeny, or Evolution of Race Stages	
Colloquial	*Technical*		
Fœtal	Embryonic	Phylembryonic	
Baby	Nepionic	Phylonepionic	Epacme
Adolescent	Neanic	Phylacmeic	
Adult	Ephebic	Physephebic	Acme
Senile	Gerontic	Phylogerontic	Paracme

Fine illustrations of such correlations between ontogenetic and phylogenetic stages have been furnished by Hyatt's study of the Arietidæ, a group of ammonites; by Beecher's demonstration of the phylogeny of the Terebratellidæ, a family of brachiopods; and by Beecher's studies on the larval forms of trilobites. This palingenetic law is of much value to the stratigraphic paleontologist, for it enables him to correlate geological formations of which the faunas consist of wholly unknown species. It also enables him to postulate the existence in earlier formations of unknown genera which when found will prove to be counterparts of larval or adolescent stages of species already under observation.

ACCELERATION AND RETARDATION. In some cases the correspondence between the two classes of stages mentioned above is incomplete, through action of 'tachygenesis,' or 'acceleration of development,' which has been defined by Hyatt as follows: "All modifications and variations in progressive series tend to appear first in the adolescent or adult stages of growth, and then to be inherited in successive descendants at earlier and earlier stages according to the law of acceleration, until they either become embryonic, or are crowded out of the organization, and replaced in the development by characteristics of later origin." Examples are seen in the spiny larvæ of the trilobites Acidaspis and Arges, which differ greatly from the smooth protaspis stages of other trilobites. Retardation of development is the reverse of acceleration and is due to the later stages dropping out of the ontogeny; in other words, animals in which this operates grow old quickly. Examples are afforded by some Cretaceous ammonites which have sutures of goniatitic and ceratitic type. These ammonites are derived from Jurassic ancestors having complex sutures, but they never attained their normal development; they stopped growing in their youth. Similar cases have been noted among the brachiopods,

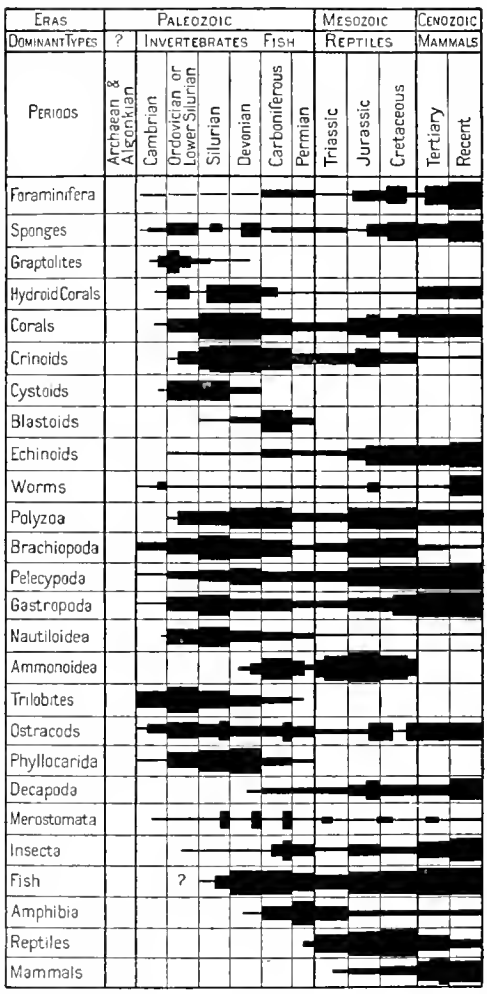
and the larval condition of many parasites may be explained in this manner. Retardation of acceleration results often in regressive evolution. These laws of acceleration and retardation explain disturbing factors in the application of embryogenic methods to elucidation of the past histories of the races of modern animals, and enable us to understand why the ontogeny of a living animal cannot always be depended upon to furnish a synopsis of the sequence of events that have occurred in the geological history of its phylum.

Ctetology (κτητός, something acquired). The question of the inheritance of acquired characters, one of the cardinal principles of evolution, has been denied by some zoölogists, and affirmed by most paleontologists. Hyatt, after tracing the genetic relations of varieties and species of fossil cephalopods through geologic time, came to the conclusion "that there is no class of characteristics which may be described as non-inheritable," and he has proved beyond any doubt the inheritance of one particular characteristic, namely the so-called 'impressed zone,' of the nautiloids, due to the adoption by the animal of a crawling mode of life, with its consequent influence upon the form of the shell. This impressed zone appeared first in the adult stages of early Paleozoic nautiloids, and through inheritance and acceleration it became fixed in successively earlier stages of growth in the succeeding nautiloids of the later Paleozoic.

Gerons and Phylogerons. When an organism has passed the acme of its development and begins to get old it sometimes acquires at that late date peculiar characteristics that seem to indicate loss of energy. The shells of mollusks and brachiopods thicken and the ornamentation decreases in prominence, etc. Among fossil cephalopods the last whorl often shows a tendency to uncoil. By acceleration these gerontic characters appear earlier in the ontogeny of succeeding species, and finally the normal closely coiled shell is found only in the very youngest stages of the phylogerontic members of the race.

Adaptation and Specialization. The manner in which many types of modern organisms have become adapted to their particular modes of existence is often well illustrated by their fossil ancestors, in which may be observed a gradual change in organization from earlier less specialized and less adapted types. One of the best known cases of gradual adaptation is that of the horse, whose one-toed hoof has become adapted from an original five-toed Eocene ancestor of generalized type. (See Horse, Fossil.) Some cases of adaptation to particular modes of existence reached a higher degree of perfection during past times than any known at the present day. There was a winged reptile, Ornithostoma or Pteranodon of the Cretaceous, in comparison with which the best of modern birds are mere tyros. This creature, with a body weighing not more than thirty pounds, had wings that spread twenty feet from tip to tip, and a skeleton so delicate that the bones are almost paperlike in structure. The cause of extinction of such a creature, which would seem to have been almost beyond the influences which are known to have caused the extinction of other races of animals, is as yet a mystery.

Extinction of Organisms. One of the most impressive phenomena brought to the attention of the student of paleontology is the extinction or disappearance of species, families, and even whole orders, as well as faunas, of fossil animals and plants. In some cases the rate of disappearance is gradual, the group diminishing in importance before final extinction occurs; in other cases extinction is sudden, as if due to some catastrophe. Extinctions of the latter type are usually associated with important changes in the sediments or with unconformities, and occur at levels which have been used to mark the limits of geological systems or formations. In many cases such extinction is only apparent, and is due to migration



Distribution of Important Groups of Fossil Animals.

of the fauna into some distant or unknown region. In some cases the extinction is very real, entire groups of animals having been, as it were, suddenly annihilated. Some types of organisms after having enjoyed a more or less extended period of life have slowly died out and have become extinct, apparently uninfluenced by any physiographic catastrophe, after having passed through a maximum period of evolution and a subsequent phylogerontic decline. They have grown old and died apparently through lack of growth force.

Without doubt the most far-reaching causes of extinction of marine animals during past times have been those changes in the relative levels of land and sea by which the water has been largely drawn off from the epicontinental shallow seas and from the continental shelf or littoral zone during intervals of isostatic readjustment. As a consequence of such readjustments, which also mark the openings of new geological periods, the faunas inhabiting the shallow seas have been driven into deeper water and have suffered annihilation, with the exception of scattered parties which found shelter in some harbors of refuge and thus served to furnish the nuclei for new faunas which evolved under future more favorable conditions.

Distribution of Organisms in the Past. Detailed information regarding the range of the various fossil animals throughout the geological formations is given in the articles on the separate groups and genera, and the range of fossil plants is described in the article Paleobotany. It is necessary here to give only a general view of the distribution of those groups of animals which are of most importance to the student of stratigraphic paleontology. The vertical divisions of the table represent geological periods, and the thickness of the black lines indicates the relative expansion of the groups. The selection of the group names is based entirely upon their importance as fossils and has nothing to do with their rank as members of a zoölogical classification.

PA'LEOTROP'ICAL, or ETHIOPIAN, REGION (from Gk. παλαιός *palaios*, ancient + Eng. *tropical*). A grand division in zoögeography composed of Africa south of the Sahara and Madagascar. The second name is the better, because only a part of the tropical regions of the Old World are included. Four subregions were delimited by Sclater and Wallace: 1. That part of Africa north of the Tropic of Capricorn as far as the Tropic of Cancer (including southern Arabia), except the Congo basin; 2. West Africa, or the equatorial Congo forest region; 3. South Africa; 4. Madagascar and the neighboring islands. This is one of the best-defined of the zoölogical regions, and [illegible]

excepted by those who would unite all the rest of the Southern Hemisphere. (See NOTOGEA.) Of its subdivisions, the most clearly defined is the Malagasy Subregion (q.v.). For the faunal characteristics of this region, see AFRICA, paragraph *Fauna*; also, DISTRIBUTION OF ANIMALS.

PALEOZO'IC (from Gk. παλαιός, *palaios*, ancient + ζῷον, ζῶον, life). The name given to the lowest of the three great divisions of the fossiliferous rocks, because they contain the most ancient forms of life. They were formerly known as the primary rocks. The systems included under this title are the Cambrian, Ordovician, Silurian, Devonian, and Carboniferous. Phillips, for the sake of uniformity, introduced Mesozoic as equivalent to Secondary, and Neozoic to Tertiary rocks. See GEOLOGY; PALEONTOLOGY; SILURIAN SYSTEM; DEVONIAN SYSTEM; CAMBRIAN SYSTEM; CARBONIFEROUS SYSTEM.

PALERMO, pä-lĕr'mō. The capital of the Province of Palermo and of Sicily, being the judicial, ecclesiastical, and military seat for the island. It is situated on the northwest coast, on the west side of the Bay of Palermo, 120 miles west of Messina (Map: Italy, H 9). The entrance to the bay affords a beautiful view. The city, which has received the appellation of 'la felice,' or 'the happy,' stretches magnificently along the shores. It is surrounded by the beautiful plain of the Conca d'Oro, and is nobly backed by mountains reaching a height of nearly 3500 feet, the shapely Monte Pellegrino rising on the north and Cape Zafferano stretching away to the east. The mean annual temperature is 63.6° F. In summer a refreshing wind blows up daily from the east, across the water.

Many of the streets are unpaved and are disagreeable from dust at certain seasons of the year; the avenues are regular, and Palermo is, on the whole, well built and clean. There are four quarters which are formed by the Corso Vittorio Emanuele and the Via Macqueda. At their intersection is the small but lively square called Quattro Canti, the geographical centre of the city. It has eight sides, and is faced by façades decorated with statues of the holy virgins of Palermo, kings of Spain, and the seasons of the year. There are in the city many relics—towers, etc.—of Norman times. All the houses are provided with balconies. The Corso, the main street, leads from the sea to the cathedral and royal palace in the southwest corner of the city—the official centre. Here the vast and picturesque cathedral faces the Piazza del Duomo (which is surrounded by sixteen huge holy statues) and stands adjacent to the important Piazza Vittoria. A statue of Santa Rosalia rises in front. The church was begun in 1169, and is a composite structure with many spoiled features. Its façade, however, is very attractive, and its tombs of the Sicilian kings, including that of Frederick II., are imposing. In the Chapel of Santa Rosalia lies the saint in a silver sarcophagus (1631), which is exhibited to the people thrice annually. Another interesting church is the San Giovanni degli Eremiti, with five domes and charming cloisters, a Norman structure belonging to the early part of the twelfth century. The superb San Salvatore is a creation of Amato, and the Carmine Maggiore is also fine. The spacious La Martorana dates from 1143. In it are the headquarters of the important Conservazione dei Monumenti di Sicilia. In the Oratorio del Santissimo Rosario is a notable altar-piece by Van Dyck.

The Palazzo Reale, or royal palace, stands on the site of a castle built in Saracenic times. The spot is associated with the lives of Manfred and Robert Guiscard. There is here, perhaps, the finest attraction in the city—the Arabic-Norman Palatina Chapel. It owes its origin to Roger II. (1132). As a palace chapel it is unsurpassed. It is beautifully ornamented with mosaics, the glass mosaics on the interior walls being especially noteworthy. Around the Piazza Vittoria stand, in addition to the royal palace, the Palazzo Sclafani, now serving as barracks; the archiepiscopal palace, dating from the fifteenth century, and possessing several graceful architectural features; and the Palazzo Municipio, containing a beautiful Greek statue of Antinoüs.

Among the fine new buildings in Palermo is the Government Finance Bureau. The modern Casino is found in the Palazzo Geraci. The beautiful Garibaldi garden lies near the small harbor of La Cala, from which, along the sea, extends the magnificent and fashionable esplanade Foro Italico as far as the Villa Giulia, or the Flora. This public park, beautified with the rarest trees, is scarcely rivaled in Italy. It has monuments to the poet Meli and to Frederick II., and a meritorious modern marble group of the Greek heroes, the Canaris, chiseled by Civiletti. Adjacent is the splendid Botanic Garden. Not far away, on the south side of the city, is the Garibaldi gate where the patriot entered in 1860. In the northwestern part of the city extends the modern Via della Libertà, the popular drive in winter. It passes through the English Garden, opposite the gate of which is a fine equestrian statue of Garibaldi, dating from 1892. In this direction lies the newest quarter of Palermo. It is occupied chiefly by foreigners. There are in the city a monument to Philip V. (1856), a statue of Charles V., the historic statue of the Genius of Palermo, and a statue of Victor Emmanuel I. In the Piazza Croce del Vespro stands a memorial (marble column and cross) erected in 1737 to the French buried here after the Sicilian Vespers.

The National Museum is in the suppressed monastery Dei Filippini, and is interesting. Among its more valuable contents is an exceptionally fine altar-piece with wings, of the early Flemish period, attributed by some to Cornelissen, by others to Mabuse. Here, also, are the famous metopes of Selinus, representing almost the highest stage of Greek art.

Palermo is the seat of a university. (See PALERMO, UNIVERSITY OF.) The communal library, rich in material on Sicilian history, has about 220,000 volumes and 3300 manuscripts. The national library has about 160,000 volumes. It together with the lyceum is established in the former New College of the Jesuits. There are in the city a Greek seminary, a conservatory of music, a royal observatory, two teachers' seminaries, the Società per la Storia Patria, a seamen's school, an agricultural institute, a Circolo Filologico, a fine modern opera house, and the new theatre called Politeama.

The manufacturing interests are small. There is now a capacious shipbuilding yard. The commerce is growing, wine, oranges, lemons, sulphur, sumach, grain, and oils being conspicuous

exports. Leading imports are coffee, sugar, coal, cotton and woolen goods, silks, and porcelain. The old harbor is the little La Cala, suitable only for small vessels. It is protected on the east by a long narrow mole reaching out toward another mole extending from the north. The new haven lies at the foot of Monte Pellegrino. The city is connected by rail with various parts of the island. Palermo is the sixth Italian port in importance and the third in Sicily, the number of ships entering and clearing in 1900 having been 6750, with a total tonnage of 3,330,000. The city is provided with electric tramways and a good water supply. At the head of the city government is a syndic. Palermo's great festival is that of Saint Rosalia, from July 11th to 15th. Regattas, races, and fireworks are its important features.

The environs, embellished with elaborate villas, are of great beauty and interest. A short distance to the southwest ancient catacombs were discovered in 1785, but were destitute of contents. Monte Pellegrino offers a very attractive ascent and a remarkable view. On its side is found the famous grotto (now converted into a church) of Saint Rosalia. The royal château at the foot of the mountain is a splendid seat, with Chinese architectural features. The population of Palermo in 1901 was 309,694. It is the fifth Italian city in size.

The town (anciently Panormus or Panhormus) was of Phœnician origin. It was Carthaginian for a long time, until taken by the Romans in B.C. 254. Augustus established a colony here. The Byzantines took it from the Goths in A.D. 535. It was a wealthy and powerful Moslem centre after 830, and became the capital of the Normans in Sicily in 1072. In 1194 it passed to the Hohenstaufen. The Court of Frederick II. here was one of the most brilliant in Europe. In 1282 occurred the massacre of the French in Palermo, known as the Sicilian Vespers (q.v.). During the residence of the Spanish viceroys the city was a regal place, and much of its distinguishing architecture and many of its features date from this epoch. It was the scene of revolutionary revolts in 1820, 1848-49, and 1860, and suffered much in consequence. Garibaldi entered the city in 1860. A national exposition was held here in 1890. Consult: Schubring, *Historische Topographie von Panormus* (Lübeck, 1870); Freeman, *Historical Essays*, 3d series (London, 1879); id., *History of Sicily* (ib., 1891); Arcoleo, *Palermo und die Kultur in Sicilien*, trans. by Nolte (Dresden, 1900).

PALERMO, University of. An institution founded by Ferdinand IV. in 1779. A higher institution of learning existed in Palermo as early as 1394. In 1805 the university was closed and was not reopened until 1850. Since then, encouraged by the Government, it has maintained a steady growth. It consists of the faculties of law, medicine, surgery, mathematics and natural science, letters and philosophy, and the schools of pharmacy and engineering. Its attendance is about 1400.

PALES, pā'lēz. In early Roman mythology, a divinity much worshiped by herdsmen. In the Roman poets, who only knew the divinity from the festival, Pales is a goddess, but Varro states that originally the divinity was masculine. The festival, the *Palilia*, or more commonly the *Parilia*, was celebrated on April 21st, which was in later times declared to be the day of the founding of Rome. It was a purification of the flocks and herds. The stables were swept, sprinkled, purified with sulphur, and adorned with wreaths. Fires of hay and straw were kindled, over which the worshipers sprang three times, and doubtless drove the herds. Prayers for the increase of the flocks were made, and also offerings of milk and cakes, but no bloody sacrifices.

PALESTINE, pāl'ĕs-tīn (Lat. *Palæstina*, from Gk. Παλαιστίνη, *Palaistinē*, from Heb. *Pĕlishti*, Philistine, from *pālash*, to wander about). A name originally applied to the coast land occupied by the Philistines, but later used in a wider sense to denote the Land of Israel. The exact limits of Palestine, taking the term in its ordinary wider significance, are somewhat hard to fix. A line drawn from the deep gorge of the Leontes (the modern Litany or Kasimiyeh), as it turns abruptly to the west to reach the sea, eastward across the valley to Mount Hermon will give a satisfactory northern boundary; similarly, a line from Mount Hermon due south to the parallel of the southern end of the Dead Sea will indicate the eastern limit; the southern boundary may be marked by a line from the south end of the Dead Sea due west to the Mediterranean. The territory thus bounded extends about 150 miles north and south, the breadth ranging from about 35 miles at the extreme north to 110 in the south. The west-Jordan portion varies in breadth from 23 to 80 miles. In other words, Palestine lies between latitudes 31° and 33° 20′ N., and extends from the sea to about longitude 35° 45′ E. of Greenwich. The west-Jordan portion comprises something over 6000 square miles, that east of the Jordan somewhat more than 3000 square miles.

Physical Features. The physical features of Palestine are very marked. The most peculiar and important of these is the remarkable depression through which flows the Jordan (q.v.). This depression is due to a geological disturbance at the end of the Pliocene period, when the whole plateau east of the Mediterranean then under water was rent in two from north to south as far as the Red Sea. In Palestine the strata just west of the fault broke and fell with a strong dip toward the deep valley thus formed. Throughout nearly the whole course of the Jordan, and to a short distance south of the Dead Sea, this valley is lower than the level of the Mediterranean. The waters of Merom (Lake Huleh) are about seven feet above sea-level, the surface of the Sea of Galilee, about 10 miles farther south, is 682 feet below the sea, while the surface of the Dead Sea, 65 miles south of the Sea of Galilee, lies 1292 feet below sea-level, with the bottom 1300 feet lower still. The surface of Palestine may be divided, roughly speaking, into four parallel zones—the seacoast plain, the hills and mountains west of the Jordan, the valley of the Jordan, and the plateau region east of the great depression.

This whole region consists of a series of limestone formations over Nubian sandstone. The upper strata are soft and porous, easily worn away by erosion, so that in many places water can be obtained only from deep wells. Where the harder strata [illegible] surface, springs abound. In the Jordan Valley

and in many parts of the east-Jordan land hot springs exist. These show that the ancient volcanic activity, evidenced not only by many earthquakes recorded in history, but especially by the great lava plateau (with many extinct volcanoes) which stretches from the Sea of Galilee to the Hauran (q.v.), is not yet entirely quiescent.

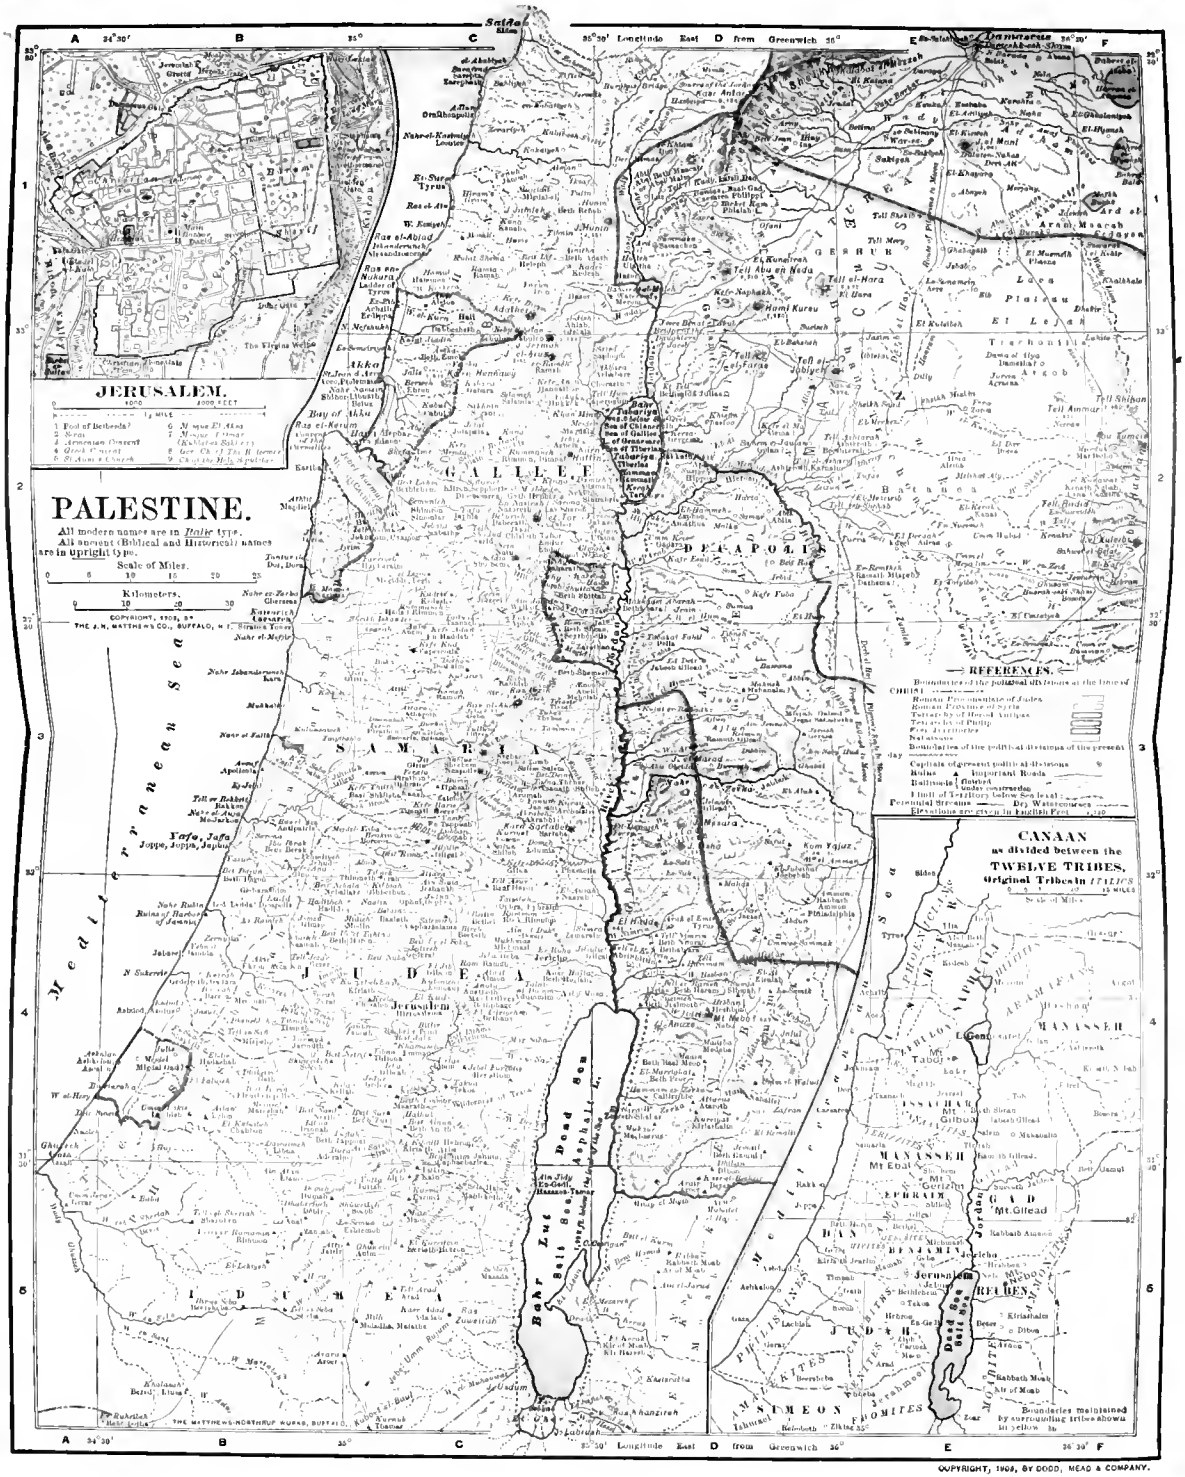
The hilly range west of the Jordan, in striking contrast to the eastern plateau, is broken and irregular in character. It may be divided into several distinct regions. Beginning at the extreme south, we have the 'Negeb' or 'south' region (literally the dry or parched land), a desert tableland, 1500-2000 feet above sea level, intersected by wadies or ravines running east toward the Dead Sea or northwest toward the Mediterranean. The largest of these is the Wady es-Seba, which passes by ancient Beer-sheba and enters the Mediterranean as Wady Ghuzzeh a few miles south of ancient Gaza.

The northern part of the Negeb is higher (about 2500 feet above sea level) and more broken. The central ridge now becomes more pronounced, and the highland or mountain region of Judah begins. This extends as a fairly unbroken plateau some miles north of Jerusalem. The highest portion of the Judean range is near Hebron (3370 feet). Toward Jerusalem the level sinks in places to about 2400 feet, but becomes higher as it extends north. The crest of the Judean highland averages nearly 15 miles in breadth. From it the descent to the Dead Sea, 10 or 15 miles away, is rapid, breaking down finally in precipitous cliffs. The whole region bordering on the Dead Sea is wild, barren, and rocky, intersected by countless deep ravines leading toward the sea. It was known as *Jeshimon* (the desert waste), and its upper reaches nearer the central plateau formed the Wilderness of Judah with its various subdivisions, the Wilderness of Tekoa, of Jeruel, of Maon, etc. West of the Judean highland the country sinks gradually toward the coast plain. This region of hills and valleys was known as the *Shephelah*, i.e. the low land. In the more open valleys and on the hillsides both the Shephelah and the central plateau are capable of high cultivation. In other parts, especially the uplands, they are more suited for pasturage. From the coast plain several large valleys lead up into the interior highlands, of which those of Ajalon, of Sorek, and of Elah have become famous as scenes of great conflicts between invaders and defenders of the uplands.

The central highland continues north of Jerusalem for upward of forty miles, but with less uniformity. North of Bethel (10 miles north of Jerusalem) it begins to be broken. The general level sinks, though many peaks are over or nearly 3000 feet high. The descent to the Jordan Valley is in places very abrupt, though also traversed by a number of passable valleys. One of these, the Wady Farah, pierces far into the interior. Near Shechem, situated in a beautiful vale between Mount Gerizim (2849 feet) on the south and Mount Ebal (3077 feet) on the north, a network of valleys seems to converge. One of these, the Wady esh-Shair, opens out northwest into the plain in which the city of Samaria was situated and continues on to the coast. Another opens into the Wady Farah, and thus gives open connection with the Jordan Valley. Near Shechem, then, the central highland may be said to break down into a system of valleys, plains, and isolated peaks. Between Bethel and Shechem, especially along its western border, the whole plateau is more open and undulating, more fertile and capable of cultivation, than that of Judah to the south. This region was known as Mount Ephraim, rather a succession of hills than one continuous mountain. The part of the coast plain west of Mount Ephraim is the famous 'Plain of Sharon.'

From the hills near Samaria northward the country takes on a new character. The low-lying plain of Dothan, 10 miles north of Samaria, connects the seacoast plain with the southern reaches of the great Plain of Esdraelon (q.v.), a triangular-shaped expanse, about 16 miles across, midway between the Jordan and the sea, with an average elevation of but about 250 feet. This remarkable district is separated from the seacoast plain to the west by a series of low hills running northwest from the plain of Dothan and culminating in the Carmel range (1500-1800 feet), which juts out into the Mediterranean in a promontory 556 feet high, at the foot of which there is a narrow strip of beach. The Plain of Esdraelon is shut in on the east by the Gilboa Mountains (1300-1650 feet) and the hills near the site of ancient Shunem and Nain. Between these two ranges of hills the deep valley of Jezreel, all of it below the sea level, leads down to the Jordan. The northeastern corner of the plain opens out into another rapidly descending valley across which Mount Tabor (1843 feet) rises in lonely grandeur.

North of Esdraelon, in Lower Galilee, the mountains begin to reappear. The whole region between the Sea of Galilee and the Mediterranean (i.e. the Galilee of the New Testament) is quite open. None of the peaks attains a height of 2000 feet, and they are for the most part isolated and interspersed with valleys and plains. There are two main systems of hills in this lower Galilee. One bounds the Plain of Esdraelon on the north, extending from the river Kishon just opposite Mount Carmel to the Sea of Galilee. The hills about Nazareth and Cana and Mount Tabor belong to this system. North of these hills, extending from the northwest coast of the Sea of Galilee to the coast plain, is a long, low plain broken into several portions by low hills, crossing it from north to south. The most famous part of this plain is the fertile Sahel el-Buttauf (Assochis), ten miles long and two to three miles wide. The eastern end of the plain as it descends to the Sea of Galilee forms the Land of Gennesaret. A second line of hills, north of the long plain, at the northern foot of which runs the bed of the Wady Shaib, completes the hill system of Lower Galilee. North of the Wady Shaib the elevation rapidly increases. As in Judah, we now find a high central plateau with an elevation of 2000-3000 feet, with occasional peaks still higher. The descent on the east, to the Jordan, is steep; that on the west, to the sea, more gradual. The plateau is narrower at the north than in its southern portion. Northern Galilee is limited by the Leontes, which, rising between the Lebanons, makes a sharp detour to the west and enters the sea just north of Tyre. East of the angle formed by the Leontes the mountains of Galilee extend north-



ward to form a portion of the great Anti-Lebanon range.

Across the valley through which flow the upper courses of the Jordan lie the rapidly ascending slopes of Mount Hermon, whose summit is 9166 feet above the sea. Out from the depths of this vast mountain flow most of the springs which combine to form the Jordan. Where these streams converge the valley is 8 to 10 miles wide and but little above the level of the sea. It soon becomes marshy, and at last opens into Lake Huleh. After this the valley narrows and the stream descends rapidly to the Sea of Galilee. From this lake to the Dead Sea, 65 miles, the Jordan Valley varies in width from 3 to 14 miles. It is only about 4 miles wide where it leaves the Sea of Galilee, but broadens where it is joined by the Valley of Jezreel, 13 miles below. It again narrows, but after receiving the Jabbok continually widens until, at Jericho, it attains its maximum breadth. Where the Jordan enters the Dead Sea the valley bottom is swampy. On either side of the valley the ascent to the highlands is generally steep. The western side is much broken by many ravines and passes, but the eastern hills present a more uniform appearance, being broken only at long intervals by the larger streams. The valley is of inexhaustible fertility, and has an almost tropical climate. The Dead Sea marks the deepest part of this great depression. It has no outlet, and the constant evaporation, aided by the saline character of many of the springs in the neighborhood, makes its waters so heavily charged with salt that they are exceedingly bitter in taste and of high specific gravity. They are, nevertheless, very transparent. In some places the shores are heavily lined with salt deposit. The Dead Sea is also remarkable for the petroleum springs below its surface from which come the lumps of bitumen often found floating on its waters. Hence its ancient name, *Asphaltis*. The sea is deepest (c.1300 feet) at its northern end. The southern half is quite shallow. Lying at a level of 1292 feet below the sea, and surrounded by hills rising 3000 to 4000 feet above its surface, the Dea Sea is one of the hottest regions on the earth.

Across the deep, hot valley lies Eastern Palestine, much more uniform in character than the territory west of the Jordan. It divides naturally into three main sections. From Mount Hermon to the Yarmuk (Hieromax), a large perennial stream traversing the eastern plateau and emptying into the Jordan, the limestone is overlain with a thick volcanic formation. Extinct volcanoes abound and the lava soil renders the region extraordinarily fertile. Only the western portion, the Jaulan (ancient Gaulanitis), belongs within the limits of Palestine. The eastern portion represents the ancient Bashan. The general elevation is highest near Hermon, gradually sinking toward the Yarmuk. The drainage is all west (to the Jordan) or south (to the Yarmuk). Only near the Sea of Galilee and the Yarmuk is the plateau much broken by ravines.

South of the Yarmuk to the Jabbok and from the Jabbok to the Arnon, a total distance of nearly 100 miles, lie ancient Gilead and the Plains of Moab, identical with the Perœa of New Testament times. The lava soil characteristic of the region north of the Yarmuk is not found here. Basalt gives place to limestone, and the soil, though fairly well watered, is of inferior fertility. It is consequently less fitted for agriculture, but has ever been famous for its pasturage. It is a high rolling plateau broken only by the larger wadies running to the Jordan. North Gilead (modern Ajlun, north of the Jabbok) is not so high as South Gilead and the Plains of Moab (the modern el-Belka), but more heavily wooded and better supplied with water. The most southern portion, south of the Arnon, and the home of ancient Moab, is even more barren and dry, yet still suitable for pasturage.

Palestine is somewhat deficient in its water supply. During the winter there are heavy rains, but the numberless wadies, with few exceptions, are dry in the summer or dry season. Where the hard limestone is near the surface, at the foot of high hills, perennial springs are numerous. This is mainly true of Northern and Central Palestine, while in Judah and on the plateau of Southern Gilead and Moab springs are rare. The Jordan is the only considerable stream. Its sources are perennial springs mostly flowing from the slopes of Mount Hermon. Of these the most famous is that near Banias, the ancient Paneas, near the site of Dan, where the stream issues forth from a large cave. The Jordan is supplied farther down by several perennial affluents, of which the Yarmuk, the Wady el-Arab, and the Jabbok on the east, and the Nahr Jaluad (in the Valley of Jezreel) and the Wady Farah on the west are the most important. On the western slope the Leontes at the extreme north, the Kishon (which drains the great Plain of Esdraelon), and the Zerka or Crocodile River are perennial.

In the whole country there are but two seasons in the year. The rainy, or 'winter' season, begins in October-November with the 'early rain.' This softens the parched and baked soil and enables the farmers to plow. The rain, with occasional snows on the mountains, falls more or less continuously until February. During February sowing takes place. Some weeks later (March-April) the so-called 'latter' rain is indispensable to the well-being of the now growing crops. By May the rains are over, and the long hot summer (May to October) begins. The average annual rainfall is 21 inches. The different elevation of the several zones of Palestine causes a great variety in the temperature and other conditions. When it is pleasantly cool on the uplands it is unendurably hot in the Jordan Valley a few miles away. The highlands are dry and salubrious, the lowlands moist and oppressive. The mean annual temperature of the uplands is 63°, with an average maximum of 100° and an average minimum of 34°. The prevailing winds are from the sea, northwest in summer, west or southwest in winter. The hot winds (sirocco) carrying clouds of dust from the deserts east and south often inflict damage and severe discomfort.

Flora and Fauna. Considering the limited area and the fact that portions of the country are desert-lands, the flora of Palestine is remarkably rich. This is owing to the fact that Palestine is the meeting point of three large floral regions which differ considerably from each other, the Mediterranean, the Asiatic steppe-flora, and the tropical flora of Arabia and Egypt. The latter is confined to the valleys, in which the papyrus grows near the water; dates, ba-

palms, figs, olives, almonds, as well as myrtles, acacias, azaleas, and many other Mediterranean and tropical plants, are also abundant. On the Lebanon slopes north of Judea there are some heavy forests. On the lower slopes they are deciduous, chiefly of oak and beech, with maples, poplars, plane trees, and mulberries. Higher up there are pine forests associated with spruce, cypress, juniper, and cedars, including some remaining specimens of the cedar of Lebanon. The fauna is also varied, including over 100 species of mammals and several hundred birds. The larger wild animals, however, such as the lion, bear, and leopard, have quite disappeared. The most characteristic surviving mammals are mountain goats and the hyrax (q.v.).

Present Economic Condition. The economic development of the country is hindered by the lack of a settled agricultural population, the present inhabitants being chiefly Syrians and Arabs. The soil is fertile chiefly in the sense that it can be rendered highly productive by irrigation and careful cultivation, but it has largely lain barren and uncultivated for many centuries. The herding of sheep and goats was, and still is, one of the chief means of support of the inhabitants. Within the last fifty years, however, considerable areas of waste land have been brought under cultivation through the efforts of Western agricultural colonists. Attempts to found agricultural settlements were made by Germans and Americans as early as 1850, but the first successful colonies were those founded by Germans at Jaffa and Haifa in 1868, and later at Jerusalem. Since then several other colonies have been founded by Jewish immigrants impelled by the Zionist movement. (See Zionist Movement.) Though they have not all been successful, the net result has been a distinct improvement in the economic conditions of the country. Modern agricultural methods have been introduced and serve as an example to the native farmers, and new industries have sprung up. Roads have been greatly improved, and wagons have begun to replace camels and mules. A railroad has been built from Jaffa to Jerusalem, and another is under construction between Haifa and Damascus.

Political Geography and History. The early history of Palestine, to the sixteenth century B.C., is exceedingly obscure. From the records of the Egyptians we learn that it was a part of the land of the *Amu* (Southwestern Asia), earlier called by the same people *Lotan* or *Ruten*. The term *Kharu* was a designation for Southern Palestine, *Amor* or *Amur* for the northern district and the Lebanon region. The earliest Babylonian records appear to have included the country under the term *Martu*, or the west land, which later gave way to *Amur*, or the land of the Amorites. While Egyptian forces may have made occasional incursions into Palestine earlier than the sixteenth century B.C., the dominant power in Southwestern Asia at this early period was Babylonian. This supremacy gave way to the so-called Amoritic, i.e. the incoming of great numbers of Semites (q.v.) from the Arabian deserts. These either absorbed or exterminated the older population, and, being of the same general Semitic stock as the Babylonians, readily learned and adopted their culture, so that the civilization of Babylonia continued dominant. Egyptian inscriptions show that this people prospered in Palestine and engaged in commerce with Egypt. Egyptian overlordship over Palestine was fully established by Thothmes III. (c. 1515-1485 B.C.), who defeated a great confederacy in which Northern Palestine was involved, near Megiddo, in the Plain of Esdraelon. His famous list of 119 subjugated towns includes names of many places in Palestine. He organized the conquered territory, established a number of fortresses, filled them with Egyptian garrisons, and appointed governors to look after his interests. The Tell el-Amarna letters (see Amarna Letters) show that the common name of the land was Canaan (see Canaan; Canaanites), and that the language of the people was simply an earlier form or dialect of that known later as Hebrew, spoken not only by Israel, but by the Phœnicians, the Moabites, and the Edomites. They show further that under the weak rule of Amenophis IV. Palestine was rapidly passing away from Egyptian control. The Hittites (q.v.) from the north, and the 'Khabiri' (thought by some to be the Hebrews, and, at any rate, a part of the great Aramean movement to which the Israelites belonged) in the central and southern regions, were seeking to gain possession. The Egyptian governors were plotting one against the other, all meanwhile writing to Egypt for aid and loudly protesting their individual loyalty to their sovereign. This era of confusion was ended by the revival of Egyptian supremacy under the new (nineteenth) dynasty (c.1350 B.C.), whose kings, Seti I. and Rameses II., rolled back the Hittite advance and again reduced Palestine to complete submission to Egypt. The next Egyptian dynasty was weak and Palestine broke up into a number of petty kingdoms.

About this time (B.C. 1300-1100) two distinct peoples, of different origin and character, sought to make this country their home, viz. the Philistines (q.v.) and the Hebrews. The former became the dominant people of the whole seacoast plain. The latter, after varied experiences, began a series of conquests which resulted finally in giving them control of Palestine.

The Canaanites appear to have been so disorganized that they offered little united opposition. Only one concerted action on their part is recorded, the confederacy of five kings in the region west of Jerusalem (Josh. x.). The work of conquest was long and gradual. At first the Israelites held but little more than the hills. The seacoast plain and the Plain of Esdraelon, defended by heavy armed troops with chariots, they avoided. Israel did not exterminate the Canaanites, except where the resistance was most stubborn. In general they simply reduced them to subjection, and in many cases probably the two peoples lived side by side on terms of equality. The old language of Canaan was used by the Israelites, and with the adoption of the language went the adoption of many Canaanitish ideas and customs, also the knowledge of the Babylonian culture then prevalent in the country.

The tribes as finally settled in the conquered land were distributed as follows, according to the biblical narrative: East of the Jordan between the Arnon and the Jabbok the Reubenites and the Gadites had their homes. The Reubenites, who occupied the northern half of the original Moabite domain, appear to have soon lost their identity, either because they were gradually absorbed by the Gadites, who finally occupied this territory,

or because they gradually drifted eastward and became absorbed among the Ammonites and other tribes nearer the desert. The western highland from Jerusalem south to the 'Negeb' was the home of Judah. Southwest of Judah lay the territory of Simeon. Between Judah and the Plain of Esdraelon the country was occupied mainly by the House of Joseph, i.e. the tribes of Benjamin (northeast of Judah), Ephraim (the central portion), and Manasseh (the northern part). A small district between Judah and Ephraim on the northwest was allotted to the tribe of Dan, but this was so small that soon after the conquest a large section of this tribe (600 families) migrated to more roomy quarters in the extreme north near the sources of the Jordan. In the valley of Jezreel and the fertile Plain of Esdraelon lay the territory of the tribes of Issachar (the eastern portion) and Zebulon (the western part). Part of Southern and all of Northern Galilee was occupied by Naphtali (on the east) and Asher (on the west behind the Phœnician territory of Sidon and Tyre). After the conquest of the west-Jordan territory men of Manasseh (and possibly of Ephraim also) passed over the Jordan and conquered North Gilead, between the Jabbok and the Yarmuk, and probably part of Golan and Bashan, north of the Yarmuk. The coast north of Carmel remained in possession of the Phœnicians. South of Carmel the Philistines controlled it. Israel was never a seafaring people.

About B.C. 1050 the divided Hebrew tribes were united into a kingdom under Saul, of the tribe of Benjamin. His successor, David, completed the work of firmly establishing Israelite supremacy in Palestine. Under David and Solomon, for the first and only time in its history, Palestine was the home of a united people all under one central government. About B.C. 937 this unity was disturbed by the formation of two kingdoms, a northern (Israel) and a southern (Judah). One result of this division, coupled with the growing power of the Aramean kingdom of Damascus, was that Israelitic control of the east-Jordan territory became weakened, without, however, resulting in any essential changes in the population. The northern kingdom fell before the power of Assyria in B.C. 722. The annals of Sargon, the Assyrian King, state that he deported 27,290 people, and, according to Assyrian custom, transported thither a number of Arameans from Babylonia. Seventy-five years later Assurbanipal (B.C. 647) added another contingent, made up of various Eastern nationalities. These united with the remnant of the old Israelitic stock, and thus a mixed population, but still essentially Semitic, came to occupy the old Ephraim-Manasseh territory. Galilee seems to have gradually filled with a mongrel Phœnician-Syrian population, which was not seriously disturbed till near B.C. 100, save by the Iturean occupation. (See ITUREA.) The southern kingdom came to an end when Nebuchadnezzar of Babylon captured Jerusalem in B.C. 586. The best elements of Judah were carried to Babylon and the whole country left desolate. For the next half century Palestine seems to have been left largely to itself. The most important movement during this period was the influx of Nabatean Arabs, who pressed in from the deserts east and southeast, occupied much of the old Ammonite and Moabite territory, and, forcing the Edomites out of their abode, pushed them northward into Southern Judah, which now became 'Idumean' territory. The colony of exiles who returned from Babylonia by permission of Cyrus in B.C. 536 occupied only the northern part of the old kingdom of Judah. For further details of the history of Palestine during this period, see JEWS.

After the reorganization of the Persian Empire by Darius I., Palestine was a part of the Province or Satrapy of Syria (i.e. of the regions west of the Euphrates). The details of its administration are somewhat uncertain. The satrapy was subdivided into a number of districts, of which Judah, Samaria, and Phœnicia certainly were administered by separate Governors. What the exact arrangement was of the coast region, Galilee, the East Jordan territory, and Idumea is obscure. Through the labors of Ezra and Nehemiah (qq.v.) the Judean community was thoroughly consolidated, Jerusalem fortified, and foreigners expelled. The Jews constantly encroached on Samaritan territory and gradually enlarged their border toward the northwest. The Samaritans also became more closely united through the founding of the Samaritan religion, based on the Pentateuch alone, by a priest who was expelled from Jerusalem by Nehemiah, and, at a date now not known, by the building of a temple on Mount Gerizim. (See SAMARITANS.) During the Persian period the language of the Jewish community assimilated itself to the Aramaic spoken throughout the region and the old Hebrew gradually ceased to be the tongue of the common people.

The chief result for Palestine of Alexander's conquest of the East was the introduction of a large Greek element. Samaria was destroyed and rebuilt as a 'Macedonian' city. It is possible that Pella and Dium, east of the Jordan, were built by Alexander's veterans. Other Greek cities followed, especially in the east-Jordan land (see DECAPOLIS), while many of the old sites became practically Greek cities. Alexander followed the Persian example and attached Palestine to Syria for administrative purposes. In the struggles of his successors it came into the hands of Ptolemy I. of Egypt, and until B.C. 197 was under Egyptian control. Then it passed to Antiochus III. (the Great) of Syria. In B.C. 168 the attempt of Antiochus IV. to destroy the Jewish religion led to the great War of Independence. (See MACCABEES; JEWS.) When the struggle was over, Judea, now under the Asmonean priest-princes, was in control of all Southern Palestine from the Jordan to the coast. The rest of the land was nominally under Syria, but was practically in a condition of anarchy. East of the Jordan the Nabatean Arabs were in possession of all but the territory of the Greek cities. Under the Asmoneans, Hyrcanus I., Aristobulus I., and Alexander Jannæus (B.C. 135-78), the Jews succeeded in subjugating, first Idumea and Samaria, then Galilee, and finally nearly all of the old east-Jordan territory. The Idumeans and Galileans were compelled to adopt Judaism, while the Samaritans saw their temple (c.127 B.C.) and capital (c.108 B.C.) destroyed. The Greek cities east of the Jordan also suffered greatly. The Jewish population of Galilee, so familiar to the readers of the New Testament, dates only from B.C. 105-104.

The quarrels of the rival factions paved the way for Roman intervention. Pompey arrived in

Syria and captured Jerusalem in B.C. 63. He deprived the Jews of the greater part of their territory except Judea proper and transferred the remainder to the government of the new Roman province of Syria, of which it remained a part from B.C. 63 to A.D. 67. During most of this time Judea and other districts were under the control of Herod the Great and his successors. (See HEROD.) The greater part of the country was included in the four districts, Judea, Samaria, Galilee, and Perea, east of the Jordan, south of the Jabbok. The territory north of the Jabbok was broken up into minor divisions, Gaulanitis, Auranitis, Trachonitis, Batanæa, etc., under petty tetrarchs or governors. At the breaking out of the Jewish War (A.D. 66-67) Palestine was made a separate province under charge of Vespasian. The great struggle against Rome was closed by the capture and ruin of Jerusalem in A.D. 70 and the destruction of the Jewish State. New cities now sprang up under Roman protection, and apart from Jerusalem the country was prosperous. In 132-135 occurred the rising of the Jews under Bar-Cochba. This rebellion was crushed out with fearful bloodshed and devastation, and the Emperor Hadrian in rebuilding Jerusalem changed its name to Ælia Capitolina, and absolutely forbade any Jew to dwell in it. Never since has Jerusalem been a Jewish city, or Palestine a Jewish land. Greeks, Romans, Arabians, and large elements of the fundamental Aramæan (Syrian) stock with the remnant of the Jews made up its population then, and of these the Arabian and Syrian are dominant to-day.

Palestine remained an integral part of the Roman Empire, and afterwards of the Byzantine Empire until the invasion of the Persian King Khosru II. in 614. Up to the era of Constantine the condition was especially flourishing. Remains of buildings and cities in now absolutely deserted places are a wonderful testimony to the great prosperity. After Constantine and the division of the Empire Greek Christianity became dominant and Palestine became a Christian land. It was now the habit to speak of it as divided into *Palæstina Prima* (Judea and Samaria), *Secunda* (Galilee), and *Tertia* or *Salutaris* (Idumea and Moab). Each of these districts was divided ecclesiastically into various bishoprics. See also the article JEWS for Palestine during the Roman period.

The Persian control was transient, but that of Mohammedanism, beginning in 635, proved to be permanent. Since then, apart from the era of the Crusades, the history of Palestine contains little of general importance. Partly under the influence of Islam, but much more from other general causes, the culture of the Græco-Roman period passed away, the beautiful cities, temples, and churches fell into decay and ruin, and no new developments took their place. The era of degeneration had set in. The Latin Kingdom of Jerusalem (see JERUSALEM) founded by the Crusaders in 1099, and overthrown by Saladin in 1187, was only an episode of no permanent value, though the Crusaders left their imprint in churches, monasteries, etc., all over the land.

After the conquest by the Ottoman Turks in 1516 the condition of Palestine became only worse. In the nineteenth century, however, mainly as a result of the labors of the missionary societies, the beginning of new activity and a better era began to manifest themselves. The large influx of Jews from Europe under the Zionist movement, and above all the opening of the country to railway enterprise, promise a better future.

Modern Palestine is broken up into a number of administrative districts. The Mutesarrif of the Sanjak (province) of Jerusalem governs the southern part west of Jordan. The remainder of Western Palestine with the Belka is a part of the Vilayet of Beirut. East of the Jordan, all north of the Jabbok belongs to the Sanjak of Hauran. The population of the Sanjak of Jerusalem is about 320,000; that of the remainder of the country is variously estimated, but exact figures cannot be obtained. The total is probably near 650,000. It has increased more rapidly in later years. Under a good government and with more thorough cultivation, several times this number could be easily supported.

BIBLIOGRAPHY. The literature on Palestine is enormous and will be found fully registered down to 1878 in Rohricht's *Bibliotheca Geographica Palestinæ* (Berlin, 1890). Outside of the Bible and Josephus the older works of importance are few. The *Onomasticon* of Eusebius (Latin trans. by Jerome) and the various accounts of pilgrimages from Jerome to the Crusaders are valuable as contemporary witnesses, but not reliable for identification of ancient sites or for ancient history. The great works of Reland, *Palæstina* (Utrecht, 1714), and Ritter, *Erdkunde*, vols. xiv.-xvii. (Berlin, 1848-54), are still of great value, especially for the notices by early writers. The results of modern exploration are given in Robinson, *Biblical Researches* (Boston, 1841 and 1856); id., *Physical Geography* (Boston, 1865); the various works of Titus Tobler, from 1849 to 1868; Guérin, *Description de la Palestine* (7 vols., Paris, 1868-89); the *Quarterly Statements* of the Palestine Exploration Fund (London, 1869 et seq.); the seven quarto volumes of the *Survey of Palestine*, published by the Fund; and in the publications of the German *Palästina-Verein* (Leipzig, 1878 et seq.). To these, as of special value, may be added: *The Library of the Palestine Pilgrims' Text Society* (13 vols., Palestine Exploration Fund); Schumacher, *The Jaulan*, *Across the Jordan*, and *Ajlun* (London, 1888, 1889, and 1890); Hull, *The Survey of Western Palestine* (ib., 1886); Le Strange, *Palestine Under the Moslems* (ib., 1890); Tristram, *The Fauna and Flora of Palestine* (ib., 1884); and other works published by the Palestine Exploration Fund. Comprehensive general treatises on Palestine are the guide books of Baedeker and Murray; G. A. Smith, *The Historical Geography of the Holy Land* (London, 1897); and Buhl, *Geographie Palästina* (Leipzig, 1896), most excellent. For the most ancient period, consult Paton, *Early History of Syria and Palestine* (New York, 1901), where a full bibliography will be found. The standard histories of Israel and the archæologies of Benzinger and Nowack (both 1894) are valuable for the Old Testament period. For the era from B.C. 175 to A.D. 135, Schürer, *History of the Jewish People in the Time of Jesus Christ* (Eng. trans., Edinburgh, 1886-90), is the most reliable work. An excellent map is that of Smith and Bartholomew (Edinburgh, 1902); the maps of Kiepert and of the Palestine Exploration Fund are also to be recommended.

PALESTINE. A city and the county-seat of Anderson County, Texas, 100 miles southeast of Dallas; on the International and Great Northern Railroad (Map: Texas, G 4). It has two libraries, Young Men's Christian Association, fine city hall, and opera house buildings, and the general offices and shops of the International and Great Northern Railroad. Old 'Fort Houston' is of interest. The products of the most extensive industries, in which there is a considerable trade, include cotton, cottonseed oil, beef, iron, fruit, and vegetables. There are in the vicinity large iron ore deposits, also a salt mine of importance. Settled in 1846, Palestine was incorporated under a general law in 1870. The government, under this statute, is vested in a mayor, biennially elected; in a council composed of the mayor and aldermen elected on a general ticket; and in administrative officials, the majority chosen by popular vote. Population, in 1890, 5838; in 1900, 8297.

PALESTINE EXPLORATION FUND, THE. A society founded in London, June 22, 1865, for the accurate and systematic investigation of the archæology, topography, geology and physical geography, natural history, manners, and customs of the Holy Land for biblical illustration. Under its auspices the following expeditions, travels, and excavations have been made: December, 1865-May, 1866, under Captain Wilson, to fix spots for investigation and to collect information; May, 1867-April, 1870, under Lieutenant Warren, to settle questions connected with the Holy Sites; 1870, under Professor Palmer and C. F. Tyrwhitt Drake, to examine the desert of the Tih; 1872-77, under Captain Stewart Drake, Lieutenant Conder, and Lieutenant Kitchener, to survey Western Palestine; 1873-74, under Clermont-Ganneau, for archæological research; 1881, under Lieutenant Conder, for the partial survey of Eastern Palestine; 1883-84, under Prof. E. Hull and Lieutenant Kitchener, for the geological survey of the Dead Sea region and the Wady Arabah; 1890-93, under Flinders Petrie and Frederick J. Bliss, for the excavation of the buried cities in the mound Tell el-Hesy; 1894-97, under Bliss and Dickie, for excavations at the south and the southwestern portion of Jerusalem; 1898-1900, under Bliss, for excavations at Tell es-Safi (Gath?), Tell Zakariyah, Tell Sandahannah, and Tell el-Judaidah; 1902, under R. A. Stewart Macalister, for the excavation of Gezer. Since 1869 the society has issued a *Quarterly Statement*. The more important publications of the society are: *Survey of Western Palestine: Memoirs* (7 vols., 1881-84); *Survey of Eastern Palestine*, by Conder (1900); *Excavations at Jerusalem*, by Bliss and Dickie (1894-97); *The Fauna and Flora of Palestine*, by Tristram (1884); *The Geology of Palestine and Arabia Petræa*, by E. Hull (1886); *Archæological Researches*, by Clermont-Ganneau (1896, et seq.); the great map of Western Palestine; the raised map; the map of Modern Palestine (in 20 sheets). The society has also a Palestinian Museum at its office, 38 Conduit Street, London. Consult: *Thirty Years' Work in the Holy Land* (London, 1895), an official *résumé* of the work of the Fund prepared by Walter Besant; Conder, "Palestine," in *The World's Great Explorers and Explorations* (ib., 1899).

PALESTINE PILGRIMS' TEXT SOCIETY, THE. A society established in London, England (about 1885), for the purpose of publishing translations of the early descriptions of Palestine and the holy places, written by pilgrims and travelers between the fourth and fifteenth centuries. These accounts were intended to explain many of the topographical references which abound in ancient and mediæval literature from the earliest times to the periods of the Crusades and later, and to illustrate the manners and customs prevalent in the East in bygone times. The narratives are written in Greek, Latin, Arabic, Hebrew, Old French, Russian and German, and include curious records of pilgrimages, which begin with the *Unknown Pilgrim of Bordeaux*, and follow in unbroken line down to comparatively recent date, including such interesting historical monuments as Saint Jerome's *Pilgrimage of the Holy Paula* (A.D. 382), Mukadda's Description of Syria (785), *Jacques de Vitry* (1180), and Bohaedden's *Life of Saladin* (1145-1232). After a period of eleven years' work, the Society carried out the programme originally outlined and the results of its labors are found in a library of twelve volumes, which in 1896 were handed over to the Palestine Exploration Fund to be by that society distributed to the members of the Palestine Pilgrims' Text Society.

PALES'TRA (Gk. παλαίστρα, *palaistra*, from πάλη, *palē*, wrestling). Properly, a wrestling-school; hence one of the schools in which the Greek boys were trained in gymnastic exercises. They were usually private institutions, though in later times some were supported by the State. The name is also applied to that part of the Greek gymnasium which was set apart for wrestling, and sometimes even becomes a synonym for gymnasium.

PALESTRINA, pä'lēs-trē'nä. A town of Central Italy, the ancient Præneste (q.v.).

PALESTRINA. GIOVANNI PIERLUIGI DA (c.1524-94). A great Italian composer. He was born in a small town southeast of Rome called Palestrina. His real name and the condition of his parents in life are as uncertain as is the correct year of his birth. The date of his birth is variously stated from 1514 to 1524, with the weight of evidence strongly in favor of the latter date. His first experience in music is said to have been in the Church of Santa Maria Maggiore, whose choirmaster gave him his first lessons in music. He is supposed to have studied four years in Rome at the celebrated Gallo Belgian school established by the Frenchman Goudimel (q.v.). This would seem to comprise all the instruction he ever received. At the age of twenty he was appointed to a canonry in the cathedral of his native town, his duties being to play the organ, sing, and teach the boys. The pay was very poor, and the duties seem to have been very distasteful. During his stay here he married a peasant girl named Lucrezia de Goris, who owned a small vineyard. The chief ecclesiastical functionary of the town was Giovanni del Monte, who afterwards became Pope, with the title of Julius III., and who, as sovereign pontiff, maintained his interest in the young composer of Palestrina. Jacob Arcadelt, the great Flemish musician, resigned his post in the Cappella Giulia, and, although he was legally ineligible for the post, by reason of his marriage, Palestrina was named for the appointment by his patron, Pope Julius III. This was the most

important period of his life, in that it was the period of his greatest development as a musician. On the accession of Pope Paul IV., in 1555, Palestrina was dismissed, with a pension of six gold *scudi* (about six dollars) a month. He was so well known, however, that he secured almost immediate employment at the Church of Saint John Lateran, where he stayed for six years, until his appointment as director of the Church of Santa Maria Maggiore, where he remained for many years. This was the most prolific period of his life, and many of his finest madrigals, including the *Donna bella e gentil*, date from this time. The crucial test of his life, however, was yet to come. Pope Pius IV., after the close of the famous Council of Trent, appointed, in 1564, a committee of cardinals to investigate and, if possible, reform the condition of Church music. (See SACRED MUSIC.) Palestrina was asked to support the argument of those who in the Council of Trent had fought against a too rigid application of the Pope's radical views, by submitting a mass which should be free from all the errors prevalent at this time and yet be polyphonic in character. In response he wrote the great *Missa Papæ Marcelli*, which was so successful that it won the day, and secured for its composer the appointment of composer to the Pontifical chapel. On the death of Animuccia he was appointed Master of Music at the Cappella Giulia, an office which he held up to the time of his death. His music is grave, beautiful, and unemotional in character, but reverential in the highest and purest sense of the term. As a composer he is one of the important landmarks in the entire history of music, and in the realm of sacred composition he remains supreme. He was a prolific composer, his compositions alone filling 33 volumes, a complete edition of which was published between 1862 and 1894 by Breitkopf & Härtel, Leipzig, Germany. Particularly exquisite are the following masses: *Æterna Christi Munera; Dies Sanctificatus; O Sacrum Convivium; Assumpta est Maria in Cælum; Dilexi Quoniam; Ecce Ego Joannes.*

PALESTRO, pä-lĕs'trō. A village in the Province of Pavia, Italy, on the Sesia, 34 miles west by south of Milan (Map: Italy, C 2). It is famous as the scene of a battle between the allied Sardinians and French and the Austrians in May, 1859, in which the latter were defeated with great loss. Population (commune), in 1901, 3498.

PALEY, pā'lĭ, FREDERICK APTHORP (1816-88). An English classical scholar, born at Easingwold, near York. He was educated at Saint John's College, Cambridge, where he lived from 1838 to 1840, when he left the university on account of his conversion to the Roman Catholic faith. Subsequently (1860) he returned to Cambridge, and remained there until in 1874 he was elected professor of classical literature in the Roman Catholic College at Kensington. He was classical examiner to Cambridge, London University, and the Civil Service Commission. A tireless student, he prepared numerous thoroughgoing and discriminating editions of the classics, including Æschylus, Euripides, Aristophanes, Propertius, and Pindar. It was chiefly as a verbal critic that he won recognition, and his original compositions in Latin and Greek were far superior to his few English renderings. Besides his literary studies, which attracted much attention in Germany, he published works on ecclesiastical architecture, including an excellent *Manual of Gothic Mouldings* (1845).

PALEY, WILLIAM (1743-1805). An English divine, born at Peterborough. He entered Christ's College, Cambridge, as a sizar at sixteen, and for the next two years led a dissipated life, but thereafter became a severe student, and took his bachelor's degree in 1763 with the highest honors. After teaching in a school for three years he was elected a fellow and afterwards a tutor of Christ's, and ordained in 1767. In 1776, upon his marriage, he was obliged to give up his fellowship and became rector of Musgrave, and later vicar of Dalston in Cumberland. In 1780 he was collated to a prebendal stall in the cathedral church of Carlisle; in 1782 he became archdeacon, and in 1785 chancellor of the diocese. The last of these years witnessed the publication of his *Principles of Moral and Political Philosophy*. In this work he propounds his ethical theory, which is a most remarkable mixture of utilitarianism and theology. Virtue was defined as "the doing good to mankind in obedience to the will of God, and for the sake of everlasting happiness." The will of God is discoverable "from Scripture and the light of nature combined." The light of nature is the tendency of actions to promote human happiness, the benevolence of the Deity being supposed. In 1790 appeared the *Horæ Paulinæ*, in which he aims to prove, by a great variety of 'undesigned coincidences,' the improbability, if not impossibility, of the hypothesis that the New Testament is a 'cunningly devised fable.' *A View of the Evidences of Christianity* was published in 1794. In his own day he was held to have achieved a splendid triumph over skeptics, and was handsomely rewarded. Several preferments came to him in rapid succession, until finally he obtained the rich rectory of Bishop-Wearmouth (worth £1200 per annum). After 1800 he became subject to a painful disease of the kidneys; but he continued to write, and in 1802 published perhaps the most widely popular of all his works, *Natural Theology, or Evidences of the Existence and Attributes of the Deity*, which, however, was to a large extent borrowed from a Dutch work. In natural theology he is well known on account of his shallow argument from design to the existence of God. Paley died May 25, 1805. A complete edition of his works was published in 1825 by one of his sons, the Rev. Edmund Paley. There are biographies by Meadley (London, 1809), and Lynam (ib., 1825). Consult: Stephen, *English Thought in the Eighteenth Century* (London, 1876); Albee, *History of English Utilitarianism* (ib., 1902).

PALFREY, pāl'frĭ, FRANCIS WINTHROP (1831-89). An American historian, born in Boston, son of J. G. Palfrey. He graduated at Harvard in 1851 and at the Law School two years afterwards. During the Civil War he rose to the rank of colonel and brevet brigadier-general, and in 1872 he was appointed register in bankruptcy. He published *A Memoir of William F. Bartlett* (1879); *Antietam and Fredericksburg*, in the "Campaigns of the Civil War Series" (1882); and contributed to the first volume of *Military Papers of the Historical Society of Massachusetts*, and the *North American Review*.

PALFREY, John Gorham (1796-1881). An American theologian and historian. He was born in Boston, May 2, 1796, graduated at Harvard in 1815, and studied for the ministry. In 1818 he was called to the pulpit of the Brattle Street Church (Congregational-Unitarian), Boston, and in 1831 to the chair of sacred literature at the Harvard Divinity School, where he remained till 1839. He was editor of the *North American Review* (1835-43), and in 1839 and 1842 gave a course of lectures before the Lowell Institute, Boston, on *The Evidences of Christianity*, which appeared in book form the next year. He was a member of the House of Representatives of the Massachusetts Legislature, 1842-43, and Secretary of the Commonwealth, 1844-48. He entered Congress as a Whig in 1847. He had already opposed the extension of slavery in a series of articles called *The Progress of the Slave Power* (1846); and in December, 1847, he declined to vote for Robert C. Winthrop, the Whig candidate for Speaker. This step, with his well-known anti-slavery principles, cost him his seat at the election of 1848, after a close contest. He soon joined the Free-Soil Party, was one of the editors of the *Commonwealth*, the Massachusetts organ of that party, and their candidate for Governor. He died in Cambridge, April 26, 1881. Dr. Palfrey published *Lectures on the Jewish Scriptures and Antiquities* (1838-52); *Sermons* (1834); *Elements of Chaldee, Syriac, Samaritan, and Rabbinical Grammar* (1835); and *The Relation Between Judaism and Christianity* (1854). But his reputation now rests upon his *History of New England During the Stuart Dynasty* (1858-75); abridged as *A History of New England from the Discovery by Europeans to the Revolution of the Seventeenth Century* (1866); again under title *A Compendious History of New England, from the Discovery by Europeans to the First General Congress of the Anglo-American Colonies* (4 vols., 1873). The closing part of the fourth volume in this edition was incomplete, and a fifth volume was published, *History of New England from the Revolution of the Seventeenth Century to the Revolution of the Eighteenth Century*, ed. by F. W. Palfrey (1890).

PALGHAT, pâl-gät'. A town and railway station in the District of Malabar, Madras, India, on the southern slope of the Nilgiri Hills, 26 miles southwest of Coimbatore (Map: India, C 6). It is at the foot of the Palghat Pass, which connects Travancore and Malabar by a military road and the Madras Railway. It has an extensive trade, and is noted for its educational institutions, including the Victoria Jubilee College, a law library, and a Swiss Protestant mission. Anciently of strategic value, Palghat was captured by the British in 1768, since when its military importance has declined, and its fortress, which still exists, has been abandoned. Population, in 1891, 39,481; in 1901, 44,177.

PALGRAVE, pal'grāv, Sir Francis (1788-1861). An English historian. He was born in London of Hebrew parentage, his father, Meyer Cohen, being a member of the stock exchange. He studied law and for a time was prominent in pedigree cases before the House of Lords. In 1823 he married, and on that occasion changed his faith and assumed the maiden name of his wife's mother, Palgrave. He became known as a literary antiquary by publishing some Anglo-Norman chansons. Gradually, however, he turned to the study of English history, and in 1831 published a *History of England*. In 1832 appeared his best work, the *Rise and Progress of the English Commonwealth*, and in the same year Palgrave also received the honor of knighthood. In 1838 he was appointed deputy keeper of Her Majesty's records, and held this office until his death. To him was due the gathering of the valuable records and their removal from their various insecure repositories to the great Public Record Office. In 1851 Palgrave published the first volume of his *History of Normandy and England*, but most of the work appeared after his death, which took place on July 6, 1861. As deputy keeper of the records, he published twenty-two annual reports. He also edited for the Record Commission the following works: *The Parliamentary Writs* (1827); *Essay on the Original Authority of the King's Council* (1834); *Rotuli Curiæ Regis* (1835). His historical works display a union of research, daring, and ingenuity. Nevertheless, they are not monumental, and they have been superseded by later works. The author lays great stress on the development of legal institutions, on which he was an authority; but his style is discursive, and the subject matter is badly arranged. Sir Francis Palgrave was the father of Francis Turner, William Gifford, Robert Henry Inglis, and Reginald Francis Douse Palgrave (qq.v.).

PALGRAVE, Francis Turner (1824-97). An English poet and critic. He was born at Great Yarmouth, was educated at Charterhouse and in Balliol and Exeter colleges, Oxford; served for five years as vice-principal of the training college for schoolmasters at Kneller Hall, and afterwards until 1884, when he retired, was successively examiner and assistant secretary in the education department. In 1885 he succeeded John C. Shairp in the Oxford professorship of poetry. He was the author of *Idylls and Songs* (1854); *Essays on Art* (1866); *Hymns* (1867); *Lyrical Poems* (1871); and *Landscape in Poetry* (1897); but is best known as the scholarly editor of such admirable collections as the *Golden Treasury of English Lyrics* (1861); *Sonnets and Songs of Shakespeare* (1877); *Selected Lyrical Poems of Herrick* (1877); *Selected Lyrical Poems of Keats* (1885); and the *Treasury of Sacred Song* (1889).

PALGRAVE, Sir Reginald Francis Douse (1829—). An English writer, born in London, June 28, 1829. He was educated at Charterhouse School and became a solicitor in 1851. Entering the committee office of the House of Commons as a clerk in 1853, he was appointed examiner of petitions for private bills to both Houses (1866), then second clerk assistant (1868-70), and clerk assistant (1870-86), and finally clerk of the House of Commons (1886-1900). He was knighted in 1892. His books include: *The House of Commons: Illustrations of Its History and Practice* (1877); *The Chairman's Handbook* (1890); *Oliver Cromwell* (1890). He also edited the first two books of Sir T. E. May's *Treatise on the Law of Parliament* (1893).

PALGRAVE, Robert Harry Inglis (1827—). An English economist. He was born at Westminster, was educated at the Charterhouse, and went into banking. From 1877 to 1883 he

edited *The Economist*. He wrote: *Local Taxation of Great Britain and Ireland* (1871); *Notes on Banking* (1873); *Bank Rate in England, France, and Germany* (1880); and contributions to the *Dictionary of Political Economy* (1900), of which he was editor.

PALGRAVE, William Gifford (1826-88). An English traveler and diplomatist. He was born in Westminster, won the Charterhouse medal for classical verse, and obtained an open scholarship at Trinity College, Oxford. He served in the Indian army as a lieutenant in the Eighth Bombay native infantry. In 1853 he resigned his commission, entered the Jesuit Order, and after courses of study at Laval and Rome, voluntarily joined the Syrian mission. Here he acquired such knowledge of Arabic language and manners as to be able thereafter to pass as a native. This guaranteed his safety in a perilous expedition through Central Arabia (1862-63), undertaken under commission of Napoleon III., and described in the admirable *Narrative of a Year's Journey* (1865). Having withdrawn from the Jesuit Order, in 1865, he went on a special governmental mission to Abyssinia, held various consulates in 1866-79, and in 1884 received appointment as Minister Resident to Uruguay, where he died. Among his works are: *Essays on Eastern Questions* (1872); *Hermanu Agha* (1872); and *Dutch Guiana* (1876).

PALI, pä'lē (Skt., line, series, sacred text). The language and literature of primitive Buddhism (q.v.), now represented in Ceylon, Burma, and Siam. Strictly speaking, Pali is the name of the literature only, which is so called because it is regarded as a series of sacred texts. The language itself was called *Pālibhāsā*, 'language of the series,' or *Māgadhibhāsā*, 'language of Magadha' (q.v.). It appears, however, to have formed a linguistic belt along the northern slope of the Vindhya Mountains. It is not impossible that its centre was in the city of Ujjain (q.v.), where the first great patron of Buddhism, Aśoka (q.v.), had been governor before he ascended the throne. Thence the language was carried to Ceylon by the Buddhist missionaries. Pali may be divided into two groups, that of the inscriptions and that of the literature. Of these the inscriptional Pali is the older. Its earliest records in India are in the inscriptions of Aśoka, and date from the third quarter of the third century B.C., and the youngest are as late as the tenth century A.D. In Ceylon the oldest inscriptions cannot be dated before the first century B.C. The relation of Pali to the other languages of India is in some respects uncertain. It is clear, however, that it is not a corruption of classical Sanskrit, but is descended from a dialect closely akin to Vedic Sanskrit. (See Sanskrit Language.) There is much evidence for the view that Pali was the language of India between the Himalayas and the Vindhyas before the rise of classical Sanskrit. Sanskrit inscriptions are not common before the first century B.C., and it was not until the fourth century A.D. that Pali inscriptions, except for a few, chiefly archaistic in character, were superseded by those in Sanskrit. Many proper names in Megasthenes (about 300 B.C.) and other classical authors, are evidently Pali, while others are as plainly Sanskrit. Epigraphical evidence further leads to the view that the classical Sanskrit originated in the region which was bounded by the Ganges and the Jumna, and which stretched between these rivers from the Himalayas to Muttra. From this country classical Sanskrit spread, superseding Pali and the other Indo-Germanic folk-dialects of India. On the other hand, it must be borne in mind that classical Sanskrit was at an early date a language of high culture, and that it was fixed in its literary form by Panini (q.v.) as early as B.C. 300. Again, the resemblances between Pali and Prakrit (q.v.) are so close that Pali may be regarded merely as a Prakrit dialect (see Prākrit), and the Prakrits long survived as literary and doubtless, also, as spoken languages, so that not only is Prakrit found in the Hindu drama, but we have a collection of Prakrit poems by Hala, probably about A.D. 1100. It would appear, therefore, that Pali and the later Prakrits existed contemporaneously with classical Sanskrit, which was the language of the higher classes and of literature, while Pali was vernacular and sectarian in use. Within Pali itself the existence of a number of dialects may be inferred from the epigraphical remains.

As contrasted both with Vedic and with classical Sanskrit, Pali, like Prakrit, shows a marked decadence both in phonology and in morphology. As a few of the most striking deviations from the Sanskrit phonology found in Pali, and frequently also in Prakrit, may be mentioned: The loss of *r*, as Sanskrit *vṛddha*, 'large,' Pali *vaddha*, *riddha*, *buḍḍha*, *ruddha*, Prakrit *vaddha*, *viḍḍha*, *vuḍḍha;* the frequent change of dentals to cerebrals, as Sanskrit *dahati*, 'burns,' Pali *ḍahati*, Prakrit *ḍahaï;* the occasional change of *d* to *l*, as Sanskrit *dōhada*, 'longing of a pregnant woman,' Pali *dōhala*, Prakrit *dōhula*, *dōhada;* the change of Sanskrit *ś*, *ṣ* to *s*, as Sanskrit *śōbhati*, 'is beautiful,' Pali *sobbhati*, Prakrit *sōhai*, Sanskrit *vṛṣabha*, 'bull,' Pali *vasabha*, Prakrit *vasaha;* the avoidance of consonant-groups, usually by assimilation, but occasionally by the insertion of an epenthetic vowel, as Sanskrit *bhakta*, 'boiled rice,' Pali and Prakrit *bhatta*, Sanskrit *ślāghā*, 'praise,' Pali *sīlāghā*, Prakrit *salāhā*. Inflection in Pali closely resembles that of classical Sanskrit, except that the aorist, comparatively rare in classical Sanskrit, occurs not infrequently in Pali. Pali has no distinctive alphabet, but is written according to locality in Cevlonese, Burmese, or Cambodian script. The Devanagari (q.v.) writing is never employed.

Pali literature is almost entirely religious. The greatest work in it is the *Tripitaka*. Of much importance are the *Visuddhi Magga*, or Way of Purity, by Buddhaghosa, a treatise on Buddhist doctrine dating from the fourth century A.D., and the *Milindapañha*, or Questions of Milinda (q.v.), which was probably composed about the beginning of the Christian Era. There are further a number of historical works, which have an increased interest from the fact that Sanskrit literature (q.v.) is almost without authentic histories. Among the most important works of this class in Pali are the *Mahāvansa* (q.v.), or Great History, and the *Dīpavansa* (q.v.), or History of the Island (of Ceylon). There is an abundant literature besides, including not only religious and historical writings, but also metrics, grammar, and lexicography.

Consult: Burnouf and Lassen, *Essai sur le Pali* (Paris, 1826); Minayef, *Grammaire Palie*, translated by Guyard (ib., 1874); Kuhn,

Beiträge zur Pali-Grammatik (Berlin, 1875); Frankfurter, *Handbook of Pali* (London, 1883); Müller, *Simplified Grammar of the Pali Language* (ib., 1884); Tilbe, *Pali Grammar* (Rangoon, 1899); Oung, *Grammar of the Pali Language* (Akyab, 1899-1903); Childers, *Pali-English Dictionary* (London, 1875); Torp, *Floxion des Pali in ihrem Verhaltniss zum Sanskrit* (Christiania, 1881); Franke, *Geschichte und Kritik der einheimischen Pāli-Grammatik und Lexikographie* (Strassburg, 1902); id., *Pāli und Sanskrit* (ib., 1902); Takakusu, *Pāli Chrestomathy* (Tokio, 1900); Andersen, *Pāli Reader* (London, 1901).

PALIKAO, pä'lē'kä'ō'. CHARLES GUILLAUME MARIE COUSIN-MONTAUBAN, Count of (1796-1878). A French general and statesman, born in Paris. After serving with distinction in Spain, and for twenty years in Africa, he was created a general in 1855. In 1860 he was placed in command of the French and English forces sent to China, and with relatively insignificant forces captured the forts at Taku, and after gaining a decisive victory at Palikao he entered Peking at the beginning of October of the same year. The Chinese Government was forced to accept his terms, and the conditions of peace were rigidly enforced. On his return to France in 1861, Napoleon III. presented him with the grand cross of the Legion of Honor, and gave him the title of Count. After the first defeats of the French army in 1870 he succeeded Ollivier as Premier, was at the same time Minister of War, and was consequently associated with the misfortunes that followed the French army. He published a history and defense of his administration in 1871. He died January 8, 1878, in Paris.

PALIL'IA, or **PARILIA**. An ancient Roman feast in honor of Pales (q.v.), celebrated on April 21st, and of such importance that its date was deemed the anniversary of the founding of Rome.

PAL'IMPSEST (Lat. *palimpsestus*, from Gk. *παλίμψηστος*, scraped again, from *πάλιν*, *palin*, again + *ψηστός*, *psēstos*, scraped, from *ψῆν*, *psēn*, to rub smooth). The name given to parchment, papyrus, or other writing material, from which, after it had been written upon, the first writing was wholly or in part removed in order that the page might be made available a second time. The ink used on papyrus and sometimes on parchment was commonly of soot mixed with gum and thinned with water, or else the liquid of the cuttlefish. This could be washed out with a sponge, and the latter was part of the writing equipment. Where this ink has been used, there is usually no trace of the original writing if the manuscript has been used again. Later for parchment, ink made from gall-apples, sometimes with the addition of vitriol, or metallic substances, was used. This took hold of the vellum, and for removal required the use of pumice, or of a mixture of milk, cheese, and lime to soften the parchment. Sometimes the knife was used, of course to the complete destruction of the writing. The processes employed were not always very complete, nor were they carefully carried out, and as a result in a number of cases the earlier writing is still more or less legible. The fragile character of papyrus made it difficult, if not impossible, to wash out writing of long standing, though the sponge was probably used while the ink was fresh. Since on papyri, as a rule, the writing was only on the *recto*, the back was frequently used to receive later writing. In the case of parchment, especially when bound in books, erasure was needed for a second use. The practice was common in classical times, and is frequently mentioned in the ancient writers, though in some cases it may be doubted whether the reference is not to wax tablets. In general, these old palimpsests were used as note-books or for rough drafts. The relative scarcity and cost of papyrus or vellum undoubtedly was responsible for this custom, and, with the disuse of papyrus and increasing demand for parchment, the habit of using old books increased in the East and West. Though vellum began to supersede papyrus for important works in the fourth century of our era, it was not till the seventh century, when the Arab conquest shut off the supply, that it became practically the only material in use, and it is from that time that palimpsests begin to increase. In the East, in 691, a Greek synod forbade the destruction of manuscripts of the Bible or of the Fathers, unless they were already damaged, and in the West much use was made of old manuscripts from the seventh to the ninth century, when, in consequence of the disturbed state of the country, there was some scarcity of material, and the old volumes of neglected authors were used for more popular works. Some writers have ascribed this to the indifference and even to the hostility of the monks and clergy to classical literature, and have attributed to their reckless destruction of classic manuscripts, in order to provide material for their own service-books and legendaries, the deficiencies in the remains of ancient learning which scholars have now to deplore. That some part of the loss may have so arisen it is impossible to doubt, although it is equally certain that we owe to the mediæval monks and clergy the preservation of a large part of the surviving ancient literature. Moreover, it seems probable that in general damaged copies were drawn upon for palimpsests, and in some cases the writing was not erased till the sheets had been resewn. It is said that no palimpsest shows that it originally contained a complete work under the later writing, though in some cases the amount preserved is very large. It should also be noted that in not a few cases the Bible or Church Fathers are found under classical or late texts, so that convenience, not hostility, seems in general to have determined the choice of material for erasure. While the practice continued even down to the sixteenth century, and in at least one case cleaned parchment was used for a printed book, most of the valuable Latin palimpsests are earlier than the tenth century, when it was possible to use the fine parchment of earlier times. In the East the practice was much more general, and the best palimpsests are of a later period. In fact, it is said that a relatively large proportion of existing Greek manuscripts are on reused vellum. While many of these are of Eastern manufacture, not a few show that the upper writing was done in Italy and the West. The natural result of these factors is that in general the palimpsests yield fragments, whose value lies largely in testimony to the early state of the text. In biblical criticism some very important results have been obtained from early palimpsests, and in classical

literature such palimpsests as the Codex Ambrosianus of Plautus have unique value. Most important of course are the rare cases where a lost work may be recovered from a palimpsest, as in the case of the *Republic* of Cicero, or the *Institutes* of Gaius.

It will easily be understood, therefore, that the chief, if not the sole, interest of palimpsest manuscripts lies in the ancient writing which they had contained, and that their value to literature mainly depends on the degree of legibility which the ancient writing still retains. Very commonly the original writing is much larger than the modern; the modern lines and letters do not cover those of the old manuscript, but follow the same order. In other specimens the new writing is transverse, and in some the old page is turned upside down. Sometimes, where the old page is divided into columns, the new writing is carried over them all in a single line; sometimes the old page is doubled, so as to form two pages in the new manuscript. Sometimes it is cut into two or even three pages. The most perplexing case of all for the decipherer is that in which the new letters are of the same size, and are written upon the same lines with those of the original manuscript. In the case of Latin palimpsests, it is generally true that lower minuscule writing, when legible at all, is scarcely worth the trouble of reading. The valuable manuscripts are in capitals or uncials. Some variety, also, is found in the language of the palimpsests. In those which were originally found in the Western libraries the new writing is almost invariably Latin, while the original is sometimes Greek, and sometimes Latin. In the palimpsests discovered in the East the original is commonly Greek, the new writing being sometimes Greek, sometimes Syriac, sometimes Armenian.

The possibility of making use of palimpsest manuscripts in order to increase our store of ancient literature was suggested as far back as the days of Montfaucon; but the idea was not turned to practical account till the latter part of the eighteenth century. The first palimpsest editor was a German scholar, Dr. Paul Bruns, who discovered that one of the Vatican manuscripts was a palimpsest, the effaced matter of which was a fragment of the ninety-first book of Livy's *Roman History*, and printed this fragment at Hamburg in 1773. In the field of discovery thus opened by Bruns, but little progress was made until the following century, when Barrett of Trinity College, Dublin, published his palimpsest fragments of Saint Matthew, and when palimpsest literature rose to importance in the hands of the celebrated Angelo Mai (q.v.). The great historian Niebuhr about the same time applied himself to the subject, and was followed by Blume, Pertz, Gaupp, Mommsen, Studemund, and other German scholars, whose labors, however, were for the most part confined to the department of ancient Roman law. Tischendorf's (q.v.) labors drew attention to the biblical texts thus preserved, and Cureton's examinations of Syriac and other Eastern manuscripts showed the importance of this field, where the most valuable result has been the discovery in the monastery at Mount Sinai of an early Syriac version of the Gospels under some lives of female saints.

Greek Palimpsests. Among these, the first place in importance belongs to the biblical palimpsests, the earliest of which was *Fragments of the Gospel of Saint Matthew*, in fac-simile as well as in ordinary type, printed from a palimpsest manuscript of Trinity College, Dublin, by Barrett (Dublin, 1801). The original writing appears to be of the sixth century. Barrett's transcript of the text was not in all respects correct, and a revised edition was published by Abbott in 1880. It is chiefly, however, to a collection of Syriac manuscripts brought from the East that we are indebted for the more recent palimpsest restorations of the ancient biblical readings. In this line the chief discoverer has been Tischendorf. Of these the best known is the celebrated *Codex Ephremi*, in the National Library, Paris. This manuscript had been early observed to be palimpsest, and the original Greek text was collated by Wetstein in 1716. It was completely published by Tischendorf, the New Testament in 1843, and the Old in 1845. The modern writing of this palimpsest consists of a Greek translation of works by Saint Ephrem the Syrian. Another palimpsest of interest is the *Codex Nitriensis*, in the British Museum, containing part of the Gospel of Saint Luke from the sixth century, part of the *Iliad* of about the same date, and a somewhat later Euclid, all used by a monk of the Nitrian monastery for a copy of a Syriac treatise. The number of these fragments constantly grows, and now probably about 30 Greek, Old Latin, and Gothic biblical palimpsests are known, of which the majority are Greek. As most of them belong to the fifth or sixth century, their testimony is often of great value.

In Greek classical literature the results from the palimpsests are not great. The Homer fragments are older than other parchment codices, but are outranked by the numerous papyri. A small part of the *Phaëthon* of Euripides is preserved in the *Codex Claromontanus* at Paris, and a collection of extracts from the later historians, containing some passages from lost works, has been published by Mai in his *Scriptorum Veterum Nova Collectio* (Rome, 1825-38). In Greek, however, no such discoveries have been made as in Latin, though it should be said that the Eastern libraries contain many palimpsests not yet carefully examined.

Latin Palimpsests. The first fragment of Latin literature printed from a palimpsest original is the portion of the ninety-first book of *Livy* already referred to, published at Hamburg and also at Rome in 1773. It was reëdited in a more complete form by Niebuhr in 1820. Of the Latin palimpsests edited by Mai, the earliest were some fragments of lost orations of Cicero from two different palimpsests in the Ambrosian library at Milan, in the later of which the second writing consisted of the acts of the Council of Chalcedon. These orations were published in two successive volumes in 1814. He also published eight orations of Symmachus (1815) and the comedies of Plautus, including a fragment of the lost play entitled *Vidularia* (1815). This is the celebrated *Codex Ambrosianus* in Milan, which has since been studied by Ritschl and other Plautine scholars, notably Studemund (Berlin, 1889). Mai likewise edited the works of M. Cornelius Fronto, together with the epistles of Antoninus Pius, Lucius Verus, M. Aurelius, and others (1815), as well as the celebrated dialogue of Cicero, *De Republica*, from a palimpsest

of the Vatican, the modern writing on which is the commentary of Saint Augustine on the Psalms (1821). Soon after the *De Republica* he published another volume from palimpsest sources, the most important of whose contents were some fragments of ancient Roman law, which prepared the way for the more distinguished success of Niebuhr, who, in a palimpsest of the library of Verona, recognized a portion of an ancient work on Roman law, afterwards identified as the *Institutiones* of Gaius. The text was deciphered by Göschen and others, and the first edition published at Berlin in 1820. A careful new collation was published by Studemund in 1874, and a text edition carefully revised by Krüger and Studemund (4th ed. Berlin, 1899). The latest considerable Latin publication in this department is *Gai Granii Liciniani Annalium Quæ Supersunt* (Berlin, 1857), edited from a palimpsest of the British Museum by the younger Pertz. This palimpsest, as was already stated, is a thrice-written codex, the earliest and original contents being the *Annales* of Granius Licinianus, a writer of the second century A.D. The second writing was also in Latin, and the work is a grammatical treatise, of which the chapters *De Verbo* and *De Adverbio* are still legible. The most modern writing is Syriac, written in the cursive character.

It will be gathered from the above that the ancient works recovered by means of palimpsest manuscripts are all fragmentary, and one might be led to rate at a low value the result thereby obtained. Yet such works as the *Republic* of Cicero, the *Institutes* of Gaius, and the very early text of Plautus in the Ambrosian palimpsest are of priceless value. And it must be remembered that in some of the departments to which these palimpsestic fragments belong every scrap, no matter how trifling, has an independent value. In biblical remains, for example, a single text may present a valuable reading, the merest fragment may throw light on an important critical question. In history, in like manner, a small fragment may disclose an interesting fact, or supply a significant commentary upon facts otherwise ascertained. And as regards critical uses especially, it must not be forgotten that the obliterated text of the palimpsest manuscripts for the most part far exceeds in antiquity the very oldest known codices which we possess, and is, probably, second only in age to the papyri of Herculaneum.

The method of treating palimpsest manuscripts, with a view to deciphering their contents, has been fully described by different editors. Mai, after having washed the palimpsest with an infusion of galls, exposed it to the light and air, and, generally speaking, found this sufficient for his purpose. Peyron washed the parchment in water, afterwards in dilute muriatic acid, and finally in prussiate of potash. A mixture compounded on this principle is called from its inventor, M. Gioberti, *tinctura Giobertina*. Sometimes the treatment does not succeed equally well on both sides of the parchment, the outer surface, from its softer texture and more thorough erosion, yielding poorer results. When the ink contained animal substances, as milk, or the blood of the cuttlefish, Mone plunged the parchment into a close vessel filled with oil, which he heated to a temperature of 400° R. But almost, if not quite, all of the earlier processes have resulted, after the course of some years, in such darkening, and sometimes corrosion of the surface of the manuscripts treated, as to make them quite illegible and worthless. Von Sickel recommended an apparently harmless process, that of washing the pages of the manuscript discreetly with a potash, soap, and then immersing them in clear water, from which treatment they take no injury if they are carefully dried afterwards. Pringsheim published the details of a process purely photographic, whereby, through successive photographings, the effect on the plate of the later writing is weakened, and that of the earlier and fainter hand is intensified, until the erased writing becomes legible in the negative.

Consult: Mone, *Lateinische und griechische Messen* (Frankfort, 1850); id., *De Libris Palimpsestis tam Latinis quam Græcis* (Karlsruhe, 1855); Wattenbach, *Das Schriftwesen im Mittelalter* (3d ed., Leipzig, 1896). See PALÆOGRAPHY.

PAL'INDROME (Gk. παλινδρομος, *palindromos*, a running back, from πάλιν, *palin*, back + δρόμος, *dromos*, a running, from δραμεῖν, *dramein*, to run). A name given to a kind of verse the peculiarity of which is that it reads the same backward as forward. It is very common in Latin. Examples are:

Si bene te tua laus taxat sua laute tenebis,
Et necat eger amor non Roma rege tacente,
Roma reges una non anus eger amor.

In this, *eger* is the mediæval spelling for *æger*. To a Roman lawyer is credited the following:

Si nummi immunis.

which Camden translates:

Give me my fee, and I warrant you free.

Consult: Wheatley, *Anagrams* (Hartford, 1862); Clark, *Palindromes* (Glasgow, 1887).

PAL'INGENE'SIA (ML., from Gk. παλιγγενεσία, new birth, from πάλιν, *palin*, again + γένεσις, *genesis*, birth). A term that appears to have originated among the Stoics, who employed it to denote the act of the *demiurgus*, or creator, by which, having absorbed all being into himself, he reproduced it in a new creation. The occurrence of the word in the New Testament (Titus, iii. 5, where it is used to denote regeneration) has given it a place in Christian theology, and divines have variously used it to express the resurrection of men, the new birth of the individual soul, and the restoration of the world to that perfect state that it lost by the fall—"the new heavens and the new earth wherein dwelleth righteousness."

PAL'INGEN'ESIS (Neo-Lat., from Gk. πάλιν, *palin*, again + γένεσις, *genesis*, birth), and **CŒNOGENESIS.** The recapitulation theory (q.v.) or 'biogenetic law' is a statement of the general fact that the development of the individual is an epitome of that of the class to which it belongs. Haeckel, and Fritz Müller in substance before him, further distinguished two modes of operation of this law. To the first he gave the name 'palingenesis.' Briefly defined, it is the fact of the regular repetition of ancestral features caused by inheritance. Thus the shrimps and crabs in the egg pass through a nauplius stage, the embryo possessing the rudiments of only three pairs of appendages, but they hatch in an advanced larval condition called the zoëa. The lobster, on the other hand, before hatching passes through phases which recall the nauplius.

and also the zoëa stages, and the animal hatches in a more advanced stage than the zoëa, undergoing a partial metamorphosis. The toad or frog, in the embryo, pass through an ascidian, an Amphioxus, a fish, and a salamander stage, before they assume the tailless adult condition. The animal thus repeats in its own development certain (but not all) of the features which characterized its successively ascidian, Amphioxus-like, and fish-like ancestors.

The second phase or mode of operation of the law of recapitulation is 'cœnogenesis,' which means the modification of palingenesis by the inheritance of later acquired characters, the ancestral characters having been lost or crowded out, owing to the lapse of heredity. This was fully explained by Fritz Müller, his illustration being the metamorphosis of the more specialized insects, such as the butterfly, bee, and fly. The larval stages of these insects (caterpillar, maggot) are secondary. The most primitive insects were born in the shape of the parent, and passed through no larval stage. The primitive features of the ancestral insect have been lost, except the transitory indications of a series of abdominal legs, showing that the insects all descended from polypodous forms; but the caterpillar and maggot stages are recent acquisitions, and to this phenomenon the term cœnogenesis (or recent genesis) is applied. As Müller expressed it: In contradistinction to the *inherited* metamorphosis of the prawns, we may call that of the Coleoptera, Lepidoptera, etc., an *acquired* metamorphosis. He then goes on to show at some length that the 'complete' metamorphosis of insects was not inherited from the primitive ancestor of all insects, but acquired at a later period. See RECAPITULATION THEORY.

Consult: Fritz Müller, *Facts for Darwin* (London, 1869); Haeckel, *Generelle Morphologie* (Berlin, 1866); Hyatt, *Phylogeny of an Acquired Character* (Philadelphia, 1894); Lang, *Textbook of Comparative Anatomy*, vol. i. (New York, 1891).

PALINURO, pä'lē-nōō'rō, CAPE, or CAPE SPARTIMENTO. A promontory on the coast of Lucania, Italy, projecting into the Tyrrhenian Sea, northwest of the entrance to the Gulf of Policastro (Map: Italy, K 7). It was named in honor of Palinurus (q.v.), the pilot of Æneas, said to have been buried here, where some ruined walls bear the name of his tomb. In B.C. 253 and in B.C. 36 Roman fleets were wrecked on this point.

PAL'INU'RUS. A pilot of Æneas. When the Trojans were approaching the coast of Italy, he slept and fell overboard. The ghost of Palinurus appeared to Æneas on his visit to Hades, and said that he had been washed ashore and murdered by the natives. In accordance with the promise of the Sibyl, his body received suitable burial.

PALISA, pä'lē-sä, JOHANN (1848—). An Austrian astronomer, born at Troppau. He was assistant in the Vienna observatory (1870), and in the observatory at Geneva (1871), and director of the Marine Observatory at Pola until 1880, when he became adjunct in the Vienna Observatory. Before the use of photography Palisa discovered more than 50 asteroids and made special research on comets, mostly published in the *Astronomische Nachrichten* (1871 et seq.). His valuable charts based on observations were begun in 1878.

PALISADE CELLS (Fr. *palisade*, from *palisser*, to inclose with pales, from OF. *palisse*, *palis*, *palice*, from ML. *palitium*, paling, from *palus*, pale). The green working cells (*mesophyll*) upon the more exposed side of foliage leaves. Since these cells become elongated and stand close together, with their long axes at right angles to the epidermis, this arrangement suggested the name. See LEAF.

PALISADES. The name given to the line of cliffs that extend along the western shore of the Hudson River from near Haverstraw, N. Y., to Weehawken, N. J., a distance of about 30 miles. The cliffs for most of this distance rise almost directly from the water's edge in a single escarpment which simulates a wall of masonry and lends a characteristic and picturesque effect to the scenery in this section of the Hudson Valley. Their height ranges from 200 to 550 feet. They are formed by the outcrop of a thick sheet of diabase which was intruded while in a molten condition between sandstones and shales of the Newark system. The overlying strata have been partially removed by erosion, and the harder igneous rock now stands exposed in the form of a ridge along the eastern edge of the sheet. The scarp wall of the Palisades is a complex fault (q.v.). Extensive accumulations of talus are found in places. The fissure through which the molten rock rose toward the surface is situated near the western edge of the sheet. The slope toward the west is for the most part very gradual. See HUDSON RIVER.

PALISOT DE BEAUVOIS, pä'lē'zō' de bō'vwä', AMBROISE MARIE FRANÇOIS JOSEPH (1752-1820). A French naturalist, born at Arras. He became a corresponding member of the Academy of Sciences in 1781, and five years later set out on a journey, during which he visited West Africa, Santo Domingo, and North America. He returned to France in 1798, succeeded Adanson at the Institute in 1806, and in 1815 became a member of the council of the University of Paris. Among his works are: *Flore d'Oware et de Bénin* (1804-21); *Insectes recueillis en Afrique et en Amérique* (1805-21); *Essai d'une nouvelle agrostographie* (1812); *Muscologie, ou traité sur les mousses* (1822).

PALISSY, pä'lē'sē', BERNARD (c.1510-89). A celebrated French art potter, scholar, and author, born at La Chapelle Biron, near Agen (Lot-et-Garonne). The son of a poor workman in glass, his education was limited, but by his own studious efforts he acquired a considerable knowledge in the natural sciences, besides geometry, drawing, and painting, and extended it while traveling for a period throughout France, in Flanders, and on the Rhine. In 1539 he married and settled at Saintes, where he practiced glass and portrait painting, at the same time carrying on the business of a land surveyor. An enameled cup of faïence which he saw by chance inspired him with the resolution to discover the mode of producing white enamel. Neglecting all other labors, he confined himself to investigations and experiments for sixteen years, exhausting all his resources until, unable any longer to buy fuel, he was reduced to the necessity of burning his furniture piece by piece, and finally the flooring of his rooms. Scoffed at by his

neighbors, overwhelmed with reproaches by his wife, and besought by his starving family crying for food, he nevertheless persisted in the search, and at length his efforts were crowned with success. A few pieces adorned with figures of animals, colored to represent nature, sold for high prices, after which he became famous and was patronized and encouraged by the royal family and the nobility, who employed him to embellish their mansions with specimens of his art. An enthusiastic follower of the Huguenot cause, he was arrested in 1562 and imprisoned at Bordeaux, but was soon released by order of the King, who gave him a patent as inventor of 'figulines rustiques.' He removed to Paris about 1564, and set up his pottery-works on a plot of ground assigned to him near the Tuileries. There he worked and prospered for years, escaping the Massacre of Saint Bartholomew's under the protection of Queen Catharine de' Medici, and in 1575 began a course of lectures on natural history and physics, which were attended by all the learned men of the day and made him prominent as a man of science. Many of his views of nature have been supported by subsequent discovery and investigation, and have made good his title to a very high rank among the natural philosophers of the sixteenth century. On a fresh outburst of religious fanaticism in 1587, he was thrown into the Bastille as a heretic, and condemned to death, but died before the sentence was carried out. The faience of Palissy is of a peculiar style. His figures and other ornaments are all executed in colored relief, the colors being usually bright, but not of great variety, blues, grays, and yellows prevailing. The most remarkable of his productions are the 'pièces rustiques,' dishes ornamented with crayfish, frogs, lizards, fishes, snakes, shells, and plants, admirably true to nature in form and color. Magnificent specimens of his work are in the Louvre, the Musée de Cluny, and at Sèvres. A few may be seen in the South Kensington and British museums, but the Fountaine Collection at Narford Hall, England, is hardly equaled by any even in France. His *Œuvres complètes*, edited by France (Paris, 1880), containing also a most stirring autobiography, fully justify Lamartine's verdict assigning to Palissy a high position among French writers. For his life and work, consult Henry Morley (London, 1852), Audiat (Paris, 1868), Burty (ib., 1886), and Dupuy (ib., 1898); consult also: Delange and Borneman, *Monographie de Faurre de Bernard Palissy* (Paris, 1862), and Marryat, *A History of Pottery and Porcelain* (3d ed., augmented, London, 1868).

PALITZSCH, pä'lich, Johann Georg (1723-88). A German astronomer, born at Prohlis, near Dresden. On Christmas night, 1758, he discovered, a month before any one else, the comet usually called Halley's, and in 1782 simultaneously with Goodrike determined the period of variation in Algol, a star in Perseus. Palitzsch made his own instruments and continued to live as a peasant in the country near Dresden.

PALIZZI, pä-lēt'sē, Giuseppe (1812-98). An Italian landscape and animal painter, born at Lanciano, in the Abruzzi. He studied in Naples, and under Troyon in Paris, where he afterwards lived. His works, usually of Italian subjects, are notable for energetic treatment and fine color. They include "Goats in the Vineyard" (1855), and "Goats of the Abruzzi," in the Montpellier Museum. His brother, Filippo Palizzi (?-1899), born at Vasto, in the Abruzzi, was one of the ablest of those Neapolitan painters who, in the second half of the nineteenth century, did so much to revive Italian art.

PALK STRAIT. The northern portion of the passage between the south coast of Hindustan and the island of Ceylon (Map: Asia, H 8). This passage is continued southward by the Gulf of Manar (q.v.). It is from 40 to 80 miles wide, 80 miles long, and so shallow that it cannot be navigated in safety by large vessels.

PALL (Lat. *palla*, robe, mantle, curtain). A small square, generally of cardboard, covered on both sides with fine linen, which is used in the Roman Catholic Church to cover the chalice during the mass. It seems to have evolved from a fold of the corporal (q.v.), which in earlier times was turned back over the chalice; this custom, which maintained itself as late as the twelfth century, is still preserved in the Carthusian Order, and a trace of it remains in the fact that the Pontifical has no separate form for blessing the pall as distinct from the corporal. The Theatines use a second pall on which to lay the host; and in the Greek rite also two are used, one to cover the chalice, the other the paten. The name is also applied to a covering of black or purple (sometimes white for young persons) thrown over a coffin while it is being carried to burial.

PALL. A bearing in heraldry (q.v.). See also Pallium.

PALLA, pä'lä, or Impalla (South African name). A South African antelope (*Epyceros melampus*), called 'rodebok' by the Dutch, because reddish. It is a wood-loving species and fond of water; and in former days gathered into large herds in winter, when this species furnished the principal food of the lion and leopard. Consequently these antelopes were exceedingly suspicious, and were not only hard to shoot, but were likely to alarm all other game in the neighborhood by their shrill whistling as soon as they discovered the hunter. The genus is peculiar in having no dew-claws. The males alone have horns, which are lyrate with an abrupt angular bend in the middle.

PALLADIO, pä-lä'dē-ō, Andrea (1518-80). An Italian architect of the late Renaissance. He was born at Vicenza, November 30, 1518. He studied architecture in his native city, his patron, Trissino, enabling him to visit Rome, where he prepared himself by a thorough study both of Vitruvius and of ancient monuments, which he assimilated more thoroughly than any other architect of the Renaissance. His first great work was the magnificent two-storied arcade around the Basilica of Vicenza (1545). He produced many works of both civil and religious architecture in and near his native city, which he made a great architectural centre. His scientific treatise on architecture, *I quattro libri dell' architettura* (1570), attained immediate success. The precise rules and formulas, clearly expressed, carried his style not only throughout Italy, but through Europe and Great Britain, where they found especial favor. Palladio became the standard bearer of late Renaissance architecture.

His strength lay rather in composition than in detail, and his originality was manifested in the knowledge, taste, and skill with which he reproduced the composition, proportions, and details of Roman architecture, and adapted them to the requirements of his time. The Basilica of Vicenza was epoch-making; so was his theatre (Teatro Olimpico). His palaces were equally characteristic. A few had two orders of columns, the finest of these being the Barbarano and Chierigiti palaces, in Vicenza. Of the more numerous palaces with but a single colossal order of pilasters or engaged columns standing on a rustic basement, the masterpiece is the Marcantonio Tiene Palace, which is finer even than the Porto and Valmarana palaces. Of his numerous villas the most famous is the Rotonda Capra, outside Vicenza, with circular hall in the centre and four Ionic façades; its interior ornaments in stucco are especially fine. In Venice his works were all ecclesiastical; the earliest was the atrium in front of the Church of La Carità, the church itself coming later; then came the refectory and later the Church of San Giorgio Maggiore, with its beautiful tower (the façade being of later date, by Scamozzi); in 1562 the façade of San Francesco della Vigna; and in 1578-80 the Church of Il Redentore—all of them marked by great dignity and refinement of composition. His Vicentine buildings have suffered from being executed in brick, stucco, and wood, instead of stone. Consult: Scamozzi, *Fabbriche di Palladio* (Venice, 1786); and the monographs by Temanza (Venice, 1762), Boito (Milan, 1883), Melani, in *L'Art* (Paris, 1890), and Fletcher (New York, 1902).

PALLADIS TAMIA. See MERES, FRANCIS.

PALLA'DIUM (Lat., from Gk. Παλλάδιον, *Palladion*). Among the Greeks, an image of the protecting divinity of a city, on whose preservation the safety of the town was believed to depend. In general, these images seem to have had the form of armed figures, usually with shield and spear, of rude workmanship, often scarcely more than a mere column, but gradually assuming the type of the Athena Promachos, the colossal bronze statue on the Acropolis at Athens. They were early identified with that goddess, and their name is connected with hers, Pallas. Such images are seen even on Mycenæan gems and paintings, and are frequent in later works of art. In literature the great example is the Palladium of Troy, believed to have fallen from heaven, like many another palladium or venerable cult-image. This was stolen by Odysseus and Diomedes, and its subsequent fate was the subject of many different legends, since various cities desired to show that they possessed the original. With the acceptance by the Romans of the belief in their descent from the Trojans arose the belief stated by Varro that the Palladium, which was kept in absolute secrecy in the house of Vesta, was the Trojan original and had been brought to Italy by Æneas. Consult Chavannes, *De Raptu Palladii* (Berlin, 1891).

PALLADIUM (Neo-Lat.). A metallic element discovered in 1803 by Wollaston, who named it from the planetoid Pallas, which had been discovered by Olbers in 1802. It is found in grains usually containing platinum and iridium in the proportion of about 2 per cent., and with gold and silver in the proportion of 5 to 10 per cent.; also with gold and lead selenide in the Harz. The principal sources are the platiniferous sands of Brazil, the Urals, and other localities where platinum ores are found. For its separation the ore is dissolved in aqua regia; the solution is kept boiling for some time with an excess of caustic soda, then acidified with hydrochloric acid and precipitated with ammonium chloride; the filtrate is then boiled with copper foil, the metallic powder thus obtained is extracted with nitric acid, and metallic palladium is precipitated from the nitric acid solution by shaking the latter with metallic mercury.

Palladium (symbol, Pd; atomic weight, 106.36) is a white lustrous metal with a specific gravity of 11.4 at 22.5° C. It melts at about 1500° C., and is fairly malleable and ductile. It is remarkable for its capacity for absorbing hydrogen. The metal itself is used for making scales and division marks on scientific instruments and for coating and preserving silvered ware. The wire finds some use in dentistry on account of its hardness. An alloy of palladium with steel is used in making parts of physical instruments.

Palladium combines with oxygen to form a suboxide (Pd_2O), a monoxide (PdO), and a dioxide (PdO_2), but none of its salts has any important application.

PALLA'DIUS. An early Christian writer. He is supposed to have been born in Galatia in the latter half of the fourth century. At the age of twenty he started on foot to visit the cells of the famous monks in different parts of the Roman Empire. He spent some time in Egypt in the Nitrian Desert, then went to Palestine and lived several years with the monks of the Mount of Olives. At the beginning of the fifth century he was consecrated a bishop in Asia Minor, but he is probably not the Palladius who was Bishop of Helenopolis in Bithynia. He was the author of a work addressed to Lausus, a chamberlain at the Imperial Court, and hence called *Historia Lausiaca*, which is a rich collection of pictures of the monkish life in Egypt and Palestine, based on personal knowledge, oral testimony, and probably also written sources. The existing manuscripts differ greatly and the text has not yet been established. It was published in the original Greek by Migne in *Patrol. Græca*, xxxiv., and in Latin translation in *Patrol. Latina*, lxxiii., lxxiv. Palladius was an adherent of Origen and an opponent of Jerome. He may also have been the author of a *Dialogus de vita S. Johannis Chrysostomi* (in Migne, *Patrol. Græca*, xlvii.). Consult Preuschen, *Palladius und Rufinus* (Giessen, 1897).

PALLADIUS, RUTILIUS TAURUS ÆMILIANUS. A Roman author, who probably lived in the fourth century A.D., under Valentinian and Theodosius. He wrote a work, *De Re Rustica* (On Agriculture), in fourteen books, the last of which is a poem of eighty-five elegiac couplets. It is, from a literary and grammatical point of view, full of faults; but, as it was a complete calendar of Roman agriculture, it was very useful for its time, and was much read and followed during the Middle Ages. The best edition is that by Schneider in his *Scriptores Rei Rusticæ Veteres Latini* (4 vols., Leipzig, 1795), and the most recent by Schmitt (ib., 1898). The

work of Palladius was translated into English by Owen (London, 1803).

PALLANZA, pä-län'tsä. A town in the Province of Novara, Italy, situated on a headland in Lake Maggiore, 45 miles northwest of Milan (Map: Italy, C 2). It is esteemed as a winter resort, owing to its mild climate and delightful situation. Population (commune), in 1901, 5237.

PAL'LAS. The Greek goddess of wisdom, identical with Athena. See MINERVA.

PALLAS, päl'läs, PETER SIMON (1741-1811). A German-Russian traveler and naturalist, born in Berlin. He studied natural history, and was employed in classifying many valuable collections in both Holland and England. In 1764 he was elected a foreign member of the Royal Society. He gained a high reputation by the publication of his *Elenchus Zoophytorum* (1766), a work still much valued, and *Miscellanea Zoologica* (1766). In 1768 the Empress Catharine II. invited him to Saint Petersburg, where he was made a member of the Academy of Sciences, and he was subsequently appointed naturalist to a scientific expedition bound for Siberia, the immediate object of which was to observe the transit of Venus. Pallas spent six years on his journey (1768-74), exploring in succession the Ural Mountains, the Kirghiz Steppes, a great part of the Altaian range, the country around Lake Baikal, and the steppes of the Volga, returning to Saint Petersburg in 1774 with an extraordinary treasure of specimens in natural history, which form the nucleus of the museum of the Academy of Saint Petersburg. His travels, *Reisen durch verschiedene Provinzen des russischen Reichs*, were published at Saint Petersburg (1771-76), and were followed by his *Sammlung historischer Nachrichten über die mongolischen Völkerschaften* (1776-1802), and his *Neue nordische Beiträge zur physikalischen und geographischen Erd und Völkerbeschreibung, Naturgeschichte und Ockonomie* (1781-96). Without neglecting any branch of natural history, he now devoted himself more particularly to botany; his magnificent *Flora Rossica* (1784-1815) and his *Species Astragalorum* (1800-02) were among the results of his studies. He published also *Icones Insectorum praecipue Rossiae Sibiriaque Peculiarium* (1718-98), and contributed to a glossary of all the languages of the Russian Empire, which was published at Saint Petersburg. As he wished to live in the Crimea, the Empress Catharine presented him with an estate in the finest part of that peninsula, where he resided after 1796. His *Bemerkungen aus einer Reise durch die südlichen Statthalterschaften des russischen Reichs* was published in 1799-1801. In 1810 he went to Berlin, where he spent the last year of his life.

PALLAVICINO, päl'lä-vē-chē'nō, SFORZA (1607-67). An Italian historian, son of the Marquis Alessandro Pallavicino of Parma. He was born at Rome, November 28, 1607. He took orders, and held several important ecclesiastical appointments during the pontificate of Urban VIII. In 1637 he became a member of the Society of Jesus, and was created a cardinal in 1659 by Pope Alexander VII. He died in Rome, June 5, 1667. In Latin he wrote theological and polemical works, such as the *Vindicationes Societatis Jesu* and the *Assertionum Theologicarum Libri*. Of his Italian works there may be mentioned the fragmentary *Fasti sacri* in octaves; the tragedy *Ermenegildo* (1644); the *Avvertimenti grammaticali a chi scrive in italiano* (1661), and the posthumously published *Della vita di Alessandro VII., libri cinque* (1839-40), one of his best works; and his correspondence (*Lettere*, recent ed., Rome, 1848). The most noted of all his writings is the *Istoria del Concilio di Trento ove insieme si rifiutasi con autorevoli testimonianze un' istoria falsa divulgata nell' istesso argomento da Pietro Soave Polano* (Rome, 1656-57; 2d ed. 1664). This work, written to do away with the history by Paolo Sarpi, has many decided merits, but, as Ranke has stated, it sins by being unduly partial.

Consult the *Opere edite ed inedite di Sforza Pallavicino*, containing in vol. ii. Affo's *Memorie della vita e degli studi del cardinale Sforza Pallavicino* (Rome, 1844-48).

PALLESKE, päl-lĕs'ke, EMIL (1823-80). A German author and dramatic reader, born at Tempelburg, Pomerania. He studied at the universities of Berlin and Bonn, then became an actor at Posen, and from 1845 until 1851 was attached to the Court theatre at Oldenburg. Subsequently he was widely known in Germany through his public readings of Shakespeare's dramas, later on also of selections from the works of Fritz Reuter. Besides three dramas he published *Die Kunst des Vortrags* (3d ed. 1892), but he owes his reputation as an author chiefly to his *Schillers Leben und Werke* (15th ed. 1900).

PAL'LISER, Sir WILLIAM (1830-82). An English soldier and inventor. He was born in Dublin, Ireland; was educated at Rugby, Trinity College, Dublin, Trinity Hall, Cambridge, and the Staff College, Sandhurst; and entered the rifle brigade as ensign in 1855. He was transferred to the hussars in 1858; retired from the service in 1871, and was knighted in 1873. He introduced a number of inventions, among them being the chilled projectiles known by his name, improvements in the manufacture of ordnance, and the process of converting smooth-bore guns into rifled ordnance. He was elected to Parliament in 1880.

PAL'LIUM (Lat., mantle, cloak). The name given in the Roman Catholic Church to an ecclesiastical vestment worn by the Pope, by patriarchs, and by archbishops. Its use is very ancient, and a respectable tradition carries it much further back than the earliest positive historical notice of it, in the life of Pope Marcus, a contemporary of Constantine the Great. By archbishops it cannot be worn until it has been solemnly asked for and granted by the Pope, and even then only at high mass on certain specified great festivals or on the occasion of important functions, such as the consecration of bishops or churches. The pallium is a narrow band of white woolen web, about three inches wide, embroidered with black crosses, which encircles the neck of the archbishop, and from which two narrow bands of the same material depend, one falling over the breast, the other over the back of the wearer. It is made by nuns wholly or in part from the wool of two lambs, which are blessed annually on the festival and in the Church of Saint Agnes. During the night before the feast of Saint Peter and Saint Paul the *pallia* made of this wool are placed on the

altar above the tomb of these Apostles. Within three months of his consecration every new archbishop is obliged to apply to the Pope, in person or by proxy, for the pallium; nor is it lawful for him, until he shall have received it, to exercise any act of what is properly archiepiscopal jurisdiction. Consult: Thurston, *The Pallium* (London, 1892); Vespasiani, *De Sacri Pallii Origine* (Rome, 1856).

PALL MALL, pĕl mĕl. The name of a street of London, famous for its clubs and palaces. The name is derived from the old game of *pall mall*, introduced during the reign of Charles I. Originally a suburban promenade, Pall Mall became a street at the close of the seventeenth century. Many important historical and literary personages have lived along its borders. Among the prominent clubs are the Athenæum, Travellers', Reform, Carlton, Army and Navy, Oxford and Cambridge, White's, and the Devonshire Club. The Crimean Monument, the York Column, and the statue of George III. and Sir John Franklin are the principal works of sculpture on the thoroughfare, upon which Her Majesty's Theatre and the Haymarket Theatre also front. The London House, the Winchester House, the Marlborough House, St. James's Palace, and the Spencer House are the principal places of note.

PALM (AS. *palm*, from Lat. *palma*, palm-tree, palm of the hand; connected with Gk. παλάμη, *palamē*, Skt. *pāni*, Olr. *lam*, OHG. *folma*, AS. *folm*, palm of the hand, and ultimately with OHG. *fuolen*, Ger. *fühlen*, AS. *fēlan*, Eng. *feel*; so called from the resemblance of the leaves to the outspread hand). The great tree group of about 130 genera and 1200 species of monocotyledons, displayed almost exclusively in the tropics, where they form a most striking part of the vegetation. Having been described chiefly from cultivated and incomplete specimens, the species are very inadequately understood, as may be seen from the fact that in a collection of Porto Rican palms, thirteen were new species and seven were new genera. The general habit of the palm, with its columnar trunk often buttressed at the base, sometimes rising more than 100 feet and crowned by a rosette of huge leaves, is well known. All palms, however, do not exhibit this habit, for some have branching stems (e.g. doom palm), some are but three or four feet high, and some have such long and slender stems that they are ropelike and climbing by means of hooked spines, as in the rattan palms. Some species have flexible stems which often attain a height of 500 and even 600 feet. Indeed, Rumphius asserts that they are sometimes 1200 or even 1800 feet long.

The leaves of palms are of two general kinds, the palmate or fan forms, and the pinnate or fern forms, for example, the date palm (*Phœnix dactylifera*) and the cocoanut palm (*Cocos nucifera*). Examples of the former are the common fan palm (*Livistona Sinensis*) and the palmetto (*Sabal Palmetto*) of the Southern States. In the latter some species produce leaves 50 feet long and 8 feet broad; in the former 30 feet long and 4 to 5 feet broad, undivided. The flowers occur in enormous clusters at first ensheathed by huge and frequently woody spathes which often burst with an explosion, and are usually more or less pendant from among the crown of leaves. Humboldt estimated the number of flowers on a single palm (a species, Elæis) to be about 600,000. The fruit is sometimes a kind of berry, sometimes a drupe, either with a fleshy or fibrous covering; and sometimes contains a very hard and bony nut. It is sometimes only of the size of a pea or a cherry; sometimes, as in cocoanut, notwithstanding the smallness of the flowers, it is of very large size. See Plate of PALMETTOS.

A few species are found in temperate regions; one species only, *Chamærops humilis*, being a native of Europe, and extending as far north as latitude 44°, while the northern limit of palms in Asia is about latitude 34°, and in North America, latitude 35°. In South America the southern limit of palms is latitude 36°; in Australia it is latitude 35°; in Africa no native species is found farther south than latitude 30°; but in New Zealand one species extends as far south as latitude 38°. Some of the species which are found in tropical America grow in mountain regions bordering upon the limits of perpetual snow. Some species are restricted to very narrow geographical limits. The cocoanut palm, which is by far the most extensively distributed, grows in maritime, others in inland, districts. Some grow on dry and sandy ground, others in the richest alluvial soil, and some in swampy situations; some in open districts, others in dense forests. Some species are generally found singly, some in groups; some even cover tracts of country in which no other tree appears.

There is almost no species of the palm which is not capable of being applied to some use, and in economic importance the order is excelled by no other order of plants except the grasses. For the vast variety of its products, see ARRACK; ASSAI; DATE; COCOANUT; OIL PALM; PALMYRA PALM; SAGO; RATTAN; ASTROCARYUM; PALMETTO; etc.

The classification of Drude of the suborders and principal genera is as follows: Phœniceæ—Phœnix; Sabaleæ—Chamærops, Sabal, Rhapis, Corypha, Livistonia, Copernicia; Borasseæ—Borassus, Lodoicea; Mauritieæ—Mauritia; Metroxyleæ—Raphia, Metroxylon, Calamus; Arecineæ—Caryota, Arenga, Leopoldinia, Ceroxylon, Oreodoxa, Euterpe, Areca; Cocoineæ—Elaïs, Attalea, Cocos, Bactris, Desmoncus; Phytelephantineæ—Phytelephas, Nipa.

The cultivation of palms in hot-houses is generally attended with great expense. In hot-houses they are cultivated merely as objects of interest, and for the gratification of a refined taste, never for the sake of their fruit or any other product.

The earliest fossil palms date back to the Middle Cretaceous. They are common in the Upper Cretaceous of North America, where they occur as far north as Greenland, and they are found also in the Tertiaries of North America and Europe. The prominent genera are Flabellaria, Chamærops, Sabal, Phœnix, allied to the modern fan, palmetto, and date palms.

PALM, JOHANN PHILIPP (1766-1806). A bookseller of Nuremberg, who has acquired historic celebrity as a victim of Napoleonic justice in Germany. He was born in Schorndorf, Bavaria, and succeeded his father-in-law, Stein, as a bookseller in Nuremberg, the old name of the firm being retained. In the spring of 1806 a pamphlet, entitled *Deutschland in seiner tiefen Erniedrigung*, which contained some bitter truths concerning Napoleon and the conduct of the

1. ROYAL PALM

2. WINE PALM

3. SAGO PALM

French troops in Bavaria, was sent by this firm to a bookseller in Augsburg in the ordinary course of trade, and, as Palm to the last moment of his life averred, without any regard, on his part, to its contents. Napoleon's police traced it to the shop in Nuremberg, and an investigation was ordered. Palm was in Munich, but he returned to Nuremberg, and was there arrested. An extraordinary court-martial, held at Braunau, to which place he was removed, condemned him to death (August 25, 1806), no advocate being heard in his defense. General Saint-Hilaire declared that the orders of the Emperor were positive; and the sentence was executed at two o'clock on the same day on which it was pronounced. The execution of Palm served to stir up a feeling of bitter hatred among the German people against the domination of the French, and aroused the general indignation of Europe. With the murder of the Duc d'Enghien (q.v.) this was one of Napoleon's gravest blunders. Consult Schultheiss, *Johann Philipp Palm* (Nuremberg, 1860).

PALMA, päl'mä. One of the Canary Islands (q.v.).

PALMA. The capital of the island of Majorca (q.v.) and of the Spanish Province of Baleares (Map: Spain, G 3). It is situated on the southwest coast of the island, on the Gulf of Palma, which, between capes Figuera and Blanco, is 18 miles long, and sweeps 12 miles inland. The city is surrounded by orange plantations, and is walled and fortified. The houses, some of which are built of marble, are mostly in the Moorish style of architecture; a number of the streets are wide and regular. It is the see of a bishop, and has a Gothic cathedral which, from its lofty situation, dominates the whole city. It is simple but beautiful in style, with a spire which, from the delicate and airy character of its construction, is called the Angel's Tower. Besides other ecclesiastical edifices, the town has a number of fine modern commercial and other secular buildings, such as the Bank of Spain, the Exchange, a beautiful and ornate structure in Germano-Gothic, and the Governor's palace. The chief educational institutions are a seminary, a normal school, a school of fine arts, and a museum of paintings. The chief manufactures are alcohol, liquors, chocolate, starch, sugar, flour, soap, leather, and glass. In the port, a mole 500 yards in length runs out from the bastions facing the south; and on each side of it are ship-building yards. The harbor is well sheltered, and is much used as a port of call; steamers leave it regularly several times a week for Barcelona, Valencia, and Alicante. The chief exports are oil, wine, and fruit. Population, in 1887, 60,514; in 1900, 63,783.

PALMA, Jacopo, called Il Vecchio (the elder) (c.1480-1528). A Venetian painter of the High Renaissance. He was born at Serinalta, near Bergamo, about 1480, and studied principally under Giovanni Bellini, but there is a latitude in his art method that indicates the successive dominance of several artists. His earlier works call to mind the style and technique of Bellini, as may be seen in the "Tobias and the Angel" in Stuttgart. His second manner reflects the influence of Giorgione and Titian, and is characterized by rich coloring and brilliant lighting, combined with masterly breadth of treatment. Like his great contemporaries, he achieved idealism through the perfection of nature. The finest example of this period is the altar-piece of Saint Barbara in the Church of Santa Maria Formosa, Venice. The figure of the saint is one of the most beautiful and majestic female forms in Venetian art. His later works, cast in a lower key and executed with less care, constitute his third (*blonde*) manner. The "Three Sisters," Dresden, is typical of this class. Palma was a prolific painter, and at the time of his death, which occurred at Venice, August 18, 1528, no fewer than forty unfinished works remained. Among his works the following may be selected as characteristic: "Adam and Eve," Brunswick; "The Virgin Enthroned," altar-piece at Zerman, near Treviso; "Saint Peter Enthroned" and "Healing of the Widow's Son," in the Academy, Venice. To the best period are assigned "The Adoration of the Shepherds," in the Louvre; "Meeting of Jacob and Rachel," Dresden Gallery; "Saint Peter Presenting a Worshiper to the Infant Christ," Colonna Palace, Rome; "The Madonna and Child Adored by Saints;" and a number of female portraits in the Vienna Museum. Consult: Crowe and Cavalcaselle, *History of Painting in North Italy* (2d ed., London, 1871); Rosenberg, in Dohme, *Kunst und Künstler Italiens*, iii. (Leipzig, 1879); Morelli, *Italian Masters in German Galleries* (London, 1883); Locatelli, *Notizie intorno a Giacomo Palma* (Bergamo, 1890).

PALMA, Jacopo, called Il Giovane (the younger) (c.1544-1628). A Venetian painter, grandnephew of the preceding. He was born in Venice, where he passed most of his life. A pupil of Antonio Palma, a second-class Venetian painter, he received his real inspiration from the study of the works of Titian and Tintoretto, and later, during an eight years' stay in Rome, came under the influence of the great masters of the Roman Renaissance. He acquired a mastery of expression and a facility in handling beyond that possessed by the majority of his contemporaries. The great deficiency in his work is the mechanical or mannéristic method, which makes itself felt in spite of the excellences of color or line. A number of his best productions, which are historical and religious in character, are in the Ducal Palace, the Academy, and the churches of Venice, a typical example being "Saint Catharine Rescued from the Wheel," in the Church of the Frari. Other examples are in the galleries of Vienna, Madrid, Munich, Dresden, etc.

PALMA, Ricardo (1833—). A Peruvian poet and prose writer, born at Lima. He was educated at the University of San Marcos del Rimac, and as associate editor of the Lima periodical *El Diablo* (1860) he was banished for a time for his political opinions. He held a position in the Peruvian National Library, and after it was destroyed by the Chileans in 1881, Ricardo undertook its restoration with foreign help. Besides translations from the German, Portuguese, French, English, and Italian, he published in Lima *Los anales de la inquisicion de Lima* (1863) and a volume of poems, some of which had been previously printed in Paris (1865) and in Havre (1870). His *Tradiciones* (1883-87) contain many interesting historical and other legends of Peru.

PALMA, Tomas Estrada (c.1836—). First President of Cuba, born near Bayamo, where

his father owned large estates. He studied law at the University of Seville in Spain. Upon the outbreak of the ten years' war (1868-78) he joined the revolutionists, soon rose to the rank of general, and toward the end of the war was elected to the Presidency of the Cuban Republic. Soon afterwards he was captured by the Spaniards and sent to Spain, where he was kept in confinement until the end of the insurrection. Then, as his parents were dead, and his estates confiscated, he went to Honduras, where he married the daughter of the President, and became Postmaster-General. A few years later he removed to the United States and opened a school for Latin-American boys at Central Valley, Orange County, N. Y. This he maintained until 1895, when the Cubans again rebelled; whereupon he closed his school and organized in New York City the Junta to which the present Republic in great measure owes its existence. His services were remembered by his countrymen when in 1901 they were called upon to choose their first President, for after Máximo Gomez (q.v.) refused to be a candidate Palma became their almost unanimous choice. He was inaugurated on May 20, 1902, and on the same day the United States formally relinquished all claim to jurisdiction over the internal affairs of the new nation.

PALMA DI MONTECHIARO, dē mōn'tā-kyä'rō. A town in the Province of Girgenti, Sicily, near the southwest coast, 13 miles southeast of Girgenti (Map: Italy, H 10). It is comparatively modern, dating from 1637. It has a trade in almonds, dried fruits, and sulphur. Population (commune), in 1881, 11,702; in 1901, 14,330.

PALMA CHRISTI. See Castor-Oil Plant.

PALMAROLI, päl'mä-rō'lē, Pietro (1750-1828). An Italian painter, chiefly distinguished as a restorer of paintings. He invented the art of transferring frescoes from the wall to canvas. The first work which he transferred in this manner was the "Descent from the Cross," by Daniele da Volterra, in the Church of Trinità de' Monti in Rome in 1809. This transfer created great interest throughout Italy, and in 1820 he was called to Dresden, where he restored above fifty paintings, including the Sistine Madonna. He afterwards transferred and restored a number of famous paintings at Rome, including Raphael's "Sibyls" in Santa Maria della Pace.

PAL'MAS, Cape. See Cape Palmas.

PALMBLAD, pälm'bläd, Vilhelm Fredrik (1788-1852). A Swedish author, professor of history, geography, and Greek at Upsala, and editor of the great *Swedish Biographical Dictionary* (23 vols., 1835-52). While a student at Upsala (1806-10) he purchased the university printing-press, and used it for the popularization of learning. He published the literary journal *Phosphorus*, an annual *Poetic Calendar*, and a literary review. In these enterprises Atterbom and Hammarsköld were associated with Palmblad in efforts to supplant the classical by romantic literary ideals. Palmblad was an industrious writer. His *Manual of Physical and Political Geography* (5 vols., 1826-37) is the best in Swedish. His contributions to history are superseded, as are his translations of Greek dramatists and his Greek Etymology (1845). Of his novels, the best are *Familjen Falkenstrand* (1844) and *Aurora Königsmark* (1846). Of his short stories, *Amala* (1817) and *Holmen i sjön Dall* (1819) are good.

PALM CIVET. A civet (q.v.) of the genus Paradoxurus; a paradoxure, tree-cat, or toddy-cat. This group differs from the true civets in important points of skull structure, dentition, and coloration (the tail not being distinctly ringed), and in having mainly arboreal habits. All are Oriental, and ten or a dozen species are scattered over India, the Malay Peninsula and Archipelago, and Southern China. They have the slender, sharp-nosed civet form, are about the size of house-cats, and their relatively long fur is often beautifully striped and spotted. The animals spend most of their time in trees, especially palms, but often live in the thatched roofs of cottages. During the day they sleep, coiled into a ball, and they become active only in the night, when they display remarkable agility in climbing. Their food is mainly vegetable, but all eat more or less of insects, birds' eggs and fledglings, and other small creatures. Like the fox-bats, they are very fond of the palm-juice or 'toddy' collected by the natives in vessels attached to the cut spathes of various Indian palms, especially the jaggery (*Caryota urens*). They are sometimes domesticated. Consult: Jerdon, *Mammals of British India* (London, 1868); Blanford, *Fauna of British India: Mammals* (London, 1888); Lyddeker, "Cats, Civets, and Mungooses," in *Allen's Natural History* (London, 1894); Wallace, *Tropical Nature* (London, 1878).

PALMER, pä'mēr. A town, including several villages, in Hampden County, Mass., 15 miles east by north of Springfield; on the Chicopee River, and on the Central Vermont and the Boston and Albany railroads (Map: Massachusetts, C 3). It has a public library, the Young Men's Library Association, with more than 6000 volumes; and is prominent as an industrial centre, its manufactures including cotton and woolen goods, carpets, straw hats, wire, etc. The government is administered by town meetings. Population, in 1890, 6520; in 1900, 7801.

Settled in 1716, Palmer became a district in 1752 and a town in 1775. Before incorporation it was known variously as New Marlborough, Kingsfield, The Elbow Tract, and in 1741-52 as Kingston, in honor of the first settler, John King. Consult Temple, *History of the Town of Palmer, Massachusetts* (Palmer, 1889).

PALMER. See Pilgrim.

PALMER, Alice (Freeman) (1855-1902). An American educator. She was born at Colesville, N. Y., was brought up in Windsor, graduated at Michigan University in 1876, and taught in Ottawa, Ill., and East Saginaw, Mich. Elected to the chair of history in Wellesley College in 1879, after a year she became acting president, and then received a permanent appointment (1882). Under her direction the college grew, and its organization was perfected. She married George Herbert Palmer, professor of philosophy at Harvard, in 1887, and became prominent in the Woman's Educational Association of Boston. She received the appointment of non-resident dean of the women's department in the University of Chicago in 1892. She died suddenly in Paris. Consult *Report of a Memorial Service with Addresses by J. B.*

Angell, Caroline Hazard, W. J. Tucker, and C. W. Elliot (Boston, 1903).

PALMER, ANTHONY (c.1675-1749). An American colonial Governor, born probably in England. After engaging in mercantile pursuits in Barbados for some years, he emigrated to Pennsylvania in 1707, and settled in Philadelphia. From 1708 until his death he was a member of the Provincial Council of Pennsylvania, ultimately becoming its president, in which capacity, after the resignation of Lieutenant-Governor Thomas in 1747, he acted as Governor for a year and a half, taking measures for the protection of the colony against Spain and France, then at war with Great Britain, and making several important Indian treaties. He was the founder of what is now the 'Kensington District' of Philadelphia.

PALMER, ARTHUR (1841-97). An English Latinist, born in Guelph, Ontario, Canada. He was reared in Canada, studied with high honors at Trinity College, Dublin, and became fellow there in 1867, and professor of Latin in 1880. His field was Latin poetry, especially of the Augustan age, and he was famed for his brilliant Latin style and for his felicitous emendations of Plautus, the Augustan poets (save Vergil), and Aristophanes. In the first editions of Herondas (1891) and of Bacchylides (1897) he was active. He edited: Ovid's *Heroides*, with Planudes's version (1874; revised 1898), probably his greatest work; *Propertius* (1880); and Horace, *Satires* (1883; 5th ed. 1893).

PALMER, ARTHUR HUBBELL (1859—). An American Germanic scholar, born in Cleveland, Ohio, and educated at Western Reserve College. After two years' study in Europe he became professor of German at Adelbert College, and from 1886 to 1891 was librarian of the college as well. In 1891 he was called to Yale University as professor of German language and literature. He edited various German texts, among them Schiller's *Wilhelm Tell* (1898) and *Geschichte des Dreissigjährigen Krieges* (1899), and Goethe's *Hermann und Dorothea* (1902).

PALMER, BENJAMIN MORGAN (1818-1902). An American Presbyterian clergyman, born in Charleston, S. C. He was a student at the University of Georgia, and studied theology at Columbia Theological Seminary, S. C. Afterwards he was in charge of churches at Savannah (1841-43) and at Columbia (1843-46). He had the chair of Church history and polity in the Columbia Theological Seminary from 1853 until 1856, when he took charge of the First Presbyterian Church at New Orleans. He was moderator in the first General Assembly at Augusta, Ga., in 1861. He was one of the founders, in 1847, of *The Southern Presbyterian Review*.

PALMER, EDWARD HENRY (1840-82). An English Oriental scholar. He was born in Cambridge, and went into business in London. In 1863 he entered Saint John's College, Cambridge, where he graduated in 1867, and was in that year appointed fellow. In 1869 he went to Sinai on the Sinai survey expedition; and in 1870 he again made explorations in the desert of Tih, Edom, and Moab with C. F. T. Drake. In 1871 he became professor of Arabic at Cambridge. In 1881 he resigned this position and went to London, where he engaged in journalism. In 1882 he was sent on a secret service mission among the Bedouin tribes to induce them not to ally themselves with Arabi Pasha (q.v.) in his rebellion against the Khedive. He met with eminent success, but while on the mission was betrayed by a guide and shot by the rebels. Palmer was a prolific writer on Oriental topics. Among his works are the following: *Oriental Mysticism, Theosophy of the Persians* (1867); *The Desert of the Exodus* (2 vols., 1871); *The Negeb or South Arabic Language* (1874; 2d ed. 1885); *A Concise Dictionary of the Persian Language* (1876; 2d ed. 1884), *English-Persian Dictionary*, completed after his death by G. Le Strange (1883); a translation of the Koran, in the *Sacred Books of the East* (1880); several translations from and into Persian; *The Poetical Works of Beha-ed-din Zoheir of Egypt, with a Metrical English Translation, Notes and Introduction* (1876-77; the notes were never published); and a *Simplified Grammar of Hindustani, Persian, and Arabic* (1882; 2d ed. 1885). Consult his *Life* by Walter Besant (London, 1883).

PALMER, ERASTUS (1817-1904). An American sculptor. He was born at Pompey, Onondaga County, N. Y., April 2, 1817. He was a carpenter by trade, but in 1840-48 entered upon an artistic career in Albany as cameo-cutter. He then attempted sculpture, and in 1851 exhibited his first marble bust, the "Infant Ceres," at the Academy of Design, New York. His works include the bas-reliefs "Faith," "Mercy," and "Peace in Bondage;" the ideal busts "Resignation," "Spring," and "June;" portrait busts of Alexander Hamilton, Washington Irving, and of Dr. Armsby, Washington Park, Albany, N. Y.; and the statues "The Sleeping Peri," "The White Captive," and "The Angel of the Sepulchre" (Rural Cemetery, Albany, N. Y.).

PALMER, GEORGE HERBERT (1842—). An American educator and writer on classical and pedagogical subjects. He was born in Boston, graduated at Harvard in 1864, studied at Tübingen, Germany, and Andover Theological Seminary, became instructor in Greek at Harvard College in 1870, assistant professor in philosophy there in 1883, and Alford professor of natural religion, moral philosophy, and civil polity in 1889. He was twice married, first to Ellen Margaret Wellman (1871-79), next (1887) to Alice Freeman, then president of Wellesley College. His publications include *New Education, The Glory of the Imperfect, Self-Cultivation in English*, and translations of the *Odyssey* of Homer and the *Antigone* of Sophocles.

PALMER, JAMES SHEDDEN (1810-67). An American naval officer, born in New Jersey. He entered the United States Navy as midshipman in 1825, was made lieutenant in 1836, and during the Mexican War commanded the blockade-schooner *Flirt*. In 1855 he was promoted to be commander, and at the outbreak of the Civil War he was in command of the *Iroquois* of the Mediterranean squadron. He was soon recalled and attached to Admiral Dupont's blockading fleet; was made captain in 1862, led the advance in the passage of the Vicksburg batteries, and participated in the fight with the Confederate ram *Arkansas*. In 1863 he was promoted to be commodore. He became a close friend of Farragut, whose flag-captain he was at Mobile Bay and New Orleans. In 1866 he was made [illegible]

[illegible] and commanded the North Atlantic [illegible] until his death.

PALMER, John (c.1742-98). An English [illegible], born in London. He made his first appearance on the stage in 1762, but gained no great success until 1768. In 1772 he played at Liverpool, and four years afterwards reappeared at the Haymarket, where in 1777 he was the first Joseph Surface in *The School for Scandal*. Palmer built the Royalty in 1785, but never made it a success. The pamphleteering war in which he then engaged broke his spirit and health, and he died on the stage in the fourth act of Lewis's *Castle Spectre*, in which he was playing Father Philip.

PALMER, John McAuley (1817-1900). An American soldier and political leader, born at Eagle Creek, Scott County, Ky. In 1831 he removed to Illinois and in 1839 was admitted to the bar. He took an active interest in politics, and was elected by the Democrats to the State Senate in 1852, but soon afterwards became identified with the new Republican Party, was chosen a delegate to its first national convention, and in 1856 zealously supported Frémont's candidacy. On the outbreak of the Civil War he was commissioned colonel of the Fourteenth Illinois Volunteers, and on December 20, 1861, was promoted to be brigadier-general. He served with Frémont in Missouri, and with Pope at New Madrid (March 13, 1862) and Island No. 10 (April 8, 1862). The same year he was advanced to the rank of major-general and received command of a division, which he led at Murfreesboro (December 31, 1862, to January 2, 1863). At the battle of Chickamauga (September 19-20, 1863) he led one of Crittenden's divisions, and at Chattanooga commanded the Fourteenth Corps of the Army of the Cumberland. His corps formed part of Thomas's command during the Atlanta campaign, and took part in the desperate charge at Kenesaw Mountain (June 27, 1864), and in the battle at Peach Tree Creek (July 20, 1864), soon after which Palmer gave up his command. In 1868 he was elected Governor of Illinois by the Republicans, but four years later returned to the Democratic Party, and in 1876 energetically supported Samuel J. Tilden. In 1890 he was elected United States Senator, and in 1896 accepted the nomination for President from the Gold Democrats.

PALMER, John Williamson (1825-96). An American poet, born in Baltimore, Md., April 4, 1825. He studied medicine, was city physician in 1849, went to China in 1851, volunteered in the East India Company's service, and was surgeon on a war steamer in the Burmese campaigns (1852-53). He was war correspondent for the New York *Tribune*. In 1853 he returned to the United States and wrote for various publications till his death. He wrote novels and books of travel, e.g. *The New and the Old, or California and India in Romantic Aspects* (1859), and many poems, which have been collected (1901). He is best known for his stirring ballad *Stonewall Jackson's Way*, written September 17, 1862, while the battle of Antietam was in progress. He was also an editorial assistant on the *International*, the *Century*, and the *Standard* dictionaries.

PALMER, Nathaniel Brown (1799-1877). An American sea-captain, the discoverer of the Palmer Archipelago. He was born at Stonington, Conn., and was educated at a private school. He went to sea at the age of fourteen, and in 1821, in command of the sloop *Hero*, a vessel of only 40 tons, set out from Yankee Harbor in the South Shetlands to investigate a new land that had been sighted to the southward. On his return from this land he met the Russian exploring expedition under Bellinghausen. The region that he discovered was for more than half a century held to be a portion of that spur of the alleged Antarctic continent which lies below South America; but more recent investigations have shown that it is merely a part of the archipelago lying above what is supposed to be the continental mass. Palmer was subsequently in command of various clipper ships and was himself a designer of clippers, among them the *Hoqua* and the *Oriental*. In 1849 he retired from the sea. He became a director of the Fall River line of steamers and was mainly instrumental in building the *Bristol* and the *Providence*.

PALMER, Ray (1808-87). An American clergyman and hymn-writer. He was born at Little Compton, R. I., studied at Phillips Academy, Andover, Mass., and graduated from Yale College in 1830. After graduation he taught in a private school in New York City, and later became associated with Prof. E. A. Andrews in conducting a young ladies' institute at New Haven, Conn. Becoming a licentiate in 1832, he was called to the pastorate of the Central Congregational Church, Bath, Maine, in 1835, where he remained until 1850, when he resigned to accept a call from the First Congregational Church, Albany, N. Y. In 1866 he relinquished pastoral work and became secretary of the American Congregational Union at New York. The years previous to his death were spent at Newark, N. J. He is chiefly remembered as a writer of hymns, one of which—"My faith looks up to Thee"—exists in twenty different languages. His collections of hymns are: *Hymns and Sacred Pieces* (1865); *Hymns of My Holy Hours* (1868); and *Voices of Hope and Gladness* (1880).

PALMER, Roundell, first Earl of Selborne (1812-95). An English politician and judge. He graduated in 1834 from Oxford after a brilliant career there, and received his master's degree in 1836. In the following year he was admitted to the bar, and soon became noted for his keen and subtle mind and his vast learning. In 1847 he entered Parliament for Plymouth and joined the adherents of Peel. After a varied Parliamentary career, losing his seat on two occasions, he became Solicitor-General in Palmerston's Cabinet in 1861, and in 1863 Attorney-General, which post he held until 1866. Palmer gave an independent support to Gladstone, and in 1872 became Lord Chancellor, and was raised to the peerage as Baron Selborne of Selborne. As Chancellor, Selborne had much to do with the reformation of the judiciary. In 1874 he was displaced, but again became Chancellor in 1880, and in 1882 was created Viscount Wolmer of Blackmoor and Earl of Selborne. He was opposed to home rule for Ireland, and became a Liberal-Unionist. Selborne also wrote several works on hymns, and held at different times posts of honor in the universities, receiving also various honorary degrees.

PALMER, Samuel (1805-81). An English landscape painter, illustrator, and etcher. He was born at Newington, January 27, 1805. He first studied under an obscure artist named Wate, and then in the antique school of the British Museum; but his style was formed under the influence and advice of his father-in-law, John Grinnell, and William Blake. After sketching extensively in Wales and Devonshire, he went to Rome in 1837, remaining there two years. From this time he devoted himself mainly to water colors, becoming a full member of the Water Color Society in 1854. He also illustrated a number of works, the best of which were Milton's *Comus*, *L'Allegro*, and *Il Penseroso*. Palmer was the last of the ideal school of landscape painters, represented in England by Wilson, Turner, and others. His paintings, mostly aquarelles, are good in color and chiefly characterized by wealth of poetic feeling. Among the best are: "Dream on the Apennines" (1864); "Curfew" (1870); "The Waters Murmuring" (1877); "The Eastern Gate" (1881); "The Bellman" (1882); and the "Street of the Tombs, Pompeii" (1870), an oil painting. As an etcher he is placed in the first rank by Ruskin and Hamerton; he became a member of the Etchers' Club in 1853. His best plates include: "The Sleeping Shepherd," "The Skylark," and "The Rising Moon" (1857); "The Herdsman" (1865); "Morning of Life" (1872); "The Lonely Tower" (1880). Like his water colors, his etchings are highly finished and are marked by a subtle treatment of light. His literary proclivities are shown by his translation of Vergil's *Eclogues*, which he began to illustrate, but completed only one etching, "The Opening of the Fold," before his death, which occurred near Reigate, May 24, 1881. Consult: A. H. Palmer, *Samuel Palmer, Painter and Etcher* (London, 1891); Varley, *Samuel Palmer, Memoir* (ib., 1882).

PALMER, Walter Launt (1854—). An American landscape painter. He was born at Albany, N. Y. He was a pupil of F. S. Church at Hudson, N. Y., in 1870-72, and of Carolus Duran in Paris. He became noted for his landscapes, especially winter scenes with snow effects, but also painted Venetian scenes. His chief works include: "Venice" (1882), in private possession, Lynn, Mass.; "January" (1887); "Autumn Morning" (1892); "Panorama of Venice," "Domes of La Salute," "End of a Winter Day," and "Under the Pines" (1896); "The Open Door" (1901). He received the second Hallgarten prize at New York in 1887, a gold medal at the World's Columbian Exhibition in 1893, and honorable mention at Paris in 1900. He is a member of the National Academy, the Society of American Artists, and the American Water-Color Society.

PALMERÍN DE OLIVA, päl'mâ-rēn' dā ō-lē'vä (Sp., Palmer of the Olive Tree). The first of a series of chivalrous romances written in the Spanish Peninsula in imitation of the earliest and most famous work of the kind, the *Amadis*, and likewise of great importance in the development of the modern novel. The *Palmerin de Oliva* is attributed to Francisco Vázquez, and seems to belong to about 1511. The series of *Palmerines* ended with the *Palmerin de Inglaterra* (c.1544) of the Portuguese Francisco de Moraes. Consult the English translations of this latter romance by Anthony Munday, begun in 1589 and completed in 1595, and by Southey (1807). The earliest French *Palmerin* appeared at Lyons in 1553.

PALMERSTON, päm'ẽr-stun, Henry John Temple, third Viscount (1784-1865). A celebrated English statesman. He was born in Hampshire, October 20, 1784, a descendant of an old and historic family. Receiving his early education at home under an Italian refugee and at Harrow, Palmerston studied later in the University of Edinburgh, under Dugald Stewart, in whose family he lived, and at Saint John's College, Cambridge, where he received his master's degree in 1806. He succeeded his father in the Irish peerage in 1802. His eminent abilities were early recognized; the Tory Party in the university selected him in 1806 as their candidate to succeed Pitt. Twice unsuccessful, he entered Parliament for Newtown, which seat he held till 1811, when he was chosen at Cambridge and represented his *alma mater* for twenty years, losing his seat only when he entered the Grey Ministry and supported the Reform Bill. After a term for Bletchingley, and one for South Hampshire, he found a seat at Tiverton, in 1835, which he held till his death. In 1809 he accepted the office of Secretary at War in the Duke of Portland's Administration. This office he held during the governments of Perceval, Liverpool, Canning, Goderich, and Wellington—a period extending from 1809 to 1828. There was ample scope at the War Office for Palmerston's administrative talents and activity. The military system swarmed with abuses, and the labor thrown upon the Secretary at War during the Peninsular campaign was prodigious. Palmerston early attached himself to the Canning section of the Liverpool Administration, and accepted a seat in the Cabinet of Canning. His official connection with the Tory Party ceased in 1828, when Wellington insisted on accepting Huskisson's resignation, which was followed by Palmerston's retirement. The Duke's Government was swept away in the reform flood of 1830, and Earl Grey, who became Prime Minister, offered the seals of the Foreign Office to Palmerston. The European horizon was so disturbed at this crisis that war seemed inevitable, but Palmerston brought about friendly relations with the new King of France, Louis Philippe, and the two countries thus acting in reasonable harmony, the independence of Belgium was effected, and constitutional governments were established in Spain under Queen Isabella, and in Portugal under Queen Maria. In addition to the above questions Palmerston had to deal with Eastern problems. He supported Turkey against Russian aggression. Later (1840) he united with Russia against France to curb the rising power of Mehemet Ali, apparently fearing that French influence in Egypt might endanger England's communication with India. The Opium War of 1840-42 resulted in the opening of five Chinese ports to trade. In 1841 the Quintuple Treaty to suppress the African slave trade was negotiated, but failed, being opposed by Lewis Cass, United States Minister to France, on account of the right of visitation clause. A strong foreign policy gave Palmerston during these years greater reputation abroad than in England. At home he favored free trade, labor laws, shorter hours, and factory acts.

In 1841 Palmerston went out of office with

the Whigs on the question of corn duties; but on their return in 1846 he resumed the seals of the Foreign Office. His second foreign administration furnished various subjects of hostile party criticism. A vote of censure on the foreign policy of the Government was carried in 1850 in the House of Lords on the motion of Lord Stanley (afterwards Earl of Derby). A counter-resolution, approving the foreign policy of the Government, was thereupon moved in the House of Commons. The debate lasted four nights. In December, 1851, however, Palmerston was dismissed from the Russell Cabinet. He had in an unofficial oral way expressed his approbation of the coup d'état of Louis Napoleon, without consulting either the Premier or the Queen; and, as explanations were refused, her Majesty exercised her right of dismissing her Minister. A few weeks later Palmerston avenged himself by bringing about the fall of the Russell Administration on a comparatively trifling question regarding the militia. He refused an offer from the Earl of Derby to join the Government which that statesman was commissioned to form, but accepted the post of Home Secretary in the coalition Administration of the Earl of Aberdeen in 1852. The fall of this Government, on account of the mismanagement in the Crimean War, placed Palmerston in the position of Prime Minister, to which he was unanimously called by the voice of the nation (February, 1855). He vigorously prosecuted the Russian war until Sebastopol was taken and peace was made. His Government was defeated in March, 1857, on Cobden's motion condemnatory of the Chinese war. Parliament was dissolved, and Palmerston met the House of Commons with a large majority. But his Administration fell in February, 1858, on account of the Conspiracy Bill, intended to protect foreign rulers against the machinations of plotting refugees. A short Conservative administration followed; but in June, 1859, Palmerston was again called to the post of First Lord of the Treasury and Premier, which he continued to fill up to his death. His sympathies were always with oppressed nationalities, so he favored Italian unity, and opposed the war of Prussia and Austria against Denmark in 1864. It was his ambition to be considered the minister of a nation rather than the minister of a political party; and his opponents were constrained to admit that he held office with more general acceptance than any English minister since the time of Chatham. As an orator, he was usually homely and unpretending, but always sensible and practical. He was a dexterous tactician, and a ready, witty, and often brilliant debater. He was popular as a minister, because he was thoroughly English in his ends and aims. He died without issue October 18, 1865. Lord Dalling (Sir Henry Bulwer) prepared the *Life of Palmerston to 1847*, in three volumes; this work was completed by Sir Evelyn Ashley in two additional volumes (London, 1870-76). Consult also: Ashley, *Life and Correspondence of Henry John Temple, Viscount Palmerston* (London, 1878); Sanders, *Life of Viscount Palmerston* (ib., 1888); Lorn, *Biography of Lord Palmerston* (New York, 1891); Francis, *Opinions and Policy of Viscount Palmerston* (London, 1852).

PALMETTE. A conventional ornament, so called because of its resemblance to a palm-leaf, of which it is a conventionalized form. It was very generally used in Greek art, either carved or painted, upon friezes, columns, vases, cloths, etc. Since the Renaissance it has been frequently applied in modern decoration.

PALMET'TO (from Sp. *palmito*, diminutive of *palma*, palm), *Sabal Palmetto*. A species of palm, a native of maritime parts of North America, from Florida to North Carolina, found farther north than any other American species of palm. It attains a height of 40 to 50 feet, and has a crown of large palmate leaves, the blade from one foot to five feet in length and breadth, and the footstalk long. The flowers are small, greenish, and in long racemes; the fruit black, about as long as a pea-pod, and inedible. The leaves are made into hats, mats, etc., and are also largely used for thatch. The terminal bud or cabbage is eaten. The wood is extremely porous, but is preferred to every other kind of wood in North America for wharves, as it is very durable, and not liable to be attacked by the teredo. A second American species, the saw palmetto (*Serenoa serrulata*), occurs from South Carolina to Florida. It has a short stem and numerous clustered fan-shaped leaves, while its berries have certain medicinal properties. A still smaller species is the dwarf palmetto (*Sabal Adansonii*), a stemless species which bears a cluster of leaves a foot or two long. (See CABBAGE PALM.) The *Chamærops humilis* of the south of Europe is also called palmetto, and the name is applied to other species.

PALMETTO STATE. South Carolina. See STATES, POPULAR NAMES OF.

PALMI, päl'mē. A town in the Province of Calabria, Italy, situated on the southwest coast, 21 miles northeast of Reggio by rail (Map: Italy, K 9). Near by rises Mount Elia, commanding a magnificent view, and surrounded by vineyards, and orange and olive groves. The harbor affords good fishing. Population (commune), in 1881, 11,082; in 1901, 13,297.

PALMIERI, päl'mē-ā'rē, LUIGI (1807-96). An Italian physicist, born in Faicchio. He was appointed professor of physics at the University of Naples in 1847, and in 1854 became director of the meteorological and seismological observatory on the slope of Mount Vesuvius, whose eruptions and other phenomena he studied most carefully. He published a series of annals of this observatory (1869-73) and various studies in electricity, seismology, and volcanology. He was the inventor of a seismograph, an electrometer for the study of atmospheric electricity, and other meteorological instruments.

PALMIRA, päl-mē'rä. A town of the Province of Santa Clara, Cuba, 8 miles north of Cienfuegos, on the Cienfuegos-Santa Clara Railway. Palmira lies in the midst of a district producing largely sugar, corn, and tobacco. Its population, in 1899, was 4519.

PALMIRA, päl-mē'rä. The capital town of the province of the same name, in the Department of Cauca, Colombia, 160 miles southwest of Bogotá, and 7 miles from the right bank of the Cauca. It is situated on a spacious plain called Llanos de Malagana, famous as a rich agricultural district, and especially for the cultivation of a fine grade of tobacco. Stock-raising is also an important industry. It is a modern town,

OLD FAN PALMS (Washingtonia Filifera) AT PASADENA, CALIFORNIA

SABAL PALMETTO, FLORIDA

and now ranks as the second in the department, with a population of about 12,500.

PALMISTRY. See CHIROMANCY.

PALMITIC ACID, $C_{16}H_{32}O_2$. One of the most important of the fatty acids. In a pure state, when crystallized from alcohol, it occurs in the form of beautifully white acicular crystals arranged in tuft-like groups. These crystals are devoid of odor or taste, communicate a fatty feeling to the finger, melt at 62° C., and solidify on cooling in the form of crystalline scales. The acid is lighter than water, in which it is insoluble; but it dissolves freely in boiling alcohol and in ether, and the solutions have a distinctly acid reaction. In small quantities it may be distilled without decomposing, if the heat be carefully regulated; and it may be distilled in any quantity under reduced pressure. The neutral palmitates of the alkalies constitute soaps, and are soluble in warm water; if, however, their solutions are largely diluted with cold water, they are decomposed, an insoluble acid salt being precipitated, while a half of the alkali remains in solution. The other most important compounds of palmitic acid are those which it forms with glycerin and with cetyl alcohol. With glycerin this acid forms three compounds, the most important of which is palmitin (q.v.). In combination with cetyl alcohol, whose composition is represented by the formula $C_{16}H_{33}OH$, it is the main constituent of spermaceti (q.v.), and as palmitate of melissyl it occurs in beeswax. The calcium salt of palmitic acid is found in adipocere, its sodium salt in blood and in serous fluids. Palmitic acid was first obtained from palm oil—hence its name. It may be obtained from oleic acid by fusing with caustic potash (see OLEIC ACID), but is now usually prepared either from Japan wax or myrtle wax.

PAL'MITIN, or TRI-PALMITIN. A white fat, usually occurring, when crystallized from ether, in the form of a mass of small scaly crystals, insoluble in water, but readily soluble in ether and in boiling alcohol. It is a constituent of almost every kind of fat, and is the preponderating ingredient in those of a semi-solid consistence, and in many oils. It receives its name from the abundance in which it occurs in palm oil, from which it may be readily obtained, and then purified by recrystallization from ether. The true melting-point of the pure substance is 61° C. (See STEARIN.) Chemically it is a compound formed by the union of one molecule of glycerin with three molecules of palmitic acid, three molecules of water being set free, according to the following equation:

$$\underset{\text{Glycerin}}{C_3H_5(OH)_3} + 3\underset{\text{Palmitic acid}}{C_{15}H_{31}CO_2H} = \underset{\text{Palmitin}}{C_3H_5(OC_{15}H_{31}CO)_3} + \underset{\text{Water}}{3H_2O}.$$

It is saponified, or broken up into its constituents with formation of soap, by boiling with the caustic alkalies.

PALM OIL. An oil obtained from the fruit of several species of palm. When fresh it is of an orange tint, sweetish taste, and violet-like odor. It is of the consistency of butter, for which it is sometimes used, and, like butter, it easily becomes rancid. It is prepared by boiling the fruit in water. It is used in candle and soap making, and, on account of its pleasant odor, as a scent to toilet preparations.

PALM SUNDAY (Lat. *Dominica Palmarum*). The last Sunday of Lent, so called from the custom of blessing branches of the palm tree, or of other trees substituted in those countries in which palm cannot be procured, and of carrying the blessed branches in procession, in commemoration of the triumphal entry of Christ into Jerusalem (John xii.). The date of the origin of this custom is uncertain. Some special celebration of the day is described as early as 386, but the ceremony of blessing the branches can hardly be referred to an earlier date than the ninth, or possibly the eighth century. A procession is formed, the members of which issue from the church carrying branches in their hands, and singing the hymn of Venantius Fortunatus, "*Gloria, laus, et honor.*" In the Greek Church the book of the Gospels is borne in front. In some countries a priest, or occasionally a lay figure, was led at the head, mounted upon an ass, a usage which still exists in Spain and in Spanish America. Before their return to the church the doors have been closed, and certain strophes of the hymn are sung alternately by a choir within the church and by the procession without, when, on the sub-deacon's knocking at the door with the shaft of the processional cross, it is again thrown open, and the procession re-enters. During the singing of the passion in the solemn mass, which ensues, the congregation hold the palm branch in their hands, and at the conclusion of the service it is carried home to their respective houses, where it is preserved during the year. The ashes employed in the service of Ash Wednesday are made by burning the palms of the preceding year.

PALM-SWIFT. A bird. See SWIFT.

PALM-WEEVIL. See GRU-GRU.

PALMY'RA (Lat., from Gk. Παλμυρά, translation of Heb. *Tadmōr*, Tadmor, from *tāmār*, palm-tree). The Greek Tadmor, connected by tradition with a city built by King Solomon (I. Kings ix. 18; II. Chron. viii. 4), an ancient city in an oasis of the Syrian desert, 150 miles northeast of Damascus (Map: Turkey in Asia, G 5). It owed its importance to two springs of water which produced luxurious vegetation. Being halfway between the Orontes and the Euphrates, it became, at an early date, a caravan station for the trade between the Mediterranean and the Tigris-Euphrates Valley. Its population was, therefore, always hybrid, though in the main Aramean. The city is first mentioned in B.C. 41 in connection with the wars of Antonius against the Parthians, when the Triumvir made an unsuccessful attempt to possess himself of its riches. At an early time it was reckoned as belonging to the Roman Empire, though retaining a large measure of independence. No Roman troops were stationed here, and Palmyra had to patrol the district between Damascus and the Euphrates with her own troops. In the wars of Trajan the city was almost destroyed, but was rebuilt by Hadrian (130) and called Hadrianopolis or Hadriana Palmyra. It was made a Roman colony under Caracalla (212), receiving the *Jus Italicum*. In the course of time a semi-independent monarchy was developed here. Originally it was governed by a senate, at the head of which was a senator. The first senator of whom we have mention was Hairan, son of Wahballat (222-235), who took the name of Septimius.

He was followed by his son Udainath (Odenathus), who in turn was followed by his son Hairan (Septimius Hairanes, died 255). He was followed by his brother Udainath II., who, though still called *Vir Consularis*, was made King of Palmyra and Viceroy of the Emperor for the East. After his death he received the high-sounding title of 'King of Kings' (inscription of the year 271). The city itself was governed by another Palmyrene, Septimius Varodes, as procurator. Udainath took the part of Rome in her war against the Persian King Sapor; relieved Edessa, recovered Nisibis and Carrhæ (264), marched against Ctesiphon, drove out the Persians, expelled the Goths from Cappadocia, and marched into Emesa (266). He seems to have had Armenia, Cilicia, Cappadocia, Syria, and Arabia in his power. He was killed in the year 267. His son Wahballat (Athenodorus) was too young to rule, and the Prince's mother, Zenobia (in Palmyrene Bat-Zabbai), wielded the sceptre in his stead. She bore the title 'Queen of Palmyra and the East,' and she tried to free herself from Roman tutelage. Under her rule the Palmyrene realm reached its greatest extension. Her adviser and instructor in Greek was the Platonic philosopher Longinus. She defeated the Roman army under Heraclianus, and attempted to add Egypt to her dominions, sending thither Zabdas with an army of 70,000 men. Though he occupied Alexandria for a time, he was driven out of Egypt (270) by Probus, the general of Aurelian. The Emperor himself marched against her in 272, and being only weakly supported by the Parthian Varahran, she was defeated in Syria, and Palmyra was besieged. Zenobia escaped to the Euphrates, but was captured and graced the triumph of the conqueror in 274. While Aurelian was on his way home the Palmyrenes rose, appointed a certain Antiochus their ruler, and massacred the Roman garrison. Aurelian turned back and destroyed the city (273), taking the most beautiful spoils of the Temple to Rome. The city now lost its chief importance as a trade centre, the caravans being sent via Bosra and Ctesiphon. An attempt was made by Diocletian (284-305) to rebuild the city. It was the seat of the first Illyrian regiment, and later became also the seat of a Christian bishopric. Justinian rebuilt the churches and the public buildings and placed a garrison there. The city, however, continued to decline. It was taken by the Arabs under Khalid in 634, destroyed again in 744, severely injured by an earthquake in 1157, and plundered by the Tatars under Tamerlane in 1401. Toward the end of the sixteenth century the Druse chieftain Man Oghlu fortified it; but the fortifications were destroyed by the Turks in the seventeenth century. Since then the place has been occupied by the Aneze Bedouins. The modern city is a miserable conglomeration of Bedouin huts, containing about 1500 souls.

Palmyra was an Aramean city, thickly overlaid with Greek culture. Its municipality was patterned after those of the other Greek cities in the Roman Empire. Its officials had Greek titles. With the district around it, it formed a separate tariff union, the customs being collected by the community itself. The tariff of duties, engraved on stone, found in 1882, is in Palmyrene and Greek. The caravans formed regular associations, the leaders of which were the prominent and influential men of the place. There were also guilds of goldsmiths and silversmiths. Remains of a Jewish synagogue were found there by Euting in 1883, and Mitwoch in 1899. The ruins of Palmyra were discovered by Huntington in 1678 and were visited by Wood and Dawkins in 1751. Since then many travelers have described these ruins and have given an idea of the beauty and stateliness of this city in the desert at the time of its grandeur. The great temple of Baal had a colonnade of 390 columns of the Corinthian order, and was surrounded by walls 50 feet high. There must have been numerous other shrines, as the Palmyrene pantheon was quite extensive. The walls of Justinian still remain, as well as the ruins of the aqueduct and many beautifully carved commemorative towers. The Palmyrene language belonged to the western branch of the Aramaic family. The script is a development of the Aramaic branch of Semitic writing and is the direct parent of the square Hebrew. A large number of grave inscriptions have been found, not only in Palmyra itself, but also in Rome, Africa, and Britain, the latter set up by soldiers of Roman legions at one time quartered in Palmyra. Most of the grave inscriptions are accompanied by reliefs of the dead persons, most beautifully executed. The inscriptions are often bilingual and two have been found in Dacia only in Latin. Other inscriptions have been found engraved upon clay medallions, which evidently served as talismans. Consult: Mommsen, *Römische Geschichte*, vol. v., ch. ix. (3d ed., Berlin, 1886); Von Oppenheim, *Vom Mittelmeer zum Persischen Golf*, vol. i., ch. viii. (Berlin, 1899); Wright, *An Account of Palmyra and Zenobia* (New York, 1895); Abamelek-Lasarew, *Archäologische Untersuchungen* (Saint Petersburg, 1885); De Vogüé, *Inscriptions semitiques* (Paris, 1869); Sallet, *Die Fürsten von Palmyra* (Berlin, 1866); Moritz, *Zur antiken Topographie der Palmyrene* (Berlin, 1889).

PALMYRA. A city and the county-seat of Marion County, Mo., 16 miles southwest of Quincy, Ill., on branches of the Chicago, Burlington and Quincy Railroad (Map: Missouri, E 2). It has Centenary Academy, a fine courthouse, fair grounds, and a 'Big Spring.' The industries are represented by flour and grist mills, a creamery, a pickle factory, and a carriage and wagon factory. Settled in 1818, Palmyra was laid out in the following year, and incorporated in 1855. Population, in 1890, 2515; in 1900, 2323.

PALMYRA PALM (named from the city of Palmyra in Syria), *Borassus flabellifer*. A species of palm with a magnificent crown of fan-shaped leaves. It occurs throughout India and the Archipelago, and in tropical West Africa. The stem attains a height of 20 to 100 feet, and tapers slightly upward. The leaves are about 4 feet long, with spiny-edged stalks of about the same length, each leaf having 70-80 rays. The fruit is somewhat triangular, about the size of a child's head, having a thick, fibrous, and rather succulent yellowish-brown or glossy black rind, and containing three seeds each as large as a goose's egg. The Palmyra palm is the most common palm of India, growing spontaneously in many districts, cultivated in others, and reaching as far north at latitude 30°. It is one of the most valuable palms known, more

than 800 uses having been enumerated for its different parts. It is of slow growth, and the wood near the circumference of the stem in old trees is very hard, black, heavy, durable, susceptible to a high polish, and valuable, easily divided in a longitudinal direction, but very difficult to cut across. The Palmyra palm abounds greatly in the north of Ceylon, forming extensive forests; and the timber is exported to the opposite coast of India, being of superior quality to that which is produced there. It is much used in house-building. The stalks of the leaves are used for making fences, etc. The leaves are used for thatching houses; for making baskets, mats, hats, umbrellas, and large fans; and for writing upon. Their fibres are employed for making twine and small rope. A fine down found at the base of the leaf-stalks is used for straining liquids and for stanching wounds. The Palmyra palm yields palm wine, arrack, and sugar (*jaggery*) of India. (See ARRACK.) The fruit is cooked in a great variety of ways, and used for food. The seeds are jelly-like, and palatable when young. A bland fixed oil is extracted from the fruit. The young plants, when a few inches high, are esteemed as a culinary vegetable, being boiled and eaten generally with a little of the kernel of the cocoanut; and sometimes they are dried and pounded into a kind of meal. Multitudes of the inhabitants of the north of Ceylon depend almost entirely on the Palmyra palm to supply their wants. In the 'Palmyra regions' of the southern Deccan vast numbers of the people subsist chiefly on the fruit of this palm.

The Deleb palm, so important to the inhabitants of Central Africa, formerly considered as a distinct species, is now believed to be the same as the Palmyra palm.

PALMYRA WOOD. Properly this name applies only to the wood of the Palmyra palm (*Borassus flabellifer*), but it is generally used for all kinds of palm-tree wood upon the market, of which very much is the wood of the cocoanut palm (*Cocos nucifera*) and the allied species *Cocos plumosa*. These woods are also called speckled wood and porcupine wood by the dealers, the former name being applied to those veneers cut transversely, and showing the ends of numerous black fibres mixed with the lighter colored portions, and the latter to longitudinal sections, in which the mixed black and white fibres much resemble porcupines' quills.

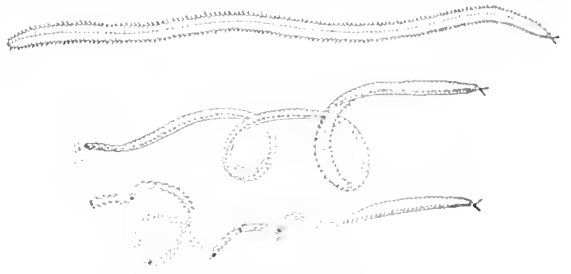
PALO, pä'lō. A town of Leyte, Philippines, situated on the northeast coast, six miles south of Tacloban (Map: Philippine Islands, K 8). Population, 17,736.

PALO ALTO, pä'lō ăl'tō. A town in Santa Clara County, Cal., 33 miles southeast of San Francisco, on the Coast Division of the Southern Pacific Railroad (Map: California, B 3). It has a beautiful location and healthful climate, and is the seat of Leland Stanford Junior University (q.v.), and of a large Roman Catholic theological seminary. There are municipal water-works and a municipal electric-light plant. Palo Alto was settled in 1890-91, and was incorporated in 1894. Population, in 1900, 1658.

PALO ALTO. A place in southern Texas, 8 miles northeast of Brownsville (q.v.), where on May 8, 1846, the first important battle in the war between Mexico and the United States was fought. 2300 Americans under General Taylor defeating about 6000 Mexicans under General Arista. It was essentially an artillery battle, though the Mexicans made a futile cavalry charge late in the day. Early on the following day General Arista retreated, and took up a strong position at Resaca de la Palma (q.v.), where he was again defeated. The Americans lost at Palo Alto 7 killed, 47 wounded; the Mexican loss was 252. After the battle Arista retreated to Resaca de la Palma. Consult: Bancroft, *History of Mexico*, vol. v. (San Francisco, 1885); and Howard, *General Taylor* (New York, 1892), in the "Great Commanders Series." See MEXICAN WAR.

PALO DEL COLLE, del kōl'lā. A town in the Province of Bari delle Puglie, Italy, 12 miles southwest of Bari. It is in a fruit-growing region, and carries on a trade in wine and cattle. Population (commune), in 1881, 10,278; in 1901, 12,851.

PALOLO (pa-lō'lō) **WORM** (Samoan name, Fijian *mbulolo* or *bololo*). One of the annelid worms (*Eunice viridis*) allied to Nereis, which on a certain night in November appears in immense numbers at the surface of the shores of the Samoan and Fiji islands. It is then collected as food by the natives and considered a great delicacy. In this worm the sexual or hinder part of the body (epitoke), when the eggs or sperm are ripe, separates from the rest of the body and swims to the surface, where the reproductive elements are discharged, after which the worm collapses and dies. The swarming of this singular worm has been observed by A. Agassiz, at Bololo Point, Fiji Islands. On his arrival, before daylight, his guide fished up a few of the worms, and soon the water was full of them, both males and females, and men and women were catching them in all kinds of utensils. Their activity was wonderful, and the bursting of the animal when reproduction was over was most peculiar.



1. Palolo worm, the anterior end of the body at the right; 2, the same discharging the sexual products in the water from broken front end of body; 3, the same breaking into pieces and discharging the sexual products from the rents. (After Mayer.)

The Atlantic palolo worm (*Eunice fucata*) is abundant at the dry Tortugas, Fla., near Porto Rico, and probably it will be found to be widely distributed. The animal commonly lies coiled upon itself within its burrow, and very often another worm (*Polynoë granulata*) is found sharing the same burrow. The worm does not

liv[illegible] in new and compact coral rock, or in coquina of recent formation, but abounds in that which is disintegrating and has become infested with [illegible]das shells, other worms, crustaceans, etc. The burrow of the palolo always opens outward at the surface of the rock, although as far as is known the worm never leaves its burrow permanently until the time of the breeding-swarm. The Atlantic palolo swarms within three days of the time of the moon's last quarter, between June 29th and July 28th. When the swarm occurs the hinder end of the worm crawls out backward from the burrow, and attempts to swim away from the anterior, non-sexual part, which remains within the burrow. A constriction appears, allowing the sexual portion to break away from the anterior part of the worm; and immediately the posterior end darts upward to the surface, upon reaching which it continues to swim hind end foremost very near to the surface of the ocean. The worms move in all directions and begin to discharge sperm or eggs through their genital outlets (nephropores), but the least stimulus, such as being lifted from the water, or the current from the stroke of an oar, will cause them to contract violently, often breaking themselves into fragments and casting the sexual products out through rents in the skin. This normally occurs as soon as the first rays of the sun fall upon the water, and in a few minutes after sunrise all the worms will have completely freed themselves of genital products, so that the ocean becomes milky with the vast quantity of sperm and eggs. Two or three hours after sunrise no worms remain to be seen. In a dense swarm there may be on an average about one worm per square foot over wide areas of the sea, commonest where the water is about six fathoms in depth. Great numbers of the worms are devoured by fishes as they sink, although they are not attacked to any great extent while on the surface. When set free the sexual ends swim vertically upward with such rapidity that they run little risk of capture, and this habit must be a great advantage to the worm. If the swimming worm be broken into fragments each piece continues to swim backward in a normal manner, showing that the reaction is not controlled by any one ganglion, or localized group of ganglia, but that the whole sexual end of the worm is affected by the stimulus which causes the breeding-swarm.

PALOMINO DE CASTRO Y VELASCO, päl'ō-mē'nō dā kä'strō ē vā-lä'skō, Acisclo Antonio (1653-1726). A Spanish painter and author, born at Bujalance. He studied under Valdés Leal and Alfaro at Cordova. Afterwards he was associated with Claudio Coello at Madrid, and became Court painter in 1688. He executed a number of large frescoes at Valencia, Salamanca, Granada, and Madrid, which are clearly designed. He wrote *El museo pictorico y escala optica* (1715-24), which contains a history of art and a biographical dictionary from Antonio del Rincon to his own time. It furnished much of the material for the later work of Ceán-Bermudez.

PALOS, päl'ōs, or Palos de la Frontera. A small town on the southwest coast of Spain in the Province of Huelva, near the mouth of the Rio Tinto (Map: Spain, B 4). It was formerly an important port, and from here Columbus set sail with his three caravels on August 3, 1492, on the voyage which resulted in the discovery of America. Population, in 1900, 1619.

PALPITATION (Lat. *palpitatio*, from *palpitare*, to throb, frequentative of *palpare*, to feel, move quickly). The term used to signify inordinately forcible pulsations of the heart, so as to make themselves felt, and frequently to give rise to a most troublesome and disagreeable sensation. It may be either functional or a symptom of organic disease of the heart. Although it may be persistent, it far more frequently comes on in paroxysms, which usually terminate within half an hour, recurring afterwards quite irregularly, sometimes daily or several times a day, and sometimes not till after a long interval. The attack often comes on under some mental or physical excitement, but sometimes when the patient is quite composed, or even asleep. If the paroxysm is a severe one, the heart feels as if bounding upward into the throat; and there is a sensation of oppression over the cardiac region, with hurried or even difficult respiration, and even nausea. In milder attacks there is simply a consciousness of sinking or fluttering of the heart.

Palpitation is due to many different causes. It is more common in women than in men, and is apt to occur especially at puberty, the menstrual periods, and the menopause. An anæmic condition of the blood is a frequent cause. Palpitation is present in unstable states of the nervous system, such as occur in neurasthenia, hysteria, worry, anxiety, and excitement. The excessive use of tea, coffee, alcohol, and tobacco predisposes to cardiac irregularities. Perhaps the most frequent cause is a flatulent and distended stomach, acting both reflexly and directly. Palpitation is a symptom of exophthalmic goitre, and lastly it is a concomitant of organic disease of the heart itself. Either hypertrophy or degeneration of the cardiac muscle may produce it as well as affections of the valves.

The treatment of palpitation naturally depends on the causation. When the stomach is at fault, dietetic errors will need to be corrected. Tea, coffee, alcohol, and tobacco should be interdicted, since they not only affect the nerves, but hurt the digestion. Anæmia calls for iron, and neurotic conditions for sedatives such as the bromides, valerian, and camphor. When the cardiac muscle is diseased and palpitation is an expression of weakened power, digitalis, strychnine, and other cardiac stimulants must be given. During the paroxysms, relief may be had from the diffusible stimulants, as ammonia, in the form of the aromatic spirit.

PALSGRAVE, päl'grāv, John (c.1480-1554). An English grammarian, chaplain to Henry VIII. He was born in London, studied at Corpus Christi, Cambridge, and at the University of Paris, and taught French to Henry's sister, the Princess Mary, whom he accompanied to Paris on her marriage to Louis XII. Thanks to her favor, he was rapidly advanced in ecclesiastical honors. About 1517, as we know from the testimony of Sir Thomas More and of Erasmus, Palsgrave studied at Louvain, and, eight years after, he was appointed tutor to the Duke of Richmond, a natural son of Henry VIII. Palsgrave is known now as the author of one of the earliest French grammars for English use,

Lesclarcissement de la Langue Francoyse (1530), a work which still has value as a treasury of idiomatic English of this unliterary period. It is very rare and was reprinted in France in 1852. Palsgrave translated into English Fullonius's Latin comedy *Acolastus* (1540).

PALSY. See PARALYSIS; PARALYSIS AGITANS.

PALTOCK, pâl'tŏk, ROBERT (1697-1767). An English author, born in London. He was educated at Saint Paul's School, studied law, and always lived in London. His fantastic romance, *The Life and Adventures of Peter Wilkins, a Cornish Man*, which probably appeared first in 1750, was published anonymously, and the author was not known for several years. He also wrote an inferior work, *Memoirs of the Life of Parnese* (1751).

PALUDAN-MÜLLER, pä'lu-dân mu'lĕr, FREDERIK (1809-76). A Danish poet, born at Kjerteminde. He entered the University of Copenhagen in 1828, studied law there, and afterwards traveled abroad. As early as 1831 he became known through some of his poems. A year afterwards his play *Kjaerlighed ved Hoffet* ("Love at Court") was successful, and the Byronic *Dansersinden* (1833) and the lyric drama *Amor og Psyche* (1834) established his reputation. But his most important work is *Adam Homo* (1841-48), a novel in verse. His other writings include: *Abels Død* (1854), *Dryadens Bryllup* (1844), *Benedikt fra Nursia* (1861), *Paradiset* (1861), *Absurcus* (1861), *Kalanus* (1861), the last a notable poem on the life of the Indian sage, and *Adonis* (1874), a romance, also in verse. His *Poetiske Skrifter* were published in 1878-79. His two prose works, *Ungdomskilden* ("The Fountain of Youth," 1865) and *Ivar Lykkes Historie* (1866-73), are among his most characteristic productions, although it is as a poet that he is best known.

PALUDISM. See MALARIA AND MALARIAL FEVER.

PALUS, pä'lōōz. A tribe of Shahaptian stock (q.v.) occupying the country about Palouse River and the adjacent portion of Snake River in southeastern Washington. They are closely connected with the Nez Percé and Yâkima, but, although mentioned as parties to the treaty made with the latter tribe in 1855, they have never come upon a reservation or recognized any treaty limitations, but still continue a wandering existence within their ancient territory. They retain most of their primitive characteristics and adhere to the religion of Smohalla (q.v.). They are supposed to number from 400 to 500.

PALY. A term in heraldry (q.v.).

PAMEKASAN. The capital of the island of Madura (q.v.).

PAMELA, OR VIRTUE REWARDED. A novel by Samuel Richardson (1740). Begun as a series of letters for the use of the illiterate, it grew into the story of a maid-servant dishonorably pursued by her mistress's son, who, after her withstanding his advances, finally married her. With all its defects, it is of interest as marking the starting point of the modern novel.

PAMIERS, pâ'myâ'. The capital of an arrondissement and an episcopal see in the Department of Ariège, France, on the Ariège, 40 miles south of Toulouse (Map: France, H 8). It has an ancient cathedral of mixed architecture, a communal college, a seminary, and a large hospital. It manufactures hardware, woolens, paper, and flour; has iron foundries and saw mills, and a trade in corn and wine. Population, in 1901, 10,886.

PAMIR, pâ-mēr', or THE PAMIRS (Pers. *Bāmi-dunyā*, Roof of the World). An elevated mountain region in Central Asia, forming in greater part the southeastern corner of Russian Turkestan, and bounded by Chinese or East Turkestan on the east and Bokhara and Afghanistan on the west, while on the south a narrow projection of Afghanistan separates it from the extreme northwestern part of British India (Map: Asia, G 5). It stretches in either direction about 170 miles, and its area is estimated at 36,000 square miles. Along its eastern boundary runs the short but lofty Sarikol Range, which is the nucleus from which the four great mountain systems of Central Asia radiate, the Hindu Kush toward the west, the Himalayas to the southeast, the Kuen-lun to the east, and the Tian Shan to the northeast. The culminating point of the Sarikol is the Mustagh-ata, 25,790 feet (or 24,400 feet, according to most recent measurements) above the sea. Westward the Sarikol sends out a number of parallel spurs or cross ranges dividing the country into level-floored valleys four or five miles broad. These valleys, which are known as Pamirs and form the characteristic feature of the country, lie from 10,000 to 14,000 feet above sea level. They differ in formation from the Tibetan Plateau, and seem to have been originally deep river-gorges which have been filled with detritus from the mountain sides. They are watered by the headstreams of the Oxus, and contain a number of beautiful lakes. The climate is very severe, cold and stormy; the mountains are always, and the valleys for more than half of the year, covered with snow. The country is treeless, but the valley floors are covered with grass which yields rich pasture in summer.

Though there is a considerable population in the extreme western valleys, the population of Pamir proper, or Russian Pamir, is very sparse, consisting only of a few hundred nomadic Kirghiz seeking the pastures during summer. The great plateau of Pamir was formerly regarded as the place of dispersion, if not of origin of the Aryan or Indo-European peoples. Its ethnological importance is lessened by the fact that the best opinion among investigators of Aryan prehistory to-day fixes the seat of this great branch of the white race in some part of Northern or Eastern Europe. The Pamirian region is, however, interesting from the fact that about it cluster Aryan peoples of a rather primitive sort, the remnants, in all probability, of the Aryan invasion of Asia and the representatives of a comparatively undeveloped Aryan character. Eastward of the Pamir was also the primitive home of the Chinese, while north of it lay the region of development of the Tatar or Turkic peoples. South of it various Aryan tribes have lived and wandered for ages. Here naturally, as languages, religions, customs, and habits show, considerable intermingling of races has taken place.

Considerable interest has been centred around

Pamir owing to its frontier position between Russian and British possessions, and during the last three decades of the nineteenth century it was probably more thoroughly explored than any other part of Central Asia. Great Britain desired in 1891 to have the region portioned between Afghanistan and China, but in the same year Russia sent an official expedition into the country in order to substantiate its claims. In 1895 the boundaries were defined as outlined above by a treaty between Russia and Great Britain. Russia has established a fortified outpost, Pamirsky Post, on the Murghab River. Consult: Bonvalot, *Through the Heart of Asia* (London, 1889); Geiger, *Die Pamirgebiete* (Vienna, 1887); Dunmore, *The Pamirs* (London, 1893); Cobbold, *Innermost Asia* (New York, 1900).

PAMLICO (păm'lē-kō) **SOUND.** The largest of the numerous sea-lagoons which line the eastern coasts of the United States. It stretches along the coast of North Carolina from Roanoke Island 80 miles southward, and has an average width of 20 miles (Map: North Carolina, F 2). It is separated from the Atlantic Ocean by long, narrow sand bars or beaches, which run out into an angle known as Cape Hatteras, and which are broken by the Ocracoke and Hatteras Inlets. The depth along the centre of the sound ranges from 10 feet in the north to 20 feet in the south, but on either side are large areas of shallow water, and the inner shores are lined with marshes. The Neuse and Pamlico rivers enter the sound through large estuaries, and north of Roanoke Island the Pamlico connects with the Albemarle Sound (q.v.). The fisheries on the Pamlico are important, and large numbers of wild fowl frequent its waters.

PAMMARI, păm-mä'rē. An Indian tribe of Brazil. See PURU-PURU.

PAMPA, păm'pä, LA. A territory of Argentina, bounded on the north by the provinces of Mendoza, San Luis, and Córdoba; on the east by Buenos Ayres; on the south by the Territory of Rio Negro; and on the west by the Territory of Neuquén and the Province of Mendoza (Map: Argentina, D 11). Its estimated area is 56,320 square miles. Its territory belongs almost wholly to the pampas region, with some hills and woodlands in the northwest, and médanos (shifting sand hills) in other portions. The Rio Colorado forms its southern boundary with an affluent, the Curaco, wholly within its territory. There are many lagoons and small lakes, into the largest of which flows the Rio Salado. Since the Indians were driven out in 1879 the country has been occupied by sheep and cattle ranches. The capital of the territory is General Acha (population about 2000), which has railway communication with the coast. The population of the territory, in 1895, was 25,914; in 1900 (estimated), 46,662.

PAMPANGA, păm-păn'gä. A province of Central Luzon, Philippines. It is situated north of Manila Bay, and bounded on the north by the Province of Tárlac, on the east by Bulacán, and on the west by Zambales (Map: Luzon, D 6). Its area is 2209 square miles. It is mountainous in the west, but the eastern and southern portions are taken up by a part of the low and marshy delta of the Rio Grande de la Pampanga. Agriculture is extensively carried on, yielding rice, sugar-cane, sweet potatoes, tobacco, and cotton. Industries are also well developed; just before the Spanish-American War there were over 12,000 looms and 177 steam sugar mills in operation. The population of the province in 1901 was 223,922, chiefly of the Pampanga race. The capital is Bacolor (q.v.).

PAMPANGA, RIO GRANDE DE LA. The second largest river of Luzon, Philippines, draining the greater part of the large central plain between Manila Bay and the Gulf of Lingayén (Map: Luzon, E 5). It rises on the Caraballo Sur and flows southward through the provinces of Nueva Ecija and Pampanga, emptying into Manila Bay through the numerous ramifications of a large, marshy delta. It is about 125 miles long, and receives several large and innumerable small tributaries. In the rainy season its inundations cover large extents of territory, which are converted into excellent rice fields.

PAMPANGO, păm-păn'gō. A group of tribes in Central Luzon speaking a Malay language and having at the conquest by Spain their own culture and mode of writing.

PAMPAS, păm'păz (Sp., Port. *pampa*, from South American Indian *pampa*, Quichua *bamba*, *banba*, plain). The designation of certain plains in South America. In Peru the name is applied to the forested region along the Ucayali River and also to the dry lake basins on the Andean Plateau. The more common signification of the term, however, refers to the immense grassy plains which occupy the central part of Argentina between the Rio Salado on the north and the Rio Negro on the south and which merge into the forested region of the Gran Chaco and the steppes of Patagonia. The pampas comprise an area of about 250,000 square miles, with a flat or gently undulating surface sloping toward the southeast and south. On their western border the elevation ranges from 1000 to 1300 feet above the sea, while along the Atlantic it is generally less than 100 feet. The soil is mostly clay of Quaternary and Tertiary age. During the wet season a luxuriant growth of grasses covers the plains, affording pasturage to great herds of cattle and flocks of sheep. A portion of the region along the Paraná is adapted to agriculture, and there are smaller areas of arable land in the interior. In the northern and western parts the surface is often broken by deep ravines or barrancas and by shallow depressions which are filled with brackish water during a part of the year. Strips of sandy, arid land are known as travesías. The inhabitants comprise the half-wild gauchos of mixed Spanish and Indian blood, who are chiefly occupied in hunting and grazing, and European immigrants. See ARGENTINA.

PAMPAS CAT. A robust, yellowish-gray wild cat, of the Argentine pampas and La Plata Valley. It is striped with straw-colored bands running obliquely backward across the flanks, and horizontally on the chest and legs. It has an exceedingly short head, and only two premolar teeth in the upper jaw. Other names are 'grass-cat' and 'straw-cat.' Hudson (*Naturalist in La Plata*, London, 1892) speaks of it as one of the most characteristic animals of the pampas; and Mivart notes the resemblance between it and Pallas's cat (*Felis manul*) of the steppes of Russia.

PAMPAS DEER. A small deer of Argentina (*Cervus campestris*), locally called 'guazuti,'

whose antlers are marked by the development of the forked posterior tine, and a consequent stunting of the unbranched front tine, giving three points to each antler. See Plate of FALLOW DEER, MUSK, ETC., with DEER.

PAMPAS DEL SACRAMENTO, dĕl säk'rä-mān'tō. An extensive plateau region in Northeastern Peru between the Huallaga and Ucayali rivers. It consists largely of open savanna country, and was settled by Jesuit missionaries in the middle of the eighteenth century, but is now almost uninhabited.

PAMPAS GRASS (*Gynerium argenteum*). A grass common in Brazil and Argentina, usually along watercourses, and not, as formerly stated, upon the pampas or vast plains of South America. It has been introduced into various countries as an ornamental plant. It is quite hardy in England, but requires protection in winter as far north as New York. Its tufts have a splendid appearance. The leaves are six to eight feet long, the ends hanging gracefully; the flowering stems 10 to 14 feet high; the panicles of flowers silvery white, and from 18 inches to 2 feet long. The herbage is too coarse to be of any agricultural value. The male and female flowers are on separate plants, in panicles, the palee of the female florets elongated, awn-shaped, and woolly. The pampas grass is grown commercially in California, where it was introduced about 1880. Another Brazilian species of the same genus, uva grass (*Gynerium saccharoides*), yields a considerable quantity of sugar. Stapf, in a monograph of this genus, published in the *Gardener's Chronicle* for 1897, separates the genus, placing the pampas grass in the genus Cortaderia, and leaves *Gynerium saccharoides*, or uva grass, as the only representative of Gynerium. For illustration, see GRASSES.

PAMPELUNA, päm'pā-lōō'nä. A city of Spain. See PAMPLONA.

PAM'PHILUS (Lat., from Gk. Πάμφιλος, *Pamphilos*). A Greek painter of the early fourth century B.C. He was a native of Amphipolis, but studied and lived at Sicyon, where he succeeded his master, Eupompos, as the head of the Sicyonian school. Of his works we hear of a "Battle at Phlius," painted for the Athenians, "Odysseus on the Raft," and apparently of a "Cognatio" or "Relationship," which may have been a family group, though the text of Pliny is probably corrupt at this point. It is possible also that Aristophanes refers to a painting by him of the Heraclidæ as suppliants at Athens. He was noted for his thorough technical knowledge, insisting that arithmetic and geometry were necessary to the painter, thus performing for painting a service similar to that which the Canon of Polyclitus did for sculpture. Through his influence, we are told, drawing was introduced into the schools as part of the education of free-born boys. This scientific training always characterized the Sicyonian school, and was emphasized by the great pupils of Pamphilus, Apelles and Melanthius.

PAMPHILUS (?-309). A Christian teacher and writer of the fourth century. He belonged to a good family of Berytus (Beirut, Syria, studied under Pierius of Alexandria, and spent most of his life as a priest at Cæsarea in Palestine, where he founded a Christian school and established a valuable and celebrated ecclesiastical library. He multiplied copies of the Scriptures and gave liberally to the poor. He was an admirer of Origen and teacher of Eusebius, who took the name of Eusebius Pamphili. With Eusebius he prepared an edition of the *Septuagint* from the text in Origen's *Hexapla*, which was generally used in the Eastern Church. During the persecution of the Christians under Maximinus he was imprisoned (307-309) and employed himself in writing an apology for Origen in five books, to which Eusebius added a sixth. All of the work has perished and our knowledge of it depends upon the untrustworthy Latin translation by Rufinus of Book I. and Photius's summary. Pamphilus died a martyr in 309. Consult his literary remains in Migne, *Patrol. Græca*, xx., xvii.

PAMPHLET (of uncertain etymology). A small book, whether stitched or bound, with or without covers, written to provoke discussion on some topic of current interest. On its first appearance among English writers, the word seems to have been used to designate any booklet, whatever its aim. It was so employed by Richard of Bury (died 1345), in his *Philobiblon*, a Latin hand-book to his library at Durham College; and by Caxton in his *Eneydos* (1490), where printed matter is classed as 'pamflettis and bookys.' Sometimes single pieces of verse in manuscript or in print were also called pamphlets by the poets of the fifteenth century. But since the Reformation, when pamphlets began to be employed in controversy, they have come to stand mainly for a class of writings that deal with questions of the day, in politics, religion, and literature. They are thus to be differentiated from academic theses and dissertations and from all other short scientific treatises written with a calm didactic aim. Besides being brief, pamphlets are spirited in style and often vehement and angry in tone. The sober pamphlet is represented by Sidney's *Apologie for Poetrie*, and the vehement by Milton's *Tenure of Kings and Magistrates*. Both are pamphlets by virtue of their controversial aims.

A history of English pamphlets would fall little short of a history of English institutions from the establishment of the House of Tudor to the death of George III. In them as nowhere else is to be found the story of the fierce controversies whereby Protestantism won against the Roman Catholic Church, and whereby the English people wrested from their kings their social and political rights. Several hot debates have also marked the course of our literature. Somewhat earlier than the date here assigned, the pamphleteer was abroad. Wiclif, for example, circulated among the people little sheets copied by the poor priests, in which an appeal was made against the abuses of the professional clergy and against the current authority in religion. Of these tracts the *Septem Heereses* is perhaps the most famous. The beginning of the Reformation in England has been ascribed, of course with exaggeration, to the *Supplycacyon of Beggers* (1529) of Simon Fish, copies of which were strewn abroad in the streets of London, apparently with the connivance of Henry VIII. As no other pamphlet had yet done, it let the public view concerning "the ravens in wolves going in shepherds' clothing and devouring the

flocks.' With little effect Sir Thomas More replied to Fish in the *Supplycacyon of Soulys*. This incident is but an example of what was taking place everywhere throughout the Reformation period. Erasmus, Luther, and Melanchthon were all pamphleteers. The Anglican Church was no sooner established than it was attacked by the Puritans, for example, by Thomas Cartwright in an *Admonition to the Parliament* (1572). Then followed the Martin Marprelate controversy (q.v.), the most heated religious dispute in the reign of Elizabeth. At this time, too, were debated, in stitched sheets of varying length, questions in literature, especially the essence and form of poetry, and the principles underlying the drama. In these discussions some of the great Elizabethans bore a hand, like Campion, Daniel, and Sidney.

Numerous as were the pamphlets in the Elizabethan age, they were but a sign of the deluge that was to come during the great Civil War, when the passions of sects and factions ran high. Prynne alone, it is estimated, was the author of nearly two hundred pamphlets, of which may be cited *A Looking Glass for All Lordly Prelates*. If he was the most prolific of all the Puritan pamphleteers, it must be remembered that he was only one among hundreds. Indeed, on both the Puritan and Royalist sides the news-letters which were issued in all the larger towns were little more than controversial pamphlets. Milton dropped his poetry and entered the lists on a variety of questions, discussing in turn education, divorce, the press, and the right to put to death kings and magistrates. Substantial as are Milton's tractates, as he sometimes called them, he was surpassed in brevity and directness by Col. Edward Sexby in *Killing No Murder* (1657), addressed to 'His Highness, Oliver Cromwell,' and containing the memorable sentence: "Let this consideration arm and fortify your Highness's mind against the fears of death, and the terrors of your evil conscience, that the good you will do by your death will something balance the evils of your life."

After the Restoration (1660), freedom to print was strongly repressed by the Government, and pamphlets had to be printed and circulated privately. Still, one should not forget *A Rough Draft of a New Model at Sea* (passed about in manuscript during 1667), in which George Savile, Marquis of Halifax, attacked the scandalous behavior of the navy in the war with the Dutch; nor the protests of the Quaker George Fox against the formalism of the established Church; nor the virulent debate between Samuel Parker and Andrew Marvell on the relation of Church and State. Much of the literature of the time, as Dryden's essays and satires, was also controversial in tone and was issued in pamphlet form.

Dr. Johnson was probably right in describing the reign of Queen Anne as *par excellence* the age of pamphlets. The Revolution of 1688 had transferred political power to the House of Commons; two great parties, Whig and Tory, had come into existence, depending for the retention of office upon the people; and by the lapse of the licensing act in 1695, the press had become practically free. As the newspaper had not yet become thoroughly organized, the pamphleteer was a necessity for explaining, defending, and attacking public policies. Party spirit extended to literary questions, and dissent from the State Church was assuming new forms. Under these circumstances, the pamphleteer reaped a harvest. To pass over the horde of minor writers, the Marquis of Halifax, already mentioned, paid his compliments to Whig and Tory, in *Some Cautions for the Choice of Members of Parliament* (1695), and gave the Dissenters some excellent advice in *A Letter to a Dissenter* (1687), a tract that went everywhere and provoked a score of replies. Defoe in *The Shortest Way with the Dissenters* (1702) urged the complete extirpation of all Dissenters—a piece of irony surpassed only by Swift. Charles Leslie—"a reasoner not to be reasoned against," said Dr. Johnson—rode roughshod over Quakers and Deists. William Law attacked the latitudinarian opinions of the Bishop of Bangor, and two hundred pamphlets followed from fifty different pens. Of all his contemporary pamphleteers, Swift was easily the prince. His *Argument to Prove that the Abolishing of Christianity . . . May be Attended with Some Inconveniences* (1708) is a superb example of ironical humor. Swift also performed valuable services to the Tories in many pamphlets, of which may be mentioned *The Conduct of the Allies* (1711) and *Some True Thoughts Upon the Present State of Affairs* (1714). The condition of Ireland was handled in a masterly manner in the *Drapier's Letters* containing the famous "Modest Proposal." With Arbuthnot, Pope, and others, he joined in excellent foolery aimed against literary quacks and poetasters. Of this joint work the best is perhaps *The Art of Political Lying* (1712), mostly from Arbuthnot, though Swift bore a hand.

Later in the eighteenth century there were other debates in which were active Bolingbroke, 'Junius,' who may have been Sir Philip Francis, and Burke, who defended the French Revolution. The rise of the great reviews soon after 1800 turned controversy into new channels. Still the war of pamphlets has never quite ceased. Bowles and Byron fought over the question as to whether Pope was a poet; and pamphlets played an important part in the discussion over the poor laws, the corn laws, the Crimean War, the Irish land laws, the Armenian massacres, and the struggles between the shifting parties in the Church. Even nowadays, a poet occasionally challenges his reader by issuing his verse in pamphlet form. Such, for example, seems to be the intent of John Davidson, who began in 1901 a series of verse pamphlets dealing with the religious and philosophical questions of special interest at this time. Consult Arthur Waugh, *The Pamphlet Library* (4 vols., London, 1897-98). This work contains examples of political, religious, and literary pamphlets, from Wiclif to Newman. There are also historical essays under each division.

PAMPHYL'IA (Lat., from Gk. Παμφυλία). In ancient geography, a country on the south coast of Asia Minor, with Cilicia on the east and Lycia on the west. On the north it was separated from Pisidia by the Taurus range, and the southern boundary was formed by the crescent-shaped Gulf of Attalia. The population was a mixed race, in which there was a strong Greek element, and the inscriptions show a dialect strongly resembling that of Cyprus and Areadia, which seems to indicate Greek immigration prior

to the Dorian conquest of the Peloponnesus. The chief cities, Perge, Sillæum, Aspendus, and Side, were Greek, but the country early lost touch with the mother country and plays no part in Greek history, though it was on the river Eurymedon in Pamphylia that the Athenian Cimon won his great victory over the Persians. The country was freed from the Persian rule by the conquests of Alexander, and after his death passed into the hands of the Seleucid kings of Syria. With the rise of Pergamum it became a part of that kingdom, and Attalus II. founded the city of Attalia, now Adalia. With the rest of the kingdom it passed to the Romans, and from this time shared the history of the rest of Asia Minor. For the inscriptions, see Collitz, *Griechische Dialekt Inschriften*, vol. i. (Göttingen, 1884). Consult also: Lanckoronski, *Die Städte Pamphyliens und Pisidiens* (Vienna, 1890); Ramsay, *Historical Geography of Asia Minor* (London, 1890).

PAMPLONA, pām-plō'nā (often called by English writers **PAMPELUNA**, pām'pe-lōō'nā). The capital of the Province of Navarre (Navarra), in Northern Spain, and in the Middle Ages capital of the Kingdom of Navarre. It is situated on an eminence dominating the surrounding plain among the foothills of the Pyrenees, 16 miles from the French frontier (Map: Spain, E 1). It is a military station of the first class and is surrounded by a circle of detached forts. The streets in the old quarters are narrow, while in the suburbs have sprung up many modern houses lining broad and well-kept streets. The city has three beautiful plazas, of which the Plaza del Castillo, with its arcades flanked by the edifice of the provincial deputation and the simple modern theatre, is the best, and four charming promenades and the park-like Forest of Tijería; while among the principal buildings are the Gothic cathedral, begun in 1397, with a Græco-Roman façade, and the historic Sala Preciosa, where formerly met the Cortes of Navarre; the ornate municipal palace, the viceregal palace, and the bull ring, capable of seating 8000 persons. The aqueduct of Noain, eight miles long, for a portion of its course supported by 97 arches, furnishes the city with its water supply. The town possesses also a large hospital, a provincial institute, normal schools, and a seminary. The chief manufactures are linen, flour, soaps, beverages, leather, and paper, and there are iron, lead, and copper foundries. Population, in 1887, 26,663; in 1900, 30,609.

The name Pamplona is said to be derived from *Pompeiopolis* (the city of Pompeius), though this etymology is disputed. Being a fortified frontier town, Pamplona has figured in the wars with the French and also in the Carlist wars.

PAMUNKEY, pā-mŭŋ'ki. A former leading tribe of the Powhatan confederacy (q.v.) of Virginia and one of the very few tribes of the Atlantic Coast region of the United States which have retained their organization. On the first colonization of Virginia in 1607 they were estimated at nearly three hundred warriors, being the largest tribe of the confederacy. Their most noted chiefs were Opechancano (q.v.), Totopotomoi, and Queen Anne. The war begun under Opechancano in 1622 resulted in the destruction of their town, which was burned by Governor Wyatt in 1625, after a desperate battle in which he met and defeated nearly 1000 Indians. A second rising in 1644 ended a year later in the capture and death of Opechancano and the disruption of the confederacy, each tribe, including the Pamunkey, making a separate treaty of peace and being assigned to a reservation held on condition of the payment of an annual tribute. About the year 1654 the Pamunkey suffered another terrible loss in the death of their chief Totopotomoi with nearly one hundred of his men, who had volunteered their services to the English to repel an invasion of a hostile mountain tribe. Queen Anne, the widow and successor of Totopotomoi, maintained her friendship with the English, and for her services in later Indian wars was presented with a silver coronet by the English Government. In 1781 the Pamunkey occupied the same reservation which they still hold, consisting of a few hundred acres in a bend of Pamunkey River. Here about 140 mixed-bloods still keep the name and tribal organization under State laws. They are all fishermen or hunters, making a good living from their annual catch. They do not vote or pay taxes, but still present the Governor of Virginia an annual tribute of game in token of their former submission.

PAN (Lat., from Gk. Πάν, connected with Lat. *pasci*, to feed, *pastor*, shepherd, Skt. *pā*, to protect). A Greek god of herds and hunters, pastures and forests. He seems to have been originally the god of shepherds and goatherds, while he is but slightly connected with neat cattle, which formed a very unimportant part of the wealth of the region where his cult grew up. This was especially the mountainous district of Arcadia, and the varied aspects of the god can be easily referred to the wandering life of the herdsmen, which led them from the lower pastures and valleys up to the high mountains and cooler regions in the summer. From this life also is derived Pan's connection with the hunt and fishing, as both are diversions of the herdsman's life. He seems to have passed into a war-god with the growth of the mercenary service of the Arcadians, though from relatively early times we hear of the *Panic fear*, which he inspired. This seems derived from the apparently causeless 'stampedes' of herds, often hurrying them to destruction, and the observation that similar frenzy seemed to seize an army at times and drive it into mad rout. Pan is not mentioned in the epic, and his worship seems to have spread but gradually beyond Peloponnesus. It was introduced into Athens after the battle of Marathon, when Pan was believed to have fulfilled a promise to help the Athenians. A sanctuary in a cave on the northwest side of the Acropolis was then given to him, and many votive reliefs of Pan and the nymphs attest his popularity. He was also honored with annual sacrifices and a torch race. Owing to the character of his cult, the legends about Pan are largely local. He is called the son of Zeus and Callisto and twin brother of Arcas; of Hermes and the daughter of Dryops, or Penelope; or by later mythographers, who connected the name with πᾶν, 'all,' as the son of Penelope and all the suitors. A late Homeric hymn tells of his birth, and how Hermes carried him to Olympus, where he delighted all the gods. Later philosophers, especially some of the Stoics, transformed this divinity into the great All-God, but this was never a general belief. Pan's appearance was described in accord-

ance with his nature. Goat's legs and horns, a shaggy beard and hair, and goat-like features suggest his origin, and this type is common in art, though associated from the middle of the fifth century B.C. with another, representing him as a youth, whose animal nature is only marked by short horns on the forehead. Hellenistic art also introduced female Pans and child Pans, though the Greek religion knew of but the one god. In art he became attached especially to Dionysus, perhaps on account of the satyrs. The artistic type of Pan seems also to have contributed to the development of the popular representations of the Devil in the earlier Christian art.

PA'NA. A city in Christian County, Ill., 99 miles northeast of Saint Louis, Mo., on the Illinois Central, the Baltimore and Ohio Southwestern, and the Cleveland, Cincinnati, Chicago and Saint Louis railroads (Map: Illinois, C 4). It carries on considerable trade, and is largely engaged in coal-mining. Settled in 1853, Pana was incorporated by a special charter in 1867. The government is administered under a general law of 1870, which provides for a mayor, elected every two years, and a council. The city owns and operates the water-works. Population, in 1890, 5077; in 1900, 5530.

PANÆTIUS, pā-nē'shĭ-ŭs (Lat., from Gk. Παναίτιος, *Panaitios*) (c.185-c.112 B.C.). A Greek Stoic philosopher, born at Rhodes. He studied and taught in Athens, where Lælius became his pupil. He went to Rome, and became one of the literary circle patronized by the younger Scipio; but it seems that he returned to Athens several years before his death. He belonged to the Middle (or eclectic) Stoa, borrowing much from Plato and Aristotle; and his great work on moral obligation was the basis of Cicero's *De Officiis*. Consult: Van Lynden, *De Panætio Rhodio* (Leyden, 1802), and Fowler, *Panætii Fragmenta* (1885).

PANAMA, pă'nà-mä'. A department of Colombia, South America, bounded by the Caribbean Sea on the north, the Colombian department of Cauca on the east, the Pacific on the south, and Costa Rica on the west (Map: Colombia, B 2). Its area is 31,571 square miles. The department is only sparsely settled, and the population in the cities is supported chiefly by the inter-oceanic commerce. Agriculture is in a backward state, but stock-raising is becoming important. The commerce has greatly increased since the opening of the Panama Railway, connecting Panama, the capital, with Colón. The population was estimated at 285,000 in 1896. Consult: Peratta, *Costa Rica, Nicaragua y Panamá* (Madrid, 1883); Reclus, *Panama et Darien* (Paris, 1881).

PANAMA. The capital of the Department of Panama, Colombia, situated at the head of the Bay of Panama, on the south shore of the Isthmus. It is at the southern terminus of the Panama Railroad and of the canal route (Map: Colombia, B 2). Though its streets are narrow, the town is well built, and has a large cathedral, a Jesuit college, several convents, a modern hotel, and a hospital, built by the Canal Company. The inhabitants are supported almost wholly by the inter-oceanic transit trade, and, since the definite proposal of the United States Government to complete the Panama Canal (q.v.), the importance of the town has been much enhanced. The harbor of the town itself is shallow, and large boats formerly had to anchor seven miles from the landing place, being loaded and unloaded by means of small steamers and lighters. In 1898, however, a new wharf 1000 feet long and accessible for large steamers was completed at the canal terminus. The population of the city is about 25,000. Panama was founded in 1519 by Pedro Dávila, being the first town founded by Europeans on the American continent. During the seventeenth and eighteenth centuries it was the chief port for the Spanish trade in the Pacific. In the nineteenth century its commerce declined, but received a new impetus by the completion of the Panama Railroad in 1855. It has often suffered from civil wars.

PANAMA, Isthmus of. A narrow strip of land extending between the southern end of the active volcanic region of Central America and the northern termination of the Andes (Map: Central America, G 6). Its outline is that of a gentle arc stretching in an east and west direction, its limit on the east being the Atrato River, and on the west the southeastern boundary of Costa Rica. In a broad sense much of major Central America is included in this Isthmian region, but the expression is commonly confined to the limits of country here indicated, extending between the meridians of 79° and 83° W. longitude, or about 415 statute miles. Its average width is nearly 70 miles, which is reduced to 31 miles between the bays of Panama and San Blas. There is no well-defined coastal plain, though occasional stretches of beach, as at Panama, are exposed at low tide, but their continuity is interrupted by abrupt cliffs and mountains fronting on the sea. The surface of the greater part of the Isthmus consists of low mountains and hills covered with dense forests. These elevations are not arranged in systematic chains or ridges, but are very irregularly distributed. Only in the extreme west and in the neighborhood of San Blas are there mountains of systematic arrangement. With these exceptions the topography consists of hills from 200 to 1500 feet in height, separated by drainage valleys that are cut down almost to sea level. There are, however, a few small areas of nearly level treeless upland, as from the mouth of the Bayano River to the Costa Rican boundary on the Pacific side. The region assumes the character of lofty mountains in its western section, where also are found a number of towering and seemingly extinct volcanoes (Chiriqui, Pico Blanco, both over 11,000 feet in height).

There is no well-defined water parting. The drainage is about equally divided between the two oceans. The streams are of great age, and the larger rivers, receiving the waters of many branches, usually reach sea level so far inland that they become tidal rivers, sometimes at a distance nearly half way across the Isthmus. The Atrato, rising in Colombia about latitude 4° N., flows nearly 600 miles almost due north into the Gulf of Darien, with a fall of less than one foot to the mile. The Tuyra drains most of the country west of the Atrato as far as the Gulf of Panama and empties into the Pacific. This is the largest drainage basin of the Isthmus. Farther westward the Bayano, with many tributaries, drains the central part of the Isthmus. It

is succeeded farther west by the drainage of the Chagres Basin, whose waters are carried to the Caribbean, though the basin extends nearly to the Pacific. From the Chagres to the Costa Rican border, the drainage consists of less complicated streams rising nearer the central or axial line and flowing into either ocean. Thus the drainage of the eastern or larger part of the Isthmus is complex and reaches the sea by concentrating into three principal channels, while to the westward it is simple.

Among the hills covering the Isthmus are a number of natural passes which afford the easiest routes between the two seas. These passes are: Culebra (287 feet); Atrato-Suenbti (583 feet); Atrato-Napipi (778); Caledonia (1003); San Blas (1142); and Atrato-Morte (1143).

The mean annual temperature, 78° to 80° F., is somewhat higher on the Atlantic coast, owing to the warmer waters of the Caribbean. The extreme annual range of temperature rarely exceeds 30°, the limits being 65° and 95° or 100°. The entire region is under the influence of the northeast trades between December and April, and in the remainder of the year these air currents are replaced by southeasterly winds. The rainfall is very heavy, and the climate is very unhealthful. The whole region is covered with a jungle of grasses, sedges, wild plantains, and trees characteristic of the lower lands of the Caribbean. Owing to less copious rainfall, vegetation is less exuberant on the Pacific than on the Atlantic side. The oceanic fauna on the Caribbean side differs greatly from that on the Pacific side, and even the land animals differ in the same way, to some extent.

The general level of the Isthmus has been enormously lowered by long continued erosion. The surface is rapidly approaching base level. Antiquity is stamped upon every form. The igneous rocks are now exposed by erosion. But the volcanic fires which still persist eastward in the Andes and westward in Central America have long ceased to exist in the Isthmus. There is no evidence that the oceans have ever communicated across the Isthmian regions since Tertiary times. If the Isthmus could be lowered 300 feet at present the waters of the two oceans would commingle through the low Culebra Pass.

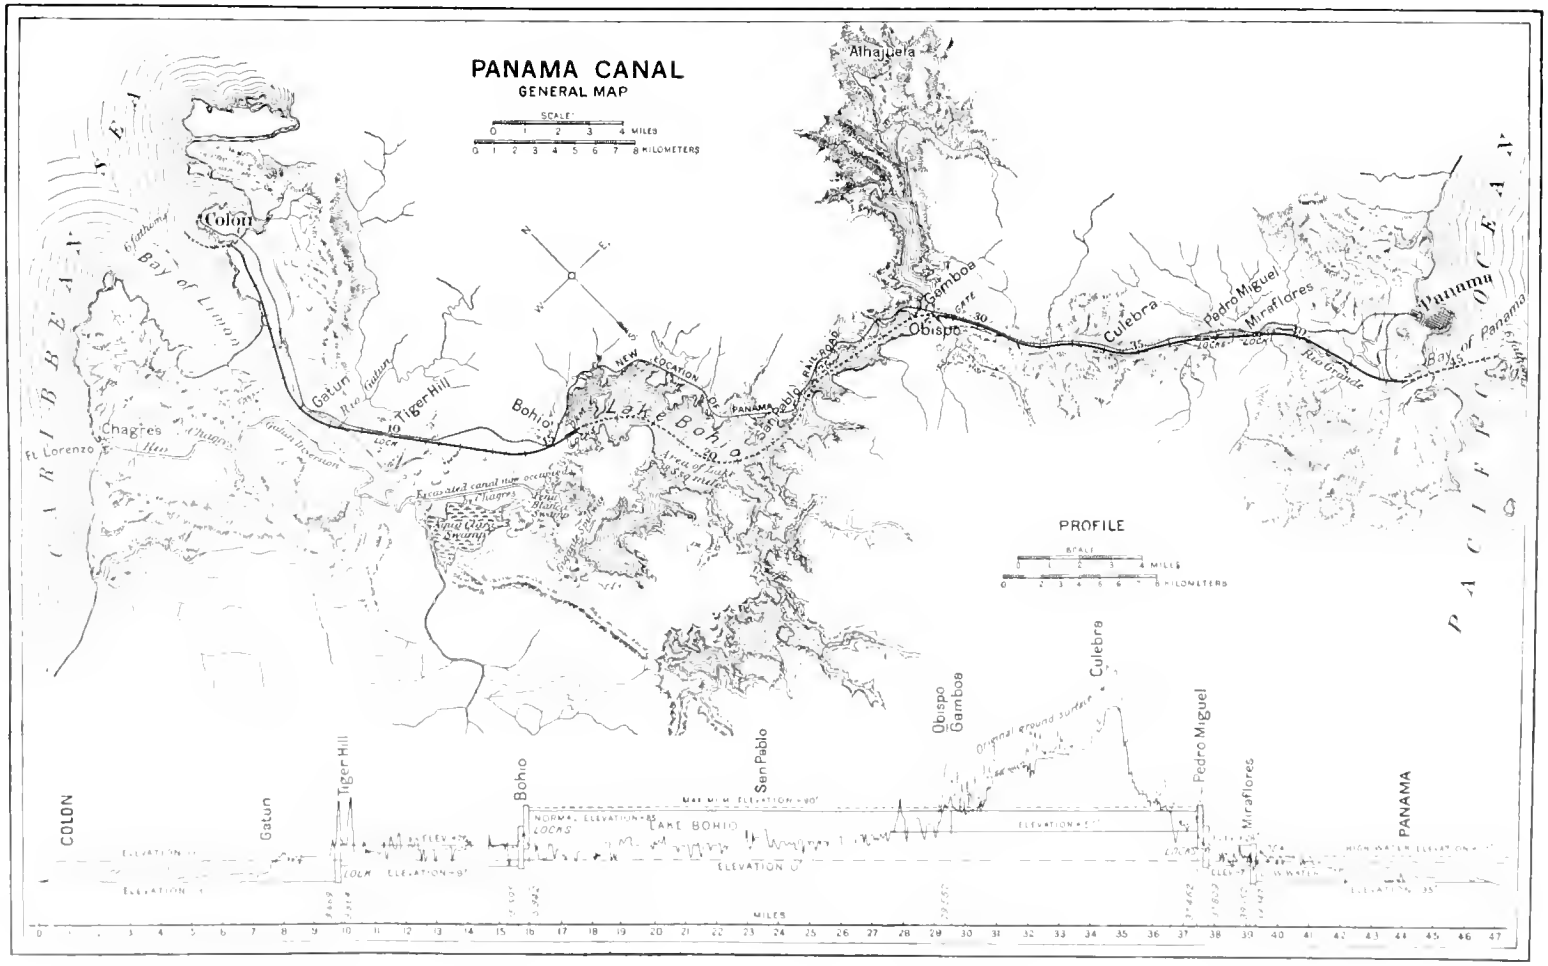
Most of the inhabitants are a mixed people of Spanish, Indian, and negro origin. Some of the aborigines, however, as the Guaymi and Chocos, have preserved their physical type, customs, and speech. The Isthmus is thinly peopled and has no very important towns except the ports of Panama and Colón, the termini of the Panama Railroad and of the proposed Panama Canal. Politically the Isthmus proper forms the Panama department of the Republic of Colombia. In other respects, however, it has small relations with the Republic. Its ports are not used in the commerce of the rest of Colombia; there is very little trade between the Isthmus and the other departments, and its railroad is merely a means of transport for the commerce (duty free) of other nations. The most complete treatment of the geographic and geologic aspects of the Isthmus is contained in Hill, "The Geological History of the Isthmus of Panama and Portions of Costa Rica," *Bulletin of Museum of Comparative Zoology at Harvard University*, vol. xxviii., No. 5 (Cambridge, 1903); and of the Isthmus in all its features in Reclus, *The Earth and Its Inhabitants, North America*, vol. ii. (New York, 1893).

PANAMA CANAL. The projected ship canal across the Isthmus of Panama, connecting the Atlantic and Pacific oceans. The first project for the construction of such a canal to result in the actual beginning of the work grew out of a concession granted by the Government of Colombia to Lieut. Lucien N. B. Wyse and others in May, 1878, giving to them the exclusive privilege, for 99 years, of constructing and operating a canal across the territory of the Republic between the Atlantic and Pacific oceans. An international congress of 135 delegates, mostly engineers, 11 being from the United States, was held at Paris in May, 1879, under the auspices of Ferdinand de Lesseps, who had been induced to assume the leadership in the undertaking, and after a session of two weeks decided that the route for the canal should be across the Isthmus of Panama, between the cities of Colón and Panama, and that the canal should be a sea-level one and without locks. For the purpose of construction the Panama Canal Company, officially known as the 'Compagnie Universelle du Canal Inter-océanique de Panama,' was organized under the laws of France with Lesseps as president. It purchased the Wyse concession for 10,000,000 francs, and at once entered upon the task of surveying the route and doing other preliminary work. The plan adopted provided for a sea-level canal 29.5 feet in depth, with a bottom width of 72 feet, involving an excavation of 157,000,000 cubic yards of earth and rock. The estimated cost of construction, as calculated by Lesseps, was $127,000,000, and the time required was estimated at eight years, both of which estimates were considerably under those made by the International Congress. Work was begun in 1881, but in a short time it became evident that the undertaking involved difficulties which had not been foreseen, and that the estimates were absurdly low. In order to obtain additional funds and to retain the confidence of the French public, bribery on an almost unprecedented scale was resorted to, prominent newspapers were subsidized, and a number of members of the French Chamber of Deputies were corrupted. In 1892 many of the transactions of the company or its agents became known to the public, and the disclosures, implicating a number of the most prominent men in France, gave rise to perhaps the greatest financial scandal in French history. The company was declared to be bankrupt, and it was found, on examination, that up to this time 1,300,000,000 francs had been expended; that the assets of the company amounted to only 700,000,000 francs, and that only a small part of the work had been done. The company was dissolved by the French courts and a receiver was appointed to take charge of its affairs. The receiver was authorized to cede to any new company all or a part of the assets and to borrow money and make contracts with a view to completing the work of construction. He asked for and received from the Government of Colombia three successive extensions of time within which the canal was to be completed and put into operation. The last extension gave the promoters until 1910 to complete the work. The receiver finally succeeded in October, 1894, in organizing the new Panama Company, with a capital stock of 650,000 shares of 100 francs each (about $13,000,000),

the Government of Colombia subscribing for 50,000 shares. The property and assets of the old Panama Company were now transferred to the new Panama Company. An international technical commission composed of ten eminent engineers, representing the United States, Great Britain, Germany, and France, was appointed to investigate the subject, and in November, 1899, reported unanimously in favor of the feasibility and practicability of completing the canal. They reported that the canal was already two-fifths completed, that not more than $102,400,000 would be needed to finish the work, and that the time need not exceed ten years. The work of construction was then resumed on a small scale. Up to June 30, 1899, the new company had expended about $8,000,000 and had excavated about 5,000,000 cubic yards of earth.

In 1899 President McKinley was authorized to appoint a commission of eminent engineers and other persons to investigate the whole question of canal possibilities on the Isthmus from Nicaragua to Colombia. After an exhaustive investigation the commission reported in favor of the Nicaragua route, chiefly on financial grounds, but upon the offer of the Panama Canal Company to sell its property and franchises to the United States for $40,000,000, its value as estimated by the commission, the commission made a supplementary report advocating the acceptance of the offer and the completion of the unfinished canal by way of Panama. In Congress discussion of the respective advantages of the Panama and Nicaragua routes was long and earnest, finally ending in June, 1902, by the enactment of a law authorizing the President of the United States to purchase the property and franchises of the Panama Canal Company for $40,000,000, provided a satisfactory title could be secured, and further authorizing the Secretary of War in that event to construct the canal at a cost not to exceed $130,000,000. Negotiations were at once entered upon with the Republic of Colombia to secure the necessary concessions, and a thorough investigation was begun to ascertain the character of the legal title of the Panama Company to the property which it proposed to sell. Upon investigation it was found that the company had a valid title, and on February 16, 1903, the Government of the United States formally accepted the offer of the company to sell its rights and property for $40,000,000, subject to the ratification of the treaty with Colombia then pending before the Senate. This treaty had been concluded after a long negotiation between the two governments, lasting through a period of six months, the delay being caused by disagreement of the two governments as to the price to be paid for the concession. In January, 1903, the treaty was laid before the Senate for ratification, but on account of opposition of a few Senators, under the leadership of Morgan, of Alabama, who favored the Nicaragua route, the Fifty-seventh Congress closed without action on it. An extra session of the Senate was called to meet on March 5th, and after two weeks of debate the treaty was ratified on March 18th by a vote of 73 to 5. The treaty provides that the United States shall pay to the Republic of Colombia the sum of $10,000,000 in gold in cash for the concessions, to be paid upon the exchange of ratifications, and an annuity of $250,000, beginning nine years after the date of ratification, the latter sum being a compromise between the $600,000 demanded by Colombia and the $100,000 offered by the United States. The concession authorizes the new Panama Company to transfer to the United States all its property and franchises, including the Panama Railroad. The lease is for 100 years, with the privilege of perpetual renewal. The treaty further provides that the territory comprising the canal zone shall be neutral and under the guarantee of both governments. If it should become necessary at any time to employ armed forces to maintain the safety of the canal or insure its public use, the Republic of Colombia agrees to provide the necessary troops. Provision is made for a joint American and Colombian commission to establish and enforce sanitary and police regulations. Colombia agrees not to cede or lease any territory to any foreign power within certain limits for coaling stations, fortifications, etc., that might interfere with the construction, protection, safety, and free use of the canal, and the United States agrees to support Colombia in preventing the occupation of any such territory. Panama and Colón are to be free ports for vessels and goods intended to pass through the canal, which, it is agreed, shall be open for traffic within fourteen years, unless the United States should determine to make the canal a sea-level enterprise, in which event the time is to be extended ten years longer. In the summer of 1903 the treaty was before the Colombian Government for ratification. Already by the Hay-Pauncefote treaty (q.v.) of November, 1901, superseding the Clayton-Bulwer treaty (q.v.), the sole right of the United States to construct, maintain, and police the canal was conceded by Great Britain, which power at the same time withdrew its claim to a joint guaranty of the neutrality of the canal upon the agreement of the United States to accept substantially the rules now governing the free navigation of the Suez Canal.

The principal advantages claimed for the Panama route are: First, the existence of excellent natural harbors at both termini of the proposed canal and the existence of a line of railroad across the Isthmus, which will make it practicable to begin work without delay; second, the estimated annual cost of operating the Panama Canal will be $1,300,000 less than the corresponding charges for the Nicaragua Canal; third, the Panama route is 134.57 miles shorter in length than the Nicaragua route, has less summit elevation, will have fewer locks, 26.44 miles less curvature, and will require but twelve hours time for a deep-draught vessel to pass through, whereas it would require 33 hours in the case of the Nicaragua Canal. The estimated time for constructing the Nicaragua Canal is about six years, the cut through the divide west of the lake consuming about four years. The time estimated for completing the Panama Canal is eight years, the excavation through the Culebra section (43,000,000 cubic yards of hard clay) being the greatest obstacle. The estimated cost of constructing the two canals, including the $40,000,000 to be paid the new Panama Company for its property and concessions, but excluding the cost of acquiring concessions from the governments concerned, is $189,000,000 for the Nicaragua Canal and $184,000,000 for the Panama Canal. Finally, the remoteness of active volcanoes and the less likelihood of injury from earthquakes is an advantage commonly claimed



MAP SHOWING ROUTE AND PROFILE

for the Panama route. Among the disadvantages charged to the route are the (assumed) comparative unhealthfulness of the climate, which, it is thought, might impede the work of construction, and the remoteness of the Panama route as compared with the Nicaragua route from the highways of commerce between the Pacific and Atlantic coasts of the United States. On the other hand, the Panama route gives the direct short course to the Pacific ports of South America.

Consult also the authorities cited under NICARAGUA CANAL.

PANAMA CONGRESS. A congress of delegates respresenting various nations of America, which met at Panama in June, 1826, for the consideration of questions of common interest. Soon after the establishment of the independence of the South and Central American republics and of Mexico, a movement, largely under the direction of Simon Bolivar (q.v.), President of Colombia, was set on foot for the organization of an American Confederacy. In 1823 Bolivar invited the governments of Mexico, Peru, Buenos Ayres, and Chile to send to Panama delegates empowered to take such action; but Buenos Ayres and Chile held back, and in December, 1824, Bolivar sent a circular letter to all the Spanish-American republics, proposing that each appoint representatives to assemble immediately at Panama. This invitation was promptly accepted by Mexico, Peru, Chile, and Guatemala, and in November, 1825, the ministers of Mexico, Colombia, and Guatemala at Washington formally invited the United States to send delegates to the proposed congress, stating in a general way the questions which would be brought up for discussion. President Adams, influenced largely by Henry Clay, then Secretary of State, promptly accepted the invitation and in his annual message to Congress stated that "ministers will be commissioned to attend." This was the signal for one of the most animated debates in the history of the United States Congress, opposition being aroused particularly by the fear of 'entangling alliances,' by the proposed discussion of the recognition of Haiti, the suppression of the slave trade, and the liberation from Spanish rule of Cuba and Porto Rico, and to some extent by the reluctance on the part of many to commit the United States to the policy enunciated in the 'Monroe Doctrine.' Finally, however, Adams's appointment of two envoys extraordinary, Richard C. Anderson and John Sergeant, was ratified by the Senate, and an appropriation for the mission was voted in the House. The congress met on June 22, 1826, Colombia, Central America, Peru, and Mexico being represented. Chile, Brazil, and Buenos Ayres approved of the congress, but did not send delegates. After holding ten sessions and agreeing to a treaty of perpetual union for defense against Spain, the congress adjourned to meet again at Tacubaya, Mexico, in the following year. The treaty of union was subsequently ratified only by Colombia. The United States was not represented, Anderson having died on the way to Panama, and Sergeant not reaching that place until after the congress had adjourned. The meeting at Tacubaya was never held.

PANAMA HATS. Hats made from the immature unexpanded leaves of the stemless screwpine (*Carludovica palmata*), a native of Central America and Colombia. After special treatment to remove the soft parts of the leaf, the fibre is soaked to render it pliable, and the weaving is done under water. The hats most valued are made from single leaves.

PAN-AMERICAN CONGRESS. After the failure of the Panama Congress, held in 1826 for the purpose of taking measures looking toward a close union among the American republics for the furtherance of their common welfare, various efforts followed at intervals to bring together a congress of all the American States with a view to a more lengthy and earnest discussion of the important questions of common interest to the republics of America. Finally in 1847 a congress representing five South American republics was held at Lima and resulted in treaties of confederation and of commerce and navigation, a consular convention, and a postal treaty. Again in 1864 a congress of delegates representing seven South American republics and one Central American State was held at Lima for the purpose of forming a Latin-American Union. The sessions were secret and its work was without substantial result. In 1878 a third congress was held at Lima and consisted of representatives from seven South American States and the island of Cuba. Treaties of international law and extradition were prepared and afterward ratified by Guatemala and Uruguay. In 1881 the governments of the Central States issued invitations for a congress of American republics, to be held at Washington, D. C., in November, 1882, for the purpose of "considering and discussing the methods of preventing war between the nations of America," but, on account of the war between Chile, Bolivia, and Peru and the failure of Congress to make the necessary appropriations, the invitations were withdrawn. Finally on October 2, 1889, a congress representing every American republic except Santo Domingo met at Washington under the Presidency of Mr. Blaine. The congress remained in session till April 21st. Its work consisted of a number of recommendations, few of which were ever adopted by the governments interested. The principal of these related to the free navigation of American rivers, a uniform system of weights and measures throughout America, a uniform standard of value, and a common silver coin, an international banking system, uniform extradition treaties, reciprocity, uniform consular fees, harbor fees and regulations, uniform sanitary regulations, and the establishment of a Bureau of Information for the dissemination of intelligence concerning the commerce and resources of the American republics. In December, 1899, the Government of the United States suggested the holding of another congress, and upon the invitation of the Government of Mexico the City of Mexico was chosen for the place of meeting, and the date set was October 22, 1901. Eventually the governments of all the American republics accepted the invitation and the congress met on the date appointed. It was in session until January 31, 1902, a part of the time being spent in visiting places of interest in Mexico. The work of the

congress consisted of a number of protocols, treaties, conventions, resolutions, and recommendations. The more important of these were a protocol of adhesion to the Hague Convention for the settlement of international disputes; a treaty of compulsory arbitration signed by 10 delegations, and resolutions favoring construction of a pan-American railway; an international customs congress for international sanitation, collection, and publication of statistics relative to American trade and resources.

PAN-AMERICAN EXPOSITION. An exposition held in Buffalo, N. Y., from May 1, to November 2, 1901. It had for its purpose the illustration of the progress of civilization in the Western Hemisphere during the nineteenth century, and was originally planned for 1898, but the war with Spain intervened and the enterprise was deferred until 1901. A site in the northern part of Buffalo, covering an area of 350 acres and within three miles of the business centre of the city, was chosen. A formal ground plan introducing architecture, sculpture, and painting was early adopted, and it was agreed that the style of architecture should be a free adaptation of the Spanish Renaissance, that abrupt roofs with overhanging eaves should be used in preference to flat roofs with cornices and balustrades, that color and decorative sculpture should be introduced freely in the treatment of the buildings, and that the appearance of the exposition should be as gay and festive as possible. The buildings were arranged around a broad court having the form of an inverted T with its broad end to the south, where an approach was made over a triumphal causeway. From this on the east toward the north were the group of Government buildings, the Ethnology Building, the buildings of Manufactures and Liberal Arts, and Agriculture, while on the west side were the buildings of Electricity, Machinery, and Transportation, Temple of Music, and Horticulture, with its two wings, one of which was devoted to exhibits in graphic arts and the other to exhibits of mining. At the north end of the court thus formed, and balancing the Triumphal Causeway, was the Electric Tower. In addition to the foregoing, there were two permanent buildings, one of which, constructed of white marble and bricks, served as an art building, and is now the home of the Buffalo Fine Arts Academy, and the New York State Building, of white marble, which now contains the collections of the Buffalo Historical Society. The color scheme was designed and directed by Mr. C. Y. Turner, who chose as the underlying theme the fierce struggle of man to overcome the elements. Accordingly, the buildings on the east were arranged to represent man and his affairs, or that which man had gained after long years of strife with the elements, while those on the west represented the elements themselves. The struggle was denoted by heavy, deep coloring of red, blue, green, and gold, which graduated gently but firmly into tints, until the Electric Tower was reached, where the prevalent tone was a deep green, as near the color of Lake Erie as it was possible to attain. The tower, which had sculpture work on the four corners, itself was of a light ivory color, and was tinted with blue, green, and gold, which grew fainter as the top was reached, terminating in a gilt figure of the Goddess of Light. The color treatment gained for the Exposition the name of the Rainbow City, or the Tinted City. The sculpture was likewise harmonized with the general plan, and was under the direction of Mr. Karl Bitter. At the entrance of the Exposition, the Triumphal Causeway, which was perhaps the most ornate feature, represented the apotheosis of the United States, an allegorization of national pride, while the Electric Tower at the other end symbolized the great waters, suggesting that the importance, growth, and prosperity of Buffalo were due chiefly to the Great Lake system and waterways on which it was located. On the east side of the Esplanade the most conspicuous work was the Fountain of Man, by Mr. Charles Grady; while on the west side, which was devoted to Nature, there was placed the Fountain of Nature, by Mr. George Brewster. All of the sculpture was in white staff. The exhibits were examined by a jury of awards, and upward of 4000 awards of gold, silver, and bronze medals, and honorable mentions, were made. The total attendance was given as 8,179,674. The total cost of the Exposition was $8,860,757, and the total receipts were $5,534,643, leaving a deficit of $3,326,114. On September 6th President William McKinley (q.v.) was shot down by an assassin while holding a public reception in the Temple of Music, and he died eight days later at the house of John J. Milburn, the president of the Exposition.

PANARD, pȧ'närʹ, Charles François (1694-1765). A French song-writer, born at Courville, near Chartres. He went to Paris in early life, and was employed in the Government bureau for many years. Panard was an industrious writer of vaudeville and song, and his works in this line number more than eight hundred. His satire was never bitter, and his humor never coarse, while there was in all he wrote an insinuating grace and gayety. Marmontel gives an attractive picture of him in his *Mémoires*. Partial collections of his works were made under the titles *Théâtre et œuvres diverses* (1764) and *Œuvres choisies de Panard* (1803).

PANAS, pȧ'nä', Photinos (1832-1903). A French surgeon and ophthalmologist. He was born in Cephalonia, and studied medicine at Corfu and in Paris, where he was naturalized in 1863. After service in various other hospitals he became surgeon to the Hôtel Dieu in 1877. Two years afterwards he was appointed professor of clinical ophthalmology in the Ecole de Médecine. In general surgery Panas won some reputation by his services in the Franco-Prussian War, through his introduction of Lister's methods into France, and by his pioneer work as a successful operator in ovariotomy. But he was better known for his ophthalmological work, and it is in this field that he wrote: *Leçons sur le strabisme* (1873 and 1893); *Leçons sur les kératites* (1876); *Sur les affections de l'appareil lacrymal* (1877); *Anatomie pathologique de l'œil* (1879, with Remy); *Sur le glaucome et les néoplasmes intraoculaires* (1893); *Traité complet des maladies des yeux* (1894); and *Leçons de clinique ophthalmologique* (1899).

PAN'ATHENÆ'A (Lat. nom. pl., from Gk. Παναθήναια, *Panathēnaia*, from *πᾶς*, *pas*, all + Ἀθήνη, *Athēnē*, Athena). The most famous festival of Attica, celebrated at Athens in honor of Athena, patron goddess of the city. Two festivals were distinguished. The Lesser was annual,

and its origin was attributed to King Erichthonius, though Theseus was said to have changed the name from Athenæa to Panathenæa in commemoration of the union of the Attic communities into a single State. It was celebrated by a solemn procession to the Acropolis, a sacrifice and public feast, and was preceded by an evening torch-race. Probably gymnastic contests and chariot-races were also held. Like the Lesser, the Greater Panathenæa was held on the 28th of the first month of the Attic year, Hecatombæon (approximately July). Its establishment was attributed to the tyrant Pisistratus in B.C. 566. The celebration occurred in the third year of each Olympiad, and reached its culmination in the great procession which escorted to the Acropolis the sacred *peplus* of Athena. The *peplus* was a crocus-colored mantle, embroidered by chosen women of noble blood, with scenes from the contest of the gods and giants. At least as early as the end of the third century it was carried spread from the yard and mast of a ship on wheels. The procession included representatives of all the free population, the magistrates, old men with olive branches in their hands, maidens with the sacred utensils, the metics or resident foreigners with the vessels for the sacrifices, the cavalry, the chariots from the games, the animals for sacrifice, and all the other elements which were depicted by Phidias on the frieze of the Parthenon. The five days before the offering were filled with contests of various kinds. Rhapsodists contended in recitations of the epic poems, and there were also musical contests. There were prizes for pyrrhic and cyclic choruses and the ten tribes presented in competition bands of old men chosen for their beauty and strength. There were the usual athletic contests for boys, youths, and grown men, seemingly in great numbers, but the chief feature of these games was the number of the horse-races, which included, not merely the usual chariot-races with spans and four horses, but also a special variety, in which each chariot contained, besides the driver, an armed runner, who, as the chariot crossed the finish line, sprang from the moving car and ran back the length of the stadium. The last contest was a race of triremes off the Piræus. For the musical contests the prizes were crowns of gold and silver and money, for the choruses an ox for sacrifice, and for the athletic games vases filled with oil from the sacred olive-trees. Many of these vases have been found, all similar in style, showing on one side Athena brandishing her lance, between two columns, and on the other a scene from the sport for which the vase was a prize. Consult: Michaelis, *Der Parthenon* (Leipzig, 1871); Mommsen, *Feste der Stadt Athen im Alterthum* (ib., 1898).

PANAX. A genus of plants. See ARALIA; GINSENG.

PANAY, pä-nī'. One of the Philippine Islands, the westernmost of the Visayan group. It lies nearly in the geographical centre of the archipelago, and is bounded on the north by the Visayan Sea, on the east and southeast by the Strait of Guimarās, from 9 to 56 miles wide, separating Panay from Negros, and on the west by the arm of the Sulu Sea known as the Mindoro Sea, which on the northwest separates Panay from Mindoro (Map: Philippine Islands, G 8).

Panay ranks fifth in size among the Philippine Islands. Its area is 4752 square miles, and with the 118 dependent islands, 5103 square miles, the mainland being thus somewhat larger than the island of Corsica. It is broadly triangular in shape. Its southern and western coasts are very little indented, and afford no harbors except open roadsteads. On the northeast and east coasts, however, there are numerous small bays and sounds with anchorages, sheltered by the adjacent islets. The best harbor is at Hoilo, on the strait of that name separating the island of Guimarās from the mainland. Guimarās, the principal dependent island of Panay, has an area of 243 square miles, and lies in the narrowest part of the channel between Panay and Negros.

The centre of Panay is the nucleus of its mountain system, which consists of three principal mountain ranges radiating from that point to the three corners of the triangular island. These ranges divide the island politically into its three provinces, and hydrographically into its three main drainage basins, that of the Panay River in the north, the Jalaur in the southeast, and the Cadiān in the west. These dividing ranges are very rugged and almost insurmountable. They have a number of peaks exceeding 3000 and 4000 feet, several above 5000, and Mount Madiaās in the northwestern range has a height of 7264 feet. In each of the three basins the land descends gradually to the sea. The southeastern slope is gently undulating, while the western and northern are more rugged, with a number of outlying peaks. Extensive forests cover the uplands, and the lower slopes, especially in the southeast, have a pleasant park-like aspect. The soil is everywhere fertile and well watered; besides the three rivers mentioned there are many smaller streams flowing through every part of the island. For climate and natural history, see the article on the PHILIPPINE ISLANDS.

As in the rest of the archipelago, the chief occupation is agriculture, and the staple products are rice, sugar, and copra. The shipment of sugar through the port of Hoilo in 1899 amounted to 77,641 tons, and that of copra to 636 tons. Under ordinary conditions, however, as shown by the figures for 1892 (177,467 tons of sugar), the export will be more than twice as great. Other agricultural products are cotton, hemp, corn, coffee, tobacco, cacao, indigo, and pepper. There are large areas of fine grazing land in Panay, especially in Hoilo Province. Before the war with Spain there were more than 200,000 head of live stock on the island, consisting chiefly of carabaos, sheep, and horses, the latter being highly prized throughout the archipelago. The mineral wealth has not yet been exploited, but there are known to be deposits of iron, gypsum, coal, and marble, while gold has been found in various localities. The manufacturing industry yields products in sufficient quantity for export. There are numerous looms in operation producing fabrics of pineapple fibre, jusi, sinamay, silk, cotton, and hemp. Coasting trade and commerce with the rest of the archipelago through the port of Hoilo are also very active.

The natives of Panay offered a spirited resistance to the authority of the United States from the beginning of the insurrection. The town of

Iloilo was occupied and garrisoned by United States troops on February 11, 1899, but the insurgents practically held the whole interior of the island until the beginning of active operations after the fall of 1900. The insurgents were then dispersed and driven to the mountains after a number of sharp engagements. The surrender of General Delgado in January, 1901, followed by that of other influential leaders, practically accomplished the pacification of the island, and on April 13, 1901, civil government was inaugurated. Under the Spanish rule the island was divided into the three provinces of Antique in the west, Cápiz in the north, and Iloilo in the southeast, and the Commandancia of Concepción in the northeast. The last is now incorporated with the Province of Iloilo. The population of Antique was estimated in 1901 at 115,434, that of Cápiz at 224,000, and of Iloilo 464,444, giving a total for the whole island of 801,878. The inhabitants are nearly all Visayans, there being only a few thousand savage Mundos and Negritos in the mountains. The capitals are San José de Buenavista (q.v.) in Antique and Cápiz (q.v.) and Iloilo (q.v.) in the provinces of those names.

PANAY. A town of Panay, Philippines, in the Province of Cápiz, situated about three miles southeast of Cápiz (Map: Philippine Islands, G 8). Population, 15,500.

PANCATANTRA, or **PANCHATANTRA**, pän'chä-tän'trä (Skt., five threads, or books). The most important collection of Sanskrit beast-fables. Its date is uncertain, but is probably as old as the fifth century A.D., since it was translated into Pahlavi in the sixth century by Barzoi, the Court physician of the Sassanian King Khosru Anushirvan (531-579). The Pancatantra is almost certainly drawn from Buddhistic sources. Its analogies with the Jatakas (q.v.), or birth stories of the Buddha, are too close to admit of any other explanation than direct borrowing. Thus the mingling of maxims in verse with the prose story and the similarity of the beast-fables of the Sanskrit work to many of the *jataka* tales are resemblances both striking and significant. On the other hand, the original Buddhism of the Pancatantra has been modified and given a veneer of Brahmanism by the later redactors of the collection, who exercised whatever was anti-Brahmanistic in spirit. The outline of the collection is a simple one. Amaraśakti, King of Mahilaropya, a city of the south (perhaps the Maliarpha of Ptolemy, and the modern Mayilapur near Madras), had three idle and stupid sons. On the advice of his minister Sumati, he requested an aged Brahman, Vishnuśarman, to teach these youths and make them princes indeed. The sage promised to achieve this result within six months, and, to inculcate in them moral principles, he wrote the Pancatantra. After the young men had read this work, they became, within the six months' space, all that Amaraśakti could desire. The Pancatantra itself is divided, as its name implies, into five books. The first of these, the *Mitrabhēda* or *Separation of Friends*, tells how two jackals, Karataka and Damanaka (whence is derived the title of the Syriac version, Kalila and Dimna), bring together a lion, Pingalaka, and a bull, Sanjivaka. Damanaka, however, soon feels himself neglected, and, by telling the lion and the bull alike that each is plotting against the other, he causes the death of both, and, as the lion's prime minister, becomes the gainer by his craft. The second book, called the *Mitraprāptika*, or *Acquisition of Friends*, deals with the friendship of a crow, Laghupatanaka, a mouse, Hiranyaka, a tortoise, Mantharaka, and a deer, Citranga, and sets forth the value and advantage of true friendship. The third book, the *Kōkōlūkiya*, or *(Book of) the Crows and Owls*, is designed to show the impossibility of real friendship between those who are natural enemies, as were Meghavarna, king of the crows, and Arimardana, king of the owls. In the fourth book, entitled *Labdhapranāśa*, or *Loss of what has been Gained*, the main story is of a crocodile, Vikaralamukha, and a monkey, Raktamukha. The latter gave the former nuts of the rose-apple tree, which so delighted the crocodile's wife, when she tasted some, that she compelled her husband to seek the heart of the monkey, which must be, she thought, better even than the nuts. Raktamukha, however, escaped, and the crocodiles for their greed and ingratitude lost all chance of future dainties. The last book is named *Aparīkṣitakāraka*, or *Thoughtless Action*. A certain pious merchant named Manibhadra, who had lost all, had a vision in which he was bidden to strike a Jaina monk who should appear to him the following day. He did as he was bidden, and the apparition turned into gold. A barber seeing this, and knowing nothing of the vision, invited a number of Jaina monks to his house, and struck them so severely that many were killed, and the barber himself was impaled as a punishment for his folly. About these frameworks fables appropriate to the title of each book are built. After the introduction, the order is a box arrangement, familiar to readers of the *Arabian Nights*. The situations are often excellent, and the moral teaching beyond reproach. The quaint treatment of the beasts as men, yet retaining all their peculiar traits, has a touch of delicate humor. Thus the crocodile falls at his wife's feet, and the tiger stands with folded hands after performing his religious ablutions. The influence of the Pancatantra on literature has been considerable, as from it, in large part, the Hitopadesa (q.v.) was taken, and its form very probably exercised an influence, at least remotely, on the *Arabian Nights* (q.v.). The text of the work, which seems from the evidence of the oldest translation to have comprised twelve books instead of five as at present, varies considerably in the different recensions. Consult: *Pantchatantrum*, ed. Kosegarten (Bonn, 1848-59); *Panchatantra*, ed. Kielhorn and Bühler (Bombay, 1885-96); Benfey, *Pantschatantra, übersetzt mit Einleitung und Anmerkungen* (Leipzig, 1859); Lancereau, *Pantchatantra, traduit* (Paris, 1871); Fritze, *Pantschatantra, neu übersetzt* (Leipzig, 1884); Shadagopa Chari, *Panchatantra*, translated (Trichinopoli, 1887); Mankowski, *Der Auszug aus dem Pañcatantra in Kshemendras Brihatkathamanjarī* (Leipzig, 1892); Schmidt, *Pañcatantra (Textus ornatior), zum ersten Male übersetzt* (ib., 1901). See BIDPAI; FABLE.

PANCHALA, pän-chä'lä. The name of a country in ancient India. It was one of the two great divisions of the so-called Madhyadeśa, or Midland Country. Its territory lay between the Ganges and the Jumna, and extended nearly from Bulandshahr to Allahabad, although at one

time it extended over the wider district which lies between the Chambal River and Gangadvara.

PAN'COAST, Joseph (1805-82). An American surgeon, born in Burlington County, N. J. He graduated from the medical department of the University of Pennsylvania in 1828, and in 1834 was appointed a physician at the Philadelphia Hospital. Four years later he accepted the professorship of surgery in Jefferson Medical College, a chair which in 1841 he exchanged for that of anatomy. The latter he held until 1878, when he resigned in favor of his son, Dr. William Henry Pancoast, and was elected emeritus professor. After leaving his position at the Philadelphia Hospital he was until 1845 one of its visiting surgeons, and later (1854-64) held a similar position at the Pennsylvania Hospital. He originated several important operations, and published a number of medical and surgical works, among which are: *A Treatise on Operative Surgery* (3d ed. 1852); *A Treatise on the Structure, Functions, and Diseases of the Human Sympathetic Nerve* (1831), a translation of Lobstein's Latin original; and *A System of Anatomy for the Use of Students* (1844), adopted from Caspar Wistar. In addition he contributed frequently to the *American Journal of the Medical Sciences* and to the *American Medical Intelligencer*.

PANCRAS, or **PANCRATIUS.** A Christian martyr, who suffered death at Rome at the early age of fourteen years, during the Diocletian persecution. He was highly honored during the Middle Ages and considered to be the avenger of false oaths. The French kings at one time confirmed their treaties by swearing in his name. His day is May 12th, the date of his martyrdom.

PANCRATIUM (Lat., from Gk. παγκράτιον, *pankration*, complete contest, from παγκρατής, *pankratēs*, all-powerful, from πᾶς, *pas*, all + κράτος, *kratos*, strength). A form of Greek athletics, combining wrestling and boxing, the invention of which was ascribed to Theseus. The bare hands were used, and were curved, but not clenched, in boxing. It formed part of the great national games of Greece, and became very popular at Rome, where it appears to have been introduced in Caligula's time.

PANCREAS (Neo-Lat., from Gk. πάγκρεας, *pankreas*, sweetbread, from πᾶς, *pas*, all + κρέας, *kreas*, flesh). A compound racemose gland, found lying transversely across the posterior wall of the abdomen behind the stomach, varying in length from six to eight inches, having a breadth of about an inch and a half, and a thickness of from half an inch to an inch. Its usual weight is about three ounces. The large expanded end of the pancreas directed to the right is known as the head, the smaller pointed extremity extending to the left is known as the tail. The head of the pancreas lies in the concavity of the duodenum.

The secretion of this gland, or the pancreatic fluid, is conveyed from its various parts by means of the pancreatic duct to the duodenum. This gland is found in all mammals, birds, reptiles, amphibians, and osseous fishes, and in some cartilaginous fishes.

For the character and function of the pancreatic fluid, see Digestion, Organs and Process of.

The diseases to which the pancreas is subject, though few, are usually of a fatal character. Their existence is often not made manifest by any very well recognized set of symptoms, so that a diagnosis of the affection is frequently impossible. Wounds of this organ are usually fatal.

PANCREATIN. A mixture of the ferments naturally existing in the pancreas of warm-blooded animals, and usually obtained from the fresh pancreas of the hog. The animal should be killed about six hours after a full meal, the organ being then at the height of its activity. The extract is a yellowish, yellowish white, or grayish amorphous powder, having a faint, peculiar odor and a meaty taste. It contains or should contain the four pancreatic enzymes or ferments: trypsin, which has the property of digesting proteids (meat, eggs, etc.); amylopsin, a diastatic ferment, i.e. converts starches into sugars; steapsin, a fat-splitting and emulsifying ferment; and a milk-curdling enzyme. It is used as an artificial agent to digest the food of invalids and old people, or those prostrated by fever or exhaustion.

PANCSOVA, pōn'chō-vō. A royal free city in the County of Torontál, South Hungary, situated on the Temes a few miles from its confluence with the Danube, and about 10 miles northeast of Belgrade (Map: Hungary, G 4). It is a well-built town with a number of squares, fine public buildings, a gymnasium, and a custom-house. Its manufactures include silk, liquors, brick, and flour. The trade in grain is important. Population, in 1890, 18,289; in 1900, 19,044, chiefly Serbs, Magyars, and Germans.

PAN'DA (perhaps an abbreviation of Naipali *nigalyaponga*, bamboo-eater), or Wah. A curious Himalayan mammal (*Ursus* (*Ailurus*) *fulgens*), of the raccoon family, and much like a raccoon in habits. It is about the size of a house-cat, and has a very short muzzle, small rounded ears, a moderately long tail, covered with long hair, plantigrade feet with semi-retractile claws, and a singular dentition. It dwells chiefly among the rocks of the higher mountain slopes, but also climbs trees, and preys much on birds, small quadrupeds, and insects. It has a thick, fine, woolly covering, adapting it to a cold climate, concealed by long, soft, glistening and richly colored hair, mostly chestnut brown, which passes into black on the sides and legs, and into white on the head. The panda is also called *wah* and *chit-wa*, from a peculiar cry which it utters. It is restricted to the southeastern Himalayas, where these animals are occasionally captured and tamed into gentle but inactive pets. An extinct panda lived in Europe during the Pliocene period. Consult Lydekker, *Royal Natural History*, vol. ii. (London, 1896).

PANDAN, pän-dän'. A seaport town of Panay, Philippines, situated on the west coast of the island, in the northern part of the Province of Antique (Map: Philippine Islands, G 5). Population, 13,737.

PAN'DANA'CEÆ, the Pandanus, or Screw-Pine, Family (Neo-Lat. nom. pl., from *Pandanus*, from Malay *pandang*, conspicuous). A natural order of monocotyledonous plants, constituting a remarkable feature in the scenery of many tropical countries, where they frequent the seacoast or marshes. They are trees or shrubs, sometimes decumbent or climbing, and often sending down adventitious roots, which bear curious membranous rootcaps. The order is composed of the genera Pandanus and Freycinetia, which have

long, simple, imbricated leaves, usually spiny on the back and margin, their base embracing the stem, their spiral arrangement often notably visible. The flowers are mostly unisexual, naked, or with only a few scales, arranged on a spadix and wholly covering it. The stems are numerous; the ovaries usually clustered, one-celled, each crowned with a stigma; the fruit consists of fibrous, one-seeded drupes, collected or almost combined, or of berries with many seeds. There are about 80 known species, some of which yield useful products.

PANDANUS. See SCREW-PINE; PANDANACEÆ.

PAN'DARUS (Lat., from Gk. Πάνδαρος, *Pandaros*). (1) The son of Lycaon and a hero of the Trojan War. With the bow received from Apollo, he became famous as an archer. He was killed by Diomedes. (2) One of the companions of Æneas, killed by Turnus. (3) In Shakespeare's *Troilus and Cressida*, and in Chaucer, a go-between or procurer; the uncle of Cressida.

PĀṆḌAVAS, pän'dȧ-vȧz. In Hindu legend, the five putative sons of Pandu, the son of the sage Vyasa (q.v.). As he was prevented by a curse laid on him by a sage, whom he had unwittingly killed, from having offspring, his two wives, Kunti and Madri, by a charm obtained from the sage Durvasas, were permitted to bear children by any divinities they chose to invoke. Kunti accordingly bore three of the Pandavas, Yudhishthira, Bhima, and Arjuna, by Dharma, Vayu, and Indra respectively, while Madri gave birth to the other two, Nakula and Sahadeva, by the twin Aśvins. Arjuna is by far the noblest of the brothers, and is the real hero of the epic of the Mahabharata. It is he to whom Krishna recites the Bhagavad-gita (q.v.) on the eve of the battle of Kurukshetra. Next to him in uprightness stands Yudhishthira, while Bhima, although gifted with many good qualities, is boastful and irascible, conspicuous for physical rather than moral courage. The two sons of Madri play but a subordinate part. The strife between the Pandavas and their cousins the Kauravas, the hundred sons of Dhritarashtra, the blind brother of Pandu, is the theme of the great Sanskrit epic of the Mahabharata (q.v.). The legend seems to be a reflex of an early tribal war in Northern India.

PANDECTS (Lat. *pandecta*, from Gk. πανδέκτης, *pandektēs*, all-receiving, from πᾶς, *pas*, all + δέχεσθαι, *dechesthai*, to receive). The leading compilation of the Roman law, made by the direction of the Emperor Justinian (q.v.). It is also sometimes known as the Digest. The celebrated Justinian Code had previously been compiled by his order, but it dealt with the more practical affairs of common occurrence, and the Pandects were designed to supplement it with all the more subtle legal learning of the age.

In A.D. 530 Justinian, by an ordinance known as the *De Conceptione Digestorum*, commanded the eminent jurist Tribonianus to select some of the most learned lawyers and jurisconsults of the Empire to assist him in making a collection of decisions and opinions on all points of law. Tribonianus, who had previously had valuable experience in the preparation of the code, formed a commission consisting of himself and sixteen others for the purpose. The work was finished in the year 533, three years after it was commenced. The authorities which were compressed, interpreted, and put in systematic form were said to have consisted of upward of 2000 treatises, and the Pandects contain upward of 9000 separate extracts or statements, selected according to subjects from these treatises and authorities.

The Pandects are divided into 50 books, each containing several titles, and each title several extracts from the authorities, due credit being given to the lawyer or authority from which each extract is derived. The usual form of citation is by the numbers of the book, title, and section or extract. The work is also divided into seven parts, which correspond respectively with the books, 1-4, 5-11, 12-19, 20-27, 28-35, 36-44, and 45-50. This latter division is seldom referred to in citations.

The principal jurists from whose writings the extracts were taken were 39 in number, and are sometimes called the classical jurists, although some eminent writers confine that name to five of that number, viz. Papinianus Paulus, Ulpian, Gaius, and Modestinus. The extracts from these authorities indeed constitute the bulk of the collection, those from Ulpian alone making about one-third of the whole work, those from Paulus one-sixth, and those from Papinianus one-twelfth. Other writers besides these 39 are cited, but usually only indirectly, i.e. when cited by the jurists whose works constitute the basis of the collection. The Pandects were arranged according to the method of the code.

The work is deservedly one of the most famous collections of law the world has known. In its relations to the history and literature of Rome it is invaluable; and with its necessary complement, the Codex, it was the basis of all mediæval legislation, and of the civil law of today, besides exercising an influence on the law of England. The origin of many doctrines and terms in modern English and American law may be traced to the Pandects, and the idea of codification which prompted the work is being developed in all jurisdictions in general acts on various subjects of the law. See JUSTINIAN; CIVIL LAW; COMMON LAW; JURISCONSULT.

PAN'DER, CHRISTIAN HEINRICH (1794-1865). A Russian naturalist, one of the founders of embryology. He was born in Riga, studied in Germany at Würzburg and Jena, and in 1820 accompanied, as naturalist, a Russian expedition to Bokhara. His great contribution to the embryology of the Vertebrata was in the study of the development of the chick, and in 1817 he made careful research on the embryonic layers which, although known to Wolff half a century before, are commonly called by Pander's name, as is the kernel or central swelling on the germinal disk of the fowl's egg. Besides *Beiträge zur Entwickelungsgeschichte des Hühnchens im Ei* (1817), and a Latin dissertation on the changes in the egg in the first five days of incubation (1817), Pander wrote *Vergleichende Osteologie* (with D'Alton, 1820-28) and *Beiträge zur Geognosie des russischen Reichs* (1830).

PANDO'RA (Lat., from Gk. Πανδώρα, giver of all, also interpreted as gift of all, or gifted by all, i.e. the gods, from πᾶς, *pas*, all + δῶρον, *dōron*, gift). According to the Hesiodic poems, the first woman. To punish Prometheus

and mankind for the theft of fire, at the command of Zeus, Hephæstus formed from earth a beautiful woman, to whom all the gods contributed gifts. She was sent by the gods to Epimetheus, the brother of Prometheus, who, in spite of warnings, received her to his ruin. One version adds that Pandora opened a cask in which were kept safe many blessings, which thus became scattered and lost, only Hope being saved by the prompt closing of the lid. There are many indications that point to Pandora as an earth-goddess like Demeter, and render it probable that the original myth is of a new earth given to men as punishment for the theft of fire, from which sustenance can only be won by hard toil. The "Birth of Pandora" was represented on the base of the great statue of Athene Parthenos by Phidias, and is found on two Attic vases and two reliefs.

PANDORUS SPHINX. A large olive-brown North American hawk-moth (*Philampelus Pandorus*). See Colored Plate of MOTHS.

PANDROSOS (Gk. Πάνδροσος, all-bedewing). The daughter of the Athenian Cecrops. She was the first priestess of Athena, and with the latter was honored in the Pandroseum on the Athenian Acropolis.

PĀNDYA, pän'dyä. A country in the extreme south of ancient India, corresponding roughly to the modern Tinnevelli. Its western boundary was the famous Malaya Mountain (the southern part of the Western Ghats), and its southern the Tambraparni River. The sacred island of Rameswaram, from which Rama (see RĀMĀYANA) began his bridge to Ceylon, was also a part of Pandya. The capital was almost certainly Madhura (now Madura), although Kalidasa (q.v.) calls the chief town 'Serpent City,' which might seem to point to Negapatam, situated on the coast, a little south of Karikal. The Kingdom of Pandya was well known to Ptolemy, Strabo, and Pliny, who call it Pandion, and according to some classical accounts the King sent an embassy to the Emperor Augustus.

PANEL (OF. *panel, pannel, pancau*, Fr. *panneau*, from ML. *panellus*, panel, diminutive of Lat. *pannus*, cloth, rag, Gk. πῆνος, *pēnos*, Doric πᾶνος, *panos*, thread on the bobbin). Primarily, a flat piece of wood engaged by its edges into the grooves of a frame surrounding it; hence, by extension, any flat surface surrounded by a frame. In carpentry and joinery the frame may be plain or molded, and the flat and relatively thin board may be set with its face flush with one face of the frame (*flush* panel); or it may have the central part of its surface project more than the portions next the frame (*raised* panel); or be itself decorated with moldings or carvings (*molded* panel, *carved* panel). In architecture any space defined by inclosing moldings or framework is called a panel. The deep panels of vaults like those of the Pantheon and many Renaissance ceilings, are called *caissons* or coffers; small round panels are called *medallions*. In Gothic architecture paneling was often adorned with carved tracery, and in the late or florid period large wall surfaces were covered with paneling itself reproducing tracery-forms, as in Henry VII.'s chapel at Westminster. Wherever woodwork is used for large surfaces, it is commonly paneled, as in doors, wainscoting, and furniture.

PANEL. A schedule or list of the names of persons whom a sheriff, or other proper officer of the court, has summoned to serve as jurors.

The term is also applied to the body of persons in attendance upon a court in response to a summons to appear and serve as jurors.

In the Scotch law the term panel is employed as being synonymous with the English phrase 'prisoner at the bar.' See JURY; TALESMEN; VENIRE FACIAS.

PANGANI, pän-gä'nē. A coast town of German East Africa, at the mouth of the river Pangani, 50 miles northwest of Zanzibar (Map: Africa, H 5). The town is the seat of a government district, with a custom house, post-office, and telegraph agency. There are a mosque and some stone houses, but most of the houses are of clay. It has the building of the German East Africa Company and is the chief export point of the colony, with an extensive inland caravan trade. Population, estimated, 6000, mostly negroes and Arabs.

PANGASINÁN, pän'gä-sē-nän'. A province of Western Luzon, Philippine Islands, situated at the head of the Gulf of Lingayén (Map: Philippine Islands, E 3). Its area is 1316 square miles. It is bordered by mountains on the east and west, but practically the whole province is occupied by the lower valley and the delta of the Agno River. A large part of the coast region is subject to inundations, and even the rice, the staple crop, is sometimes injured by the floods. Other agricultural products are sugar-cane, corn, tobacco, and cocoanuts, and there are abundant deposits of salt and other minerals. The chief industry is the weaving of buri, which is made into mats, hats, and sugar sacks. There is an active commerce in the hands of the Chinese. The population was estimated in 1901 at 302,178, chiefly Pangasinán. The capital is Lingayén (q.v.).

PAN'GE LIN'GUA (Lat., Proclaim, O Tongue). One of the most remarkable of the hymns of the Roman breviary, and like its kindred hymn, *Lauda Sion*, a most characteristic example as well of the mediæval Latin versification as of that union of theology with asceticism which a large class of these hymns present. The Pange Lingua is a hymn in honor of the eucharist, and belongs to the service of the festival of Corpus Christi. It was written by Saint Thomas Aquinas (q.v.) in 1263 and consists of six strophes of verses in alternate rhyme. Besides its place in the office of the breviary, the last two stanzas form part of the service of benediction of the blessed sacrament.

PANGEN'ESIS (Neo-Lat., from Gk. πᾶς, *pas*, all + γένεσις, *genesis*, production, from γίγνεσθαι, *gignesthai*, to be born). The name given to a theory proposed by Darwin, to account for the facts of heredity. He conceived that the hereditary characters of all organisms were handed down by means of exceedingly minute gemmules thrown off from the individual cells of the body. These invisible granules or gemmules, too minute to be detected by the microscope, were supposed by Darwin to be the bearers of heredity (q.v.). These gemmules were supposed to multiply by self-division and to find their way by various routes to the developing reproductive cells, in which they would accumulate until each reproductive cell contained gemmules represent-

ing every part of the body; each gemmule was supposed to develop into the part corresponding to that from which it was derived. This theory was disproved by Galton by experimenting on the transfusion of blood from rabbits of one breed to those of another, and finding that the results proved that "the doctrine of pangenesis, pure and simple, is incorrect." Consult: Darwin, *The Variation of Animals and Plants Under Domestication*, vol. ii. (London, 1888); Brooks, *The Law of Heredity* (Baltimore, 1883); Weismann, *Essays upon Heredity* (Oxford, 1889).

PANGLOSS, Doctor. A pompous prig in Coleman's *Heir-at-Law*, the tutor of Dick Dowlas. He is given to affected expressions and to quotations, to which he always adds the source.

PANG'OLIN. A name for the East Indian scaly ant-eaters of the family Manidæ. See Manis.

PANHANDLE. A name given to the portion of West Virginia which protrudes between Ohio and Pennsylvania, and to similar projections of Texas and Idaho.

PAN'HELLE'NIA. A festival of Zeus Panhellenios instituted by the Emperor Hadrian, who also bore the surname Panhellenios.

PANIC. See Crisis, Economic.

PANICALE, pä'nē-kä'lā, Masolino da. See Masolino da Panicale.

PANICLE (from Lat. *panicula*, diminutive of *panus*, from Doric Gk. *πᾶνος*, *panos*, thread on the bobbin). A compound, spray-like flower-cluster produced by the branching of a raceme or corymb, as in many grasses. See Inflorescence.

PANICUM. A genus of grasses. See Millet.

PĀNINI, pä'nē-nē (fourth century B.C.). The greatest of all the grammarians of India. Of his life very little is known. Combined evidence fixes his birthplace at Salatura, near the modern town of Attock, in the extreme north of the Punjab. According to a verse in the Pancatantra (q.v.) he was killed by a lion. A late and trivial legend, told by Somadeva in the *Kathāsaritsāgara*, describes the future grammarian in his youth as a very stupid pupil of a Brahman named Varsha. Being sent away, Panini practiced such austerities in the Himalayas that Siva, pleased with the penance, revealed to him the grammar which he then set forth to the world. The work of Panini is the oldest Sanskrit grammar which has been preserved. Although he names no less than sixty-four predecessors in two schools, a northern and a southern, their books have been so entirely superseded by his that they have disappeared. He marks the line between Vedic and classical Sanskrit. (See Sanskrit Language.) His influence is shown by the fact that the language as he fixed it never changed its character so far as the literary usage was concerned. The grammar of Panini consists of eight books, each of which contains four chapters. The chapters are composed of varying numbers of extremely short rules, or *sūtras*, of which the entire work contains 3996. Of these three, or perhaps four, were not written by Panini himself. The rules are in algebraic style, and are so compact and obscure that they are unintelligible without close study. He invented a large number of arbitrary symbols to express various grammatical terms, which increase the obscurity of his work, even while they contribute in a large measure to its brevity. There is, however, a certain amount of method beneath these apparently arbitrary symbols. His system of grammar is based on the theory of the verbal origin of nouns. The arrangement is widely different from that found in Occidental works. Thus instead of treating phonology, inflection, conjugation, and the like separately, Panini traces a given phonetic change, as the change of *a* to *ā*, throughout the language, without reference to the class of word in which it may occur. Syntax is not considered by him, and the inflection, strictly speaking, must be built up from the rules scattered throughout the work. The authority gained by Panini was well deserved, for his grammar is one of the most exhaustive ever written. This preëminence, together with his extreme obscurity, has called forth a number of commentaries. Of these the most important were the *Mahābhāṣya*, or Great Commentary, of Patañjali (q.v.), probably in the second century B.C. (edited by Kielhorn, 3 vols., Bombay, 1878-85), in which previous commentaries were summarized, and the first complete one, the *Kāśikā Vṛtti*, or Benares Commentary, of Jayaditya and Vamana, about A.D. 650 (edited by Bala Sastri, Benares, 1898). To the grammar there are added as appendixes a *Dhātupāṭha*, or Index of Roots, and the *Gaṇapāṭha*, or Index of Classes, both ascribed to Panini. The first contains 1961 roots, of which only about eight hundred have thus far been found in Sanskrit, although comparative linguistics establishes the existence of a number besides. About fifty roots known to occur in the Vedas are omitted. The second appendix is a collection of lists of words following the same rule as the first one of their series which is given in the main grammar. The chief edition is that by Böhtlingk, *Pāninis Grammatik* (Leipzig, 1887).

PANINI, pä-nē'nē, Giovanni Paolo (c.1695-1764). An Italian painter, born at Piacenza. He was the pupil of Benedetto Luti and Andrea Lucatelli, in Rome. He confined his attention to interiors and exteriors of buildings in or about Rome, and introduced figures and accessories, which, while not archæologically accurate, are very picturesque in arrangement. His works include: "Interior of Saint Peter's," and "Antique Ruins," in the Louvre; "Ancient Ruins with Figures," in the National Gallery, London; and "Cardinal Polignac Visiting the Interior of Saint Peter's," in the Metropolitan Museum of Art, New York City.

PANIPAT, or **PANIPUT**, pän'ē-pūt'. A town in the District of Karnal, Punjab, British India, situated near the old bank of the Jumna, 53 miles north of Delhi by rail (Map: India, C 3). It figured in the negotiations between Yudishthira and Duryodhana about B.C. 1100. As an outpost of Delhi on the military road between Afghanistan and the Punjab it was the scene of several battles prominent in the history of Upper India. The most important are the battle of 1526, when the Afghan forces of Ibrahim Lodi, Emperor of Delhi, were routed by an inferior force of Moguls under Baber, who occupied Delhi and became Emperor; that of 1556, when Akbar, the grandson of Baber, won a vic-

tory over the Afghans under the Hindu general Hemu; and that of 1761, when the united armies of the Mahratta chieftains were defeated by the Afghans under Ahmad Shah Durani. At present the town is of little importance, and squalid in appearance. Population, in 1891, 27,547; in 1901, 26,914.

PANITAN, pä-nē'tän. A town of Panay, Philippines, in the Province of Cápiz, situated on the Panay River, six miles south of Cápiz (Map: Philippine Islands, G 8). Population, 10,020.

PANIZZA, pä-nēt'sä, Oskar (1853—). A German satirist. He was born at Kissingen, studied medicine at Munich, where he was physician to an insane asylum from 1881 to 1883, and then lived in Paris and London. His early publications were lyrics, *Londoner Lieder* appearing in 1887. But he is better known for his satirical writings. Among them *Die unbefleckte Empfangnis der Päpste* (1893), *Der deutsche Michel und der römische Papst* (1894), and *Abschied von München* (1896) were suppressed by the German Government. The last mentioned refers to Panizza's condemnation to a year's imprisonment for blasphemy in his tragedy *Das Liebeskonzil* (1895; 3d ed. 1897). After his departure from Munich he lived in Zurich, and then in Paris as editor of the *Züricher Diskussionen*, and wrote *Dialoge im Geiste Huttens* (1897), *Psychopathia Criminalis* (1898), and *Parisiana* (1899).

PANIZZI, pä-nēt'sē, Sir Antonio (1797-1879). Principal librarian of the British Museum from 1856 to 1866. He was born September 16, 1797, at Brescello, in the Duchy of Modena. He studied at the University of Parma, graduating in the faculty of law in 1818. He practiced in his birthplace. In 1828, despite favors from the Duke of Modena, he became involved in the conspiracy to overthrow the Modenese Government, and was arrested, but he escaped to England. Under the patronage of William Roscoe, the historian, he taught Italian at Liverpool. In 1828 Lord Brougham got him the Italian professorship at University College, London, and in 1831 the post of assistant librarian in the British Museum. In 1837 Panizzi was made keeper of the printed books, and in 1856 he succeeded Sir Henry Ellis (q.v.) as principal librarian. He resigned in 1866. He was made K. C. B. in 1869. Panizzi died at his London home near the Museum, April 8, 1879.

Panizzi was a man of immense energy and capacity. A friend of the leading statesmen of the time, in England, France, and Italy, he continued to wield political influence down to his death. Panizzi really made over the British Museum. Under his direction the library was removed from Montague House to its present quarters. He designed the famous reading room and its annexes, perhaps his most brilliant conception. He framed the catalogue rules. He obtained for the library the princely bequest of Thomas Grenville, consisting of more than 20,000 rare volumes, valued at £54,000. In 1843 he drew up an elaborate report of the deficiencies in the library, which led two years later to an annual grant from the Government of £10,000 for the purchase of books. This fund, still continued, has helped to make the library the richest in the world. Panizzi wrote for the magazines, and edited Boiardo's *Orlando innamorato*, Ariosto's *Orlando furioso* (1830-31), and Lord Vernon's reprint of the first four editions of *The Divine Comedy* (1858). Consult Louis Fagan, *Life of Panizzi* (London, 1880).

PANJAB, pun-jäb'. A province of British India. See Punjab.

PANJABI (pŭn-jä'bē) **LANGUAGE AND LITERATURE**. The modern Indian language and literature of the Punjab (q.v.). The Panjabi represents, roughly speaking, an archaic dialect of Hindi, supplemented by a large number of loan-words from Arabic and Persian. On the other hand, the infusion of Sanskrit loan-words (technically called *tatsama*, 'identical') is small, as compared with the Eastern languages of India, especially Bengali (q.v.) and Uriya (q.v.). Panjabi, like all the Indian languages, has many small sub-dialects, which shade off into each other. The chief of these dialects are Multani in the South, which stands intermediate between Panjabi and Sindhi (q.v.), Jathki in the Centre, and Chibhali Dogri in the North. There are several alphabets. Of these the oldest is the Gurmukhi, a modification of the Sanskrit Devanagari alphabet, with the omission of the signs for *r*, *ē*, *l*, *l*, *s*, and *kh*, but with the addition of *r* and *l*. It is in the Gurmukhi script that the Adi Granth (q.v.) of the Sikhs is written. Next to the Gurmukhi the Lundi, which is employed by the merchant class, deserves mention. The official character of the Government, however, is the Arabic, which is the one most generally employed. Panjabi has practically no literature, excepting the Sikh Granths, although the New Testament and parts of the Old Testament have been translated into Multani and Dogri.

Consult: Cust, *Modern Languages of the East Indies* (London, 1878); Beames, *Comparative Grammar of the Modern Aryan Languages of India* (ib., 1872-89); Tisdall, *Panjabi Grammar and Reading Book* (ib., 1889); Wilson, *Grammar and Dictionary of Western Panjabi* (Lahore, 1899); O'Brien, *Glossary of the Multani Language* (ib., 1881); Starkey and Bussawa Sing, *English and Punjabee Dictionary* (Calcutta, 1849); Newton and Janvier, *Dictionary of the Panjabi Language* (Lodiana, 1854).

PANJANDRUM, The Grand. An imaginary person in a jumble of nonsense made up by Samuel Foote to test the remarkable memory of Macklin, the actor. The title is sometimes applied to a person of leading importance in a community.

PANJIM, pän-zhēn'. The capital of the Portuguese possession of Goa (q.v.) in India.

P'AN-KU, pän'kōō'. A mythical being, invented by the later compilers of Chinese legends, said to have been the first development of conscious being out of chaos. The original historians say nothing about P'an-ku, but the Chinese names given him in popular speech and in the voluminous mediæval literature seem to mean 'Embryo'; Prince of the Three Powers (of Heaven, earth, and man); Son of Heaven, etc. The legends of this reputed first conscious being are greatly embellished, according to the fancy of myth-making writers. After toiling millions of years to bring the earth into shape, he died and his breath became wind and cloud; his voice, thunder; his left eye, the sun; his right eye, the moon; his teeth and bones, metals; his marrow, pearls and precious stones; his sweat, rain; and

the parasites on his body impregnated by the wind, the human species.

PAN MICHAEL. A novel by Henryk Sienkiewicz (1887). With the novels "With Fire and Sword" and "The Deluge," it completes the great trilogy on the Polish wars of the seventeenth century. Michael Volodyovski, the little knight and marvelous swordsman, who appeared in the earlier tales, is the hero in this romance of the Tatar invasions and border warfare. Zagloba, a Polish Falstaff, draws Michael from his retirement in a monastery to the war, to which his wife, Basia, follows him. At the surrender of Kamenyets to the Sultan, Michael and Kelting blow up the castle and perish in the ruin.

PANNA, or **PUNNAH,** pŭn'ä. A native State of the Bundelkhand Agency (q.v.), Central India. Area, 2568 square miles; population, in 1881, 227,306; in 1891, 239,333. Capital, Panna.

PANNO'NIA. A province of the ancient Roman Empire, bounded on the north and east by the Danube, and on the west by the mountains of Noricum, and on the south reaching a little way across the Save, and thus including part of modern Hungary, Slavonia, and parts of Bosnia, Croatia, Carniola, Styria, and Lower Austria. It received its name from the Pannonians, a race of doubtful origin, who at first dwelt in the country between the Dalmatian mountains and the Save, in modern Bosnia, and afterwards more to the southeast in Mœsia. The Roman arms were first turned against them and their neighbors, the Iapydes, by Augustus in B.C. 35, and after the conquest of Segestica or Siscia (Sziszek) he subdued them. An insurrection took place in B.C. 12, which Tiberius crushed after a long struggle, and a more formidable one of the Dalmatians and Pannonians together in A.D. 6, which was suppressed by Tiberius and Germanicus, but not without a two years' struggle. Fifteen legions had to be assembled against the Pannonians, who mustered 200,000 warriors. Hereupon the Pannonians settled in the more northern districts, which received their name, and of which the former inhabitants, the Celtic Boii, had been in great part destroyed in Cæsar's time. The country was now formed into a Roman province, which was secured against the inroads of the Marcomanni and Quadi by the Danube, and on its other frontiers had a line of fortresses. Military roads were constructed by the conquerors, who also planted in the country many colonies and municipia, and thus gave it a rough coating of civilization. The country was divided by Trajan, during the Dacian wars, into Upper (or western) and Lower (or eastern) Pannonia, and under Galerius and Constantine it underwent other changes. Upper Pannonia was the scene of the Marcomannic war in the second century. In the fifth century Pannonia was transferred from the Western to the Eastern Empire, and afterwards given up to the Huns. After Attila's death, in 453, the Ostrogoths obtained possession of it. The Longobards under Alboin made themselves masters of it in 527, and relinquished it to the Avari upon commencing their expedition to Italy. Slavic tribes also settled in the south. Charlemagne brought it under his sceptre. In the reigns of his successors the Slavs spread northward, and the country became a part of the great Moravian kingdom, till the Magyars or Hungarians took it in the end of the ninth century. In the time of the Romans the chief towns of Upper Pannonia were Carnuntum (Petronell), Petovio (Pettau), Siscia (Szisszek), Emona (Laibach), Savaria (Stein and Anger), and Vindobona (Vienna); of Lower Pannonia, Aquincum (Alt-Ofen, or Old Buda) and Sirmium (Mitrovic).

PANNUS. See CONJUNCTIVITIS.

PANO, pä'nō. A tribe of the Huallaga and Ucayali rivers, Northeastern Peru, the nucleus of those constituting the Panoan stock (q.v.). According to their traditions they have emigrated from a northern region. In 1670 the missionary Lucero collected a part of them into a settlement at the mouth of the Huallaga. In 1830 they removed to the mission of Sarayacu on the Ucayali, where they still reside. They are expert boatmen, building canoes of 40 feet in length, and they have a frank, easy, and courteous bearing, but are much given to drunkenness. It is said that they formerly preserved pictograph records painted on paper manufactured from the fibre of banana leaves. They number less than 2000.

PANOAN STOCK. An important South American linguistic stock, comprising some 20 tribes occupying the immense forest region on the upper portions of the Madeira, Beni, Parus, Javary, Ucayali, and Huallaga, east of the Andes and south of the Amazon, in Peru, Bolivia, and Western Brazil. Although apparently of more than average native intelligence, they are almost all in their original savage condition, some of them being even accused of cannibalism. Several of their tribes are light in color. Like most of the peoples of the Amazon region, they are steadily decreasing in number. Among the most important tribes of the stock are the Cashibo, Conibo, Mayoruna, Pano, Remo, Senci, Setebo, and Shipibo.

PANÓFKA, pä-nôf'kä, THEODOR (1801-58). A German archæologist, born and educated in Breslau. He began the important excavations at Nola, Italy, and at the establishment of the Archæological Institute at Rome became its secretary. In 1844 he was named professor of archæology at Berlin. His works, which are still valuable for the material collected and for the illustrations, include: *Neapels Antiken* (1828); *Musée Blacas* (1830-33); and *Bilder antiken Lebens* (1843).

PANORAMA (Neo-Lat., from Gk. *πᾶς, pas,* all + *ὅραμα, horama,* view, from *ὁρᾶν, horan,* to see). A pictorial representation of the whole surrounding landscape as seen from one point. It differs from a painting in that the latter only gives part of the landscape, and aims at artistic effect, whereas the chief aim of the panorama is optical illusion. The first step in the construction of a panorama is to obtain sketches of the entire region to be represented; each sketch is a representation of a portion of the landscape in the form of a sector of a circle, with the sketcher's position as a centre, and the horizon for circumference. The canvas to which the sketches are to be transferred is hung round the sides of a circular room, and forms the surface of a cylinder, on the inside of which the panorama is painted. The stage from which the picture is viewed is placed in the centre of the room, about

30 feet on every side from the picture: the picture itself is fastened above to a strong circular hoop, and, hanging down, has its lower edge fastened to a similar hoop, which is heavily weighted to keep the picture steady. The light is admitted by an aperture in the roof, which is concealed by an awning from the spectators on the stage.

The idea of a panorama was first conceived by the architectural painter Breisig, of Danzig, but the first to put it in execution was Robert Barker, a painter, of Edinburgh, to whom the idea occurred while taking a sketch of the city from the top of Arthur Seat. After surmounting numerous difficulties—one of which was the invention of a new kind of perspective for the horizontal lines—he succeeded in producing an effective panoramic view of Edinburgh, which was exhibited in that city in 1788, and in London in the following year. The next panorama executed by Barker was a view of London from the top of the Albion mills, which was followed by scenes from the Napoleonic wars. In 1799 the panorama was taken up in Paris, where it was much improved, and whence it was introduced into other European cities. Its use has greatly increased since the Franco-Prussian war of 1870-71. By the employment of plastic objects, in addition to painting, the painter Philippoteaux greatly increased the optical illusion, as was seen in his admirable panorama, "The Siege of Paris," exhibited in 1875. He was also employed in the United States on a panorama of the "Battle of Gettysburg," which was exhibited in New York, 1888-91, and afterwards in other American cities. In recent years many artists of ability have painted panoramas, which are now to be found in most of the chief cities of Europe and the United States. Consult Bapst, *Essai sur l'histoire des dioramas* (Paris, 1891).

PANORMITA, pä'nôr-mē'tä, Antonio Beccadelli (1394-1471). An Italian humanist, born at Palermo, whence the name Panormita by which he is commonly known. He was educated at Siena and taught classics at Pavia, Bologna, and Padua. His most notorious work was the collection of obscene elegies entitled *Hermaphroditus*, which, though attacked by some of the lesser clergy, and condemned by the Pope, won praise from the scholars of the time for its elegant Latinity. In 1435 Alfonso of Naples pensioned him and made him historiographer.

PANOR'MUS. The ancient name of Palermo (q.v.).

PANPSYCHISM, pān-sī'kĭz'm (from Gk. *πᾶς, pas,* all + *ψυχή, psychē,* soul). A term of somewhat rare occurrence which designates the metaphysical theory that the whole of nature, inanimate and animate alike, is endowed with mind, or has a mental side or aspect; so that the atom of the physicist, no less than man himself, though of course in immeasurably less degree, is ensouled, and the movements of the atom, no less than the voluntary movements of man, are accompanied by mental process. The name may be applied, in ancient philosophy, to the Stoic doctrine of Allbeseelung, as opposed to the earlier hylozoism; and, in modern times, to such philosophical beliefs as were held by Thomas Carlyle, still more to such a philosophical system as that of Fechner. Every pantheistic system (see Pantheism) is also, in a sense, panpsychistic. In particular, certain of the Arabian philosophers, notably Averroës (q.v.), have been termed panpsychists by the historians of philosophy.

PANSA, House of. The name given to the ruins of a large dwelling in Pompeii, from an election notice painted on its front wall. The house is interesting chiefly on account of the regularity of its plan. Although extensive, it contained few large apartments, but was cut up into small rooms and contained a number of shops, including a bakery. None of the wall decorations are preserved.

PANSLAVISM, pān-slāv'iz'm (from Gk. *πᾶς, pas,* all + Ger. *Slave,* Slav, from OChurch Slav. *Slovĭninu,* Russ. *Slavyanin* Slav). The term applied to a movement in which Russia as the great Slavic nation has assumed the leadership, for the political and cultural union of all races of Slavic descent. It had its origin about 1830 and was fostered by the general awakening of the national spirit which characterized the Europe of that time. The movement throughout Central Europe was paralleled by the Slavophile movement in Russia which had for its object the regeneration of the country through a return to the old ideas of Russian civilization as they had stood before the Western innovations of Peter the Great. Russia, owing to its predominant position in European affairs under Nicholas I., came to be regarded as the protector of the scattered Slavic peoples living under Austrian, Prussian, or Turkish rule. In 1848 the leading promoters of Panslavism summoned a congress at Prague, which was attended by Slavs from Bohemia, Moravia, Silesia, Servia, Croatia, Dalmatia, and Poland. Since 1860 Panslavism has exerted direct influence on Austro-Hungarian politics, both northern and southern Slavs tending toward united action in opposition to the Germans and Magyars. In 1867 a great Slavic congress was held at Moscow, but with little material result. It was largely as the natural champion of the oppressed Slavs of the Balkan peninsula that Russia declared war on Turkey in 1877, and the politics of the peninsula since then have been influenced to a considerable degree by the ambitions of the Panslavists. Up to the present time, however, the Panslavic spirit has asserted itself most effectually in the field of literature and more especially in philology, where the researches of many scholars have resulted in laying down the principles for a comparative science of Slavic languages.

PANSY. See Violet.

PANTÆ'NUS (Lat., from Gk. *Πανταινός, Pantainos*). Teacher of the Christian catechetical school in Alexandria about 180-195. Little is known about him, but he was probably a native of Sicily, trained in the Stoic and Pythagorean philosophy, and converted to Christianity in adult life. His fame rests chiefly upon his work as a teacher, which is described with affectionate admiration by his celebrated pupil Clement. (See Clement of Alexandria.) Tradition relates that he went on a mission to India, which is not improbable. He is said to have written commentaries on the Scriptures, but none have survived. It has been suggested that he may have written the last two chapters of the Epistle to Diognetus. There is no trace of him after the

persecution under Septimius Severus (203). The small fragments ascribed to Pantænus are given in Routh's *Reliquiæ Sacræ* (Oxford, 1846). Consult: Harnack, *Geschichte der altchristlichen Literatur* (Leipzig, 1893); Bigg, *The Christian Platonists of Alexandria* (London, 1886); Cruttwell, *Literary History of Early Christianity* (ib., 1893).

PANTAGRUEL, *Fr. pron.* pän'tà'grụ'ĕl'. The son of the giant Gargantua and the chief character in Rabelais's romance, *Gargantua et Pantagruel*. In the fifteenth century mysteries the name is given to a demon who throws salt into the mouths of sleeping persons, and Rabelais made the character King of the Dipsodes (thirsty). Like his father, Pantagruel is the hero of various burlesque adventures imitating the exploits of chivalry.

PANTALEON (?-A.D. 305). A Roman saint, physician, and martyr, born, it is supposed, at Nicomedia in Bithynia. He studied medicine and became special physician to the Emperor Galerius. He was a Christian and was martyred as such. He is the patron saint of physicians, and his feast is kept on July 27.

PANTALEON. A large dulcimer, named by Louis XIV. in honor of its inventor, Pantaleon Hebenstreit. It was four times the size of the dulcimer, and had two soundboards, on one side strung with strings of wire and brass, and on the other side with gut strings. It was played with small wooden mallets, with which the strings were struck. The pantaleon was the direct precursor of the pianoforte (q.v.).

PANTELLARIA, pän'tĕl-là-rē'à, or **PANTELLERIA.** A small island in the Mediterranean Sea between Sicily and Africa, and belonging to Italy. It is of volcanic origin, and has an extinct crater 2743 feet high, and several hot springs. The soil is fertile, producing grapes, cotton, and olives, and the harbor on the northwest coast has considerable shipping. Population, in 1901, 8619.

PANTENIUS, pän-tā'nē-ụs, THEODOR HERMANN (1843—). A German novelist. He was born at Mitau, Courland, studied theology in Berlin and Erlangen, and for six years taught at Riga, where he edited the *Baltische Monatsschrift* (1870-76). He lived at Leipzig, was editor of the weekly *Daheim* (1876, sqq.) and the *Monatshefte* (1886 sqq.); and in 1891 followed his papers to Berlin. Pantenius wrote, under the pseudonym of Theodor Hermann, some excellent sketches and novels, portraying life in Lithuania and Courland; such as *Wilhelm Wolfschild* (2d ed., 1873), *Allein und frei* (1875), *Das rote Gold* (1881), and *Kurländische Geschichten* (1892). A complete edition of his works appeared in nine volumes (1899).

PANTHEISM (from Gk. πᾶς, *pas*, all + θεός, *theos*, god). The name given usually by its opponents, and with a touch of *odium theologicum*, to any system of speculation which identifies the universe with God (*acosmism*) or God with the universe. The latter kind of pantheism is further subjected to the accusation of atheism (q.v.); the former has often been the expression of an intense religious consciousness (as in Spinoza). The term pantheism was apparently coined by John Toland in the eighteenth century, but the antiquity of the view it designates is undoubtedly great, for it is prevalent in one of the oldest known civilizations in the world—the Hindu. Yet it is a later development of thought than polytheism (q.v.). Hindu pantheism, as acosmism, is taught especially by the Upanishads (q.v.) and by the Vedanta (q.v.). The Hindu thinker regards man as born into a world of illusions and entanglements, from which his great aim should be to deliver himself. Neither sense nor reason, however, is capable of helping him; only through long-continued, rigorous, and holy contemplation of the supreme unity (Brahma) can he become emancipated from the deceptive influence of phenomena and fit to apprehend that he and they are alike but evanescent modes of existence assumed by that infinite, eternal, and unchangeable being who is all in all.

Greek pantheism finds a somewhat inarticulate expression in Xenophanes (q.v.), but comes to full utterance in the writings of the Stoics (q.v.). To the views of Neo-Platonists (see NEO-PLATONISM) a pantheistic tendency is often attributed, but it is doubtful whether emanationism does not logically escape pantheism.

During the Middle Ages Johannes Scotus Erigena (see ERIGENA) was one of the few Christian pantheists. Among the Arabian philosophers pantheism was more current.

Modern pantheism first shows itself in Giordano Bruno (q.v.). Spinoza (q.v.) comes next among modern pantheists in the order of time, and he is perhaps the greatest, certainly the most rigorous and precise, of the whole class that either the ancient or the modern world has seen. See Plumtre, *General Sketch of the History of Pantheism* (London, 1881).

PAN'THEON (Lat., from Gk. Πάνθειον, *pantheion*, temple to all the gods, neu. sg. of πάνθειος, *pantheios*, relating to all the gods, from πᾶς, *pas*, all + θεῖος, *theios*, divine, from θεός, *theos*, god). A temple to all the gods; hence in particular, the greatest of such temples at Rome. The first Pantheon, erected in B.C. 27 by Valerius of Ostia for M. V. Agrippa, was a rectangular edifice behind the Baths of Agrippa. Injured or destroyed by lightning under Trajan, it was replaced in A.D. 123 by the existing circular edifice erected by Hadrian, as is proved by the discoveries of Chidânne in 1892. The porch of sixteen superb colossal monolithic Corinthian columns appears to have been built with materials from Agrippa's porch and to have been altered from a decastyle to an octastyle porch, perhaps by Septimius Severus, A.D. 202. The Pantheon was further remodeled by Caracalla; it is possible that the interior paneling of the dome, which offers many puzzling problems, dates from this time and was hewn in the originally smooth vault. The Pantheon is the most perfectly preserved and the noblest work of Roman architecture. It consists of a circular hall, 142½ feet in internal diameter, supporting a dome rising to a height of 142 feet, and pierced at the summit by an oculus or opening 27 feet in diameter—the only window in the edifice, but wonderfully effective in its effect of interior lighting. Seven niches for statues adorn the interior, which, however, has lost much of its original aspect since the 'restorations' of 1748-56. The Pantheon, often called in Rome 'La Rotonda,' has been since A.D. 608 a Christian church. In 663 it was despoiled of its statues and bronze adorn-

ments by the Emperor Constans, and in 1632 the superb bronze vault of the portico was removed by Urban VIII., to be used in casting the baldacchino of Saint Peter's Church.

The name Pantheon has been also applied to a number of domical buildings, among which the most important is the Church of Saint Geneviève at Paris, erected 1764-1781 by the architect Soufflet in a somewhat cold but highly elegant and dignified classic style. During the Revolution it was desecrated and dedicated to the great men of France; according to the classic tendencies of the time, it was called 'Le Panthéon,' and has retained this name ever since, although in 1826 it was restored to Catholic worship and reconsecrated. In plan it forms a Greek cross of about 255 feet in width and length, exclusive of the noble portico in front. The dome over the intersection, 70 feet in diameter and rising 268 feet in air, is adorned externally with a superb peristyle of 32 colums.

Bibliography. Hirt, *Osservazione sopra il Panteon* (Rome, 1791); Adler, *Das Pantheon zu Rom* (Berlin, 1872); Piranesi, *Antichità romane* (Rome, 1768); Isabelle, *Edifices circulaires* (Paris, 1843); Lanciani, *Ruins and Excavations of Ancient Rome* (trans., Boston, 1897); Gosset, *Les coupoles d'orient et d'occident* (Paris, 1889).

PANTHER (OF. *pantere, panthere*, Fr. *panthère*, from Lat. *panthera*, panther, from Gk. *πάνθηρ, panthēr*, panther; perhaps connected with Skt. *pundarika*, tiger). (1) The leopard (q.v.). Sportsmen use the term rather loosely, although some attempt to distinguish the large, more uniformly colored specimens by this name. (2) In the United States, the puma. The name was more common in early days than at present, and more often heard in the dialect corruption, 'painter,' than in its true form. See Puma.

PANTHER-CAT. The ocelot (q.v.).

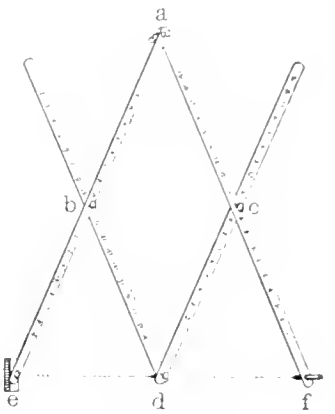
PANTHER-COWRY. An Oriental cowry (*Cypræa pantherina*), red-brown, densely spotted with blackish. See Cowry; and Colored Plate of Gastropods.

PANTHER-TOAD. A large smooth-skinned toad of Northwestern Africa, which has the upper parts adorned with a pattern of dark-edged, reddish-brown patches upon a yellowish ground, and the under parts white. This beautiful species is noted for the ease with which it may be tamed. A very similar species is to be found all over Central and Southern Africa. The former is *Bufo panthorina*, and the latter *Bufo regularis*.

PAN'TICAPÆ'UM. The ancient name of Kertch (q.v.).

PANTIN, päN'tăN'. A town of France in the Department of Seine, situated northeast of Paris just outside the fortifications. It has sugar refineries and manufactures glass and oilcloth. Population, in 1901, 29,716.

PANTOGRAPH (from Gk. *πᾶς, pas*, all + *γράφειν, graphein*, to write). An instrument used to make an outline copy of a map, design, drawing, or other picture either at the same scale or larger or smaller. It consists of four rods so joined as to form a parallelogram. One of the rods is pivoted about a fixed axis, while the apparatus is supplied with a tracer or point which is moved over the original drawing and a pencil which makes the line of the copy. A form of the pantograph which is extensively used is shown in the illustration. The rods are jointed at *a, b, c*, and *d*, so that *ab* is equal to *cd* and *ac* to *bd*, thus making the figure *abdc* a parallelogram. At *d* and *f* are the tracing point and pencil respectively, while at *e* the rod is pivoted so as to move freely. The points *e, d*, and *f* are in a straight line which is maintained no matter how the framework is moved about *e*. The triangles *bcd* and *acf* are similar and the distance traversed by the point *f* with respect to that traversed by *d* will depend on the ratio of *ae* to *af*. It is of course



SIMPLE PANTOGRAPH.

possible to interchange *f* and *d*, and in that case there will be a reduced drawing made. By means of screws or pins at *b* and *e* the ratio of the sides of the parallelogram and the scale of reduction may be altered to suit the artist, the appropriate scale being marked on the arms. There are several forms of pantographs and instruments in which numerous refinements in the way of rollers, pivots, suspenders, etc., are introduced, but all operate on the principle just described. The invention of the pantograph is ascribed to Christopher Scheiner, a Jesuit priest, in 1603, and a description of the instrument was published at Rome in 1631.

PANTOJA DE LA CRUZ, pän-tō'hä dä lä krōōth, Juan (1551-c.1609). A Spanish painter, born in Madrid. He was a pupil of Coello, whom he succeeded as Court painter to Philip II. He continued in that position under Philip III., and repeatedly painted the portraits of both these monarchs, besides those of many other members of the royal family. Although he executed several fine altarpieces and excelled also in painting animals, he is chiefly famous as one of the great portrait painters of Spain. His style resembles that of his master, but is more remarkable for care and finish than for vigor and freedom. In the Madrid Museum may be seen a "Birth of the Virgin," a "Nativity," besides portraits of Charles V. (2), Philip II., Queen Isabel de Valois (2), and others; in the Pinakothek at Munich the portraits of Archduke Albrecht (1600) and his consort Isabella (1599), and in the Vienna Museum two portraits of a child (one dated 1604).

PANTOMIME (Lat. *pantomimus*, from Gk. *παντομιμος*, one who acts by dancing and dumb show, all-imitating, from *πᾶς, pas*, all + *μῖμος*,

mimus imitator, from μιμεῖσθαι, *mimeisthai*, to imitate). The art of dramatic representation without words, through expression by attitudes and gestures. Among the Romans the term *pantomimus* was applied to the actor himself. Whether pantomimic performances had a distinct existence under the Republic it is hard to say, but Augustus showed great favor to this kind of entertainment, which seems to have arisen from the older custom of separating the actor and the reciter of dramatic dialogue; the fact also that in the great open theatres the Roman public could see much more easily than it could hear, probably contributed to the popularity of mute acting. As the *pantomimi* wore masks, no facial mimicry was possible; everything depended on the movements of the body. There was, however, commonly at the rear of the theatre, a choir, which sang the story by way of interlude or accompaniment; and as the subjects presented in dumb show were chiefly mythological love stories, they were consequently well known to the spectators. The earlier *pantomimi* came singly upon the stage, acting successively all the characters involved in the story; later several appeared together. The most celebrated *pantomimi* of the Augustan Age were Bathyllus (a freedman of Mæcenas) in comedy, and Pylades and Hylas in tragedy. The class soon spread over Italy and the provinces, and became so popular with the Roman aristocracy, who used to invite male and female performers to their houses to entertain their guests, that Tiberius thought it necessary to check the vanity of the *pantomimi* by issuing a decree forbidding the senators to go to their houses and knights to be seen walking with them on the streets. Under Caligula they were again in favor, and Nero even went the length of acting in a pantomime. From this period the *pantomimi* enjoyed unbroken popularity so long as paganism held sway in the Empire.

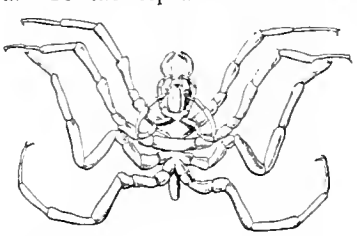
Pantomimic elements have always been found in the popular theatres, notably in the early Italian *commedia dell' arte*, in which were developed the characters of Harlequin, Pantaloon, Columbine, and the rest of their familiar troupe. In France in the seventeenth and eighteenth centuries the word pantomime was applied to a kind of mythological spectacle at the Opéra, in which allegorical characters appeared in appropriate costumes. The great *ballets d'action* of Noverre were really pantomimic in character. In the first half of the nineteenth century, at the famous little Théâtre des Funambules in Paris, pantomime enjoyed for some years a remarkable revival under the genius of Deburau and his associates.

In England the first pantomime is said to have been produced at Drury Lane in 1702. It was *The Tavern Bilkers*, by a dancing-master named John Weaver, another of whose pantomimes, *The Loves of Mars and Venus*, had a remarkable success. But it is to the noted harlequin John Rich that the establishment of the familiar Christmas pantomime is generally credited. In December, 1723, he brought out at Lincoln's Inn Fields *The Necromancer, or the History of Dr. Faustus*, by way of rivalry to *Harlequin Dr. Faustus*, which had been produced at Drury Lane not long before. Pantomimes were not then, however, limited to the Christmas season, but were regarded, as they have sometimes been since then, as a means for filling the theatre's treasury and supplementing the attractions of the legitimate drama. English pantomime was further developed by the coming in 1758 of the Grimaldi family. Joseph Grimaldi (q.v.), who was born in 1779, was especially clever at inventing tricks and devising machinery. *Mother Goose* and others of his harlequinades were long popular. A special feature in the early part of the last century was the 'transformation scene,' in which was made the change of characters to the harlequinade proper, or latter part of the programme. The subjects of these pantomimes have been generally found in popular tales like those of Aladdin, Blue Beard, Cinderella, or Little Red Riding Hood.

In the United States pantomime has for the most part been little more than an occasional importation, though such a show as *Humpty Dumpty*, with George L. Fox as clown, about 1870, had an enormous and long-continued popularity.

Consult: Broadbent, *A History of Pantomime* (London, 1901); Friedländer, *Sittengeschichte Roms* (Leipzig, 1890); Champfleury, *Souvenirs des Funambules* (Paris, 1859); Disraeli, "The Pantomimical Characters," in *Curiosities of Literature* (12th ed., London, 1841). See BALLET; HARLEQUIN; MIME, etc.

PANTOP'ODA (Neo-Lat. nom. pl., from Gk. πᾶς, *pas*, all + πούς, *pous*, foot). An aberrant group of arthropods, which seem to stand nearer the Arachnida than any other class. They are spider-like in form, with very long slender limbs arising from a remarkably small body, whence they have been called 'no-body crabs.' Each of the four pairs of legs contains a long cæcal prolongation of the stomach. The body consists of a cephalothorax, consisting of an anterior proboscis, succeeded by three segments, and one thoracic segment, behind which are three free thoracic segments and a minute rudimentary abdomen. To the cephalothorax are attached



A TYPICAL PANTOPOD, OR 'NO-BODY CRAB.'

four pairs of appendages, one or both of the first two of which may end in a forceps. These are succeeded in the male alone, by a pair of vigorous legs, and the first pair of thoracic legs, while each of the three free thoracic segments bear a pair of very long legs; there are thus in all seven pairs of appendages. The animal breathes through the walls of the body, and, as in all marine arthropods, there are no urinary tubes. In most of the forms there is a slight metamorphosis, the larva having three pairs of appendages. In one form the larvæ are internal parasites in certain hydroids. These sea-spiders live at various depths from between tide-marks to deep water. The group was formerly named Pycnogonida. By some authors they are sup-

posed to be allied rather to Crustacea than to Arachnida, having one more pair of limbs than any arachnidan.

PÁNUCO, pä'nōō-kō. A river in Mexico, rising by several headstreams on the Mexican Plateau, and flowing northeastward to the Gulf of Mexico, on the boundary between the States of Tamaulipas and Vera Cruz. With the construction of the jetties, the bar at its mouth has been removed, and it is now accessible to steamers of 24 feet draught. Tampico, at its mouth, is now one of the most important ports in Mexico.

PANURGE, pä'nurzh'. An important character in Rabelais's *Gargantua et Pantagruel*. He is discovered by Pantagruel at Paris and becomes his friend. Panurge is given to practical jokes, and is gifted, hand-some, and always without money. His desire for enlightenment on the subject of his marriage leads to the voyage to the oracle of the Dive Bouteille.

PANY'ASIS, or **PANY'ASSIS** (Lat., from Gk. *Πανύασις*) (?-c.454 B.C.). A Greek epic poet of Halicarnassus; a relative, probably an uncle, of Herodotus, the historian. He was put to death by Lygdamis, the tyrant of Halicarnassus, for assisting his native town in a fight for freedom. He was the author of a poem in 14 books and 9000 verses, entitled *Heraclea* (*Exploits of Heracles*), which led the critics of the Alexandrian school to rank him among the five great epic poets. There are extant a few elegantly written fragments on the use and abuse of wine-drinking, which are said to resemble the elegies on the same subject by Xenophanes and Theognis. According to Suidas he was also the author of *Ionica* (*Ἰωνικά*), an elegiac poem of 7000 lines on the history of Neleus, Codrus, and the Ionian colonies. The fragments have been edited by Tzschirner (1842), and by Kinkel in the *Epicorum Græcorum Fragmenta* (1877).

PANZER, pän'tsĕr, Georg Wolfgang (1729-1805). A German bibliographer. He was born at Sulzbach, studied theology at Altdorf, and lived at Etzelwang, a suburb of Nuremberg, and in that city as pastor and author. He was for several years director of the city library, and wrote: *Geschichte der romisch-katholischen deutschen Bibelübersetzung* (1781); *Geschichte der deutschen Bibelübersetzung M. Luthers von 1517-81* (1783); *Annalen der ältern deutschen Litteratur* (1788); *Aelteste Buchdruckergeschichte Nürnbergs* (1789); and *Annales Typographici* (1793-1803), a valuable catalogue of the old prints of all countries, in 11 volumes.

PAOAY, pä'ō-ī'. A town of Northern Luzon, Philippines, in the Province of Ilocos Norte. It lies near the western coast, 11 miles south of Laoag (Map: Philippine Islands, E 1). Population, 11,848.

PAOLA, pā-ō'lá. A city and the county-seat of Miami County, Kan., 43 miles south by west of Kansas City; on the Saint Louis and San Francisco, the Missouri Pacific, and the Missouri, Kansas and Texas railroads (Map: Kansas, H 3). It has a public library with more than 5500 volumes. The city is in a productive farming and stock-raising country, rich also in natural gas and coal. There are grain elevators and wagon shops. Paola was first settled in 1855, and in 1869 was chartered as a city. Population, in 1890, 2943; in 1900, 3144.

PAOLI, pä'ō-lē, Pasquale (1725-1807). A Corsican patriot, born at Morosaglia. His father, having taken a leading part in the insurrection against the Genoese, was obliged to flee to Naples in 1739. There Paoli received an excellent education. In July, 1755, he was summoned to Corsica, and elected Captain-General of the island, and the chief of a democratic government. He energetically and successfully applied himself to the reformation of the barbarous laws and customs of the island, and at the same time to the expulsion of the Genoese, who lost, in a short time, nearly all their strongholds. The fleet of the Genoese was also defeated and they were obliged to seek help from France. Finally, in 1768, Genoa ceded the island to France. Paoli refused all offers of the French Government, and continued to struggle for the independence of his country, but was defeated by the superior force of the Count de Vaux, and the French became masters of the island. After continuing the vain struggle for a year, Paoli was compelled to take refuge on board a British frigate, in which he sailed for England, where he was well received and granted a pension by the King (1769). Twenty years afterwards the French Revolution of 1789 recalled him to Corsica as lieutenant-general and military governor. Subsequently, when the island became a department, he was made president of the administration and commander of the National Guard. After the execution of Louis XVI. Paoli's attitude toward the Convention changed. With the active sympathy of England, he organized in 1793 a revolt against the Convention. He was proscribed by that body and made general-in-chief and president of the Council by a *Consulta* which assembled at Corte. He now openly allied himself with Great Britain, and favored the landing of 2000 British troops on the island in 1794, with whose aid he drove out the French. He was forced, however, to surrender the island to the English. Disappointed in his hope of being made Viceroy, and finding his influence over the Corsicans gone, he retired from the island in 1796, and spent the remainder of his life in England, where he died near London, February 5, 1807. In 1889 his body was removed to Corsica and there buried with great honor and solemnity. The earliest account of Paoli is found in Boswell's *Account of Corsica* (Glasgow, 1768). Consult also: Arrighi, *Histoire de Pascal Paoli* (Paris, 1843); Bartoli, *Histoire de Pascal Paoli* (new ed., Bastia, 1891).

PAOLO VERONESE, pä'ō-lō vā'rō-nā'zā. See Veronese, Paul.

PAOMBONG, pä'ōm-bŏng'. A town of Luzon, Philippines, in the Province of Bulacán (Map: Luzon, E 7). It is situated on the Pampanga River two miles west of Malolos, and has a population of 10,297.

PAO-TING FU, pä'ō-ting' fōō' (locally abbreviated into *Pao-fu*). A walled departmental city of China, capital of the Province of Chi li. It lies about 80 miles southwest of Peking and 76 to the west of Tien tsin; it is connected by rail with Peking, being an important station on the uncompleted Lu-Han Railway from Peking to Han kow (Map: China, E 4). The city contains several old temples, a Mohammedan mosque, several very good streets with well-filled shops, including a

very large number of curio and book shops. The city was occupied by the allied troops during the Boxer rebellion on October 19, 1900.

PÁPA, pä'pō. A town in the County of Veszprém, Hungary, situated on the Tapolcza, about 60 miles south-southeast of Pressburg (Map: Hungary, E 3). It has an extensive palace of the Counts of Eszterházy, a house in which Matthias Corvinus lived, three monasteries, and a Protestant gymnasium. The manufactures include pottery, tobacco, and textiles. Population, in 1890, 14,417; in 1900, 17,426, chiefly Roman Catholic Magyars.

PAPACY (OF. *papacie*, from ML. *papatia*, Papal office, from Lat. *papa*, pope, bishop, father; reduplication of *pa*, an early infantile utterance, supposed to apply to the child's father). The See of Rome considered as an historic institution, claiming to be the head of and centre of unity for the whole Christian Church. The origin of the primacy of Rome is, according to the Roman tradition, to be found (1) in the leading part played by the Apostle Peter in the New Testament records, and (2) in the alleged historic fact of a residence of Peter at Rome as head or bishop of the Christian community there. On the first basis is constructed a theory of a divine commission given to Peter by Jesus Christ, in virtue of which Peter was invested with the three attributes of king, priest, and teacher over all the followers of his master. On the second basis the Roman Church has built up its practical earthly structure of influence and power. The identification of the Petrine idea with Rome was needed to localize and make concrete the abstract claims of a divine commission. Whatever powers were conveyed to Peter by Jesus Christ were now held to be continued in full measure to his duly appointed successors in the Roman bishopric. Although a majority of Christians reject both the Roman interpretation of the Petrine commission and the historical proof of a 'bishopric' of Peter in Rome, and still more emphatically deny any connection whatever between these two sets of ideas, the historian finds abundant explanations of the origin and growth of the Roman supremacy without resorting to these sources. Doubtless the tradition of an Apostolic origin was a powerful aid to the bishops of Rome in enforcing their claims to superiority.

The Roman community was certainly one of the earliest Christian foundations. It enjoyed the prestige of the work and of the martyrdom of the great Apostles, Peter and Paul. It was the centre of life of the vast Roman Empire, and the focal point toward which all ideas streamed in and from which they were redistributed in effective form. Rome, however, had never been an important source of ancient culture. Her gifts to the world were law and administration, her culture was always a borrowed one. This same tradition of practical administrative skill was now to be continued by the Church. The authentic records of Roman church life during the first two centuries are few, and many instances of the exercise of Papal power at this time are not to be found.

The evidences of an aggressive, dominating jurisdiction appear very clearly in the administration of Victor I. (?193-203). This active and zealous churchman was bent upon securing uniformity in the outward practices of the Church, and he made the existing variations in the time of celebrating Easter a test question. He demanded of the Eastern churches agreement with the Roman Easter period and threatened them with excommunication if they refused. Excommunication, as the refusal to share Christian fellowship with an offending brother, was the right of every church, but we distinctly see here the Roman practice of treating it as a punishment to be inflicted by a superior upon an inferior. Irenæus, Bishop of Lyons, himself a Syrian, but in agreement with Victor on the Easter question, admitted the *potentior principalitas* of Rome, a phrase naturally quoted by Roman controversialists to support their claims of right. They also cite, as justification of these claims, a letter of Clement I. to the Corinthians (A.D. 95 or 96), the epistles of Saint Ignatius, and passages of Tertullian, Origen, and other Christian writers of the second and third centuries. Whatsoever may be the value of these testimonies, as cited to sustain the claims of Papal supremacy in these early ages, the subsequent fact of a Papal domination is outlined distinctly in historical perspective by the end of the fourth century.

The Western world turned as naturally to Rome in religious as in secular matters, partly as the result of the habit of centuries, partly because there was no other resort. Papal Rome met the demand with a steadiness and prudence worthy of the great political tradition to which she was succeeding. In matters both of faith and practice she was always to be found on the side of a stanch but liberal orthodoxy. While Gnostics on the one hand and Montanists on the other were trying to make of the Church a select esoteric community of the specially initiated, Rome steered carefully between the extremes and lent all her weight to the 'Catholic' or inclusive idea of the Church, as the medium of salvation for all men. On the vexed questions of heretical baptism and ordination and the treatment of the 'lapsed' her position was always moderate and liberal. While the theologians of the Eastern world were speculating with philosophical refinements over the great Christian problems, the Roman Church quietly but persistently held fast to the idea of a mystery of redemption not to be solved by any human philosophy, but to be accepted once for all by an act of faith. When, in the storms of the Germanic invasions, the weak and cowardly emperors deserted Rome, the Roman bishops repeatedly stood forward in their place and dealt with the invaders in the name of a power greater than their own.

The earliest point at which we can clearly discern the existence of a well-developed machinery of Papal power is in the administration of Leo I. (440-461). He grasped, as none of his predecessors had done, the vast range of his opportunity. He aimed to establish, both in the East and in the West, a system of Papal vicariates through which the Roman jurisdiction could be enforced and the Roman forms of faith and practice maintained. Eastward from the Adriatic his success was only partial and temporary. The pressure of Greek Christianity backed by the forces of the Greek Empire was too great, and we may from this point practically dismiss the East from our view. At the Coun-

cil of Chalcedon (451), the formula of faith presented by Leo was accepted as a sufficient statement of the Christological problem. In Gaul the rising metropolitan power received a serious check in Leo's severe treatment of Hilary of Arles, who had on insufficient evidence deposed Chelidonius, Bishop of Besançon. In 452 Leo went out, armed with none but spiritual weapons, to meet the terrible Attila, and actually turned him back in the full tide of victory. In 455 he again faced a Vandal invasion from the south and succeeded in gaining at least milder terms for the doomed capital.

Especially clear does this Roman leadership appear in the dealings with those Germanic peoples who for a longer or shorter time occupied the soil of Italy and organized there an actual administration of government. The popes of this period, nominally subject to the emperors at Constantinople, never really questioned the *de facto* sovereignty of the barbarian rulers in Italy. With Odoacer (476-493), and then with Theodoric the Ostrogoth (493-526), we find them in relations of friendly temporal subjection. Many cases of Papal privilege and several disputed elections were referred to these barbarous and heretical chiefs of tribes, and their decisions were accepted. It was the wise policy of Rome, at this early stage, to conform itself to actual conditions and make its profit out of them. This *de facto* allegiance was readily transferred to Constantinople when, after the death of Theodoric, the armies of Justinian under Belisarius and Narses finally drove the Ostrogoths out of Italy (535-53). This revival of Byzantine sovereignty was, however, the most serious disaster that could have happened to the Papal idea. Again and again popes were made to feel the rough hand of the Empire if they ventured to act against its will, even on a matter of doctrine. The prestige of Rome was in danger of disappearing, if she were to become merely one among the numerous patriarchates under the fitful dictation of Constantinople. It was really an advantage when the dreaded Lombards swarmed over into the Po Valley (568) and rapidly drove the Byzantine garrisons from most of the country east of the Apennines. The Lombard terror forms the background of the Papal history for nearly two hundred years, but it was one of the means through which the importance of the Papal institution was recognized and justified.

These were the conditions under which Gregory I., the Great (590-604), came to power. From his correspondence we gain for the first time a clear impression of the economic side of the Papal administration. We find a considerable total of landed properties scattered from Africa, through Sicily and Italy, to Gaul, managed directly by Papal agents and serving as the chief financial basis of the Roman bishopric. Gregory, a prudent manager and astute politician, knew how to keep on good terms with the Empire, and even succeeded in making some impression on the Arian Lombards in the direction of their ultimate conversion to Catholicism. He kept up an active correspondence with the Catholic Merovingian princes of the Franks, and was the originator of the conversion of the heathen Anglo-Saxons to Roman Catholic Christianity. In a spirit of wise charity for all human diversities, Gregory I. laid the foundations for a Papal system which would have made the Roman bishop the guide and harmonizer of Western Christendom. As time went on, the hold of the Eastern Empire upon Italy became weaker and weaker. In vain popes implored emperors for help against the Lombards. The Mohammedan conquest absorbed all the energies of the declining Empire, and Rome must turn elsewhere for the material support it needed. Gregory's relations with the Franks gave the clue for the future. So long as the Merovingian dynasty lasted nothing could be done; but when the new and vigorous House of Pepin began to displace the Merovingian princes, the opportunity came. Papal appeals to Charles Martel (Major Domus, 714-741) were flatly refused, but his son, Pepin, needing a sanction for his usurpation of the kingdom, found it worth while to win this of Rome as the price of deliverance from the Lombard terror. More than this, he guaranteed to the Papacy the temporal sovereignty over an ill-defined stretch of territory including Rome and a considerable surrounding country. See PAPAL STATES for the subsequent history of the temporal sovereignty.

With the coronation of Charles the Great as Roman Emperor by Pope Leo III. (800) a new phase of the Papal power begins. The revival of the Imperial name was doubtless intended to connect the actual domination of the Frankish people with the traditions of the ancient Roman world. It was, however, to be several generations yet before the importance of this new connection was to be evident. No emperor from Charles to Otho the Saxon held a position that could in any sense be called 'Imperial.' Even the title disappeared for more than a generation before Otho. Meanwhile the Papacy kept on quietly developing the constitution under which it was to do its great work. The administration of Nicholas I. (858-867), coincident with the notable rise of intellectual culture in West Francia, serves to indicate this progress. Nicholas I. was keen to seize every occasion to assert Papal right of supreme jurisdiction. (1) As defender of a sound Christian morality he took up eagerly the cause of Theutberga, the rejected wife of King Lothair II. of Lorraine, and carried it against the support of the fighting men and the whole clergy of Lorraine to a complete triumph. (2) He assailed the metropolitan power in the person of the great Archbishop Hincmar, the most important prelate in the North, on the old question of the right of a subordinate clergyman disciplined by his local superior to appeal directly to Rome.

With the tenth century we find the Papacy in a phase which seemed at times to imperil all it had gained. Its three functions—the bishopric of Rome, the government of a Roman State, and the headship of Latin Christianity—were often in hopeless conflict, but never more than now. In the furious strife of local parties in which Rome, like every other Italian city, was involved, the Papacy came to be hardly more than the spoil of party victory. Popes of every variety of incapacity and unsuitableness were set up by rivals in politics, and, even if they succeeded in maintaining their hold upon the bishopric and the Roman territory, there was little question of any influence upon the movement of affairs outside this field. It is the most convincing proof of the need in that age of some such central religious authority in Europe that men con-

tinued to pay deference to an institution so careless of its own credit and its own future.

Two causes were destined to bring the Papacy once again into the great currents of European Christianity. The first of these was the renewal of the Empire on a German basis. The entrance of the Saxon people into the Latin-Christian culture (c.830) resulted in a great strengthening of the purely German as distinguished from the half-Romantic elements of the Western world. In 919 the German kingship passed with Henry I. into Saxon hands. His son Otho I. (937-973) took up the kingdom, no longer as a Saxon thane, but as the born King of all Germans, and after twenty-five years of varying success saw his idea of kingship fairly realized. For nearly forty years the Empire had gone begging for a power strong enough to come and take it. In 961 Otho crossed the Alps as of right, and in 962 was crowned Emperor at Rome by Pope John XII., whom he soon uncanonically deposed on accusations of every possible iniquity. He then caused the 'election' of a capable Roman layman, Leo VIII., and maintained him with his sword. He bound the clergy and nobility of Rome by solemn oaths to elect their popes in future 'canonically' and to seek for such election the approval of the Emperor. Thus it was thought to establish a formal balance of rights between these two branches of the highest earthly power. If the Papal sanction be needed to make the Emperor, no less should Imperial approval be necessary to a valid Papal election. But no sooner was the Imperial camp removed from Rome than all the evils of local factional strife broke out again. To end the perpetual conflict, Otho III. (983-1002), a youth of generous enthusiasms, tried the experiment of a Roman residence in conjunction with a German pope, Gregory V., of his own making. For a moment the problem seemed solved, but a new outbreak of Roman fury drove him from the city to his death.

Meanwhile the Church was developing a new energy through the force of its monastic principle, the second cause alluded to above. The Monastery of Cluny in Burgundy began from its foundation about 910 to exercise an influence upon clerical life quite without precedent. This took the form of a purification of the priestly office by ridding it of the frequent vice of simony and by strictly enforcing the rule of priestly celibacy. The reaction of this movement upon society at large is seen in the efforts to bring about the peace of the land known as the 'Peace of God' and the 'Truce of God.' In all this great activity the Papacy as such took no part, but the time came when these ideas took possession of it and made it do their bidding.

The two processes we have noticed—the rise of the Empire and the purification of the Church—come together in the middle of the eleventh century. Another period of Papal depression had followed the work of the Othos, and once more the Papacy became the prey of contending local factions. The office was tossed about in shameless 'deals' or by open violence. In the year 1046 three persons were claiming the Papal power on different grounds. The scandal was too great, and the 'Romans' appealed to the Emperor Henry III. In the synod of Sutri (1046), held on the borders of the Roman territory, Henry brought about the removal of all three claimants and nominated a worthy German prelate who was accepted by the Romans. Two other Germans, also nominated by the Emperor, followed in rapid succession. The last of these was Bruno, Bishop of Toul in Lorraine, who as Pope Leo IX. (1049-54), and under the guidance of the monk Hildebrand, began the aggressive policy of Church reform through Papal action, which is the most important feature of Papal history for the next century. Though nominated by the Emperor, Leo saw plainly that to succeed he must be free from all outside control and rely upon the old Roman traditions. He began his administration by a journey to France and Germany, where in two synods, at Rheims and at Mainz, he proclaimed the articles of the Cluny programme, especially that against simony, and demanded the allegiance of the northern prelates in his crusade against these evils. The conscience of Europe, roused already by the work of the monastic reformers, responded with satisfactory readiness. At Rome Leo IX. found himself involved in an entirely new political situation. The Norman conquerors of Southern Italy had reached a point in their expansion where it was important for them to have a definite legal status. They threatened to encroach upon the Papal territory and actually routed the Pope's army in the battle of Civitate (1053). But the wisdom of Leo turned this rout into a victory by persuading the Normans to become the vassals of the Holy See on condition that their power, within certain limits, should be recognized as a legitimate sovereignty.

The sense of Papal right as paramount is seen still more plainly in the action of Nicholas II. (1058-61). To check the disorders consequent upon the Papal elections and to establish the electoral process on a firm and permanent basis, he procured the passage at the synod of 1059 of a decree whereby the election of the Pope was henceforth to be in charge of the Roman 'cardinals,' including members from all three clerical orders. The initiative was to lie with these, but they were then to procure the assent of the 'Roman people,' and a certain undefined right of participation was reserved to the Emperor. On these three elements—the Roman cardinals, the Roman people, and the Roman Emperor—rested the Papal constitution for the next two hundred years. The greatest conflicts of this period arose from attempts to define more precisely the limits of each element. On the whole, the cardinalate gained steadily upon the other factors, and succeeded ultimately in winning exclusive control, not, however, without decisive modifications in its own make-up.

The Papacy was now definitely committed to the work of reform. The influence of Hildebrand grows more and more perceptible. Under his far-seeing direction what had been started as a purely moral movement becomes in the clearest sense a political one as well. Adding to the two articles of the Cluny programme a third—the prohibition of lay investiture—he combined all three under the one general demand for the 'freedom of the Church' from all external control. (1) The celibacy of the secular clergy was to be the guarantee that the clergy should be free from all the obligations arising from marriage and the social and economic duties that attend it. (2) The abolition of simony was to make the clergy free from all the complications of worldly

interest that must arise if clerical office were to be bought and sold for any valuable consideration whatever. (3) The prohibition of lay investiture was to free the clergy from any relation toward the State which might interfere with the exclusive control of all clerical interests by the supreme ecclesiastical authority, the Papacy itself. The effect of the first was to separate the priest from the family; of the second, to separate him from the temporal interests of the society about him; of the third, to cut him off from any secular service to the State. It was 'freedom' in the sense of a separation that must tend to place a gulf between the clergy and all purely secular interests. On the other hand, it is doubtful if any other process could have stayed the progress of a fatal secularization of the Church that threatened to absorb it entirely in the life of the society of the full fendal period.

As to the question of simony, all thinking men were agreed that it was an evil. The celibacy of the clergy in the major orders was already well established in the habits of most of the European populations, and the sympathy of the masses was decidedly setting toward its extension to the minor orders as well. It was, therefore, a well-considered policy that led Hildebrand from the moment of his accession as Pope Gregory VII. (1073-85) to throw his whole energy into the fight against the lay investiture.

The moment chosen for the conflict with Germany was most favorable. Henry III., the vigorous champion of Imperial right and duty as the guardian of Papal honor, died in 1056, leaving a son, Henry IV., six years old, who was accepted as King under the regency of his pious mother, Agnes of Poitou. In 1073 this son was a clever, head-strong youth of twenty-three, already at odds with many parts of his kingdom, but prepared to press to the utmost all his royal rights. The first proclamation against lay investiture was in 1075, and, though couched in general terms, was plainly aimed at Germany. To give up the right of investiture would have meant for the German King the loss of the most important means of political control, and Henry threw himself upon the loyalty of his clerical subjects. A German synod at Worms (1076) denounced the Pope in unmeasured terms, and threatened him with deposition. He replied by excommunicating the King, whose political enemies utilized the excommunication as a weapon to keep him in a semi-imprisonment until Gregory could carry out his purpose of settling the whole German question in person at a German assembly. Gregory was on his way to this meeting at Augsburg when Henry IV., leaving Germany, hurried over the Alps, met the Pope in the famous interview at Canossa, and won from him the absolution which reinstated him in the allegiance of his subjects, and thus averted the grave political danger of a settlement of German affairs by a Papal council on German soil. Through the long reign of Henry IV., under Gregory and his successors, the fight went on. The Pope repeatedly excommunicated the King and sanctioned the election of anti-kings. The King replied in virtue of his Imperial rights, actual or to be, by 'deposing' popes and causing the election of a series of anti-popes. The immediate question of the investiture was lost sight of in the larger issue—whether Church or State was to control. Henry V. (1106-25) had joined the Papacy against his father, but was no sooner King himself than he was forced into an opposition as much more dangerous as he was more powerful. In 1111 he was able to force the Papacy into a momentary agreement that the clergy of the Empire should be exempt from the Imperial investiture on condition that they should surrender all their temporal property. This agreement was promptly rejected by those most interested on both sides, and led to the final settlement in the Concordat of Worms (1122), whereby the dual nature of the clerical office as at once temporal and spiritual was recognized. The investiture with the spiritualities (ring and staff) was left to the Papacy, while that with the temporalities (sceptre) was held by the Emperor. Similar but less violent conflicts in France and England led to a similar result.

A new phase of the conflict between Church and State begins with the accession of the emperors of the House of Hohenstaufen. The Hohenstaufen (Ghibelline) policy was to extend the German kingdom, under the disguise of the Empire, over Italy. In this ambition it was checked at every turn by the rising power of the Italian city republics. Frederick Barbarossa (1152-90) sought to incorporate these communities into his administration by placing governors (podestà) over them and utilizing their growing wealth for his larger plans. Led by Milan, the Lombard communes steadily resisted. Milan, destroyed in 1162, was rebuilt by her neighbors, and at the head of the great Lombard League gave the Emperor such a defeat at Legnano (1176) that in the Peace of Constance (1183) he conceded practically all the claims of the cities to independence. Throughout this fight the communes were steadily supported by the Papacy. Their party (the Guelphs) was also the Papal party; and though outside the cities there were many territorial nobles and inside there was always a noble faction that looked toward the Emperor, the great masses of the rising industrial population, organized in their craft and merchant guilds, were sturdily Guelph and in every crisis expected the support of the Pope. Henry VI., son of Frederick I. (1190-97), had elaborate plans for refeudalizing Italy and sinking the communes in greater territorial units. Through his marriage with the heiress of the Norman kingdom in the south and the birth of a son in 1194, he seemed to see the realization of the Hohenstaufen policy. His death, the consequent confusion in Germany, and the accession of the great Pope Innocent III. (1198-1216) saved Italy for the time and gave to the Papal power one of its greatest moments of triumph.

Innocent III. realized more completely than any pope before or after him the Hildebrandine ideal. He was able to bring King John of England to surrender the overlordship of the land to him for his support against his nobles. He compelled Philip Augustus of France to take back his rejected wife. In the struggle for the German crown he championed Otho the Guelph against Philip of Hohenstaufen (1198-1208), but when Otho as King (1208-14) proved that no Emperor could be a Guelph, as no Pope could be a Ghibelline, Innocent turned against him at once. He gave his support to France against Germany and England in the battle of Bouvines (1214). By

which his ward the young King Frederick of Sicily gained the Empire. At a Lateran council in 1215 Innocent displayed as it had never been displayed before the legal system on which the working of the Papal idea depended.

The prestige of the Papacy had been greatly increased by its leadership in the Crusades. The Crusade had been commended by Gregory VII. Events in the East had roused attention to it soon afterwards, and Urban II. (1088-99) had made it the chief object of his administration. Throughout the long and not always creditable history of the Crusades (1096-1270), it was the Papacy that gave to it whatever of unity and dignity it had. From Innocent III. we may begin to note the gradual decline of the mediæval Papacy. It had thriven upon the absence of strong national governments in Europe, and the rapid rise of the new nations closed up one by one the channels through which the Papal power had made itself felt. The reign of Frederick II. (1215-50) is one long conflict between the Imperial and Papal schemes in Italy. On the whole, the Emperor was beaten, but the prestige of the Papacy as a universal power was injured. The attempt of the Hohenstaufen to maintain a government in Italy was frustrated, but the Papacy, by bringing the Angevin rulers from France into the South, sowed the seeds of new disaster. Rudolph of Hapsburg (1273-91) began a new policy for the Empire: to leave Italy out of the question in return for a free hand in Germany; and every deviation from this wise policy by his successors only showed again how completely the mediæval ideals of public life were passing over into those of the modern world. The attempts of Henry VII. (1308-13) and Louis the Bavarian (1314-47) to affect the balance of Italian politics proved utter failures.

On the other hand, the same thing is true of Papal attempts to enforce discipline on the rulers of Europe. Boniface VIII. (1294-1303) came to the Papacy as the leader of the cardinalate in an unprecedented crisis. His predecessor, Celestine V., a pious recluse, had so completely fallen into the hands of the Neapolitan Angevins that he had raised to the cardinalate a number of French and Neapolitan prelates. He had then, largely under pressure from Boniface, resigned the Papacy, and now the cardinals found themselves under the domination of such a will as had not been seen in the Papal office since Innocent III. His violent attempts to break down the faction of the Colonna drove his enemies to the Court of Philip IV. of France, and there they found a fertile soil for their complaints. Philip, a completely modern ruler, needing all the money there was to spare in France, laid a tax upon the clergy. Boniface, in a series of able documents, laid down again the Hildebrandine doctrine of the freedom of the Church. Philip appealed to the national sentiment as expressed for the first time in the States-General and won his fight. Boniface, defeated and abused by the personal enemies he had made, died, the last great exponent of the mediæval Papacy.

The wreck of the mediæval scheme of a Papacy and an Empire working in a harmony that was never attained threw the Papacy upon a new alliance. The influence of France now replaces that of Germany. The result of the second conclave after the death of Boniface was the election of a Frenchman, Clement V. (1305-14). The new Pope was met at Lyons by King Philip in person, and as a result of this interview he never left France. The cardinals summoned across the Alps obeyed, and thus began the French residence of the Papacy, the 'Babylonian Captivity' at Avignon (1309-76). This 'exile' came about naturally through the working of the cardinal system. The French influence had secured certain cardinals from Celestine V.; these decided the choice of Clement, and now he in turn was free to appoint enough more French cardinals to decide the character of the college for a generation to come. The close relation of the Papacy to France withdrew from it the sympathies of the other nations, notably of England. It seemed in danger of losing entirely that Roman character which was its only source of authority. Pressure was continually brought to induce the popes to return to Rome; several attempts to do so were made, but were hindered by the French interests of the cardinals. Finally, Pope Gregory XI. did return and died at Rome (1378). The new election, held under fear of violence from the 'Roman people,' resulted in the choice of an Italian, Urban VI., but within a few months the French influence succeeded in raising sufficient doubts as to the validity of this election to justify the cardinals in choosing another Pope, Clement VII. Thus, still by the regular working of the Papal machinery, the Church found itself, for the first time in its history, involved in a schism in which both claimants rested upon the same basis, a lawful election by cardinals.

Both parties appealed to the nations for support. In general, the northern peoples sympathized with the Roman Pope, France and Spain with the French one; but the really important result of the Great Schism (1378-1418) was the discussion it aroused as to the nature of the Papacy and its relations to the Church at large. The feeling was constantly gaining force that the Church as a whole was misrepresented by a system which threw all the weight of the Papal authority into the hands of a small body of persons at Rome. To change these persons to Frenchmen was no relief. What was demanded was a larger share to the nations in the Church constitution. These opinions gained in clearness as the difficulty of breaking the schism through the action of the cardinals became more apparent. The remedy was that most feared by the curial party at all times, a general council, but years passed before a way could be found for calling a council that would be respected. Finally, in 1409, the 'union cardinals' on both sides united in this work, and the Council of Pisa supported them in making a new election. The Pope chosen, Alexander V., lived but a few months, and the same interests succeeded in putting forward John XXIII., who failed utterly to maintain the respect of the Church as against the two claimants set aside at Pisa, who now renewed their claims.

The Church thus found itself in a triple schism, honeycombed with the heresy of Wiclif and Huss and burdened with ecclesiastical abuses which every one saw, but which no one knew how to remedy without danger to the system itself. The Council of Constance (1414-18) met under these conditions. It first attacked heresy by examining and burning John Huss, who, relying upon the safe conduct of the Emperor Sigismund, had voluntarily put himself into its power. It

then proceeded to endless discussions of abuses and the means of relief, only at last to express a series of pious wishes and leave their execution to the Pope, whose election was accomplished by a joint commission of the cardinals and the Council. Naturally, the new Pope, Martin V., of the Roman family of the Colonna, failed to consider himself bound by the action of a council that could not agree within itself upon vital questions, and his 'reforms' were of the most superficial kind. The Papacy had come out of the trial of schism and opposition unchanged in its quality. It could not avert the assembling of the Council of Basel (1431-48), but it steadily opposed it. So long as the Council could keep the respect of Europe it could maintain its existence, and at least succeeded in demonstrating its capacity to do things that the Papal administration had failed to accomplish; but the longer it lasted the more apparent it became that Europe was not ready to exchange the traditional authority of Rome for the novel tyranny of an irresponsible council. Especially when the Council proceeded of its own right to choose a pope, without reference to the Roman tradition, it became clear that such a pope could not be supported. What the Council of Basel really accomplished was to furnish to the nations a pretext for asserting their rights over their own local churches more firmly than ever, as, for example, in the case of France, through the Pragmatic Sanction of Bourges (1438). When this was done the governments were comparatively indifferent to the general question of the Papal constitution itself, and Nicholas V. (1447-55) stands at the beginning of a period more splendid than any other in the Papal annals. The Papacy now entered into the politics of Europe as one among the temporal powers (see PAPAL STATES), fell in with the prevailing enthusiasm for art and letters, and sought to direct the course of the Renaissance movement. In the meantime opposition was slowly and silently gathering in the North, which culminated in the Reformation movement, and directly challenged the traditional supremacy of the Papacy. The Protestant Reformation affirmed as the ground of its justification the financial tyranny, the spiritual indifference, and the anti-national propaganda of the Papacy. It formulated as its programme a return to what it claimed to be the early principles of a private interpretation of Scripture and a personal approach of every Christian man to his God without other mediation than that of his personal faith. Against this demand the Papacy set itself with all the resources of its past. Between the two ideas there was no compromise, and the result was secession. As late as 1541 it was hoped by many sanguine persons on both sides that some common ground might be discovered, but the Council of Trent (1545-63) reaffirmed in unmistakable terms the existing principles of the Papacy as it had come to be. Recognizing the need of 'reform' in many details, the Council carefully avoided any action that might seem like compromise with rebellion. While not admitting in theory the fact of schism, the Papacy henceforth was obliged to recognize it in practice and to devote all its energy to maintaining its hold upon what it had left and extending its sway over new lands. For later history, see ROMAN CATHOLIC CHURCH; PAPAL STATES.

PAPAGO, pä'pä-gō. An important tribe of Piman stock (q.v.), originally occupying a large portion of Arizona, south of the Gila, and extending across the border into northern Sonora, Mexico. They were missionized by the early Jesuits and Franciscans, and are now practically all Catholic. They are agricultural, industrious, and peaceable toward the whites, but have been compelled to wage constant war with the Apache until a recent period. They carry on an extensive trade in salt, collected from the salt lakes of the region. They were recognized as citizens under the Mexican Government, but their rights were disregarded on the annexation of the territory to the United States, and by the seizure of the best lands and water supplies by the American settlers and land companies, the majority have been rendered homeless nomads. Hundreds of them earn good wages as railroad laborers. They number about 3900, of whom 520 are on San Xavier reservation and 100 at Gila Bend, most of the others being nomadic. The number in Sonora is unknown.

PAPA'IN. A digestive ferment derived from the juice of *Carica Papaya*, a South American fruit tree belonging to the order Papayaceæ. This ferment is a mixture containing vegetable globulin, albumoses, and peptone. It digests all forms of proteid or albuminous matter, whether coagulated or not, and whether the medium in which it works is acid, alkaline, or neutral. It is a rapid solvent of false membrane. Papoid, derived from papain, is serviceable in gastro-enteritis, gastritis, infantile diarrhœa, and fermentative dyspepsia. It has been used locally on diphtheritic membrane, and has been injected into neoplasms with success. It is found in the shops in powder and tablet form, and a glycerole is also made. Papain is not official.

PAPAL GUARANTEES, Law of. A law passed by the Italian Parliament at Florence in 1871, which aimed at making the Papacy and the Italian Government mutually independent. It guaranteed to the Pope the diplomatic privileges of a sovereign power with its own ambassadors and its own court in the midst of Rome; separate postal and telegraphic communications with foreign countries; and an allowance of 3,225,000 francs a year. It allowed further to him and his successors the use of the Vatican and Lateran palaces, and certain other buildings, and precluded all Government officials from entering any of these buildings without permission. It relinquished the royal *exequatur* and *placet*, or the necessity of the King's assent to the publication and execution of acts of the ecclesiastical authority; it exempted the bishops from any oath of allegiance to the Crown, and gave the clergy complete freedom of meeting. It put an end to appeals to the civil courts against acts of spiritual discipline, but, on the other hand, it denied to the Church courts the aid of the civil tribunals in enforcing their decisions. This plan, of which a draft had been found among the papers of Cavour, and which attempted to realize his ideal of 'a free Church in a free State,' was opposed by the Liberals as

leaving the Pope in far too independent a position. It was submitted to the Powers with the view of obtaining international sanction; but this failed through the refusal of England. Partly, perhaps, owing to French influence, the Pope decided to refuse these offers and to ignore the Italian Government completely while remaining in Rome.

PAPAL STATES, or STATES OF THE CHURCH. The name applied to the territory in Central Italy, varying in extent, which until the last half of the nineteenth century was under the temporal sovereignty of the Pope. The earliest origin of this dominion is difficult to assign to a definite year. Although the so-called Donation of Constantine is now known to have been a later invention, there is no doubt that he made many rich gifts to the Church, especially after his victory over Maxentius; the Lateran Palace, for a thousand years the residence of the popes, seems to have been given to them during his reign. Like other bishops, the bishops of Rome acquired by degrees not unimportant political rights; and when the seat of the Empire was removed to Byzantium, it was partly their rich possessions that gave them their great influence in the affairs of Italy. By the time of Gregory the Great (590-604) the Roman See possessed at least twenty-three estates with a total area of some 1800 square miles in various parts of Italy and the adjacent islands, in Southern France, and even in Northern Africa. The beginning of full sovereignty in the modern sense may, however, be said to have come from the presentation of the town of Sutri by the Lombards to the Apostles Peter and Paul in the person of Gregory II. (727). The Lombards were uncertain friends, however, and the popes were obliged to appeal to the Frankish kingdom for aid against them. In 754 Pepin transferred considerable and definite territories to Pope Gregory III., and in the following year, brushing aside by conquest any claims which either the Lombards or the Byzantine Emperor made to these lands, placed the Pope in undisputed possession of them. Charlemagne increased them, until they extended from Luna, near the present Lucca, to Capua, including the Duchy of Rome, the Pentapolis, Emilia, and the Exarchate of Ravenna, or nearly the whole of Central Italy.

This sovereignty, though attacked during the troubles of the tenth century by the Italian factions, increased gradually during the eleventh and twelfth. In 1014 the Emperor Henry II. resigned half of Tuscany into the Pope's hands; Leo IX. received the overlordship of Benevento from Henry III. in 1052, and the principality came into the full possession of the Holy See in 1077, on the extinction of the family which had ruled it. In 1115 the Countess Matilda of Tuscany left the Pope her fiefs of Parma, Modena, Reggio, and Garfagnana, and part of Mantua. They were, however, seized by the Emperor, and only a part of Southern Tuscany actually came into the Pope's hands. In these times, in any case, the power of the Pope was little more than a feudal suzerainty over a number of petty princes or over cities with their own government, who paid tribute to the popes and were bound to assist them with a military force in case of need. In France, Gregory X. gained the Comtat Venaissin from Philip III. in 1274, and Clement VI. bought the town of Avignon in 1348. During the Avignon period, however (1309-76), the temporal sovereignty of the popes over their Italian territories was menaced or weakened by the ambition of the great families, and Cola di Rienzi even succeeded for a time in shaking it off from Rome itself. In the sixteenth century the popes entered so largely into the political movements of Europe, and were of such importance to the maintenance of the balance of power, that prudent statesmanship was able to increase their territory largely. Sixtus IV. at the end of the fifteenth century established his jurisdiction over Romagna; additions were made of Bologna in 1512, Ancona in 1532, Camerino in 1545, Ferrara and Comacchio, the possessions of the House of Este, in 1598, Urbino in 1631, Castro and Ronciglione, the last additions, in 1649.

Great changes began with the end of the eighteenth century. In 1768 the Bourbon rulers of Naples seized Benevento and Pontecorvo, and in 1783 dissolved altogether the connection with the Roman See which had existed for more than seven centuries. Avignon and Venaissin were occupied from 1768 to 1774, as they had been twice in the preceding century, by the French Bourbons, and in 1791 passed under the jurisdiction of the French Republic. By the Treaty of Tolentino (1797) Pius VI. was obliged to resign the three legations of Bologna, Ferrara, and Romagna into Napoleon's hands, and a year later the remaining territory was seized and erected into the Roman Republic. This was overthrown by the Second Coalition in June, 1799; on July 3, 1800, Pius VII. entered Rome, which had been held by the Neapolitans, and reëstablished the old constitution in his States, now deprived of Romagna, Bologna, and Ferrara. The French again took possession of them, and in 1809 incorporated them with the Empire, Rome being reckoned as its second city. The Congress of Vienna restored the States of the Church, now embracing the marches of Ancona and Camerino, the duchies of Benevento and Pontecorvo, and the legations, except a part of Ferrara, which Austria retained. In 1831 and 1848 there were risings against the Government. The former was suppressed by the aid of an Austrian army; the latter assumed such proportions, even in Rome itself, that Pope Pius IX was forced to flee to Gaeta, while Rome was proclaimed a republic. He was restored by the arms of France in 1849. The Austrians held the legations for the Pope until 1859, and the French occupied Rome in his behalf (except for a part of 1867) until 1870. In July, 1859, on the withdrawal of the Austrian troops, the Romagna threw off the Papal authority and declared its annexation to the Kingdom of Sardinia, or, as it was to become a few months later, of Italy. After the defeat of Lamoricière, the Papal general (1859), Umbria, Urbino, and the Marches were annexed by Victor Emmanuel; and the isolated possessions of Benevento and Pontecorvo shared the same fate. In October, 1870, the French army having been withdrawn in July, the remnant of the Papal States voted for union with the Kingdom of Italy. It was the original intention of Victor Emmanuel's Government to leave the part of Rome known as the Leonine city under the Pope's control as a compromise; but it was rejected equally by the Pope and by the inhabitants, and the Pope's jurisdiction was re-

stricted within the limits of the Vatican, outside of which, as a protest against the legality of the Italian occupation, he has never set foot since 1870. Roman Catholics generally, while of course not considering the temporal power as in any way essential, yet regard it as very expedient for the proper exercise by the Pope of his high functions that he should be independent and not the subject of any temporal ruler. This is maintained not only on theoretical grounds, but as demonstrated historically by the events of the Avignon captivity and by more than one incident of the period since 1870. Consult: Manning, *The Temporal Power of the Pope* (London, 1871); Hagelüken, *Die weltliche Macht des Papstes* (Frankfort, 1868); Döllinger, *Papstthum und Kirchenstaat* (Munich, 1861); Hergenröther, *Der Kirchenstaat seit der französischen Revolution* (Freiburg, 1860); Stillman, *The Union of Italy* (Cambridge, 1898). See PAPACY; ITALY; PAPAL GUARANTEES, LAW OF.

PAPAV'ERA'CEÆ (Neo-Lat. nom. pl., from Lat. *papaver*, poppy). THE POPPY FAMILY. A natural order of dicotyledonous plants, mostly herbs or half shrubs, and usually with a milky or colored juice. The leaves are alternate, without stipules; the flowers solitary on long stalks; the fruit pod-shaped or capsular; the seeds numerous. In several the fruit is a capsule opening by small pores just under the expansion formed by the stigmas. In this way the seeds are well protected and only escape when shaken by the wind or other agencies. The order is distinguished for narcotic properties. Opium (q.v.) is its most important product. The juice of celandine (q.v.) is very acrid. A number of species are used in their native countries for medicinal purposes. The seeds yield fixed oil, which, with the exception of that obtained from Argemone Mexicana, is bland. The flowers of many species are large and showy, most frequently white or yellow, sometimes red. Several kinds of poppy and Eschscholtzia are frequent in gardens. There are in all about 200 species, natives of tropical and temperate climates. The chief genera are Hypecoum, Eschscholzia, Chelidonium, Glaucium, Papaver, Dicentra, Corydalis, and Fumaria. See POPPY.

PAPAW' (from Sp., Port. *papaya*, from Malabar *papaiamaram*, the native name), *Asimina triloba*. A small American tree or shrub of the natural order Anonaceæ, with alternate entire leaves and lateral or axillary nodding flowers. The fruits are variable in size, ranging from two to six inches in length and from one to two inches in diameter; flesh soft, sweet, and buttery; rind thin and adherent; seeds large, kidney-shaped, and numerous. While the papaw abounds in clearings and pastures from Pennsylvania southward, it is seldom met with in cultivation outside of parks and ornamental grounds. The fruits are found in season in several American markets, where they meet with ready sale. The tropical papaw, or melon tree, is a species of Carica.

PAPÉITI, pä'pä'ē'tē'. The capital of the French possessions in the eastern Pacific. See TAHITI.

PAPER (OF., Fr. *papier*, from Lat. *papyrus*, from Gk. *πάπυρος*, *papyros*, papyrus). Although the word 'paper' is derived from 'papyrus' (q.v.), papyrus is not a paper at all, and the beginnings of the paper industry are not traced back to it, but to the genuine paper made by the Chinese from very early times. From the Chinese it spread to other races, and was probably brought into Europe during the twelfth century through the Moors into Spain, and at the time of the Second Crusade into Italy. About the year 1150 a paper mill was started at Fabriano, Italy, which became the principal centre for paper-making, and this region continues the manufacture to the present day. From Italy the art spread to France and Germany, somewhat later to England, where it was not well established until the Revocation of the Edict of Nantes in 1685 sent many French paper-makers into exile to England and America. In 1690 the first paper mill in America was built by William Rittenhouse at Roxborough, near Philadelphia. The first paper mill in New England was built by a company to which was granted by the Governor and Legislature in 1728 the sole privilege of making paper in the Province of Massachusetts for ten years. In 1730 the manufacture of paper was begun by this company, and specimens of paper were shown to the Legislature.

PAPAW.

Up to the beginning of the nineteenth century, while machinery was used to reduce the rags to a pulp, the formation of the sheet of paper was done entirely by hand, sheet by sheet, as described below. About 1798 Louis Robert, a workman in the mill of Didot at Essonne, France, patented an invention for making paper in an endless web, but it was not put to practical use till developed in England by Henry and Sealy Fourdrinier, who spent and lost a fortune perfecting the machine. They are properly considered the founders of modern paper-making, and their machine is universally known as the Fourdrinier machine. So well was their develop-

PERSIMMON TREE (Diospyros Virginiana).

PAPAW OR MELON TREE (Carica Papaya).

ment work done that the early machines differ in minor details only from the most modern machine running to-day.

Earliest Process of Manufacture. The method of manufacturing paper by hand from the inner bark of the paper mulberry, as practiced to-day by the Japanese, probably represents the method in vogue from the very earliest times. It is of interest not only on account of its antiquity, but because it presents in outline all other methods, which merely are adaptations of the processes here described. A sheet of paper is an artificially felted web of vegetable fibre, purified of perishable materials, so that the remaining fibres are more or less pure cellulose (q.v.). The process may be described as collecting the raw material, cleaning it by boiling with lye, macerating it to a fine pulp, diluting with water, forming a sheet on a porous surface (that the water may drain off), and drying the sheet of paper thus formed. The Japanese strip the paper mulberry of its bark, soak it in water till soft enough to strip the outer bark, then separate the inner bark, dry in the sun, and boil with lye obtained by leaching wood ashes. After being well washed, the bark is now beaten into pulp by four men seated around a board of hard wood on which the bark is placed. The men pound with long wooden mallets and turn out each day about 80 pounds of pulp per man. The fibre is now mixed with sufficient water, and the sheet of paper formed on a sieve made of fine strips of bamboo. A wooden frame is fitted on the sieve to hold the right amount of liquid pulp. This elevated border is called in Europe the 'deckel,' and prevents the pulp from spreading beyond the limits of the sheet. After dipping the sieve into the vat of pulp, the paper-maker dexterously shakes the mold in all directions as the water drains off, thus felting the fibres in all directions and making a strong sheet. The sheets are then spread out on a board and dried in the sun.

The European method of making paper by hand differs in several respects from the Japanese. The raw material used (originally linen rags) is too tenacious to be reduced to pulp by hand power, and the earliest European mills used a sort of trip-hammer or pestle driven by a water wheel. This in turn was superseded by the modern beating engine or Hollander, invented by the Dutch in the latter part of the seventeenth century, as described below. The sieve used, instead of being made of bamboo, is of wire cloth, with a movable edge or deckel. The workman after forming the sheet removes the deckel, turning the damp sheet onto a sheet of woolen felt. A pile of these sheets, alternate paper and felt, is called a 'post,' and is placed in a press to remove the water. The sheets are afterwards hung up in a loft to dry, and finished by sizing with glue or gelatin, and smoothed by pressure or calender rolls. Hand-made paper always has four rough edges, while machine-made paper has only two. These are usually trimmed off unless an imitation of hand-made paper is wanted.

Raw Materials. The preparation of any raw material for use as paper stock consists essentially in isolating the cellulose in the form of fibres of as great length as possible. As cellulose is the structural base of all plants, theoretically any plant might furnish the paper-maker with material for his mill. It becomes, therefore, a question of cost of producing the pure cellulose, and quality of the product. The earliest plant used was the paper mulberry, whose fibres are very easily separated, and a fairly pure cellulose obtained by simply boiling with lye. As this plant does not grow in Europe, it is not used in modern paper-making. The chief material used up to the middle of the nineteenth century was cotton and linen rags. These are already reduced to nearly pure cellulose by the processes of textile manufacture, and cleaning and boiling with an alkali is all that is needed to prepare the stock for pulp. Wood is the raw material of most importance to the paper-maker to-day, and esparto grass (alfa) is used in England on a large scale. Straw, waste paper, old rope, jute butts, hemp, etc., are also used. The different processes of reducing the material to a suitable fibre will be considered later.

Process of Manufacture by Machinery. Whether for hand-made or for machine-made paper, the preparation of rags for pulp may be divided as follows: (1) cleaning; (2) boiling; (3) washing; (4) bleaching; (5) beating or reducing to pulp. The preparation of substitutes for rags is practically the same except that the boiling process is more drastic, varying with the substance used.

(1) *Cleaning.*—Rags are received at the mill in bales more or less sorted into white, colored, linen, cotton, canvas, etc., but need, for the finer sorts of paper (in which alone rags are now used at all), a thorough dusting and further sorting by hand. The duster may be of various forms, and removes dust and foreign substances by vigorous mechanical methods. The sorting is done by girls who stand before tables covered with wire screens through which dust and dirt sifts. The girls cut off buttons, rubber (a great curse to the modern paper-maker, as it does not bleach and appears in the paper as black specks, besides sticking to rolls and clogging the straining screens), and other foreign substances, and sort the rags accurately into different grades. A further dusting and chopping into pieces a couple of inches long make the rags ready for boiling.

(2) *Boiling.*—The rags are packed in a large horizontal boiler, called the 'rotary.' This is provided with manholes for the admission and discharge of the rags and lime, and is mounted on hollow trunnions through which steam is admitted. To clean the rags from all fatty, colored, and non-cellulose impurities, a solution of lime is used, and the rags cooked and slowly rotated under steam pressure for several hours, the amount of lime, pressure, and time of boiling varying according to circumstances. When sufficiently cooked, the steam and liquor are blown off and the rags dumped out by slowly revolving the rotary with the manholes opened. The rags are now of a brown color, and most of the impurities have been saponified, combining with the lime to form insoluble compounds which can be washed away, or, in the case of colors, reduced to simple colorless compounds.

(3) *Washing.*—The washing or beating engine is shown in the cut. It is also called the Hollander. It consists of a wooden or metal tub 10 to 15 feet long, with rounded ends (see cut), in the centre of which is a partition (5)

called the 'mid-feather'; a roll (C) is provided with knives, and revolves rapidly over a bed plate (B) of similar knives. The distance between the bed plate and the roll is regulated by raising or lowering the supports of the roll with a wheel and screw. The rags after passing between the bed plate and the roll flow down

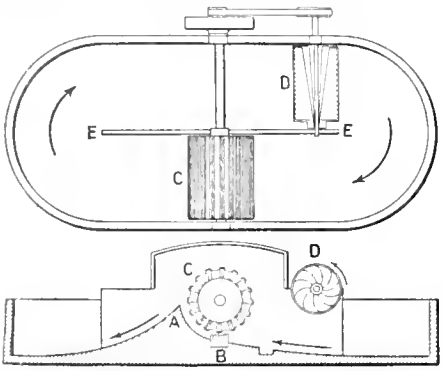

FIG. 1. PULP-BEATING ENGINE.

the 'backfall' (A) and around the mid-feather back to the starting point, as indicated by arrows. The washing engine is provided with a washing cylinder (D), which is so made that as it revolves it scoops up the water, which flows out through its axis, the rags being kept out by a fine wire cloth surrounding the cylinder. The rags to be washed are put into the washing engine with enough water, the roll being raised so that the rags pass around freely without being beaten into pulp, as otherwise the dirt would be ground into the fibre. A large quantity of water is admitted, which is removed by the drum washer, as described above, and the rags are in this manner rapidly cleaned. The roll is now lowered gradually, and the rags slowly macerated, losing their characteristics of textiles, and being finally resolved into single fibres of varying lengths. When the washing is completed, the washing cylinder is raised out of the beater and the supply of water cut off. The beating process is then continued a little longer till the pulp reaches the stage called half-stuff, the practice varying in different mills.

(4) *Bleaching.*—The pulp is now as white as it can be made without bleaching, and is a light gray if medium grade white and colored rags were used. The addition of a solution of chloride of lime (bleaching powder), decomposed by sulphuric acid, bleaches the pulp to a creamy whiteness. In America the bleaching is done in the washing engines, but in Europe a separate tub is often used. In place of chloride of lime, a solution much used in France is prepared by electrolysis of magnesium chloride. After bleaching, the pulp is emptied into the drainers, large chambers with floors of porous tiles, where the moisture and surplus bleach drain off. The pulp is left some days in the drainers, till it is nearly dry. In Europe, in place of drainers, the pulp is usually dried by making up into thick sheets of paper on a machine similar to the wire of the Fourdrinier machine called a *pressepâte*.

(5) *Beating.*—The half-stuff is next put into the beating engines, which are similar to the washers, but have no washing-drum, and the knives are arranged to macerate the pulp faster. At this point the loading materials, color, and sizing are added, and if various fibres are used, such as rag, wood fibre, or esparto, they are mixed here, while the half-stuff is being reduced to the very fine condition required for making into paper. Most papers contain a filler, usually china clay (kaolin, q.v.) or sulphate of lime ('pearl hardening'). This fills the pores, giving a more even printing surface, besides adding to the weight. As paper is usually sold by the pound, the latter consideration is not without its influence, the loading sometimes amounting to 33⅓ per cent. An addition of 10 per cent. of mineral is not considered an adulteration. Bleached pulp has a yellowish cast, and to obtain a pure white a little blue is added, and papers that are colored in the pulp are prepared at this point. Sizing is added to prevent the absorption of ink. Unsized (or 'water leaf') papers absorb water readily and cannot be used for writing with a pen. The sizing is of two kinds, vegetable (rosin) size, added at this stage of manufacture, and animal (glue) size, which is applied externally after the paper is made. The accompanying plate (Fig. 2) shows the beating engines in a 'news' mill at Rumford Falls, Maine. A boy is 'furnishing' the second engine, putting in chemical fibre, while the

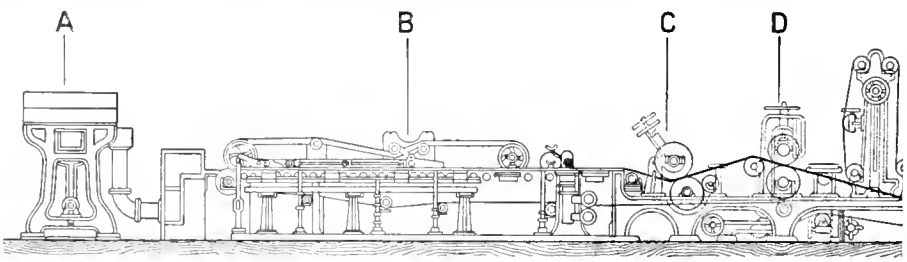

FIG. 2. FOURDRINIER MACHINE IN SECTION.

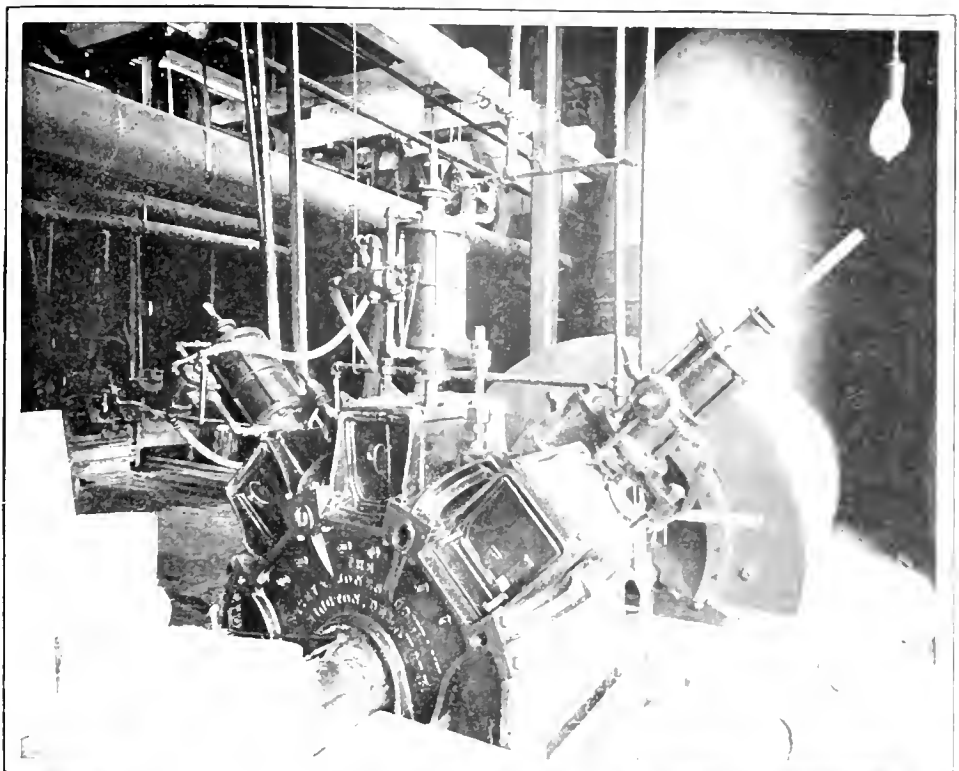
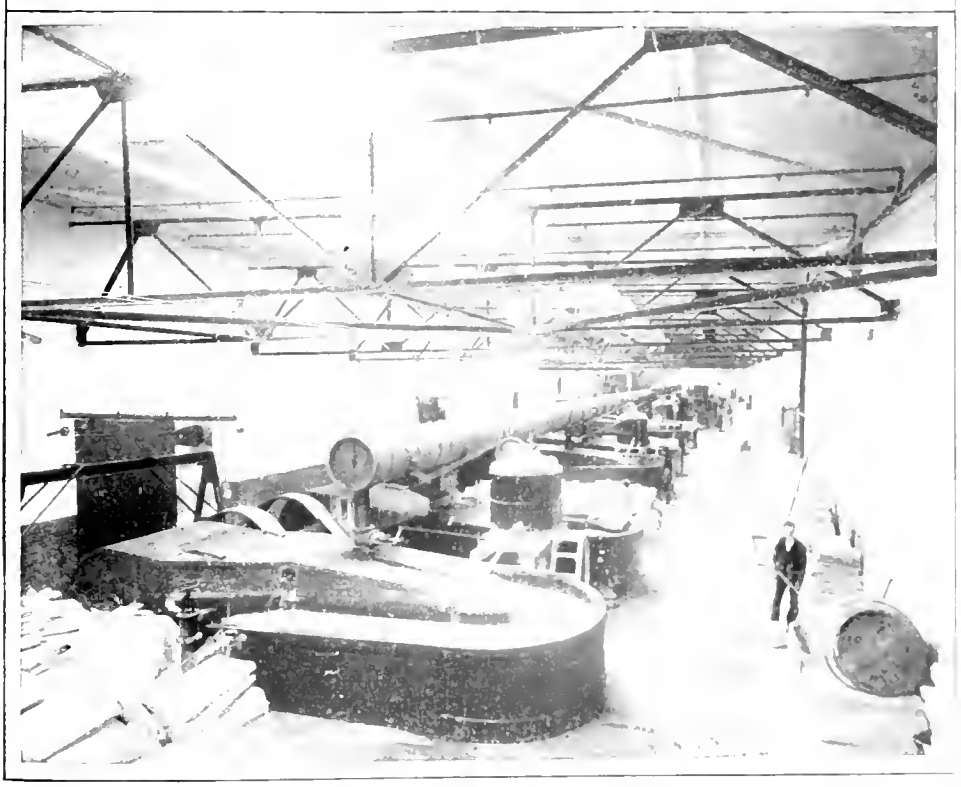
ground wood is run in from the large pipe above. On the other side is seen a man getting out china clay from a cask.

Rosin size is prepared as follows: A rosin soap is made by dissolving rosin with caustic soda or potash; this is added to the pulp in the beating engine and precipitated on the fibres by the addition of a solution of alum or sulphate of alumina. Paper thus sized is called engine-sized or rosin-sized paper, as distinguished from 'tub-sized' or animal-sized, which will be described later.

The pulp may be beaten fine enough in the beating engine, but the practice in this country





1. WOOD-PULP GRINDER AT RUMFORD FALLS, MAINE.
2. BEATING ENGINES AT RUMFORD FALLS, MAINE.

is to dump it into a 'stuff chest,' a large circular receptacle, with a horizontal agitator to keep it from settling, and then to pump it through a so-called 'Jordan' or refining engine into a second stuff chest, whence it is pumped to the Fourdrinier machine.

THE JORDAN ENGINE is a most successful American invention, in universal use in the paper mills of America, but practically unknown in Europe, in spite of its large saving of time, space, and power. It was invented in 1862 by Joseph Jordan of Paterson, N. J., who never benefited financially from the invention, and is now supported in poverty by the paper-makers of America. The 'Jordan' consists of a stationary hollow cone mounted with knives on the inside which fits over a solid rapidly revolving cone mounted with similar knives on the outside. The pulp passes between these cones, and the knives can be brought close together or separated with great accuracy, so that the degree of fineness of the pulp can be adjusted.

THE FOURDRINIER MACHINE consists of the following parts: A, the screens; B, the wire, with dandy roll, deckel straps, and suction boxes; C, the couch rolls; D, the first press; E, the second press; F, the driers; G, the calenders; H, the reel; and I, the slitter.

A. *The Screens.*—From the second stuff chest the pulp, which is now diluted with a large amount of water, flows through sand settlers and regulating gates to the screens. These consist of brass plates with a large number of longitudinal V-shaped slits cut in them, the opening being very small, only a few thousandths of an inch. A continuous jarring is given to these plates, which forces the fine pulp through the slits, but the lumps and impurities are retained. In some forms of screen a vacuum pump is used combined with an oscillating motion of the screens, which keeps the pulp flowing back and forth, preventing the clogging of the slits.

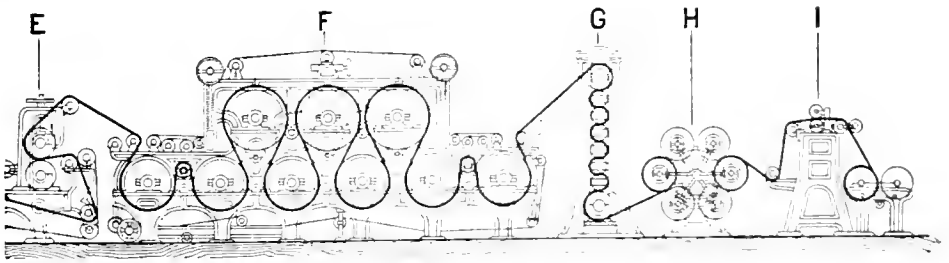


FIG. 2 FOURDRINIER MACHINE IN SECTION.

B. *The Wire.*—The strained and purified pulp flows over an apron onto an endless traveling wire cloth, the mesh of which is 60 to 90 threads to an inch. The wire is supported perfectly level on a great many small rollers (the 'table rolls'), under which is a shallow wooden box, the 'save-all,' into which much of the water runs, leaving the pulp on the wire. The water in the 'save-all' contains much pulp and is used over again. The boundary of the flow of pulp on the sides is made by endless rubber bands, called deckel straps, which travel with the wire. These are adjustable so that varying widths of paper may be made. The frame supporting the wire receives a lateral motion, which greatly assists in the felting of the fibres into a strong sheet. The forward motion of the wire tends to arrange the fibres in the same direction, and the side shake is necessary to offset this tendency, giving strength in both directions. Notwithstanding, it is easy to tell by tearing which way a sheet of paper was made on the machine. The water drains rapidly away from the pulp, assisted by two or three 'suction boxes' under the wire, which are connected with an air pump and exhaust the water much faster than would otherwise be possible. At this point, between the first and second suction boxes, is situated the 'dandy roll,' a light cylinder covered with wire, which rests on the upper surface of the moist paper, giving it the impression of whatever design is on it. 'Wove' paper has both sides impressed with the fine woven wire; that is, the dandy roll is covered with the same wire as the paper is formed on. In *laid* paper, on the other hand, the dandy is covered with parallel wires, with a cross wire at intervals. Water marks are impressed in the paper by affixing the required design on the dandy roll. A false water mark is sometimes made after the paper is partly dried by passing between rolls engraved with a design.

C. *Couch Rolls.*—At the end of the wire (that is, where it turns down over a roll to return to the starting point) are the 'couch' rolls, covered with felt, through which the wire passes bearing the web of paper. These rolls press the water out still more, and consolidate the fibre, giving it strength to cross alone the gap between the wire and the felt of the first press roll. These rolls correspond in function to the pressure applied to the 'post' of alternate sheets of damp paper and felts in hand made paper.

D and E. *The Press Rolls.*—An endless woolen blanket (the 'felt') supports the tender web of paper through a pair of highly polished brass rolls under considerable pressure, giving the upper side of the sheet a smooth surface, and leaving the impress of the felt on the under side. From the first press, D, the sheet runs *under* the second pair of rolls, E, and back through them in the *reverse* direction, thus smoothing the *other* side of the sheet and giving as even-sided results as possible.

F. *The Driers.*—The paper is now formed and it only remains to dry it. The driers are a series of steam-heated metal cylinders, two to four feet in diameter, arranged in one, two, or three tiers. The paper is carried nearly round each in turn, and on to the next, being held to the hot surfaces by an endless blanket, usually of cotton. Sometimes there are smoothing rolls

when the paper is partly dried. The size and number of driers determine how fast a paper can be run. With a given machine thin papers can be run (and dried) very fast; thick ones slowly.

G. *The Calenders.*—After being thoroughly dried the web of paper is passed through a 'stack' of smooth chilled iron rolls, which by their own weight, and pressure applied by screws or weights, smooths the paper and produces what is called 'machine finished' paper, as contrasted with 'supercalendered' paper, described farther on. It is now wound on a reel.

H and I. *The Reel and Slitter.*—After being wound on a reel the paper is passed through the slitter, the rough outside edges trimmed, and if necessary the single web slit into any required widths. It is then rewound and is ready for shipment, if intended for printing in the roll or for coating; or for supercalendering, sheeting, and packing.

The Fourdrinier machine makes automatically an endless web of paper from 60 to 160 inches wide at a speed of 10 to 400 feet per minute. The plate shows the reels, calenders, and driers of one of the largest machines in the world, 160 inches wide, belonging to the International Paper Company at Rumford Falls, Maine. It can run at a speed of 300 feet per minute and produces 64,000 pounds of paper in 24 hours.

Supercalenders. Much book paper requires a high finish, that is, a very smooth surface, and this is given by passing it between alternate iron and compressed paper rolls under great pressure. These machines are called the supercalenders. It is then sheeted, counted into reams of 480 or 500 sheets, and packed in cases or bundles.

Animal Sizing and Loft Drying. The finer grades of writing papers are not finished as here described, but when partly dried are passed through a vat of gelatin (glue) in solution, the excess squeezed off by rollers, and either slowly dried by passing over a large number of hollow drums with fans inside, or cut in sheets, and hung in lofts to dry in the manner employed for hand-made paper.

The following are the main differences in the preparation of rag substitutes from that given above:

Esparto grass comes from Spain and Africa, and is very largely used in England. The grass is cleaned, dusted, and boiled with caustic soda under pressure, a so-called vomiting boiler being usually used; it is then washed and bleached in much the same manner as rags. It gives a white fibre of fair strength.

Straw is used largely in the United States, chiefly for strawboard, and not reduced to a pure fibre. Its characteristics are similar to esparto, but it is more difficult to reduce to pure cellulose, owing to the silica it contains, requiring a stronger alkali and higher pressure in boiling.

Wood Pulp. There are two kinds of wood pulp used in paper-making, *mechanical pulp* or ground wood, and *chemical fibre*. Of the latter there are three processes of manufacture, the soda process, the sulphite, and the sulphate.

Ground wood is made by pressing blocks of wood obliquely (across the grain) against rapidly revolving grindstones, a stream of water carrying off the product, which is not chemically changed, and has very little fibre or strength. It is used very largely, however, for cheap newspaper, chiefly in connection with chemical fibre to impart greater strength. The plate (Fig. 1) shows a pulp-grinder at Rumford Falls, Maine, the stone being coupled directly to a turbine water wheel. It will be seen that there are three 'pockets,' in which blocks of wood are placed and pressed simultaneously against the stone. The pulp is then screened to remove lumps, bleached if necessary, and either run directly into the beaters if made into paper at the same mill (as at Rumford Falls; see plate, Fig. 2), or made into thick sheets by a machine similar to the cylinder paper machine described below. It is usually sold in a moist state. Paper containing ground wood turns yellow when exposed to the light, and becomes brittle. A solution of sulphate of aniline turns ground wood fibre a bright yellow, the intensity of the color giving a rough guide to the percentage of ground wood in the paper.

Chemical Wood Pulp. The oldest process of freeing cellulose from the incrusting woody matter, producing a material for making white paper, is the soda process, patented by Watt & Burgess in England in 1854. A soft wood, usually poplar in America, pine in Europe, is barked, chipped across the grain into small pieces, and cooked under steam pressure with a solution of caustic soda. The alkali dissolves everything but the cellulose, and after washing and bleaching a soft white fibre of good quality is produced, of little strength, but very useful to supplement other fibres.

The *sulphite process* is apparently an American invention, the first patent being granted in 1867 to B. C. Tilghmann. He used sulphurous acid to produce pure cellulose, and while this is the base of the modern process, it was not brought to a practical success till bisulphite of magnesium or calcium was used instead. Mitscherlich in Germany brought the process to a commercial basis, and of late years it has developed to very large proportions. Various modifications of the process are used, but in all of them the wood, properly barked, chipped, and dusted, is digested under steam pressure in a solution of the bisulphite, washed, and bleached if necessary. 'Sulphite' fibre has good strength and color, and much of it is used unbleached.

The *sulphate process* is not used in America, but produces a very good pulp at a higher cost than sulphite. It is similar to the soda process in theory, but sulphate of soda is used. An objection to it consists in the offensive odor of the by-products.
